F60 Feeder Protection System UR Series Instruction Manual revision 7.2x.

Part number: 1601-0093-AA1 (August 2013)

Use this chapter for initial setup of your new F60 Feeder Protection System.

1.1.1 CAUTIONS AND WARNINGS

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage, or downtime.

The following safety and equipment symbols are used in this document.

⚠DANGER **Indicates a hazardous situation which, if not avoided, will result in death or serious injury.**

⚠WARNING **Indicates a hazardous situation which, if not avoided, could result in death or serious injury.**

⚠CAUTION **Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.**

NOTICE Indicates practices not related to personal injury.

a) GENERAL CAUTIONS AND WARNINGS

The following general safety precautions and warnings apply.

⚠DANGER **Ensure that all connections to the product are correct so as to avoid accidental risk of shock and/or fire, for example such as can arise from high voltage connected to low voltage terminals.**

Follow the requirements of this manual, including adequate wiring size and type, terminal torque settings, voltage, current magnitudes applied, and adequate isolation/clearance in external wiring from high to low voltage circuits.

Use the device only for its intended purpose and application.

Ensure that all ground paths are uncompromised for safety purposes during device operation and service.

Ensure that the control power applied to the device, the AC current, and voltage input match the ratings specified on the relay nameplate. Do not apply current or voltage in excess of the specified limits.

Only qualified personnel are to operate the device. Such personnel must be thoroughly familiar with all safety cautions and warnings in this manual and with applicable country, regional, utility, and plant safety regulations.

Hazardous voltages can exist in the power supply and at the device connection to current transformers, voltage transformers, control, and test circuit terminals. Make sure all sources of such voltages are isolated prior to attempting work on the device.

Hazardous voltages can exist when opening the secondary circuits of live current transformers. Make sure that current transformer secondary circuits are shorted out before making or removing any connection to the current transformer (CT) input terminals of the device.

For tests with secondary test equipment, ensure that no other sources of voltages or currents are connected to such equipment and that trip and close commands to the circuit breakers or other switching apparatus are isolated, unless this is required by the test procedure and is specified by appropriate utility/plant procedure.

When the device is used to control primary equipment, such as circuit breakers, isolators, and other switching apparatus, all control circuits from the device to the primary equipment must be isolated while personnel are working on or around this primary equipment to prevent any inadvertent command from this device.

Use an external disconnect to isolate the mains voltage supply.

⚠CAUTION **LED transmitters are classified as IEC 60825-1 Accessible Emission Limit (AEL) Class 1M. Class 1M devices are considered safe to the unaided eye. Do not view directly with optical instruments.**

NOTICE This product is rated to Class A emissions levels and is to be used in Utility, Substation Industrial environments. Not to be used near electronic devices rated for Class B levels.

1.1.2 INSPECTION PROCEDURE

1. Open the relay packaging and inspect the unit for physical damage.
2. View the rear nameplate and verify that the correct model has been ordered and delivered. The model number is at the top right.

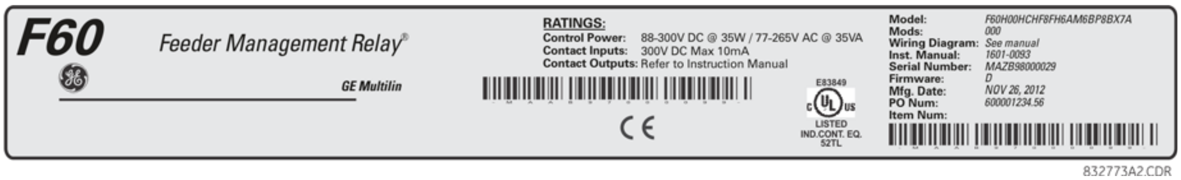

Figure 1–1: REAR NAMEPLATE (EXAMPLE)

3. Ensure that the following items are included:
   - Instruction manual (if ordered)
   - GE EnerVista™ DVD (includes the EnerVista UR Setup software and manuals in PDF format)
   - Mounting screws
4. If there is any noticeable physical damage, or any of the contents listed are missing, contact GE Digital Energy as follows.

1.2.1 INTRODUCTION TO THE UR

The GE Universal Relay (UR) series is a new generation of digital, modular, and multifunction equipment that is easily incorporated into automation systems, at both the station and enterprise levels.

1.2.2 HARDWARE ARCHITECTURE

a) UR BASIC DESIGN

The UR is a digital-based device containing a central processing unit (CPU) that handles multiple types of input and output signals. The UR device can communicate over a local area network (LAN) with an operator interface, a programming device, or another UR device.

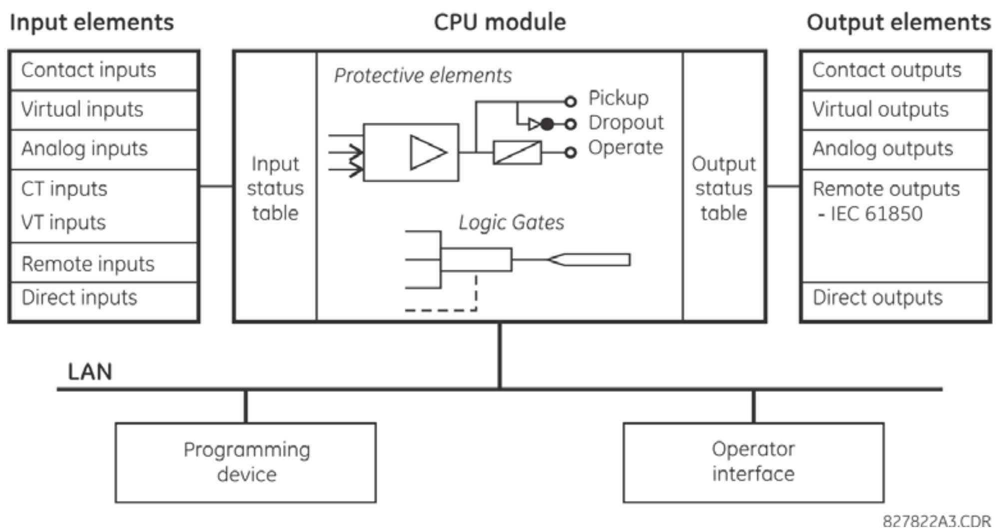

Figure 1–2: UR BLOCK DIAGRAM

The **CPU module** contains firmware that provides protection elements in the form of logic algorithms, as well as programmable logic gates, timers, and latches for control features.

Input elements accept a variety of analog or digital signals from the field. The UR isolates and converts these signals into logic signals used by the relay.

Output elements convert and isolate the logic signals generated by the relay into digital or analog signals that are used to control field devices.

The unit and software are backwards-compatible with UR devices.

b) UR SIGNAL TYPES

The **contact inputs and outputs** are digital signals associated with connections to hard-wired contacts. Both 'wet' and 'dry' contacts are supported.

The **virtual inputs and outputs** are digital signals associated with UR-series internal logic signals. Virtual inputs include signals generated by the local user interface. The virtual outputs are outputs of FlexLogic™ equations used to customize the device. Virtual outputs can also serve as virtual inputs to FlexLogic equations.

The **analog inputs and outputs** are signals that are associated with transducers, such as Resistance Temperature Detectors (RTDs).

The **CT and VT inputs** are analog current transformer and voltage transformer signals used to monitor AC power lines. The UR-series relays support 1 A and 5 A CTs.

The **remote inputs and outputs** provide a means of sharing digital point state information between remote UR-series devices. The remote outputs interface to the remote inputs of other UR-series devices. Remote outputs are FlexLogic operands inserted into IEC 61850 GSSE and GOOSE messages.

The **direct inputs and outputs** provide a means of sharing digital point states between a number of UR-series intelligent electronic devices (IEDs) over dedicated fiber, RS422, or G.703 interface. No switching equipment is required as the IEDs are connected directly in a ring or redundant (dual) ring configuration. This feature is optimized for speed and intended for pilot-aided schemes, distributed logic applications, or the extension of the input/output capabilities of a single relay chassis.

1.2.3 SOFTWARE ARCHITECTURE

Firmware is the software embedded in the relay in functional modules that can be installed in any relay as required. This is achieved with object-oriented design and programming (OOD/OOP) techniques.

Object-oriented techniques involve the use of *objects* and *classes*. An object is defined as “a logical entity that contains both data and code that manipulates data.” A class is the generalized form of similar objects. By using this approach, one can create a protection class with the protection elements as objects of the class, such as time overcurrent, instantaneous overcurrent, current differential, undervoltage, overvoltage, underfrequency, and distance. These objects represent completely self-contained software modules. The same object-class concept can be used for metering, input/output control, software interface, communications, or any functional entity in the system.

Employing OOD/OOP in the software architecture of the F60 achieves the same features as the hardware architecture: modularity, scalability, and flexibility. The application software for any UR-series device (for example, feeder protection, transformer protection, distance protection) is constructed by combining objects from the various functional classes. This results in a common interface across the UR series.

1.3.1 SYSTEM REQUIREMENTS

The relay front panel or the EnerVista UR Setup software can be used to communicate with the relay. The software interface is the preferred method to edit settings and view actual values because the computer monitor can display more information.

The minimum system requirements for the EnerVista UR Setup software are as follows:

- Pentium 4 (Core Duo recommended)
- Windows XP with Service Pack 2 (Service Pack 3 recommended), Windows 7, or Windows Server 2008 Release 2 64-bit
- 1 GB of RAM (2 GB recommended)
- 500 MB free hard drive space (1 GB recommended)
- 1024 x 768 display (1280 x 800 recommended)

The following qualified modems have been tested to be compatible with the F60 and the EnerVista UR Setup software:

- US Robotics external 56K FaxModem 5686
- US Robotics external Sportster 56K X2
- PCTEL 2304WT V.92 MDC internal modem

1.3.2 INSTALLATION

After ensuring that the requirements for using EnerVista UR Setup software are met, install the software from the GE EnerVista DVD. Or download the UR EnerVista software from http://www.gedigitalenergy.com/multilin and install it.

If you are upgrading from version 7.0 or 7.1 to 7.2 or later, some CPU modules require a new boot version. Update this first in EnerVista under **Maintenance > Update Firmware**.

To install the UR EnerVista software from the DVD:

1. Insert the GE EnerVista DVD into the DVD drive of your computer.
2. Click the **Install Now** button and follow the instructions.
3. When installation is complete, start the EnerVista Launchpad application.
4. Click the **IED Setup** section of the **Launch Pad** window.

Figure 1–3: ADDING A UR DEVICE IN LAUNCHPAD WINDOW

5. In the EnerVista Launch Pad window, click the **Add Product** button and select the appropriate product as follows. Select the **Web** option to ensure the most recent software release, or select **CD** if you do not have an Internet connec-

tion, then click the **Add Now** button to list software items for the product. EnerVista Launchpad obtains the software from the Internet or DVD and automatically starts the installation program.

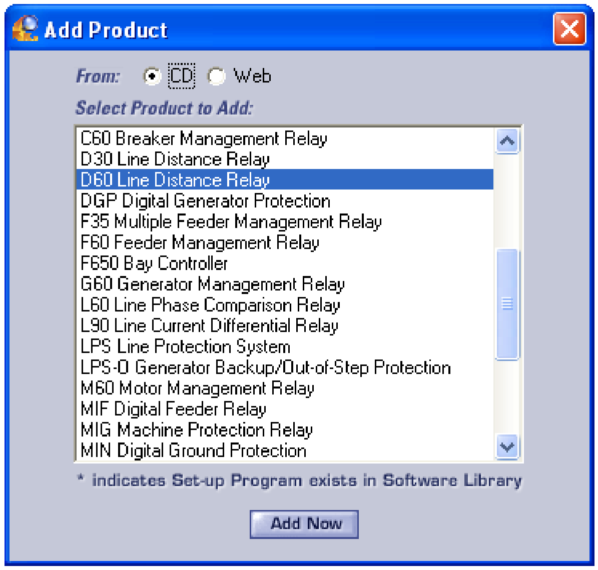

Figure 1–4: IDENTIFYING THE UR DEVICE TYPE

6. Select the complete path, including the new directory name, where the EnerVista UR Setup software is to be installed.
7. Click the **Next** button to begin the installation. The files are installed in the directory indicated, and the installation program automatically creates icons and adds an entry to the Windows start menu.
8. Click **Finish** to complete the installation. The UR device is added to the list of installed intelligent electronic devices (IEDs) in the EnerVista Launchpad window, as shown.

Figure 1–5: UR DEVICE ADDED TO LAUNCHPAD WINDOW

1.3.3 CONFIGURING THE F60 FOR SOFTWARE ACCESS

a) OVERVIEW

You connect remotely to the F60 through the rear RS485 or Ethernet port with a computer running the EnerVista UR Setup software. The F60 can also be accessed locally with a laptop computer through the front panel RS232 port or the rear Ethernet port using the *Quick Connect* feature.

- To configure the F60 for remote access via the rear RS485 port, see the *Configuring Serial Communications* section.
- To configure the F60 for remote access via the rear Ethernet port, see the *Configuring Ethernet Communications* section. An Ethernet module must be specified at the time of ordering.
- To configure the F60 for local access with a laptop through either the front RS232 port or rear Ethernet port, see the *Using the Quick Connect Feature* section.

b) CONFIGURING SERIAL COMMUNICATIONS

A GE Multilin F485 converter (or compatible RS232-to-RS485 converter) is required. See the F485 instruction manual for details.

1. Connect a serial cable to the RS485 terminal on the back of the UR device.
2. In the EnerVista Launchpad software on the computer, select the UR device to start the software.
3. Click the **Device Setup** button to open the Device Setup window, and click the **Add Site** button to define a new site.
4. Enter a site name in the **Site Name** field. Optionally add a short description of the site along with the display order of devices defined for the site. This example uses "Location 1" as the site name. When done, click the **OK** button. The new site appears in the upper-left list in the EnerVista UR Setup window.
5. Click the **Device Setup** button, then select the new site to re-open the Device Setup window.
6. Click the **Add Device** button to define the new device.
7. Enter a name in the "Device Name" field and a description (optional) of the site.
8. Select "Serial" from the **Interface** drop-down list. This displays a number of interface parameters that must be entered for serial communications.

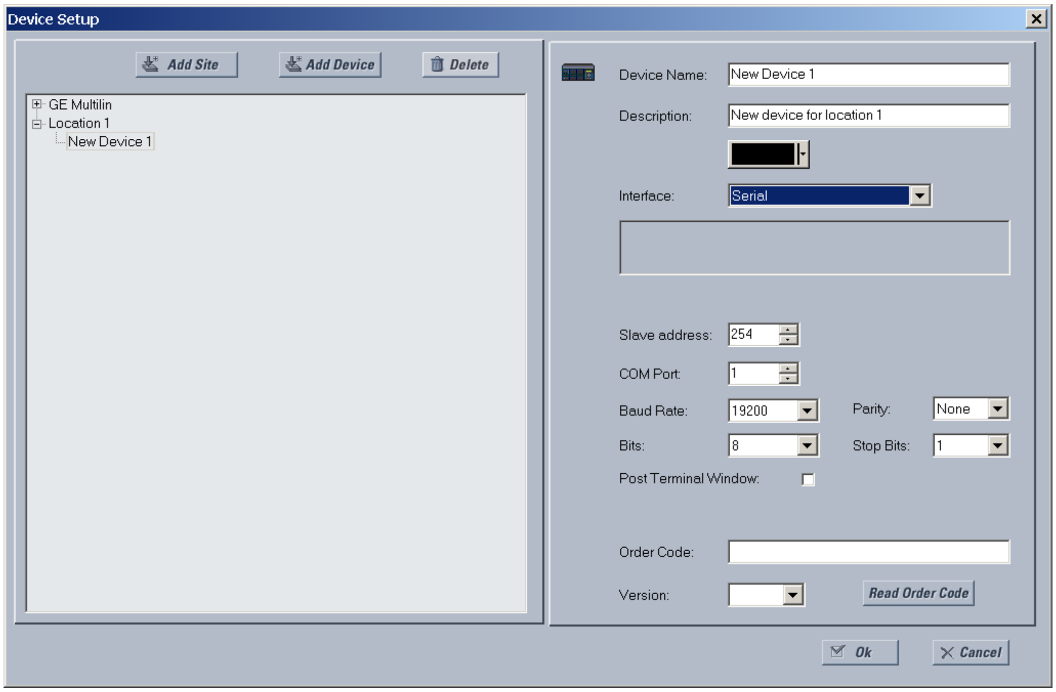

Figure 1–6: CONFIGURING SERIAL COMMUNICATIONS

9. Enter the relay slave address, COM port, baud rate, and parity settings from the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **SERIAL PORTS** menu in their respective fields.
10. Click the **Read Order Code** button to connect to the F60 device and upload the order code. If a communications error occurs, ensure that the EnerVista UR Setup serial communications values entered in the previous step correspond to the relay setting values.
11. Click the **OK** button when the relay order code has been received. The new device is added to the Site List window (or Online window) located in the top left corner of the main EnerVista UR Setup window.

The device has now been configured for RS232 communications. Proceed to the *Connecting to the F60* section to begin communication.

1

c) CONFIGURING ETHERNET COMMUNICATIONS

Before starting, verify that the Ethernet network cable is properly connected to the Ethernet port on the back of the relay. To setup the relay for Ethernet communications, you define a Site, then add the relay as a Device at that site.The computer and UR device must be on the same subnet.

12. Select the “UR” device from the EnerVista Launchpad to start EnerVista UR Setup.
13. Click the **Device Setup** button to open the Device Setup window, then click the **Add Site** button to define a new site.
14. Enter the desired site name in the “Site Name” field. If desired, a short description of site can also be entered along with the display order of devices defined for the site. In this example, we use “Location 2” as the site name. Click the **OK** button when complete.
15. The new site appears in the upper-left list in the EnerVista UR Setup window. Click the **Device Setup** button then select the new site to re-open the Device Setup window.
16. Click the **Add Device** button to define the new device.
17. Enter the desired name in the “Device Name” field and a description (optional) of the site.
18. Select “Ethernet” from the **Interface** drop-down list. This displays a number of interface parameters that must be entered for proper Ethernet functionality.

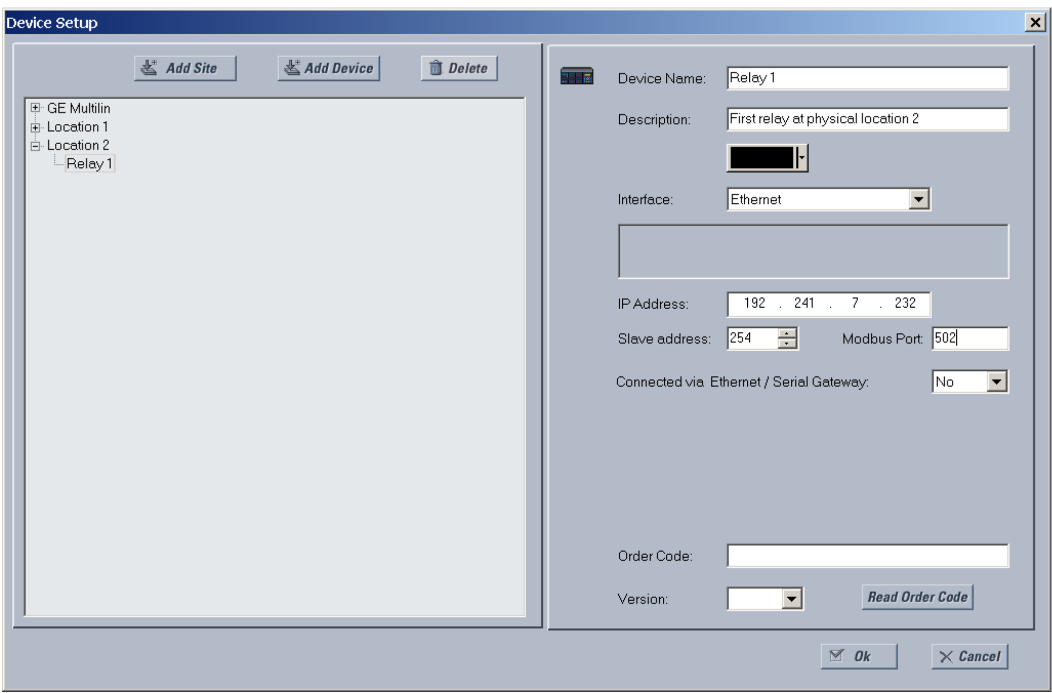

Figure 1–7: CONFIGURING ETHERNET COMMUNICATIONS

19. Enter the relay IP address specified in the SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ NETWORK ⇨ IP ADDRESS in the “IP Address” field.
20. Enter the relay slave address and Modbus port address values from the respective settings in the SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ MODBUS PROTOCOL menu.
21. Click the **Read Order Code** button to connect to the F60 device and upload the order code. If an communications error occurs, ensure that the three EnerVista UR Setup values entered in the previous steps correspond to the relay setting values.
22. Click **OK** when the relay order code has been received. The new device is added to the Site List window (or Online window) located in the top left corner of the main EnerVista UR Setup window.

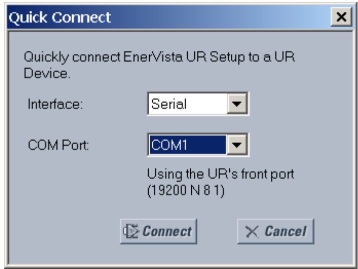
The Site Device has now been configured for Ethernet communications. Proceed to the *Connecting to the F60* section to begin communications.

1.3.4 USING THE QUICK CONNECT FEATURE

a) USING QUICK CONNECT VIA THE FRONT PANEL RS232 PORT

Before starting, verify that the serial cable is properly connected from the computer to the front panel RS232 port with a straight-through 9-pin to 9-pin RS232 cable.

1. Verify that the latest version of the EnerVista UR Setup software is installed (available from the GE EnerVista CD or online from http://www.gedigitalenergy.com/multilin). See the *Software Installation* section if not already installed.
2. Select the “UR” device from the EnerVista Launchpad to start EnerVista UR Setup.
3. Click the **Quick Connect** button to open the Quick Connect dialog box.



4. Select the **Serial** interface and the correct COM Port, then click **Connect**.
5. The EnerVista UR Setup software creates a site named “Quick Connect” with a corresponding device also named “Quick Connect” and displays them at the upper-left of the screen. Expand the sections to view data directly from the F60 device.

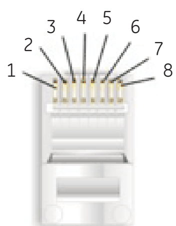
Each time that the EnerVista UR Setup software is initialized, click the **Quick Connect** button to establish direct communications to the F60 device. This ensures that configuration of the EnerVista UR Setup software matches the F60 model number.

b) USING QUICK CONNECT VIA THE REAR ETHERNET PORTS

To use the Quick Connect feature to access the F60 from a computer through Ethernet, first assign an IP address to the relay from the front panel keyboard.

1. Press the MENU key until the SETTINGS menu displays.
2. Navigate to the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ NETWORK ⇨ IP ADDRESS** setting.
3. Enter an IP address, for example “1.1.1.1,” and select the ENTER key to save the value.
4. In the same menu, select the **SUBNET IP MASK** setting.
5. Enter a subnet IP address, for example “255.0.0.0,” and press the ENTER key to save the value.

Next, use an Ethernet cross-over cable to connect the computer to the rear Ethernet port. In case you need it, the figure shows the pinout for an Ethernet cross-over cable.



END 1		
Pin	Wire color	Diagram
1	White/orange	
2	Orange	
3	White/green	
4	Blue	
5	White/blue	
6	Green	
7	White/brown	
8	Brown	

END 2		
Pin	Wire color	Diagram
1	White/green	
2	Green	
3	White/orange	
4	Blue	
5	White/blue

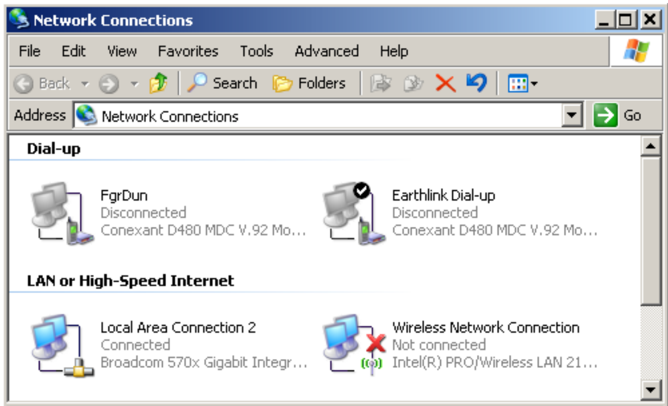
7	White/brown	
8	Brown	

842799A1.CDR

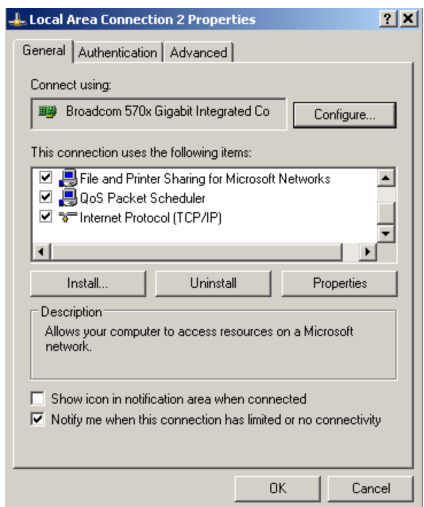
Figure 1–8: ETHERNET CROSS-OVER CABLE PIN LAYOUT

Now, assign the computer an IP address compatible with the relay’s IP address.

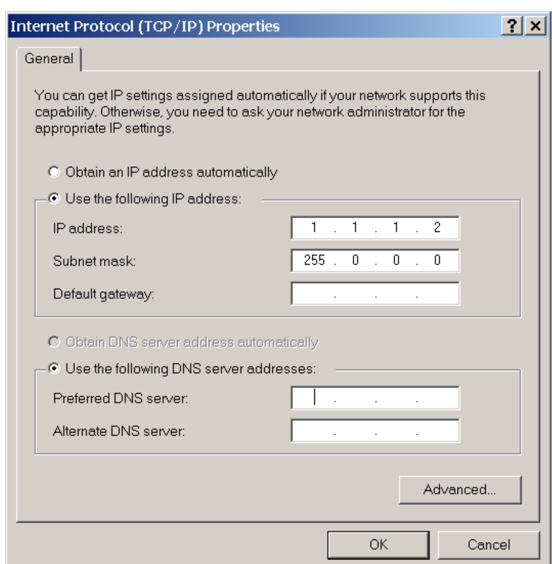
1. From the Windows desktop, right-click the **My Network Places** icon and select **Properties** to open the network connections window.



2. Right-click the **Local Area Connection** icon and select **Properties**.



3. Select the **Internet Protocol (TCP/IP)** item from the list, and click the **Properties** button.



4. Click the “Use the following IP address” box.

5. Enter an **IP address** with the first three numbers the same as the IP address of the F60 relay and the last number different (in this example, 1.1.1.2).
6. Enter a subnet mask equal to the one set in the F60 (in this example, 255.0.0.0).
7. Click the **OK** button to save the values.

Before continuing, test the Ethernet connection.

1. Open a Windows console window by selecting **Start > Run** from the Windows **Start** menu and typing “cmd”.
2. Type the following command, substituting the IP address of 1.1.1.1 with yours:

```
C:\WINNT>ping 1.1.1.1
```

3. If the connection is successful, the system returns four replies similar to the following:

```
Pinging 1.1.1.1 with 32 bytes of data:

Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
Reply from 1.1.1.1: bytes=32 time<10ms TTL=255

Ping statistics for 1.1.1.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip time in milliseconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0 ms
```

4. Note that the values for `time` and `TTL` vary depending on local network configuration.
5. If the following sequence of messages appears when entering the `C:\WINNT>ping 1.1.1.1` command:

```
Pinging 1.1.1.1 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 1.1.1.1:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
Approximate round trip time in milliseconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0 ms

Pinging 1.1.1.1 with 32 bytes of data:
```

   verify the physical connection between the F60 and the laptop computer, and double-check the programmed IP address in the **PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ NETWORK ⇨ IP ADDRESS** setting, then repeat step 2.

6. If the following sequence of messages appears when entering the `C:\WINNT>ping 1.1.1.1` command:

```
Pinging 1.1.1.1 with 32 bytes of data:

Hardware error.
Hardware error.
Hardware error.
Hardware error.

Ping statistics for 1.1.1.1:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
Approximate round trip time in milliseconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0 ms

Pinging 1.1.1.1 with 32 bytes of data:
```

   verify the physical connection between the F60 and the laptop computer, and double-check the programmed IP address in the **PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ NETWORK ⇨ IP ADDRESS** setting, then repeat step 2.

7. If the following sequence of messages appears when entering the `C:\WINNT>ping 1.1.1.1` command:

```
Pinging 1.1.1.1 with 32 bytes of data:

Destination host unreachable.
Destination host unreachable.
Destination host unreachable.
Destination host unreachable.

Ping statistics for 1.1.1.1:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
Approximate round trip time in milliseconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0 ms

Pinging 1.1.1.1 with 32 bytes of data:
```

verify the IP address is programmed in the local computer by entering the ipconfig command in the command window.

```
C:\WINNT>ipconfig

        Subnet Mask . . . . . . . . . . . : 0.0.0.0
        Default Gateway . . . . . . . . . :

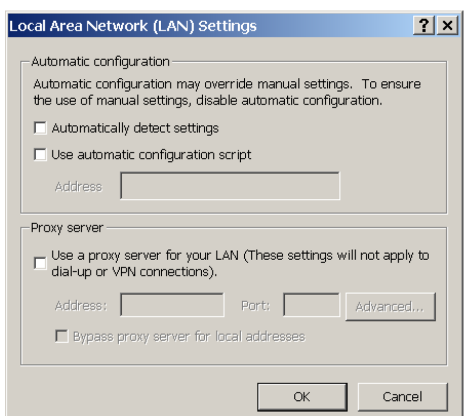
Ethernet adapter Local Area Connection:

        Connection-specific DNS suffix  . :
        IP Address. . . . . . . . . . . . : 1.1.1.2
        Subnet Mask . . . . . . . . . . . : 255.0.0.0
        Default Gateway . . . . . . . . . :

C:\WINNT>
```

Before using the Quick Connect feature through the Ethernet port, disable any configured proxy settings in Internet Explorer.

1. Start the Internet Explorer software.
2. Select the **Tools > Internet Options** menu item and click the **Connections** tab.
3. Click on the **LAN Settings** button to open the following window.

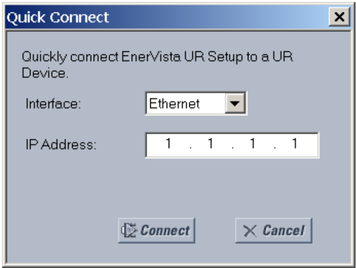


4. Ensure that the “Use a proxy server for your LAN” box is not checked.

If this computer is used to connect to the Internet, re-enable any proxy server settings after the laptop has been disconnected from the F60 relay.

1. Start the Internet Explorer software.
2. Select the “UR” device from the EnerVista Launchpad to start EnerVista UR Setup.

3. Click the **Quick Connect** button to open the Quick Connect dialog box.

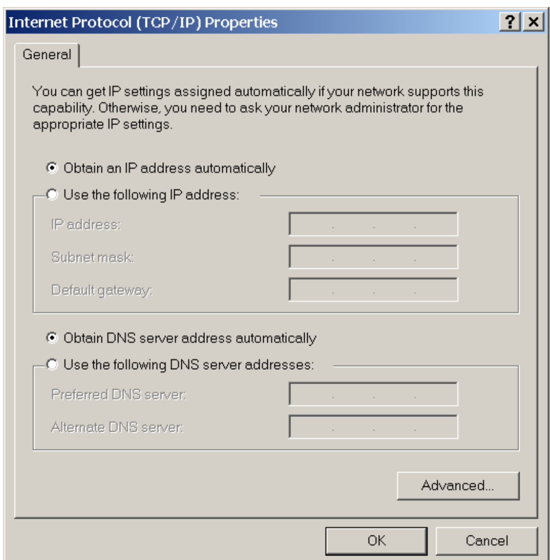


4. Select the **Ethernet** interface and enter the IP address assigned to the F60, then click the **Connect** button. The EnerVista UR Setup software creates a site named “Quick Connect” with a corresponding device also named “Quick Connect” and displays them at the upper-left of the screen.
5. Expand the sections to view data directly from the F60 device.

Each time the EnerVista UR Setup software is initialized, click the **Quick Connect** button to establish direct communications to the F60. This ensures that configuration of the EnerVista UR Setup software matches the F60 model number.

When direct communications with the F60 via Ethernet is complete, make the following changes:

1. From the Windows desktop, right-click the **My Network Places** icon and select **Properties** to open the network connections window.
2. Right-click the **Local Area Connection** icon and select the **Properties** item.
3. Select the **Internet Protocol (TCP/IP)** item from the list provided and click the **Properties** button.
4. Set the computer to “Obtain a relay address automatically” as shown.



If this computer is used to connect to the Internet, re-enable any proxy server settings after the computer has been disconnected from the F60 relay.

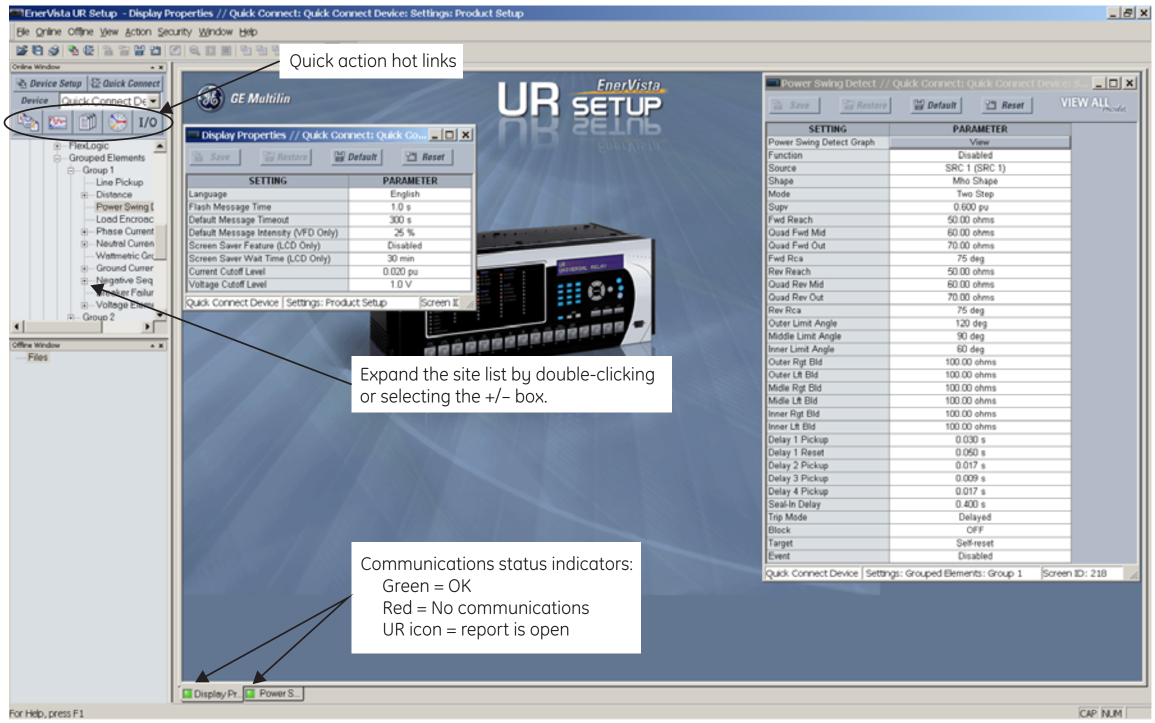
AUTOMATIC DISCOVERY OF ETHERNET DEVICES

The EnerVista UR Setup software can automatically discover and communicate to all UR-series IEDs located on an Ethernet network.

Using the Quick Connect feature, a single click of the mouse triggers the software to automatically detect any UR-series relays located on the network. The EnerVista UR Setup software then proceeds to configure all settings and order code options in the **Device Setup** menu. This feature allows the user to identify and interrogate all UR-series devices at a location.

1.3.5 CONNECTING TO THE F60 RELAY

1. Open the Display Properties window through the Site List tree as shown. The Display Properties window opens with a status indicator on the lower left of the EnerVista UR Setup window.



842743A3.CDR

2. If the status indicator is red, verify that the Ethernet network cable is properly connected to the Ethernet port on the back of the relay and that the relay has been properly setup for communications (steps A and B earlier).

   If a relay icon appears in place of the status indicator, than a report (such as an oscillography or event record) is open. Close the report to re-display the green status indicator.

3. The Display Properties settings can now be edited, printed, or changed.

NOTE

See chapter 4 in this manual or the EnerVista UR Setup Help File for information about the using the EnerVista UR Setup software interface.

QUICK ACTION HOT LINKS

The EnerVista UR Setup software has several quick action buttons to provide instant access to several functions that are often performed when using F60 relays. From the online window, users can select the relay to interrogate from a pull-down window, then click the button for the action they want to perform. The following quick action functions are available:

- View the F60 event record
- View the last recorded oscillography record
- View the status of all F60 inputs and outputs
- View all of the F60 metering values
- View the F60 protection summary
- Generate a service report

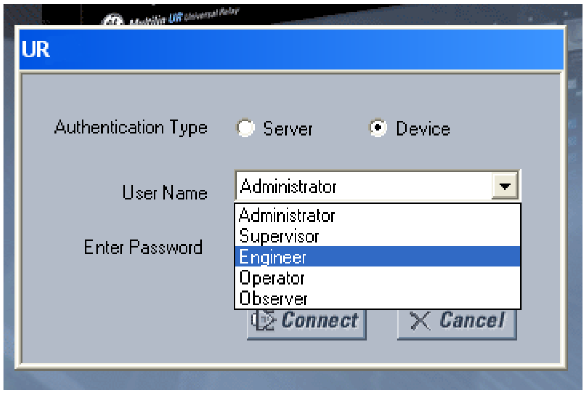
1.3.6 SETTING UP CYBERSENTRY AND CHANGING DEFAULT PASSWORD

If and when first using CyberSentry security, use the following procedure for set up.

1. Log in to the relay as Administrator by using the Value keys on the front panel or through EnerVista connected serially (so that no IP address is required). If logging in through EnerVista choose Device authentication. Enter the default password "ChangeMe1#". Note that the "Lock relay" setting needs to be disabled in the **Security > Supervisory** menu. When this setting is disabled, configuration and firmware upgrade are possible. By default, this setting is disabled.
2. Enable the Supervisor role if you have a need for it.
3. Make any required changes in configuration, such as setting a valid IP address for communication over Ethernet.
4. Log out of the Administrator account by choosing None.

Next, device or server authentication can be chosen on the login screen, but the choice is available only in EnerVista. Use device authentication to log in using the five pre-configured roles (Administrator, Supervisor, Engineer, Operator, Observer). When using a serial connection, only device authentication is supported. When server authentication is required, characteristics for communication with a RADIUS server must be configured on the UR. This is possible only through the EnerVista software. The RADIUS server itself also must be configured. The appendix called RADIUS Server gives an example of how to setup a simple RADIUS server. Once both the RADIUS server and the parameters for connecting UR to the server have been configured, you can choose server authentication on the login screen of EnerVista.

Figure 1–9: LOGIN SCREEN FOR CYBERSENTRY

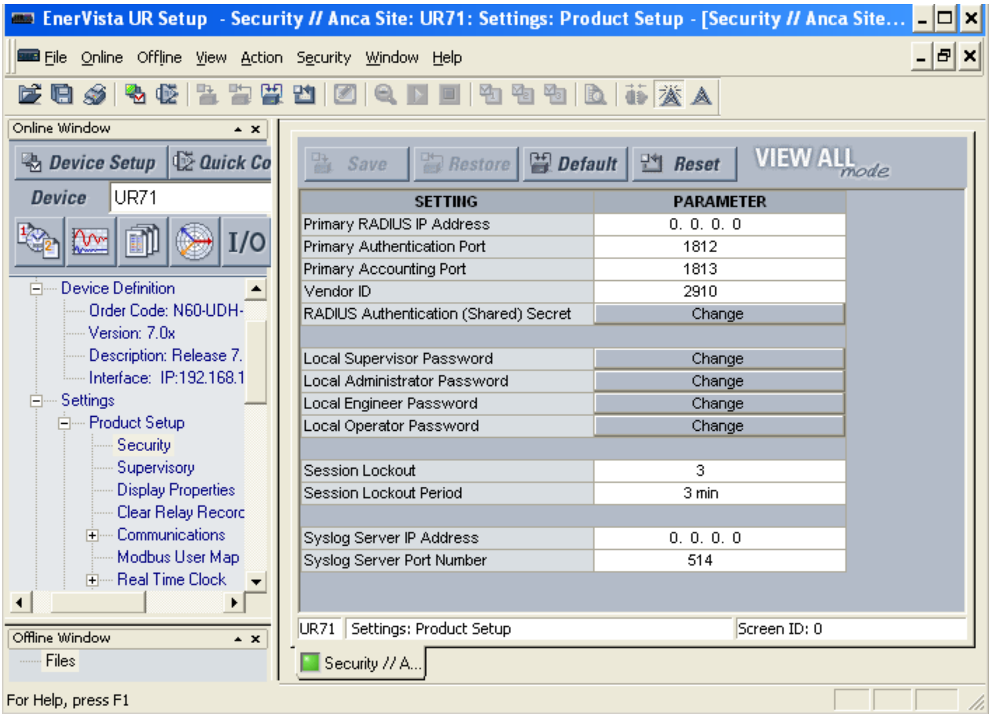


During the commissioning phase, you have the option to bypass the use of passwords. Do so by enabling the Bypass Access setting under **SETTINGS > PRODUCT SETUP > SECURITY > SUPERVISORY**. Be sure to disable this bypass setting after commissioning the device.

You can change the password for any role either from the front panel or through EnerVista.

If using EnerVista, navigate to **Settings > Product Setup > Security**. Change the **Local Administrator Password**, for example. It is strongly recommended that the password for the Administrator be changed from the default. Changing the passwords for the other three roles is optional.

Figure 1–10: CHANGING THE DEFAULT PASSWORD



1.4.1 MOUNTING AND WIRING

See Chapter 3: Hardware for mounting and wiring instructions.

1.4.2 COMMUNICATIONS

The EnerVista UR Setup software communicates to the relay via the faceplate RS232 port or the rear panel RS485 / Ethernet ports. To communicate via the faceplate RS232 port, a standard straight-through serial cable is used. The DB-9 male end is connected to the relay and the DB-9 or DB-25 female end is connected to the computer COM2 port as described in the *CPU Communication Ports* section of chapter 3.

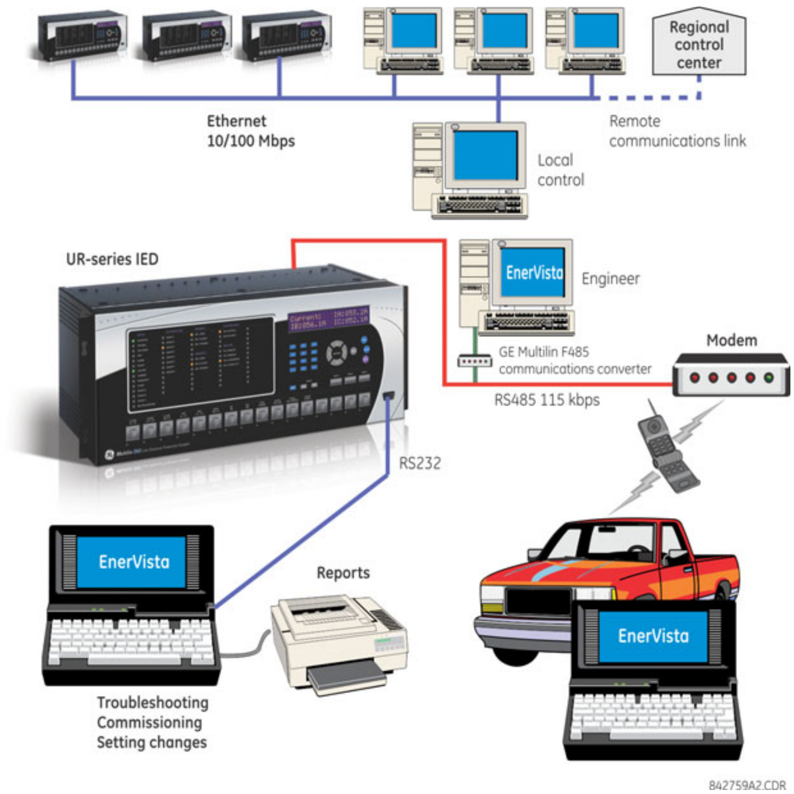


Figure 1–11: RELAY COMMUNICATION OPTIONS

To communicate through the F60 rear RS485 port from a computer RS232 port, the GE Multilin RS232/RS485 converter box is required. This device (catalog number F485) connects to the computer using a straight-through serial cable. A shielded twisted-pair (20, 22, or 24 AWG) connects the F485 converter to the F60 rear communications port. The converter terminals (+, –, GND) are connected to the F60 communication module (+, –, COM) terminals. See the *CPU Communication Ports* section in chapter 3 for details. The line is terminated with an R-C network (that is, 120 Ω, 1 nF) as described in the chapter 3.

1.4.3 FACEPLATE DISPLAY

All messages are displayed on a backlit liquid crystal display (LCD) to make them visible under poor lighting conditions. While the keypad and display are not actively being used, the display defaults to user-defined messages. Any high-priority event-driven message automatically overrides the default message and appears on the display.

1.5.1 FACEPLATE KEYPAD

Display messages are organized into pages under the following headings: actual values, settings, commands, and targets. The MENU key navigates through these pages. Each heading page is divided further into logical subgroups.

The MESSAGE keys navigate through the subgroups. The VALUE keys increment or decrement numerical setting values when in programming mode. These keys also scroll through alphanumeric values in the text edit mode. Alternatively, values can be entered with the numeric keypad.

The decimal key initiates and advances to the next character in text edit mode or enters a decimal point.

The HELP key can be pressed at any time for context-sensitive help messages.

The ENTER key stores altered setting values.

When entering an IP address on the front panel, key in the first sequence of the number, then press the • key for the decimal place. For example, for 127.0.0.1, press 127, then •, then 0, then •, then 0, then •, then 1. To save the address, press the ENTER key.

1.5.2 MENU NAVIGATION

Press the MENU key to select a header display page (top-level menu). The header title appears momentarily followed by a header display page menu item. Each press of the MENU key advances through the following main heading pages:

- Actual values
- Settings
- Commands
- Targets
- User displays (when enabled)

1.5.3 MENU HIERARCHY

The setting and actual value messages are arranged hierarchically. The header display pages are indicated by double scroll bar characters (■■), while sub-header pages are indicated by single scroll bar characters (■). The header display pages represent the highest level of the hierarchy and the sub-header display pages fall below this level. The MESSAGE UP and DOWN keys move within a group of headers, sub-headers, setting values, or actual values. Continually pressing the MESSAGE RIGHT key from a header display displays specific information for the header category. Conversely, continually pressing the MESSAGE LEFT key from a setting value or actual value display returns to the header display.

1.5.4 RELAY ACTIVATION

The relay is in the default “Not Programmed” state when it leaves the factory. When powered up successfully, the Trouble LED is on and the In Service LED off. The relay in the “Not Programmed” state blocks signaling of any output relay. These conditions remain until the relay is explicitly put in the “Programmed” state.

Select the menu message **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ INSTALLATION ⇨ RELAY SETTINGS**

```
RELAY SETTINGS:
Not Programmed
```

1. To put the relay in the “Programmed” state, press either of the VALUE keys once and then press ENTER. The faceplate Trouble LED turns off and the In Service LED turns on.

The settings for the relay can be programmed manually (see *Chapter 5*) via the faceplate keypad or remotely via the EnerVista UR Setup software (see the EnerVista UR Setup help file).

1.5.5 RELAY PASSWORDS

a) PASSWORD SECURITY

It is recommended that passwords be set for each security level and assigned to specific personnel. There are two user security access levels, COMMAND and SETTING.

1. COMMAND

The COMMAND access level restricts the user from making any settings changes, but allows the user to perform the following operations:

- Operate breakers via faceplate keypad
- Change state of virtual inputs
- Clear event records
- Clear oscillography records
- Operate user-programmable pushbuttons

2. SETTING

The SETTING access level allows the user to make any changes to any of the setting values.

NOTE

See the *Changing Settings* section in Chapter 4 for complete instructions on setting security-level passwords.

b) CYBERSENTRY

When the CyberSentry option is purchased, advanced security services are available, using either device authentication or server authentication using RADIUS. When this option is purchased, the basic password security is disabled automatically. For more information, see the CyberSentry content in the *Security* section of the next chapter.

1.5.6 FLEXLOGIC CUSTOMIZATION

FlexLogic equation editing is required for setting user-defined logic for customizing the relay operations. See the *FlexLogic* section in Chapter 5.

1.5.7 COMMISSIONING

The F60 requires minimal maintenance after it is commissioned into service. Since the F60 is a microprocessor-based relay, its characteristics do not change over time. As such, no further functional tests are required.

The F60 performs a number of continual self-tests and takes the necessary action in case of any major errors (see the *Relay Self-tests* section in chapter 7). However, it is recommended that F60 maintenance be scheduled with other system maintenance. This maintenance can involve in-service, out-of-service, or unscheduled maintenance.

In-service maintenance:

1. Visual verification of the analog values integrity, such as voltage and current (in comparison to other devices on the corresponding system).
2. Visual verification of active alarms, relay display messages, and LED indications.
3. LED test.
4. Visual inspection for any damage, corrosion, dust, or loose wires.
5. Event recorder file download with further events analysis.

Out-of-service maintenance:

1. Check wiring connections for firmness.
2. Analog values (currents, voltages, RTDs, analog inputs) injection test and metering accuracy verification. Calibrated test equipment is required.
3. Protection elements setting verification (analog values injection or visual verification of setting file entries against relay settings schedule).
4. Contact inputs and outputs verification. This test can be conducted by direct change of state forcing or as part of the system functional testing.
5. Visual inspection for any damage, corrosion, or dust.
6. Event recorder file download with further events analysis.
7. LED Test and pushbutton continuity check.

Unscheduled maintenance, such as a disturbance causing system interruption:

1. View the event recorder and oscillography or fault report for correct operation of inputs, outputs, and elements.

If it is concluded that the relay or one of its modules is of concern, contact GE Multilin for service.

2.1.1 OVERVIEW

The F60 Feeder Protection System is a microprocessor based relay designed for feeder protection.

Overvoltage and undervoltage protection, overfrequency and underfrequency protection, breaker failure protection, directional current supervision, fault diagnostics, RTU, and programmable logic functions are provided. This relay also provides phase, neutral, ground and negative sequence, instantaneous and time overcurrent protection. The time overcurrent function provides multiple curve shapes or FlexCurves™ for optimum co-ordination. Automatic reclosing, synchrocheck, and line fault locator features are also provided. When equipped with a type 8Z CT/VT module, an element for detecting high impedance faults is provided.

Voltage, current, and power metering is built into the relay as a standard feature. Current parameters are available as total waveform RMS magnitude, or as fundamental frequency only RMS magnitude and angle (phasor).

Diagnostic features include a sequence of records capable of storing 1024 time-tagged events. The internal clock used for time-tagging can be synchronized with an IRIG-B signal or via the SNTP protocol over the Ethernet port. This precise time stamping allows the sequence of events to be determined throughout the system. Events can also be programmed (via FlexLogic™ equations) to trigger oscillography data capture which may be set to record the measured parameters before and after the event for viewing on a personal computer (PC). These tools significantly reduce troubleshooting time and simplify report generation in the event of a system fault.

Several options are available for communication. A faceplate RS232 port can be used to connect to a computer for the programming of settings and the monitoring of actual values. The RS232 port has a fixed baud rate of 19.2 kbps. The rear RS485 port allows independent access by operating and engineering staff. It can be connected to system computers with baud rates up to 115.2 kbps. All serial ports use the Modbus RTU protocol. The IEC 60870-5-103 protocol is supported on the RS485 interface. IEC 60870-5-103, DNP, and Modbus cannot be enabled simultaneously on this interface. Also only one of the DNP, IEC 60870-5-103, and IEC 60870-5-104 protocols can be enabled at any time on the relay. When the IEC 60870-5-103 protocol is chosen, the RS485 port has a fixed even parity and the baud rate can be either 9.6 kbps or 19.2 kbps. The 100Base-FX Ethernet interface provides fast, reliable communications in noisy environments. The Ethernet port supports IEC 61850, IEC 61850-90-5, Modbus/TCP, and TFTP protocols, PTP (according to IEEE Std. 1588-2008 or IEC 61588), and allows access to the relay via any standard web browser (F60 web pages). The IEC 60870-5-104 protocol is supported on the Ethernet port, and DNP and IEC 60870-5-104 cannot be enabled at the same time. The Ethernet port also supports the Parallel Redundancy Protocol (PRP) of IEC 62439-3 (clause 4, 2012) when purchased as a CPU module option.

The F60 IEDs use flash memory technology which allows field upgrading as new features are added. The following single line diagram illustrates the relay functionality using ANSI (American National Standards Institute) device numbers.

Table 2–1: ANSI DEVICE NUMBERS AND FUNCTIONS

DEVICE NUMBER	FUNCTION	DEVICE NUMBER	FUNCTION
25 (2)	Synchrocheck	51P	Phase time overcurrent
27P (2)	Phase undervoltage	51_2	Negative-sequence time overcurrent
27X	Auxiliary undervoltage	52	AC circuit breaker
32	Sensitive directional power	59N	Neutral overvoltage
32N	Wattmetric zero-sequence directional	59P	Phase overvoltage
50BF/50NBF	Breaker failure	59X	Auxiliary overvoltage
50DD	Disturbance detector	59_2	Negative-sequence overvoltage
50G	Ground instantaneous overcurrent	67N	Neutral directional overcurrent
50N	Neutral instantaneous overcurrent	67P	Phase directional
50P	Phase instantaneous overcurrent	67_2	Negative-sequence directional overcurrent
50_2	Negative-sequence instantaneous overcurrent	79	Automatic recloser
51G	Ground time overcurrent	81O	Overfrequency
51N	Neutral time overcurrent	81U	Underfrequency

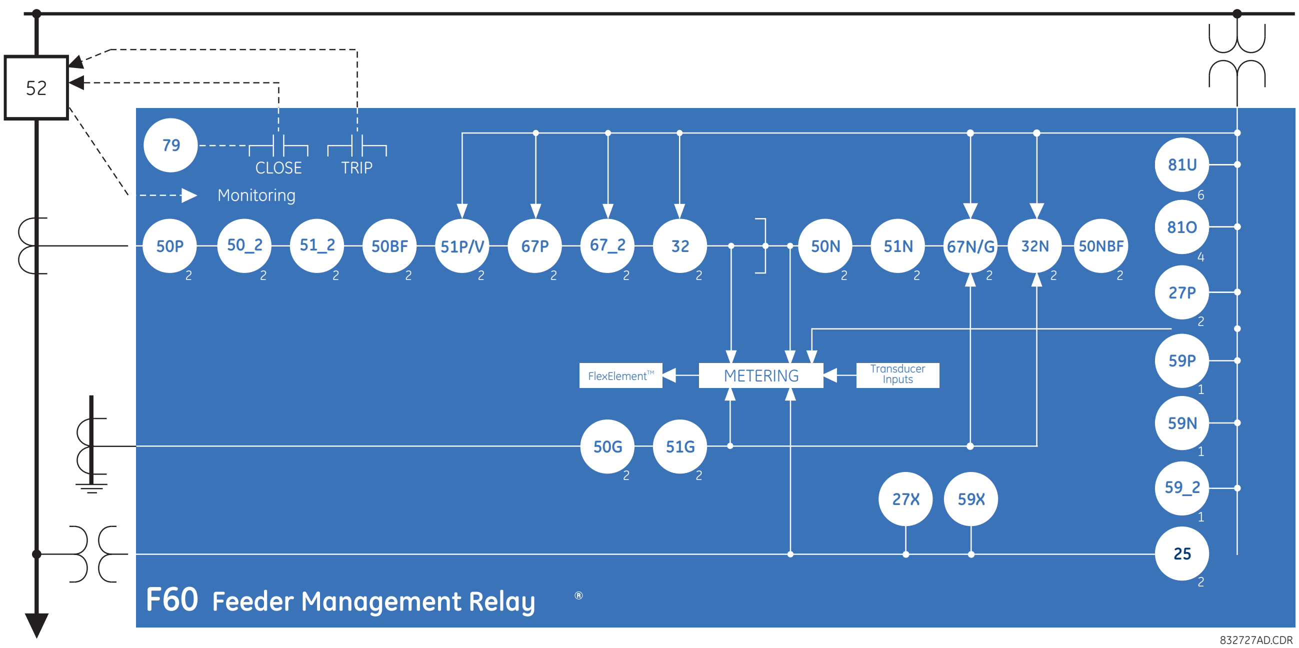

Figure 2–1: SINGLE LINE DIAGRAM

Table 2–2: OTHER DEVICE FUNCTIONS

FUNCTION	FUNCTION	FUNCTION
Breaker arcing current (I^2t)	Disconnect switches (8)	Oscillography
Breaker control (2)	Event recorder	Phasor measurement unit
Breaker flashover	Fault detector and fault report	Setting groups (6)
Breaker restrike	Fault locator	Thermal overload protection
Broken conductor detection	FlexElements™ (8)	Time synchronization over IRIG-B or IEEE 1588
Cold load pickup (2)	FlexLogic equations	Time synchronization over SNTP
Contact inputs (up to 96)	High impedance fault detection (Hi-Z)	Transducer inputs and outputs
Contact outputs (up to 64)	IEC 60870-5-103 communications (optional)	User-definable displays
Control pushbuttons	IEC 61850 communications (optional)	User-programmable LEDs
CyberSentry™ security	Incipient cable fault detection	User-programmable pushbuttons
Data logger	Load encroachment	User-programmable self-tests
Demand	Metering: current, voltage, power, PF, energy, frequency, harmonics, THD	Virtual inputs (64)
Digital counters (8)	Modbus user map	Virtual outputs (96)
Digital elements (48)	Non-volatile latches	VT fuse failure
Direct inputs and outputs (32)	Non-volatile selector switch	

2.1.2 SECURITY

The following security features are available:

- Password security — Basic security present in the default offering of the product
- EnerVista security — Role-based access to various EnerVista software screens and configuration elements. The feature is available in the default offering of the product and only in the EnerVista software.
- CyberSentry security — Advanced security options available as a software option. When purchased, the options are automatically enabled, and the default Password security and EnerVista security are disabled.

a) ENERVISTA SECURITY

The EnerVista security management system is a role-based access control (RBAC) system that allows an administrator to manage the privileges of multiple users. This allows for access control of UR devices by multiple personnel within a substation and conforms to the principles of RBAC as defined in ANSI INCITS 359-2004. The EnerVista security management system is disabled by default to allow the administrator direct access to the EnerVista software after installation. It is recommended that security be enabled before placing the device in service.

Basic password or enhanced CyberSentry security applies, depending on purchase.

b) PASSWORD SECURITY

Password security is a basic security feature present in the default offering of the product.

Two levels of password security are provided: command and setting.

The following operations are under command password supervision:

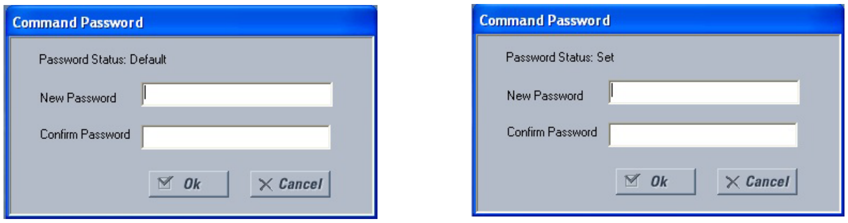
- Operating the breakers via faceplate keypad
- Changing the state of virtual inputs
- Clearing the event records
- Clearing the oscillography records
- Clearing fault reports
- Changing the date and time
- Clearing the breaker arcing current
- Clearing energy records
- Clearing the data logger
- Clearing the user-programmable pushbutton states

The following operations are under setting password supervision:

- Changing any setting
- Test mode operation

The command and setting passwords are defaulted to “0” when the relay is shipped from the factory. When a password is set to “0”, the password security feature is disabled. As shown in the figures, the window indicates when the password is at the default and when the password has been set.

Figure 2–2: WINDOW INDICATES DEFAULT PASSWORD (LEFT) AND PASSWORD SET (RIGHT)



The F60 supports password entry from a local or remote connection. Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the through the faceplate RS232 port. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

When entering a settings or command password via EnerVista or any serial interface, the user must enter the corresponding connection password. If the connection is to the back of the F60, the remote password must be used. If the connection is to the RS232 port of the faceplate, the local password applies.

Events are logged in the Event Recorder. The FlexLogic operands and events are updated every five seconds.

c) CYBERSENTRY SECURITY

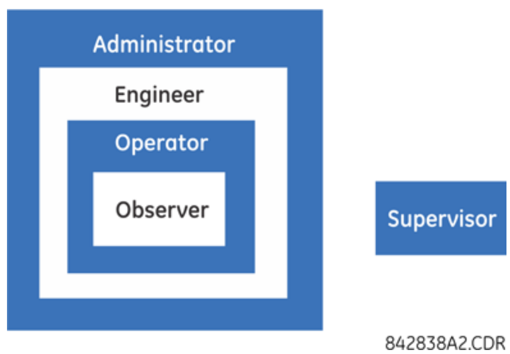
CyberSentry Embedded Security is a software option that provides advanced security services. When this option is purchased, the basic password security is disabled automatically.

CyberSentry provides security through the following features:

- An Authentication, Authorization, Accounting (AAA) Remote Authentication Dial-In User Service (RADIUS) client that is centrally managed, enables user attribution, provides accounting of all user activities, and uses secure standards-based strong cryptography for authentication and credential protection.
- A Role-Based Access Control (RBAC) system that provides a permission model that allows access to UR device operations and configurations based on specific roles and individual user accounts configured on the AAA server (that is, Administrator, Supervisor, Engineer, Operator, Observer).
- Security event reporting through the Syslog protocol for supporting Security Information Event Management (SIEM) systems for centralized cybersecurity monitoring.
- Strong encryption of all access and configuration network messages between the EnerVista software and UR devices using the Secure Shell (SSH) protocol, the Advanced Encryption Standard (AES), and 128-bit keys in Galois Counter Mode (GCM) as specified in the U.S. National Security Agency Suite B extension for SSH and approved by the National Institute of Standards and Technology (NIST) FIPS-140-2 standards for cryptographic systems.

Example: Administrative functions can be segmented away from common operator functions, or engineering type access, all of which are defined by separate roles, as shown in the following figure, so that access of UR devices by multiple personnel within a substation is allowed. Permission for each role are outlined in the next section.

Figure 2–3: CYBERSENTRY USER ROLES



There are two types of authentication supported by CyberSentry that can be used to access the UR device:

- Device Authentication (local UR device authenticates)
- Server Authentication (RADIUS server authenticates)

The EnerVista software allows access to functionality that is determined by the user role, which comes either from the local UR device or RADIUS server.

The EnerVista software has a device authentication option on the login screen for accessing the UR device. When the "Device" button is selected, the UR uses its local authentication database and not the RADIUS server to authenticate the user. In this case, it uses its built-in roles (Administrator, Engineer, Supervisor, Observer, Operator) as login names and the associated passwords are stored on the UR device. As such, when using the local accounts, access is not user-attributable.

In cases where user attributable access is required especially to facilitate auditable processes for compliance reasons, use RADIUS authentication only.

When the "Server" Authentication Type option is selected, the UR uses the RADIUS server and not its local authentication database to authenticate the user.

No password or security information are displayed in plain text by the EnerVista software or UR device, nor are they ever transmitted without cryptographic protection.

CYBERSENTRY USER ROLES

CyberSentry user roles (Administrator, Engineer, Operator, Supervisor, Observer) limit the levels of access to various UR device functions. This means that the EnerVista software allows for access to functionality based on the user's logged in role.

Example: Observer cannot write any settings.

The table lists the roles that are supported and their corresponding capabilities.

Table 2–3: PERMISSIONS BY USER ROLE FOR CYBERSENTRY

Roles	Administrator	Engineer	Operator	Supervisor	Observer
	Complete access	Complete access except for CyberSentry Security	Command menu	Authorizes writing	Default role

Table Notes:

1. RW = read and write access
2. R = read access
3. Supervisor = RW (default), Administrator = R (default), Administrator = RW (only if Supervisor role is disabled)
4. NA = the permission is not enforced by CyberSentry Security

CYBERSENTRY SERVER AUTHENTICATION

The UR has been designed to automatically direct authentication requests based on user names. In this respect, local account names on the UR are considered as reserved, and not used on a RADIUS server.

The UR automatically detects whether an authentication request is to be handled remotely or locally. As there are only five local accounts possible on the UR, if the user ID credential does not match one of the five local accounts, the UR automatically forwards the request to a RADIUS server when one is provided.

If a RADIUS server is provided, but is unreachable over the network, server authentication requests are denied. In this situation, use local UR accounts to gain access to the UR system.

2.1.3 IEC 870-5-103 PROTOCOL

IEC 870-5-103 is a companion standard to IEC 870-5 suit of standards for transmission protocols. It defines messages and procedures for interoperability between protection equipment and devices of a control system in a substation for communicating on a serial line.

The IEC 60870-5-103 is an unbalanced (master-slave) protocol for coded-bit serial communication, exchanging information with a control system. In the context of this protocol, the protection equipment is the slave and the control system is the master. The communication is based on a point to point principle. The master must be able to interpret the IEC 60870-5-103 communication messages.

The UR implementation of IEC 60870-5-103 consists of the following functions:

- Report binary inputs
- Report analog values (measurands)
- Commands
- Time synchronization

The RS485 port supports IEC 60870-5-103.

2.2.1 OVERVIEW

The F60 is available as a 19-inch rack horizontal mount or reduced-size (¾) vertical unit and consists of the following modules: power supply, CPU, CT/VT, digital input and output, transducer input and output, and inter-relay communications. Each of these modules can be supplied in a number of configurations specified at the time of ordering. The information required to completely specify the relay is provided in the following tables (see chapter 3 for full details of relay modules).

2

NOTE: Order codes are subject to change without notice. See the ordering page at http://www.gedigitalenergy.com/multilin/order.htm for the latest ordering options.

The order code structure is dependent on the mounting option (horizontal or vertical) and the type of CT/VT modules (enhanced diagnostic CT/VT modules or HardFiber^{TM} process bus modules). The order code options are described in the following sub-sections.

2.2.2 ORDER CODES WITH ENHANCED CT/VT MODULES

The order codes for the horizontal mount units are shown below.

Table 2–4: F60 ORDER CODES (HORIZONTAL UNITS)

	F60 - * ** - * * * - F ** - H ** - M ** - P ** - U ** - W/X **	Full Size Horizontal Mount
BASE UNIT	F60	Base Unit

		A								Chinese display
		P								English display with 4 small and 12 large programmable pushbuttons
		G								French display with 4 small and 12 large programmable pushbuttons
		S								Russian display with 4 small and 12 large programmable pushbuttons
		B								Chinese display with 4 small and 12 large programmable pushbuttons
		K								Enhanced front panel with English display
		M								Enhanced front panel with French display
		Q								Enhanced front panel with Russian display
		U								Enhanced front panel with Chinese display
		L								Enhanced front panel with English display and user-programmable pushbuttons
		N								Enhanced front panel with French display and user-programmable pushbuttons
		T								Enhanced front panel with Russian display and user-programmable pushbuttons
		V								Enhanced front panel with Chinese display and user-programmable pushbuttons
		W								Enhanced front panel with Turkish display
		Y								Enhanced front panel with Turkish display and user-programmable pushbuttons
		I								Enhanced front panel with German display
		J								Enhanced front panel with German display and user-programmable pushbuttons
POWER SUPPLY (redundant supply must be same type as main supply)			H							125 / 250 V AC/DC power supply
			H						RH	125 / 250 V AC/DC with redundant 125 / 250 V AC/DC power supply
			L							24 to 48 V (DC only) power supply
			L						RL	24 to 48 V (DC only) with redundant 24 to 48 V DC power supply
ENHANCED DIAGNOSTICS CT/VT DSP (8L, 8M, 8N, 8R require DSP to be enhanced diagnostic)						XX		XX		No DSP module (slots M and U only)
				8L		8L				Standard 4CT/4VT with enhanced diagnostics
				8M		8M				Sensitive Ground 4CT/4VT with enhanced diagnostics
				8N		8N				Standard 8CT with enhanced diagnostics
				8R		8R				Sensitive Ground 8CT with enhanced diagnostics
						8Z				Hi-Z 4CT (required for high-impedance fault detection element)
DIGITAL INPUTS/OUTPUTS					XX	XX	XX	XX	XX	No Module
					4A	4A	4A	4A	4A	4 Solid-State (no monitoring) MOSFET outputs

					7T	RS422, 1 Channel
					7W	RS422, 2 Channels

2.2.4 REPLACEMENT MODULES

Replacement modules can be ordered separately. When ordering a replacement CPU module or faceplate, provide the serial number of your existing unit.

NOTE

Not all replacement modules may be applicable to the F60 relay. Only the modules specified in the order codes are available as replacement modules.

NOTE

Replacement module codes are subject to change without notice. See the ordering page at http://www.gedigitalenergy.com/multilin/order.htm for the latest F60 ordering options.

The replacement module order codes for the horizontal mount units are shown below.

Table 2–8: ORDER CODES FOR REPLACEMENT MODULES, HORIZONTAL UNITS

	UR	-	**	-	*	
POWER SUPPLY (redundant supply only available in horizontal units; must be same type as main supply)			RH	H		Redundant 125 / 250 V AC/DC
			RL	H		Redundant 24 to 48 V (DC only)
CPU			T			RS485 with 3 100Base-FX Ethernet, multimode, SFP with LC
			U			RS485 with 1 100Base-T Ethernet, SFP RJ-45 + 2 100Base-FX Ethernet, multimode, SFP with LC
			V			RS485 with 3 100Base-T Ethernet, SFP with RJ-45
FACEPLATE/DISPLAY			3C			Horizontal faceplate with keypad and English display
			3D			Horizontal faceplate with keypad and French display
			3R			Horizontal faceplate with keypad and Russian display
			3A			Horizontal faceplate with keypad and Chinese display
			3P			Horizontal faceplate with keypad, user-programmable pushbuttons, and English display
			3G			Horizontal faceplate with keypad, user-programmable pushbuttons, and French display
			3S			Horizontal faceplate with keypad, user-programmable pushbuttons, and Russian display
			3B			Horizontal faceplate with keypad, user-programmable pushbuttons, and Chinese display
			3K			Enhanced front panel with English display
			3M			Enhanced front panel with French display
			3Q			Enhanced front panel with Russian display
			3U			Enhanced front panel with Chinese display
			3L			Enhanced front panel with English display and user-programmable pushbuttons
			3N			Enhanced front panel with French display and user-programmable pushbuttons
			3T			Enhanced front panel with Russian display and user-programmable pushbuttons
			3V			Enhanced front panel with Chinese display and user-programmable pushbuttons
			3I			Enhanced front panel with German display
			3J			Enhanced front panel with German display and user-programmable pushbuttons

Table 2–8: ORDER CODES FOR REPLACEMENT MODULES, HORIZONTAL UNITS

	UR - ** - *	
DIGITAL INPUTS AND OUTPUTS	4A	4 Solid-State (no monitoring) MOSFET outputs
	4B	4 Solid-State (voltage with optional current) MOSFET outputs
	4C	4 Solid-State (current with optional voltage) MOSFET outputs
	4D	16 digital inputs with Auto-Burnishing (maximum of three modules within a case)
	4L	14 Form-A (no monitoring) Latching outputs
	67	8 Form-A (no monitoring) outputs
	6A	2 Form-A (voltage with optional current) and 2 Form-C outputs, 8 digital inputs
	6B	2 Form-A (voltage with optional current) and 4 Form-C outputs, 4 digital inputs
	6C	8 Form-C outputs
	6D	16 digital inputs
	6E	4 Form-C outputs, 8 digital inputs
	6F	8 Fast Form-C outputs
	6G	4 Form-A (voltage with optional current) outputs, 8 digital inputs
	6H	6 Form-A (voltage with optional current) outputs, 4 digital inputs
	6K	4 Form-C and 4 Fast Form-C outputs
	6L	2 Form-A (current with optional voltage) and 2 Form-C outputs, 8 digital inputs
	6M	2 Form-A (current with optional voltage) and 4 Form-C outputs, 4 digital inputs
	6N	4 Form-A (current with optional voltage) outputs, 8 digital inputs
	6P	6 Form-A (current with optional voltage) outputs, 4 digital inputs
	6R	2 Form-A (no monitoring) and 2 Form-C outputs, 8 digital inputs
	6S	2 Form-A (no monitoring) and 4 Form-C outputs, 4 digital inputs
	6T	4 Form-A (no monitoring) outputs, 8 digital inputs
	6U	6 Form-A (no monitoring) outputs, 4 digital inputs
	6V	2 Form-A outputs, 1 Form-C output, 2 Form-A (no monitoring) latching outputs, 8 digital inputs
CT/VT MODULES (NOT AVAILABLE FOR THE C30)	8L	Standard 4CT/4VT with enhanced diagnostics
	8N	Standard 8CT with enhanced diagnostics
	8M	Sensitive Ground 4CT/4VT with enhanced diagnostics
	8R	Sensitive Ground 8CT with enhanced diagnostics

	7I	1300 nm, multimode, LED, 2 Channels
	7J	1300 nm, single-mode, ELED, 2 Channels
	7K	1300 nm, single-mode, Laser, 2 Channels
	7L	Channel 1 - RS422; Channel 2 - 820 nm, multimode, LED
	7M	Channel 1 - RS422; Channel 2 - 1300 nm, multimode, LED
	7N	Channel 1 - RS422; Channel 2 - 1300 nm, single-mode, ELED
	7P	Channel 1 - RS422; Channel 2 - 1300 nm, single-mode, Laser
	7Q	Channel 1 - G.703; Channel 2 - 1300 nm, single-mode Laser
	7R	G.703, 1 Channel
	7S	G.703, 2 Channels
	7T	RS422, 1 Channel
	7W	RS422, 2 Channels
TRANSDUCER INPUTS/OUTPUTS	5A	4 dcmA inputs, 4 dcmA outputs (only one 5A module is allowed)
	5C	8 RTD inputs
	5D	4 RTD inputs, 4 dcmA outputs (only one 5D module is allowed)
	5E	4 dcmA inputs, 4 RTD inputs
	5F	8 dcmA inputs

The replacement module order codes for the reduced-size vertical mount units are shown below.

Table 2–9: ORDER CODES FOR REPLACEMENT MODULES, VERTICAL UNITS

	UR - ** - *		
POWER SUPPLY	RH	V	125 / 250 V AC/DC
	RL	V	24 to 48 V (DC only)
CPU	T		RS485 with 3 100Base-FX Ethernet, multimode, SFP with LC
	U		RS485 with 1 100Base-T Ethernet, SFP RJ-45 + 2 100Base-FX Ethernet, multimode, SFP with LC
	V		RS485 with 3 100Base-T Ethernet, SFP with RJ-45
FACEPLATE/DISPLAY	3F		Vertical faceplate with keypad and English display
	3D		Vertical faceplate with keypad and French display
	3R		Vertical faceplate with keypad and Russian display
	3A		Vertical faceplate with keypad and Chinese display
	3K		Enhanced front panel with English display
	3M		Enhanced front panel with French display
	3Q		Enhanced front panel with Russian display
	3U		Enhanced front panel with Chinese display
	3L		Enhanced front panel with English display and user-programmable pushbuttons
	3N		Enhanced front panel with French display and user-programmable pushbuttons
	3T		Enhanced front panel with Russian display and user-programmable pushbuttons
	3V		Enhanced front panel with Chinese display and user-programmable pushbuttons
	3I		Enhanced front panel with German display
	3J		Enhanced front panel with German display and user-programmable pushbuttons
DIGITAL INPUTS/OUTPUTS	4A		4 Solid-State (no monitoring) MOSFET outputs
	4B		4 Solid-State (voltage with optional current) MOSFET outputs
	4C		4 Solid-State (current with optional voltage) MOSFET outputs
	4D		16 digital inputs with Auto-Burnishing (maximum of three modules within a case)
	4L		14 Form-A (no monitoring) Latching outputs
	67		8 Form-A (no monitoring) outputs
	6A		2 Form-A (voltage with optional current) and 2 Form-C outputs, 8 digital inputs
	6B		2 Form-A (voltage with optional current) and 4 Form-C outputs, 4 digital inputs
	6C		8 Form-C outputs
	6D		16 digital inputs
	6E		4 Form-C outputs, 8 digital inputs
	6F		8 Fast Form-C outputs
	6G		4 Form-A (voltage with optional current) outputs, 8 digital inputs
	6H		6 Form-A (voltage with optional current) outputs, 4 digital inputs
	6K		4 Form-C and 4 Fast Form-C outputs
	6L		2 Form-A (current with optional voltage) and 2 Form-C outputs, 8 digital inputs
	6M		2 Form-A (current with optional voltage) and 4 Form-C outputs, 4 digital inputs
	6N		4 Form-A (current with optional voltage) outputs, 8 digital inputs
	6P		6 Form-A (current with optional voltage) outputs, 4 digital inputs
	6R		2 Form-A (no monitoring) and 2 Form-C outputs, 8 digital inputs
	6S		2 Form-A (no monitoring) and 4 Form-C outputs, 4 digital inputs
	6T		4 Form-A (no monitoring) outputs, 8 digital inputs
	6U		6 Form-A (no monitoring) outputs, 4 digital inputs
	6V		2 Form-A outputs, 1 Form-C output, 2 Form-A (no monitoring) latching outputs, 8 digital inputs
CT/VT MODULES (NOT AVAILABLE FOR THE C30)	8L		Standard 4CT/4VT with enhanced diagnostics
	8N		Standard 8CT with enhanced diagnostics
	8V		Standard 8VT with enhanced diagnostics
	8Z*		HI-Z 4CT
INTER-RELAY COMMUNICATIONS	2A		C37.94SM, 1300 nm single-mode, ELED, 1 channel single-mode
	2B		C37.94SM, 1300 nm single-mode, ELED, 2 channel single-mode
	2E		Bi-phase, single channel

2

Table 2–9: ORDER CODES FOR REPLACEMENT MODULES, VERTICAL UNITS

	UR - ** - *		
	| 2F |		Bi-phase, dual channel
	| 2G |		IEEE C37.94, 820 nm, 128 kbps, multimode, LED, 1 Channel
	| 2H |		IEEE C37.94, 820 nm, 128 kbps, multimode, LED, 2 Channels
	| 2I |		Channel 1 - IEEE C37.94, multimode, 64/128 kbps; Channel 2 - 1300 nm, single-mode, Laser
	| 2J |		Channel 1 - IEEE C37.94, multimode, 64/128 kbps; Channel 2 - 1550 nm, single-mode, Laser
	| 72 |		1550 nm, single-mode, Laser, 1 Channel
	| 73 |		1550 nm, single-mode, Laser, 2 Channel
	| 74 |		Channel 1 - RS422; Channel 2 - 1550 nm, single-mode, Laser
	| 75 |		Channel 1 - G.703; Channel 2 - 1550 nm, single-mode Laser
	| 76 |		IEEE C37.94, 820 nm, 64 kbps, multimode, LED, 1 Channel
	| 77 |		IEEE C37.94, 820 nm, 64 kbps, multimode, LED, 2 Channels
	| 7A |		820 nm, multimode, LED, 1 Channel
	| 7B |		1300 nm, multimode, LED, 1 Channel
	| 7C |		1300 nm, single-mode, ELED, 1 Channel
	| 7D |		1300 nm, single-mode, Laser, 1 Channel
	| 7E |		Channel 1 - G.703; Channel 2 - 820 nm, multimode
	| 7F |		Channel 1 - G.703; Channel 2 - 1300 nm, multimode
	| 7G |		Channel 1 - G.703; Channel 2 - 1300 nm, single-mode ELED
	| 7H |		820 nm, multimode, LED, 2 Channels
	| 7I |		1300 nm, multimode, LED, 2 Channels
	| 7J |		1300 nm, single-mode, ELED, 2 Channels
	| 7K |		1300 nm, single-mode, Laser, 2 Channels
	| 7L |		Channel 1 - RS422; Channel 2 - 820 nm, multimode, LED
	| 7M |		Channel 1 - RS422; Channel 2 - 1300 nm, multimode, LED
	| 7N |		Channel 1 - RS422; Channel 2 - 1300 nm, single-mode, ELED
	| 7P |		Channel 1 - RS422; Channel 2 - 1300 nm, single-mode, Laser
	| 7Q |		Channel 1 - G.703; Channel 2 - 1300 nm, single-mode Laser
	| 7R |		G.703, 1 Channel
	| 7S |		G.703, 2 Channels
	| 7T |		RS422, 1 Channel
	| 7W |		RS422, 2 Channels
TRANSDUCER INPUTS/OUTPUTS	| 5A |		4 dcmA inputs, 4 dcmA outputs (only one 5A module is allowed)
	| 5C |		8 RTD inputs
	| 5D |		4 RTD inputs, 4 dcmA outputs (only one 5D module is allowed)
	| 5E |		4 dcmA inputs, 4 RTD inputs
	| 5F |		8 dcmA inputs

*** CPU module types 8L and 8N cannot be ordered with the 8Z module**

SPECIFICATIONS ARE SUBJECT TO CHANGE WITHOUT NOTICE

2.3.1 PROTECTION ELEMENTS

NOTE: The operating times include the activation time of a trip rated form-A output contact unless otherwise indicated. FlexLogic operands of a given element are 4 ms faster. Take this into account when using FlexLogic to interconnect with other protection or control elements of the relay, building FlexLogic equations, or interfacing with other IEDs or power system devices via communications or different output contacts. If not specified, the operate times given here are for a 60 Hz system at nominal system frequency. Operate times for a 50 Hz system are 1.2 times longer.

PHASE/NEUTRAL/GROUND TOC

Current: Phasor or RMS
Pickup level: 0.000 to 30.000 pu in steps of 0.001
Dropout level: 97% to 98% of pickup
Level accuracy:
 for 0.1 to 2.0 × CT: ±0.5% of reading or ±0.4% of rated (whichever is greater)
 for > 2.0 × CT: ±1.5% of reading > 2.0 × CT rating
Curve shapes: IEEE Moderately/Very/Extremely Inverse; IEC (and BS) A/B/C and Short Inverse; GE IAC Inverse, Short/Very/Extremely Inverse; I^2t; FlexCurves™ (programmable); Definite Time (0.01 s base curve)
Curve multiplier: Time Dial = 0.00 to 600.00 in steps of 0.01
Reset type: Instantaneous/Timed (per IEEE)
Curve timing accuracy
at 1.03 to 20 x pickup: ±3.5% of operate time or ±½ cycle (whichever is greater) from pickup to operate

PHASE/NEUTRAL/GROUND IOC

Pickup level: 0.000 to 30.000 pu in steps of 0.001
Dropout level: 97 to 98% of pickup
Level accuracy:
 0.1 to 2.0 × CT rating: ±0.5% of reading or ±0.4% of rated (whichever is greater)
 > 2.0 × CT rating ±1.5% of reading
Overreach: <2%
Pickup delay: 0.00 to 600.00 s in steps of 0.01
Reset delay: 0.00 to 600.00 s in steps of 0.01
Operate time: <16 ms at 3 × pickup at 60 Hz (Phase/Ground IOC)
<20 ms at 3 × pickup at 60 Hz (Neutral IOC)
Timer accuracy: ±3% of operate time or ±1/4 cycle (whichever is greater)

NEGATIVE SEQUENCE TOC

Pickup level: 0.000 to 30.000 pu in steps of 0.001
Dropout level: 97% to 98% of pickup
Level accuracy: ±0.5% of reading or ±0.4% of rated (whichever is greater)
from 0.1 to 2.0 x CT rating
±1.5% of reading > 2.0 x CT rating
Curve shapes: IEEE Moderately/Very/Extremely Inverse; IEC (and BS) A/B/C and Short Inverse; GE IAC Inverse, Short/Very/Extremely Inverse; I^2t; FlexCurves™ (programmable); Definite Time (0.01 s base curve)
Curve multiplier (Time dial): 0.00 to 600.00 in steps of 0.01
Reset type: Instantaneous/Timed (per IEEE) and Linear
Curve timing accuracy
at 1.03 to 20 x pickup: ±3.5% of operate time or ±½ cycle (whichever is greater) from pickup to operate

NEGATIVE SEQUENCE IOC

Pickup level: 0.000 to 30.000 pu in steps of 0.001
Dropout level: 97 to 98% of pickup
Level accuracy: 0.1 to 2.0 × CT rating: ±0.5% of reading or ±0.4% of rated (whichever is greater); > 2.0 × CT rating: ±1.5% of reading
Overreach: <2%
Pickup delay: 0.00 to 600.00 s in steps of 0.01
Reset delay: 0.00 to 600.00 s in steps of 0.01
Operate time: <20 ms at 3 × pickup at 60 Hz
Timer accuracy: ±3% of operate time or ±1/4 cycle (whichever is greater)

PHASE DIRECTIONAL OVERCURRENT

Relay connection: 90° (quadrature)
Quadrature voltage: ABC phase seq.: phase A (V_{BC}), phase B (V_{CA}), phase C (V_{AB}); ACB phase seq.: phase A (V_{CB}), phase B (V_{AC}), phase C (V_{BA})
Polarizing voltage threshold: 0.000 to 3.000 pu in steps of 0.001
Current sensitivity threshold: 0.05 pu
Characteristic angle: 0 to 359° in steps of 1
Angle accuracy: ±2°
Operation time (FlexLogic operands):
 Tripping (reverse load, forward fault):< 12 ms, typically
 Blocking (forward load, reverse fault):< 8 ms, typically

NEUTRAL DIRECTIONAL OVERCURRENT

Directionality:	Co-existing forward and reverse
Polarizing:	Voltage, Current, Dual, Dual-V, Dual-I
Polarizing voltage:	V_0 or VX
Polarizing current:	IG
Operating current:	I_0
Level sensing:	3 × (|I_0| – *K* × |I_1|), IG
Restraint, *K*:	0.000 to 0.500 in steps of 0.001
Characteristic angle:	–90 to 90° in steps of 1
Limit angle:	40 to 90° in steps of 1, independent for forward and reverse
Angle accuracy:	±2°
Offset impedance:	0.00 to 250.00 Ω in steps of 0.01
Pickup level:	0.002 to 30.000 pu in steps of 0.01
Dropout level:	97 to 98%
Operation time:	<16 ms at 3 × pickup at 60 Hz

NEGATIVE SEQUENCE DIRECTIONAL OC

Directionality:	Co-existing forward and reverse
Polarizing:	Voltage
Polarizing voltage:	V_2
Operating current:	I_2
Level sensing:	Zero-sequence:|I_0| – *K* × |I_1| Negative-sequence:|I_2| – *K* × |I_1|
Restraint, *K*:	0.000 to 0.500 in steps of 0.001
Characteristic angle:	0 to 90° in steps of 1
Limit angle:	40 to 90° in steps of 1, independent for forward and reverse
Angle accuracy:	±2°
Offset impedance:	0.00 to 250.00 Ω in steps of 0.01
Pickup level:	0.015 to 30.000 pu in steps of 0.01
Dropout level:	97 to 98%
Operation time:	<16 ms at 3 × pickup at 60 Hz

WATTMETRIC ZERO-SEQUENCE DIRECTIONAL

Measured power:	zero-sequence
Number of elements:	2
Characteristic angle:	0 to 360° in steps of 1
Minimum power:	0.001 to 1.200 pu in steps of 0.001
Pickup level accuracy:	±1% or ±0.0025 pu, whichever is greater
Hysteresis:	3% or 0.001 pu, whichever is greater
Pickup delay:	definite time (0 to 600.00 s in steps of 0.01), inverse time, or FlexCurve
Inverse time multiplier:	0.01 to 2.00 s in steps of 0.01
Curve timing accuracy:	±3.5% of operate time or ±1 cycle (whichever is greater) from pickup to operate
Operate time:	<30 ms at 60 Hz

SENSITIVE DIRECTIONAL POWER

Measured power:	3-phase, true RMS
Number of stages:	2
Characteristic angle:	0 to 359° in steps of 1
Calibration angle:	0.00 to 0.95° in steps of 0.05
Minimum power:	–1.200 to 1.200 pu in steps of 0.001
Pickup level accuracy:	±1% or ±0.001 pu, whichever is greater
Hysteresis:	2% or 0.001 pu, whichever is greater
Pickup delay:	0 to 600.00 s in steps of 0.01
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
Operate time:	<50 ms

PHASE UNDERVOLTAGE

Voltage:	Phasor only
Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	102 to 103% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Curve shapes:	GE IAV Inverse; Definite Time (0.1s base curve)
Curve multiplier:	Time dial = 0.00 to 600.00 in steps of 0.01
Curve timing accuracy at <0.90 x pickup:	±3.5% of operate time or ±1/2 cycle (whichever is greater) from pickup to operate

AUXILIARY UNDERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	102 to 103% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Curve shapes:	GE IAV Inverse, Definite Time
Curve multiplier:	Time Dial = 0 to 600.00 in steps of 0.01
Curve timing accuracy at <0.90 x pickup:	±3.5% of operate time or ±1/2 cycle (whichever is greater) from pickup to operate

PHASE OVERVOLTAGE

Voltage:	Phasor only
Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Pickup delay:	0.00 to 600.00 in steps of 0.01 s
Operate time:	<30 ms at 1.10 × pickup at 60 Hz
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)

NEUTRAL OVERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Pickup delay:	0.00 to 600.00 s in steps of 0.01 (definite time) or user-defined curve
Reset delay:	0.00 to 600.00 s in steps of 0.01
Curve timing accuracy at >1.1 x pickup:	±3.5% of operate time or ±1 cycle (whichever is greater) from pickup to operate
Operate time:	<30 ms at 1.10 × pickup at 60 Hz

AUXILIARY OVERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Pickup delay:	0 to 600.00 s in steps of 0.01
Reset delay:	0 to 600.00 s in steps of 0.01
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
Operate time:	<30 ms at 1.10 × pickup at 60 Hz

NEGATIVE SEQUENCE OVERVOLTAGE

Pickup level:	0.000 to 1.250 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Pickup delay:	0 to 600.00 s in steps of 0.01
Reset delay:	0 to 600.00 s in steps of 0.01
Timer accuracy:	±3% of operate time or ±20 ms, whichever is greater
Operate time:	<30 ms at 1.10 × pickup at 60 Hz

UNDERFREQUENCY

Minimum signal:	0.10 to 1.25 pu in steps of 0.01
Pickup level:	20.00 to 65.00 Hz in steps of 0.01
Dropout level:	pickup + 0.03 Hz
Level accuracy:	±0.001 Hz
Time delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
Operate time:	typically 4 cycles at 0.1 Hz/s change typically 3.5 cycles at 0.3 Hz/s change typically 3 cycles at 0.5 Hz/s change

Typical times are average operate times including variables such as frequency change instance, test method, etc., and may vary by ±0.5 cycles.

OVERFREQUENCY

Pickup level:	20.00 to 65.00 Hz in steps of 0.01
Dropout level:	pickup – 0.03 Hz
Level accuracy:	±0.001 Hz
Time delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
Operate time:	typically 4 cycles at 0.1 Hz/s change typically 3.5 cycles at 0.3 Hz/s change typically 3 cycles at 0.5 Hz/s change

Typical times are average operate times including variables such as frequency change instance, test method, etc., and may vary by ±0.5 cycles.

RATE OF CHANGE OF FREQUENCY

df/dt trend:	increasing, decreasing, bi-directional
df/dt pickup level:	0.10 to 15.00 Hz/s in steps of 0.01
df/dt dropout level:	96% of pickup
df/dt level accuracy:	80 mHz/s or 3.5%, whichever is greater
Overvoltage supv.:	0.100 to 3.000 pu in steps of 0.001
Overcurrent supv.:	0.000 to 30.000 pu in steps of 0.001
Pickup delay:	0 to 65.535 s in steps of 0.001
Reset delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
95% settling time for df/dt:	<24 cycles
Operate time:	typically 6.5 cycles at 2 × pickup typically 5.5 cycles at 3 × pickup typically 4.5 cycles at 5 × pickup

Typical times are average operate times including variables such as frequency change instance, test method, etc., and may vary by ±0.5 cycles.

BREAKER FAILURE

Mode:	1-pole, 3-pole
Current supervision:	phase, neutral current
Current supv. pickup:	0.001 to 30.000 pu in steps of 0.001
Current supv. dropout:	97 to 98% of pickup
Current supv. accuracy:	
0.1 to 2.0 × CT rating:	±0.75% of reading or ±2% of rated (whichever is greater)
above 2 × CT rating:	±2.5% of reading

BREAKER ARCING CURRENT

Principle:	accumulates breaker duty (I^2t) and measures fault duration
Initiation:	programmable per phase from any FlexLogic operand
Compensation for auxiliary relays:	0 to 65.535 s in steps of 0.001
Alarm threshold:	0 to 50000 kA2-cycle in steps of 1
Fault duration accuracy:	0.25 of a power cycle
Availability:	1 per CT bank with a minimum of 2

BREAKER FLASHOVER

Operating quantity:	phase current, voltage and voltage difference
Pickup level voltage:	0 to 1.500 pu in steps of 0.001
Dropout level voltage:	97 to 98% of pickup
Pickup level current:	0 to 1.500 pu in steps of 0.001
Dropout level current:	97 to 98% of pickup
Level accuracy:	±0.5% or ±0.1% of rated, whichever is greater
Pickup delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±42 ms, whichever is greater
Operate time:	<42 ms at 1.10 × pickup at 60 Hz

2

BREAKER RESTRIKE

Principle:	detection of high-frequency overcurrent condition ¼ cycle after breaker opens
Availability:	one per CT/VT module (not including 8Z modules)
Pickup level:	0.1 to 2.00 pu in steps of 0.01
Reset delay:	0.000 to 65.535 s in steps of 0.001

INCIPIENT CABLE FAULT DETECTION

Principle:	detection of ½ cycle or less overcurrent condition during normal load
Availability:	two per CT/VT module (not including 8Z modules)
Pickup level:	0.1 to 10.00 pu in steps of 0.01
Reset delay:	0.000 to 65.535 s in steps of 0.001
Operating mode:	number of counts, counts per time window

SYNCHROCHECK

Max voltage difference:	0 to 400000 V in steps of 1
Max angle difference:	0 to 100° in steps of 1
Max freq. difference:	0.00 to 2.00 Hz in steps of 0.01
Hysteresis for max. freq. diff.:	0.00 to 0.10 Hz in steps of 0.01
Dead source function:	None, LV1 & DV2, DV1 & LV2, DV1 or DV2, DV1 xor DV2, DV1 & DV2 (L = Live, D = Dead)

AUTORECLOSURE

Single breaker applications, 3-pole tripping schemes

Up to 4 reclose attempts before lockout

Independent dead time setting before each shot

Possibility of changing protection settings after each shot with FlexLogic

LOAD ENCROACHMENT

Responds to:	Positive-sequence quantities
Minimum voltage:	0.000 to 3.000 pu in steps of 0.001
Reach (sec. Ω):	0.02 to 250.00 Ω in steps of 0.01
Impedance accuracy:	±5%
Angle:	5 to 50° in steps of 1
Angle accuracy:	±2°
Pickup delay:	0 to 65.535 s in steps of 0.001
Reset delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
Operate time:	<30 ms at 60 Hz

THERMAL OVERLOAD PROTECTION

Thermal overload curves:	IEC 255-8 curve
Base current:	0.20 to 3.00 pu in steps of 0.01
Overload (*k*) factor:	1.00 to 1.20 pu in steps of 0.05
Trip time constant:	0 to 1000 min. in steps of 1
Reset time constant:	0 to 1000 min. in steps of 1
Minimum reset time:	0 to 1000 min. in steps of 1
Timer accuracy (cold curve):	±100 ms or 2%, whichever is greater
Timer accuracy (hot curve):	±500 ms or 2%, whichever is greater for $I_p < 0.9 \times k \times I_b$ and $I / (k \times I_b) > 1.1$

TRIP BUS (TRIP WITHOUT FLEXLOGIC)

Number of elements:	6
Number of inputs:	16
Operate time:	<2 ms at 60 Hz
Timer accuracy:	±3% or 10 ms, whichever is greater

2.3.2 USER-PROGRAMMABLE ELEMENTS

FLEXLOGIC

Programming language:	Reverse Polish Notation with graphical visualization (keypad programmable)
Lines of code:	512
Internal variables:	64
Supported operations:	NOT, XOR, OR (2 to 16 inputs), AND (2 to 16 inputs), NOR (2 to 16 inputs), NAND (2 to 16 inputs), latch (reset-dominant), edge detectors, timers
Inputs:	any logical variable, contact, or virtual input
Number of timers:	32
Pickup delay:	0 to 60000 (ms, sec., min.) in steps of 1
Dropout delay:	0 to 60000 (ms, sec., min.) in steps of 1

FLEXCURVES™

Number:	4 (A through D)
Reset points:	40 (0 through 1 of pickup)
Operate points:	80 (1 through 20 of pickup)
Time delay:	0 to 65535 ms in steps of 1

FLEX STATES

Number:	up to 256 logical variables grouped under 16 Modbus addresses
Programmability:	any logical variable, contact, or virtual input

FLEXELEMENTS™

Number of elements:	8
Operating signal:	any analog actual value, or two values in differential mode
Operating signal mode:	signed or absolute value
Operating mode:	level, delta
Comparator direction:	over, under
Pickup Level:	–90.000 to 90.000 pu in steps of 0.001
Hysteresis:	0.1 to 50.0% in steps of 0.1
Delta dt:	20 ms to 60 days
Pickup & dropout delay:	0.000 to 65.535 s in steps of 0.001

NON-VOLATILE LATCHES

Type:	set-dominant or reset-dominant
Number:	16 (individually programmed)
Output:	stored in non-volatile memory
Execution sequence:	as input prior to protection, control, and FlexLogic

USER-PROGRAMMABLE LEDs

Number:	48 plus trip and alarm
Programmability:	from any logical variable, contact, or virtual input
Reset mode:	self-reset or latched

LED TEST

Initiation:	from any digital input or user-programmable condition
Number of tests:	3, interruptible at any time
Duration of full test:	approximately 3 minutes
Test sequence 1:	all LEDs on
Test sequence 2:	all LEDs off, one LED at a time on for 1 s
Test sequence 3:	all LEDs on, one LED at a time off for 1 s

USER-DEFINABLE DISPLAYS

Number of displays:	16
Lines of display:	2 × 20 alphanumeric characters
Parameters:	up to 5, any Modbus register addresses
Invoking and scrolling:	keypad, or any user-programmable condition, including pushbuttons

CONTROL PUSHBUTTONS

Number of pushbuttons:	7
Operation:	drive FlexLogic operands

USER-PROGRAMMABLE PUSHBUTTONS (OPTIONAL)

Number of pushbuttons:	12 (standard faceplate); 16 (enhanced faceplate)
Mode:	self-reset, latched
Display message:	2 lines of 20 characters each
Drop-out timer:	0.00 to 60.00 s in steps of 0.05
Autoreset timer:	0.2 to 600.0 s in steps of 0.1
Hold timer:	0.0 to 10.0 s in steps of 0.1

SELECTOR SWITCH

Number of elements:	2
Upper position limit:	1 to 7 in steps of 1
Selecting mode:	time-out or acknowledge
Time-out timer:	3.0 to 60.0 s in steps of 0.1
Control inputs:	step-up and 3-bit
Power-up mode:	restore from non-volatile memory or synchronize to a 3-bit control input or synch/restore mode

DIGITAL ELEMENTS

Number of elements:	48
Operating signal:	any FlexLogic operand
Pickup delay:	0.000 to 999999.999 s in steps of 0.001
Dropout delay:	0.000 to 999999.999 s in steps of 0.001
Timing accuracy:	±3% or ±4 ms, whichever is greater

2.3.3 MONITORING

OSCILLOGRAPHY

Maximum records:	64
Sampling rate:	64 samples per power cycle
Triggers:	any element pickup, dropout, or operate; digital input change of state; digital output change of state; FlexLogic equation
Data:	AC input channels; element state; digital input state; digital output state
Data storage:	in non-volatile memory

EVENT RECORDER

Capacity:	1024 events
Time-tag:	to 1 microsecond
Triggers:	any element pickup, dropout, or operate; digital input change of state; digital output change of state; self-test events
Data storage:	in non-volatile memory

DATA LOGGER

Number of channels:	1 to 16
Parameters:	any available analog actual value
Sampling rate:	15 to 3600000 ms in steps of 1
Trigger:	any FlexLogic operand
Mode:	continuous or triggered
Storage capacity:	(NN is dependent on memory) 1-second rate: 01 channel for NN days 16 channels for NN days ↓ 60-minute rate: 01 channel for NN days 16 channels for NN days

2

FAULT LOCATOR

Method: single-ended

Voltage source: wye-connected VTs, delta-connected VTs and neutral voltage, delta-connected VTs and zero-sequence current (approximation)

Maximum accuracy if: fault resistance is zero or fault currents from all line terminals are in phase

Relay accuracy: ±1.5% (V > 10 V, I > 0.1 pu)

Worst-case accuracy:

$VT_{\%error}$ + user data

$CT_{\%error}$ + user data

$Z_{Line\%error}$ + user data

$METHOD_{\%error}$ + see chapter 8

$RELAY\ ACCURACY_{\%error}$ + (1.5%)

HI-Z

Detections: Arc Suspected, Arc Detected, Downed Conductor, Phase Identification

PHASOR MEASUREMENT UNIT

Output format: per IEEE C37.118 or IEC 61850-90-5 standard

Number of channels: 14 synchrophasors, 8 analogs, 16 digitals

TVE (total vector error) <1%

Triggering: frequency, voltage, current, power, rate of change of frequency, user-defined

Reporting rate: 1, 2, 5, 10, 12, 15, 20, 25, 30, 50, or 60 times per second for P and M class, and 100 or 120 times per second for P class only

Number of clients: One over TCP/IP port and one over UDP/IP per aggregator

AC ranges: As indicated in appropriate specifications sections

Network reporting format: 16-bit integer (for IEEE C37.118) or 32-bit IEEE floating point numbers

Network reporting style: rectangular (real and imaginary for IEEE C37.188) or polar (magnitude and angle) coordinates

Post-filtering: none, 3-point, 5-point, 7-point

Calibration: ±5° (angle) and ±5% (magnitude)

2.3.4 METERING

RMS CURRENT: PHASE, NEUTRAL, AND GROUND

Accuracy at

0.1 to 2.0 × CT rating: ±0.25% of reading or ±0.1% of rated (whichever is greater)

> 2.0 × CT rating: ±1.0% of reading

RMS VOLTAGE

Accuracy: ±0.5% of reading from 10 to 208 V

REAL POWER (WATTS)

Accuracy at 0.1 to 1.5 x CT rating and 0.8 to 1.2 x VT rating: ±1.0% of reading at $-1.0 \leq PF < -0.8$ and $0.8 < PF \leq 10$

REACTIVE POWER (VARS)

Accuracy at 0.1 to 1.5 x CT rating and 0.8 to 1.2 x VT rating: ±1.0% of reading at $-0.2 \leq PF \leq 0.2$

APPARENT POWER (VA)

Accuracy at 0.1 to 1.5 x CT rating and 0.8 to 1.2 x VT rating: ±1.0% of reading

WATT-HOURS (POSITIVE AND NEGATIVE)

Accuracy: ±2.0% of reading

Range: ±0 to 1 × 10^6 MWh

Parameters: three-phase only

Update rate: 50 ms

VAR-HOURS (POSITIVE AND NEGATIVE)

Accuracy: ±2.0% of reading

Range: ±0 to 1 × 10^6 Mvarh

Parameters: three-phase only

Update rate: 50 ms

CURRENT HARMONICS

Harmonics: 2nd to 25th harmonic: per phase, displayed as a % of f_1 (fundamental frequency phasor)
THD: per phase, displayed as a % of f_1

Accuracy:

HARMONICS: 1. f_1 > 0.4pu: (0.20% + 0.035% / harmonic) of reading or 0.15% of 100%, whichever is greater
2. f_1 < 0.4pu: as above plus %error of f_1

THD: 1. f_1 > 0.4pu: (0.25% + 0.035% / harmonic) of reading or 0.20% of 100%, whichever is greater
2. f_1 < 0.4pu: as above plus %error of f_1

VOLTAGE HARMONICS

Harmonics: 2nd to 25th harmonic: per phase, displayed as a % of f_1 (fundamental frequency phasor)
THD: per phase, displayed as a % of f_1

Accuracy:

HARMONICS: 1. f_1 > 0.4pu: (0.20% + 0.035% / harmonic) of reading or 0.15% of 100%, whichever is greater
2. f_1 < 0.4pu: as above plus %error of f_1

THD: 1. f_1 > 0.4pu: (0.25% + 0.035% / harmonic) of reading or 0.20% of 100%, whichever is greater
2. f_1 < 0.4pu: as above plus %error of f_1

FREQUENCY

Accuracy at

V = 0.8 to 1.2 pu:	±0.01 Hz (when voltage signal is used for frequency measurement)
I = 0.1 to 0.25 pu:	±0.05 Hz
I > 0.25 pu:	±0.02 Hz (when current signal is used for frequency measurement)

DEMAND

Measurements:	Phases A, B, and C present and maximum measured currents 3-Phase Power (P, Q, and S) present and maximum measured currents
Accuracy:	±2.0%

2.3.5 INPUTS

AC CURRENT

CT rated primary:	1 to 50000 A
CT rated secondary:	1 A or 5 A by connection
Relay burden:	< 0.2 VA at rated secondary
Conversion range:	
Standard CT:	0.02 to 46 × CT rating RMS symmetrical
Sensitive Ground CT module:	0.002 to 4.6 × CT rating RMS symmetrical
HI-Z CT module:	0.002 to 4.6 × CT rating RMS symmetrical
Current withstand:	20 ms at 250 times rated 1 sec. at 100 times rated continuous 4xInom; URs equipped with 24 CT inputs have a maximum operating temp. of 50°C
Short circuit rating:	150000 RMS symmetrical amperes, 250 V maximum (primary current to external CT)

AC VOLTAGE

VT rated secondary:	50.0 to 240.0 V
VT ratio:	1.00 to 24000.00Relay burden:< 0.25 VA at 120 V
Conversion range:	1 to 275 V
Voltage withstand:	continuous at 260 V to neutral 1 min./hr at 420 V to neutral

FREQUENCY

Nominal frequency setting:	25 to 60 Hz
Sampling frequency:	64 samples per power cycle
Tracking frequency range:	20 to 70 Hz

CONTACT INPUTS

Dry contacts:	1000 Ω maximum
Wet contacts:	300 V DC maximum
Selectable thresholds:	17 V, 33 V, 84 V, 166 V
Tolerance:	±10%
Contacts per common return:	4
Recognition time:	< 1 ms
Debounce time:	0.0 to 16.0 ms in steps of 0.5
Continuous current draw:	3 mA (when energized)

CONTACT INPUTS WITH AUTO-BURNISHING

Dry contacts:	1000 Ω maximum
Wet contacts:	300 V DC maximum
Selectable thresholds:	17 V, 33 V, 84 V, 166 V
Tolerance:	±10%
Contacts per common return:	2
Recognition time:	< 1 ms
Debounce time:	0.0 to 16.0 ms in steps of 0.5
Continuous current draw:	3 mA (when energized)
Auto-burnish impulse current:	50 to 70 mA
Duration of auto-burnish impulse:	25 to 50 ms

DCMA INPUTS

Current input (mA DC):	0 to –1, 0 to +1, –1 to +1, 0 to 5, 0 to 10, 0 to 20, 4 to 20 (programmable)
Input impedance:	379 Ω ±10%
Conversion range:	–1 to + 20 mA DC
Accuracy:	±0.2% of full scale
Type:	Passive

RTD INPUTS

Types (3-wire):	100 Ω Platinum, 100 & 120 Ω Nickel, 10 Ω Copper
Sensing current:	5 mA
Range:	–50 to +250°C
Accuracy:	±2°C
Isolation:	36 V pk-pk

IRIG-B INPUT

Amplitude modulation:	1 to 10 V pk-pk
DC shift:	TTL–Compatible
Input impedance:	50 kΩ
Isolation:	2 kV

REMOTE INPUTS (IEC 61850 GSSE/GOOSE)

Input points:	32, configured from 64 incoming bit pairs
Remote devices:	16
Default states on loss of comms.:	On, Off, Latest/Off, Latest/On
Remote DPS inputs:	5

DIRECT INPUTS

Input points: 32
Remote devices: 16
Default states on loss of comms.: On, Off, Latest/Off, Latest/On
Ring configuration: Yes, No
Data rate: 64 or 128 kbps
CRC: 32-bit
CRC alarm:
  Responding to: Rate of messages failing the CRC
  Monitoring message count: 10 to 10000 in steps of 1
  Alarm threshold: 1 to 1000 in steps of 1
Unreturned message alarm:
  Responding to: Rate of unreturned messages in the ring configuration
  Monitoring message count: 10 to 10000 in steps of 1
  Alarm threshold: 1 to 1000 in steps of 1

TELEPROTECTION

Input points: 16
Remote devices: 3
Default states on loss of comms.: On, Off, Latest/Off, Latest/On
Ring configuration: No
Data rate: 64 or 128 kbps
CRC: 32-bit

2.3.6 POWER SUPPLY

LOW RANGE

Nominal DC voltage: 24 to 48 V
Minimum DC voltage: 20 V
Maximum DC voltage: 60 or 72 V; check power supply module
Voltage loss hold-up: 20 ms duration at nominal
NOTE: Low range is DC only.

HIGH RANGE

Nominal DC voltage: 125 to 250 V
Minimum DC voltage: 88 V
Maximum DC voltage: 300 or 400 V; check power supply module
Nominal AC voltage: 100 to 240 V at 50/60 Hz
Minimum AC voltage: 88 V at 25 to 100 Hz
Maximum AC voltage: 265 V at 25 to 100 Hz
Voltage loss hold-up: 200 ms duration at nominal

ALL RANGES

Volt withstand: 2 × Highest Nominal Voltage for 10 ms
Power consumption: typical = 15 to 20 W/VA
maximum = 50 W/VA
contact factory for exact order code consumption

INTERNAL FUSE

RATINGS
  Low range power supply: 8 A / 250 V
  High range power supply: 4 A / 250 V
INTERRUPTING CAPACITY
  AC: 100 000 A RMS symmetrical
  DC: 10 000 A

2.3.7 OUTPUTS

FORM-A RELAY

Make and carry for 0.2 s: 30 A as per ANSI C37.90
Carry continuous: 6 A
Break (DC inductive, L/R = 40 ms):

VOLTAGE	CURRENT
24 V	1 A
48 V	0.5 A
125 V	0.3 A
250 V	0.2 A

Operate time: < 4 ms
Contact material: silver alloy

LATCHING RELAY

Make and carry for 0.2 s: 30 A as per ANSI C37.90
Carry continuous: 6 A as per IEEE C37.90
Break (DC resistive as per IEC61810-1):

VOLTAGE	CURRENT
24 V	6 A
48 V	1.6 A
125 V	0.4 A
250 V	0.2 A

Operate time: < 4 ms
Contact material: silver alloy
Control: separate operate and reset inputs
Control mode: operate-dominant or reset-dominant

FORM-A VOLTAGE MONITOR

Applicable voltage: approx. 15 to 250 V DC
Trickle current: approx. 1 to 2.5 mA

FORM-A CURRENT MONITOR

Threshold current: approx. 80 to 100 mA

FORM-C AND CRITICAL FAILURE RELAY

Make and carry for 0.2 s: 30 A as per ANSI C37.90

Carry continuous: 8 A

Break (DC inductive, L/R = 40 ms):

VOLTAGE	CURRENT
24 V	1 A
48 V	0.5 A
125 V	0.3 A
250 V	0.2 A

Operate time: < 8 ms

Contact material: silver alloy

FAST FORM-C RELAY

Make and carry: 0.1 A max. (resistive load)

Minimum load impedance:

INPUT VOLTAGE	IMPEDANCE	
	2 W RESISTOR	1 W RESISTOR
250 V DC	20 KΩ	50 KΩ
120 V DC	5 KΩ	2 KΩ
48 V DC	2 KΩ	2 KΩ
24 V DC	2 KΩ	2 KΩ

Note: values for 24 V and 48 V are the same due to a required 95% voltage drop across the load impedance.

Operate time: < 0.6 ms

Internal Limiting Resistor: 100 Ω, 2 W

SOLID-STATE OUTPUT RELAY

Operate and release time: <100 μs

Maximum voltage: 265 V DC

Maximum continuous current: 5 A at 45°C; 4 A at 65°C

Make and carry:
- for 0.2 s: 30 A as per ANSI C37.90
- for 0.03 s 300 A

Breaking capacity:

	UL508	Utility application (autoreclose scheme)	Industrial application
Operations/ interval	5000 ops / 1 s-On, 9 s-Off	5 ops / 0.2 s-On, 0.2 s-Off within 1 minute	10000 ops / 0.2 s-On, 30 s-Off
	1000 ops / 0.5 s-On, 0.5 s-Off		
Break capability (0 to 250 V DC)	3.2 A L/R = 10 ms	10 A L/R = 40 ms	10 A L/R = 40 ms
	1.6 A L/R = 20 ms		
	0.8 A L/R = 40 ms		

CONTROL POWER EXTERNAL OUTPUT (FOR DRY CONTACT INPUT)

Capacity: 100 mA DC at 48 V DC

Isolation: ±300 Vpk

REMOTE OUTPUTS (IEC 61850 GSSE/GOOSE)

Standard output points: 32

User output points: 32

DIRECT OUTPUTS

Output points: 32

DCMA OUTPUTS

Range: –1 to 1 mA, 0 to 1 mA, 4 to 20 mA

Max. load resistance: 12 kΩ for –1 to 1 mA range
12 kΩ for 0 to 1 mA range
600 Ω for 4 to 20 mA range

Accuracy: ±0.75% of full-scale for 0 to 1 mA range
±0.5% of full-scale for –1 to 1 mA range
±0.75% of full-scale for 0 to 20 mA range

99% Settling time to a step change: 100 ms

Isolation: 1.5 kV

Driving signal: any FlexAnalog quantity

Upper and lower limit for the driving signal: –90 to 90 pu in steps of 0.001

2.3.8 COMMUNICATIONS

RS232

Front port: 19.2 kbps, Modbus RTU

RS485

1 rear port: Up to 115 kbps, Modbus RTU, isolated together at 36 Vpk

Typical distance: 1200 m

Isolation: 2 kV

ETHERNET (FIBER)

PARAMETER	FIBER TYPE
	100MB MULTI-MODE
Wavelength	1310 nm
Connector	LC
Transmit power	–20 dBm
Receiver sensitivity	–30 dBm
Power budget	10 dB
Maximum input power	–14 dBm
Typical distance	2 km
Duplex	full/half
Redundancy	yes

ETHERNET (10/100 MB TWISTED PAIR)

Modes: 10 MB, 10/100 MB (auto-detect)

Connector: RJ45

SIMPLE NETWORK TIME PROTOCOL (SNTP)

clock synchronization error: <10 ms (typical)

PRECISION TIME PROTOCOL (PTP)

PTP IEEE Std 1588 2008 (version 2)

Power Profile (PP) per IEEE Standard PC37.238TM2011

Slave-only ordinary clock

Peer delay measurement mechanism

PARALLEL REDUNDANCY PROTOCOL (PRP) (IEC 62439-3 CLAUSE 4, 2012)

Ethernet ports used: 2 and 3

Networks supported: 10/100 MB Ethernet

2.3.9 INTER-RELAY COMMUNICATIONS

SHIELDED TWISTED-PAIR INTERFACE OPTIONS

INTERFACE TYPE	TYPICAL DISTANCE
RS422	1200 m
G.703	100 m

NOTE: RS422 distance is based on transmitter power and does not take into consideration the clock source provided by the user.

LINK POWER BUDGET

EMITTER, FIBER TYPE	TRANSMIT POWER	RECEIVED SENSITIVITY	POWER BUDGET
820 nm LED, Multimode	–20 dBm	–30 dBm	10 dB
1300 nm LED, Multimode	–21 dBm	–30 dBm	9 dB
1300 nm ELED, Single mode	–23 dBm	–32 dBm	9 dB
1300 nm Laser, Single mode	–1 dBm	–30 dBm	29 dB
1550 nm Laser, Single mode	+5 dBm	–30 dBm	35 dB

NOTE: These power budgets are calculated from the manufacturer’s worst-case transmitter power and worst case receiver sensitivity.

NOTE: The power budgets for the 1300 nm ELED are calculated from the manufacturer's transmitter power and receiver sensitivity at ambient temperature. At extreme temperatures these values deviate based on component tolerance. On average, the output power decreases as the temperature is increased by a factor 1dB / 5°C.

MAXIMUM OPTICAL INPUT POWER

EMITTER, FIBER TYPE	MAX. OPTICAL INPUT POWER
820 nm LED, Multimode	–7.6 dBm
1300 nm LED, Multimode	–11 dBm
1300 nm ELED, Single mode	–14 dBm
1300 nm Laser, Single mode	–14 dBm
1550 nm Laser, Single mode	–14 dBm

TYPICAL LINK DISTANCE

EMITTER TYPE	CABLE TYPE	CONNECTOR TYPE	TYPICAL DISTANCE
820 nm LED, multimode	62.5/125 μm	ST	1.65 km
1300 nm LED, multimode	62.5/125 μm	ST	3.8 km
1300 nm ELED, single mode	9/125 μm	ST	11.4 km
1300 nm Laser, single mode	9/125 μm	ST	64 km
1550 nm Laser, single mode	9/125 μm	ST	105 km

NOTE

Typical distances listed are based on the following assumptions for system loss. As actual losses vary from one installation to another, the distance covered by your system may vary.

CONNECTOR LOSSES (TOTAL OF BOTH ENDS)

ST connector 2 dB

FIBER LOSSES

820 nm multimode 3 dB/km
1300 nm multimode 1 dB/km
1300 nm single mode 0.35 dB/km
1550 nm single mode 0.25 dB/km
Splice losses: One splice every 2 km, at 0.05 dB loss per splice.

SYSTEM MARGIN

3 dB additional loss added to calculations to compensate for all other losses.

Compensated difference in transmitting and receiving (channel asymmetry) channel delays using GPS satellite clock: 10 ms

2.3.10 ENVIRONMENTAL

AMBIENT TEMPERATURES

Storage temperature: –40 to 85°C
Operating temperature: –40 to 60°C; the LCD contrast can be impaired at temperatures less than –20°C

HUMIDITY

Humidity: operating up to 95% (non-condensing) at 55°C (as per IEC60068-2-30 variant 1, 6 days).

OTHER

Altitude: 2000 m (maximum)
Pollution degree: II
Overvoltage category: II
Ingress protection: IP20 front, IP10 back

2.3.11 TYPE TESTS

F60 TYPE TESTS

TEST	REFERENCE STANDARD	TEST LEVEL
Dielectric voltage withstand	EN60255-5	2.2 kV
Impulse voltage withstand	EN60255-5	5 kV
Damped oscillatory	IEC61000-4-18 / IEC60255-22-1	2.5 kV CM, 1 kV DM
Electrostatic discharge	EN61000-4-2 / IEC60255-22-2	Level 3
RF immunity	EN61000-4-3 / IEC60255-22-3	Level 3

Damped oscillatory	IEC61000-4-12	2.5 kV CM, 1 kV DM
Conducted RF immunity, 0 to 150 kHz	IEC61000-4-16	Level 4
Voltage ripple	IEC61000-4-17	15% ripple
Ingress protection	IEC60529	IP40 front, IP10 back
Cold	IEC60068-2-1	–40°C for 16 hours
Hot	IEC60068-2-2	85°C for 16 hours
Humidity	IEC60068-2-30	6 days, variant 1
Damped oscillatory	IEEE/ANSI C37.90.1	2.5 kV, 1 MHz
RF immunity	IEEE/ANSI C37.90.2	20 V/m, 80 MHz to 1 GHz
Safety	UL508	e83849 NKCR
Safety	UL C22.2-14	e83849 NKCR7
Safety	UL1053	e83849 NKCR

2.3.12 PRODUCTION TESTS

THERMAL

Products go through an environmental test based upon an Accepted Quality Level (AQL) sampling process.

2.3.13 APPROVALS

APPROVALS

COMPLIANCE	APPLICABLE COUNCIL DIRECTIVE	ACCORDING TO
CE	Low voltage directive	EN 60255-5
	EMC directive	EN 60255-26 / EN 50263
		EN 61000-6-5
C-UL-US	---	UL 508
		UL 1053
		C22.2 No. 14

2.3.14 MAINTENANCE

MOUNTING
Attach mounting brackets using 20 inch-pounds (±2 inch-pounds) of torque.

CLEANING
Normally, cleaning is not required; but for situations where dust has accumulated on the faceplate display, a dry cloth can be used.

NOTICE

To avoid deterioration of electrolytic capacitors, power up units that are stored in a de-energized state once per year, for one hour continuously.

3.1.1 PANEL CUTOUT

a) HORIZONTAL UNITS

The F60 Feeder Protection System is available as a 19-inch rack horizontal mount unit with a removable faceplate. The faceplate can be specified as either standard or enhanced at the time of ordering. The enhanced faceplate contains additional user-programmable pushbuttons and LED indicators.

The modular design allows the relay to be easily upgraded or repaired by a qualified service person. The faceplate is hinged to allow easy access to the removable modules, and is itself removable to allow mounting on doors with limited rear depth.

The case dimensions are shown below, along with panel cutout details for panel mounting. When planning the location of your panel cutout, ensure that provision is made for the faceplate to swing open without interference to or from adjacent equipment.

The relay must be mounted such that the faceplate sits semi-flush with the panel or switchgear door, allowing the operator access to the keypad and the RS232 communications port. The relay is secured to the panel with the use of four screws supplied with the relay.

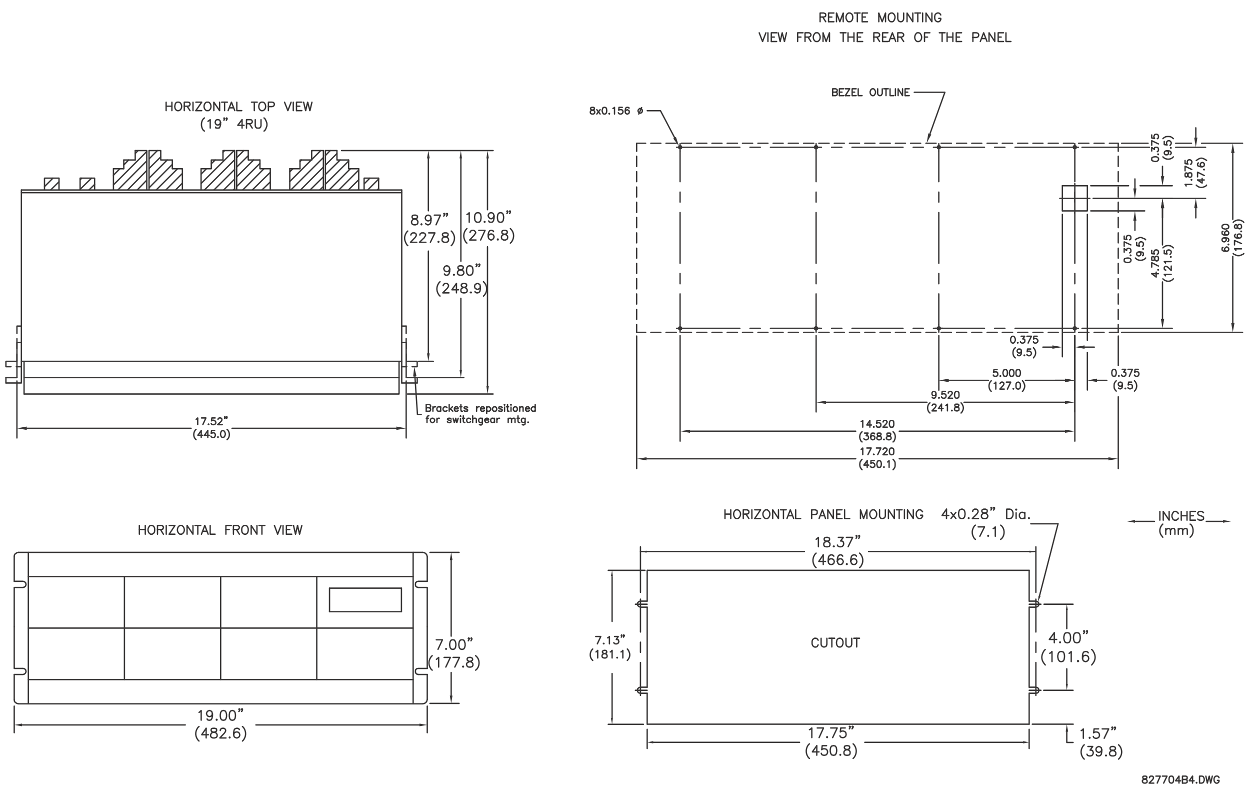

Figure 3–3: F60 HORIZONTAL MOUNTING AND DIMENSIONS (STANDARD PANEL)

b) VERTICAL UNITS

The F60 Feeder Protection System is available as a reduced size (¾) vertical mount unit, with a removable faceplate. The faceplate can be specified as either standard or enhanced at the time of ordering. The enhanced faceplate contains additional user-programmable pushbuttons and LED indicators.

The modular design allows the relay to be easily upgraded or repaired by a qualified service person. The faceplate is hinged to allow easy access to the removable modules, and is itself removable to allow mounting on doors with limited rear depth.

The case dimensions are shown below, along with panel cutout details for panel mounting. When planning the location of your panel cutout, ensure that provision is made for the faceplate to swing open without interference to or from adjacent equipment.

The relay must be mounted such that the faceplate sits semi-flush with the panel or switchgear door, allowing the operator access to the keypad and the RS232 communications port. The relay is secured to the panel with the use of four screws supplied with the relay.

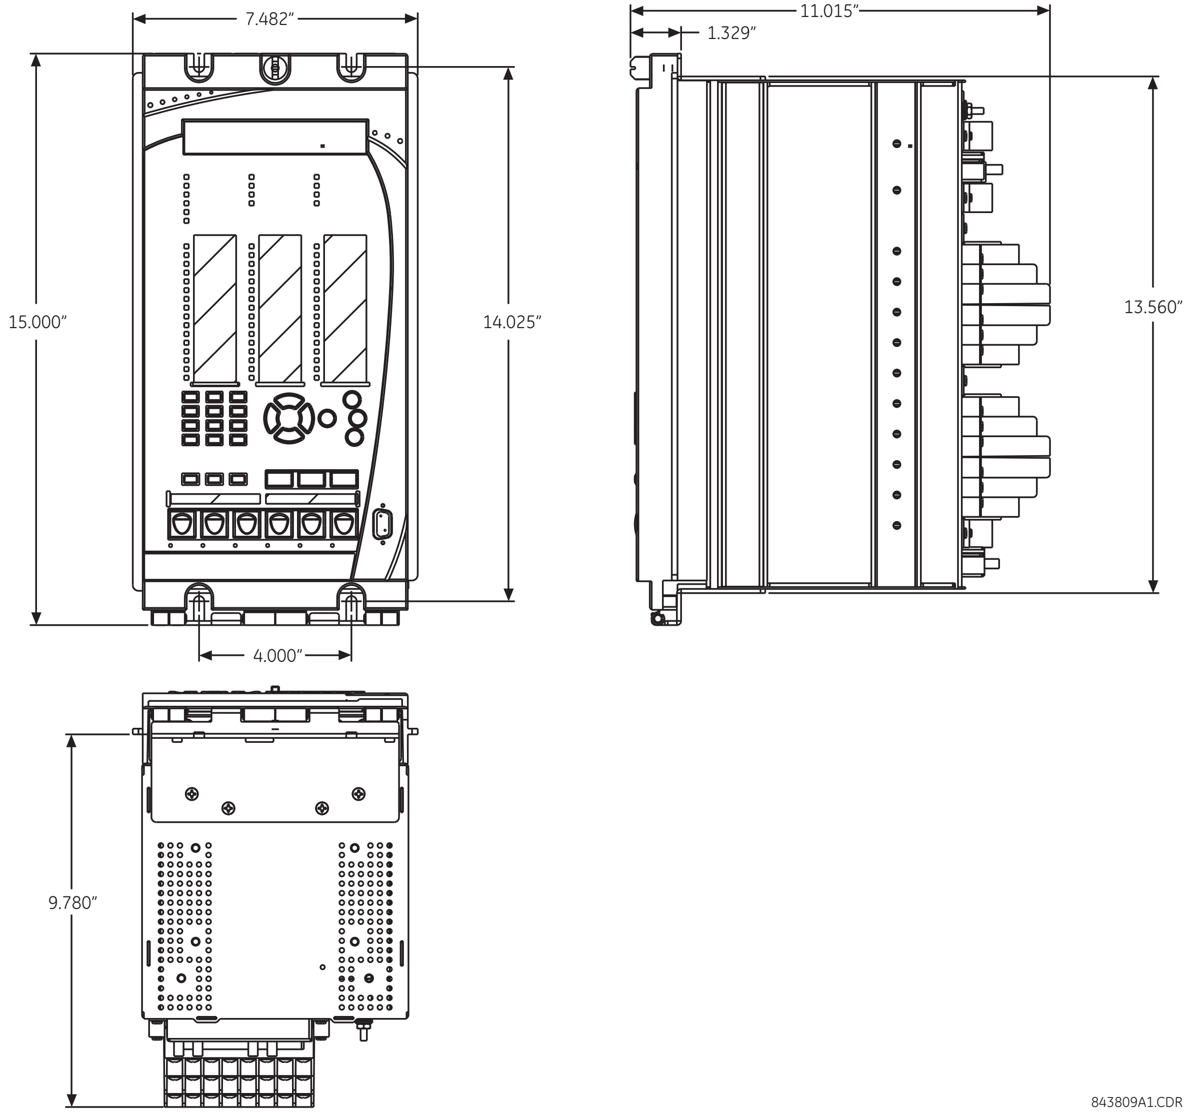

Figure 3–4: F60 VERTICAL DIMENSIONS (ENHANCED PANEL)

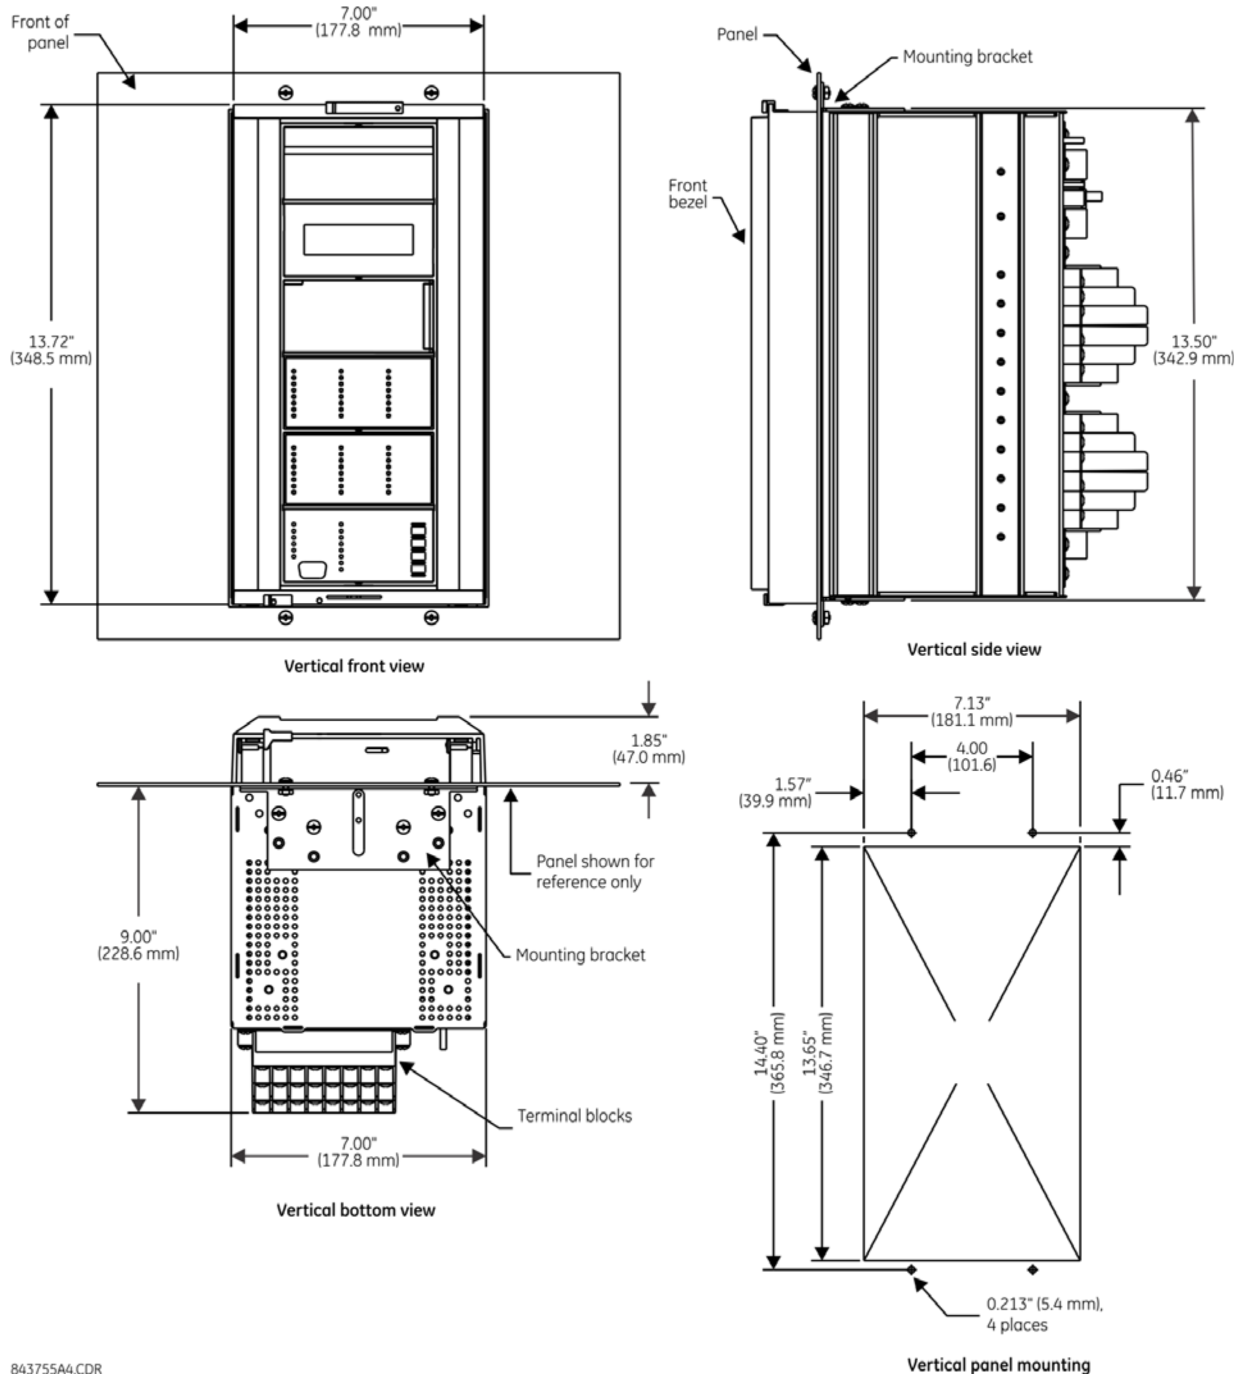

Figure 3–5: F60 VERTICAL MOUNTING AND DIMENSIONS (STANDARD PANEL)

For details on side mounting F60 devices with the enhanced front panel, refer to the following documents available online from the GE Multilin website.

- GEK-113180: UR-series UR-V side-mounting front panel assembly instructions.
- GEK-113181: Connecting the side-mounted UR-V enhanced front panel to a vertical UR-series device.
- GEK-113182: Connecting the side-mounted UR-V enhanced front panel to a vertically-mounted horizontal UR-series device.

For details on side mounting F60 devices with the standard front panel, refer to the figures below.

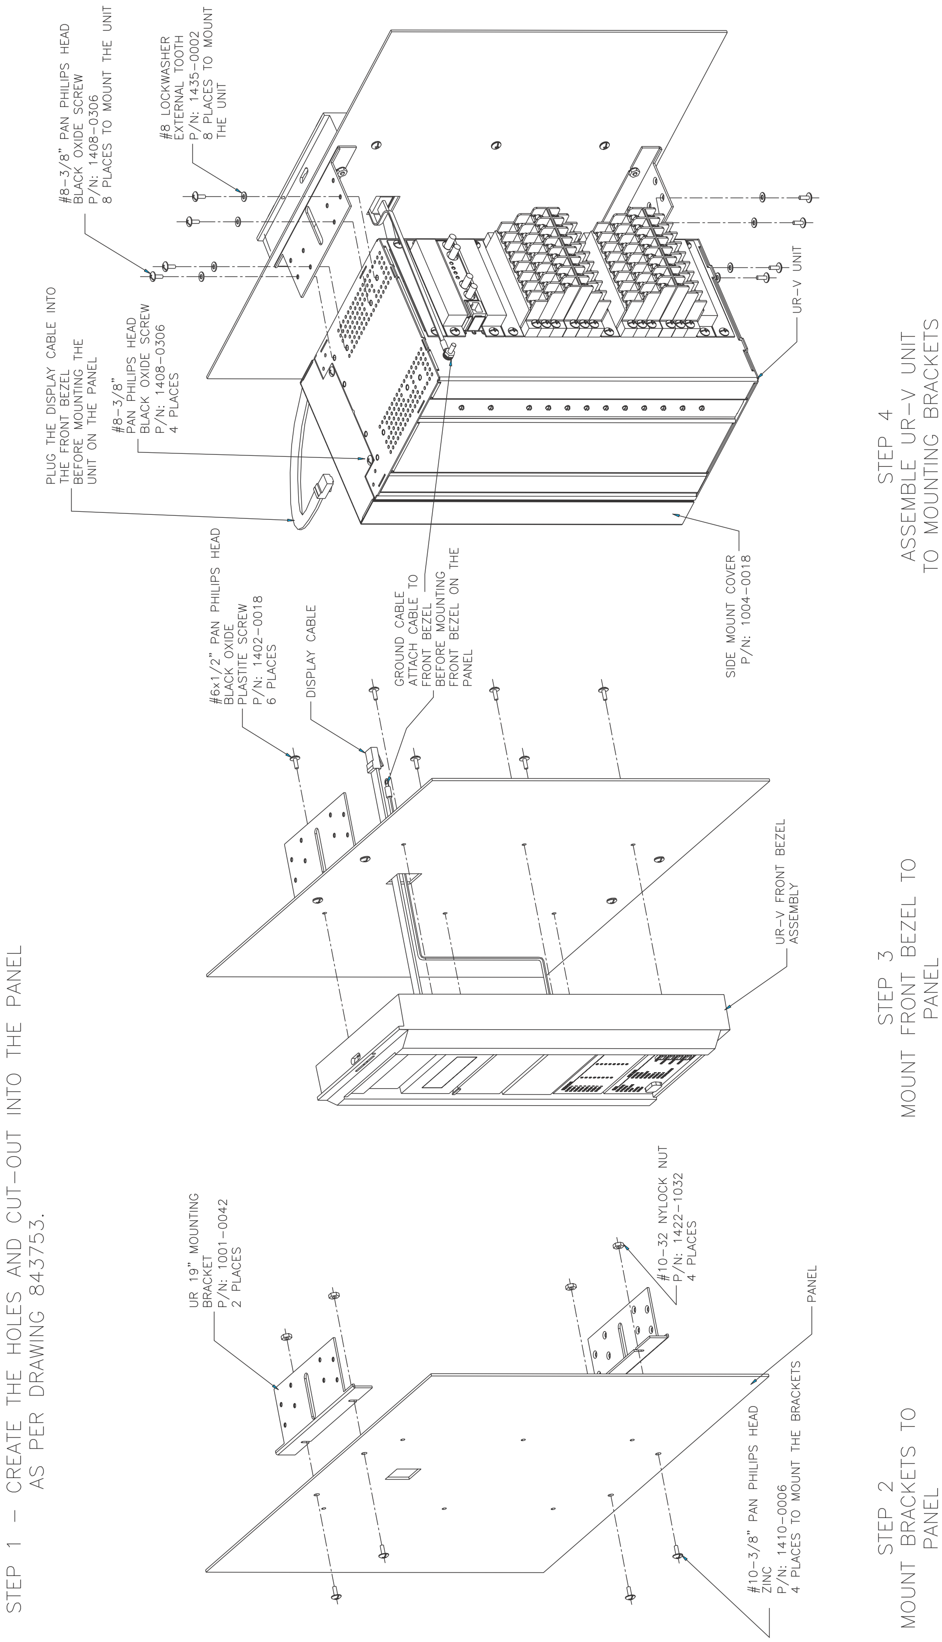

Figure 3–6: F60 VERTICAL SIDE MOUNTING INSTALLATION (STANDARD PANEL)

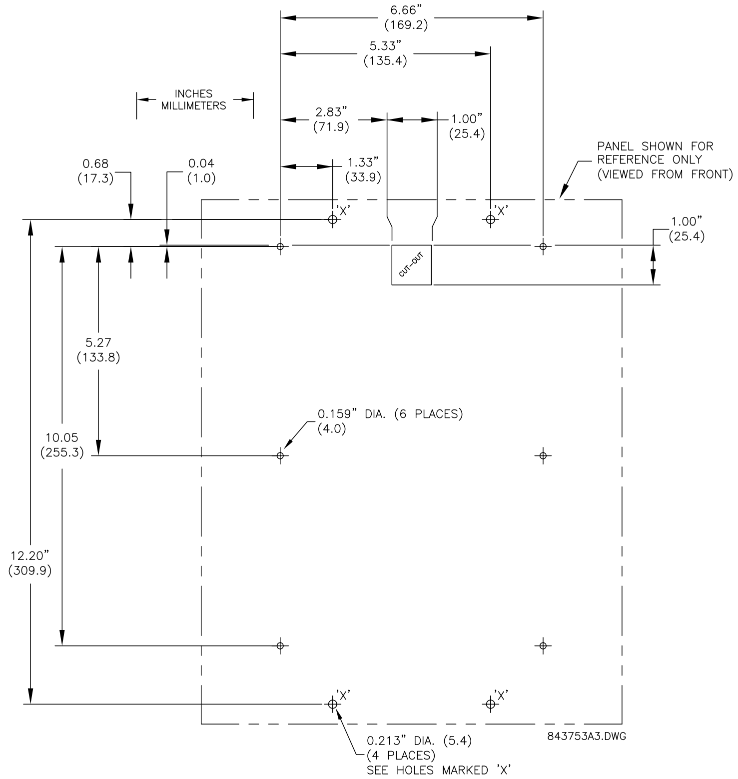

Figure 3–7: F60 VERTICAL SIDE MOUNTING REAR DIMENSIONS (STANDARD PANEL)

3.1.2 REAR TERMINAL LAYOUT

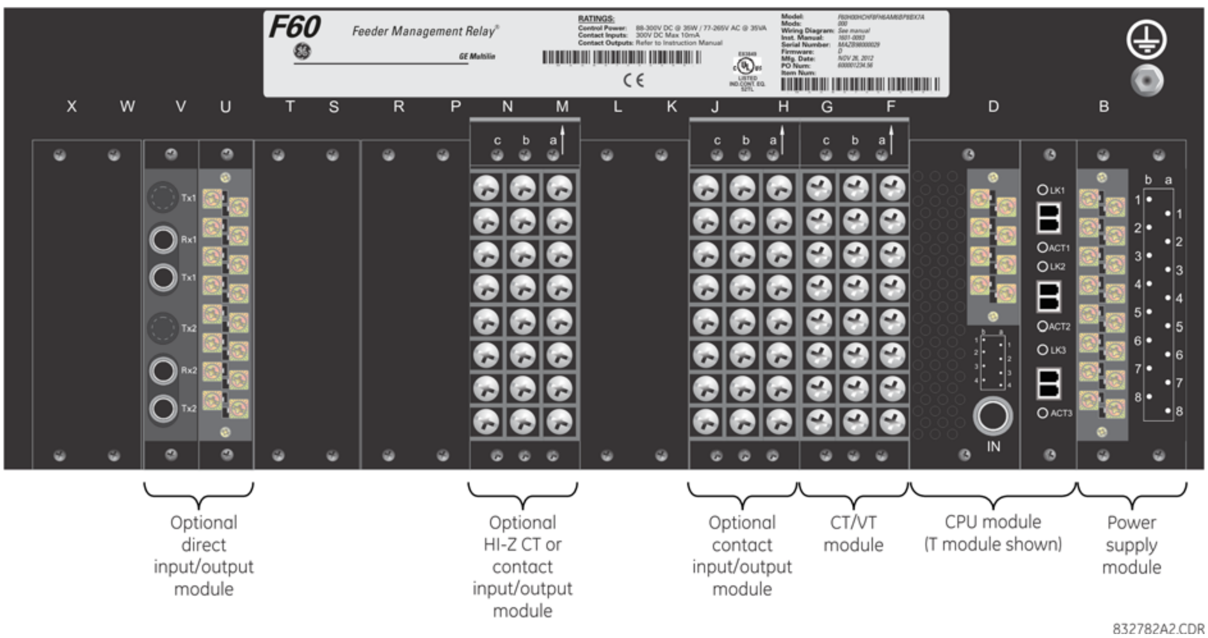

Figure 3–8: REAR TERMINAL VIEW

WARNING **Do not touch any rear terminals while the relay is energized.**

NOTICE The small form-factor pluggable ports (SFPs) are pluggable transceivers. Do not use non-validated transceivers or install validated transceivers in the wrong Ethernet slot, else damage can occur.

The relay follows a convention with respect to terminal number assignments which are three characters long assigned in order by module slot position, row number, and column letter. Two-slot wide modules take their slot designation from the first slot position (nearest to CPU module) which is indicated by an arrow marker on the terminal block. See the following figure for an example of rear terminal assignments.

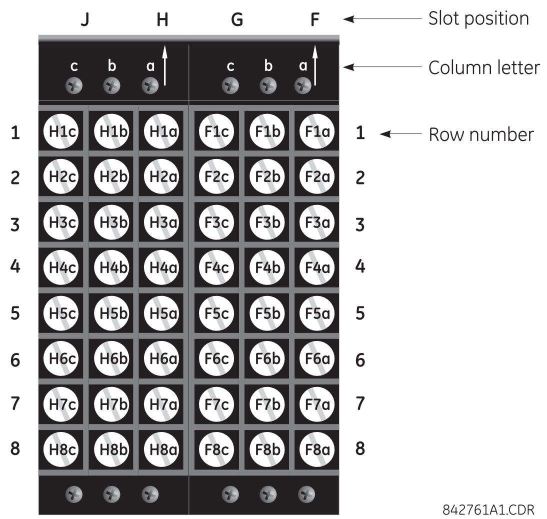

Figure 3–9: EXAMPLE OF MODULES IN F AND H SLOTS

3.2.1 TYPICAL WIRING

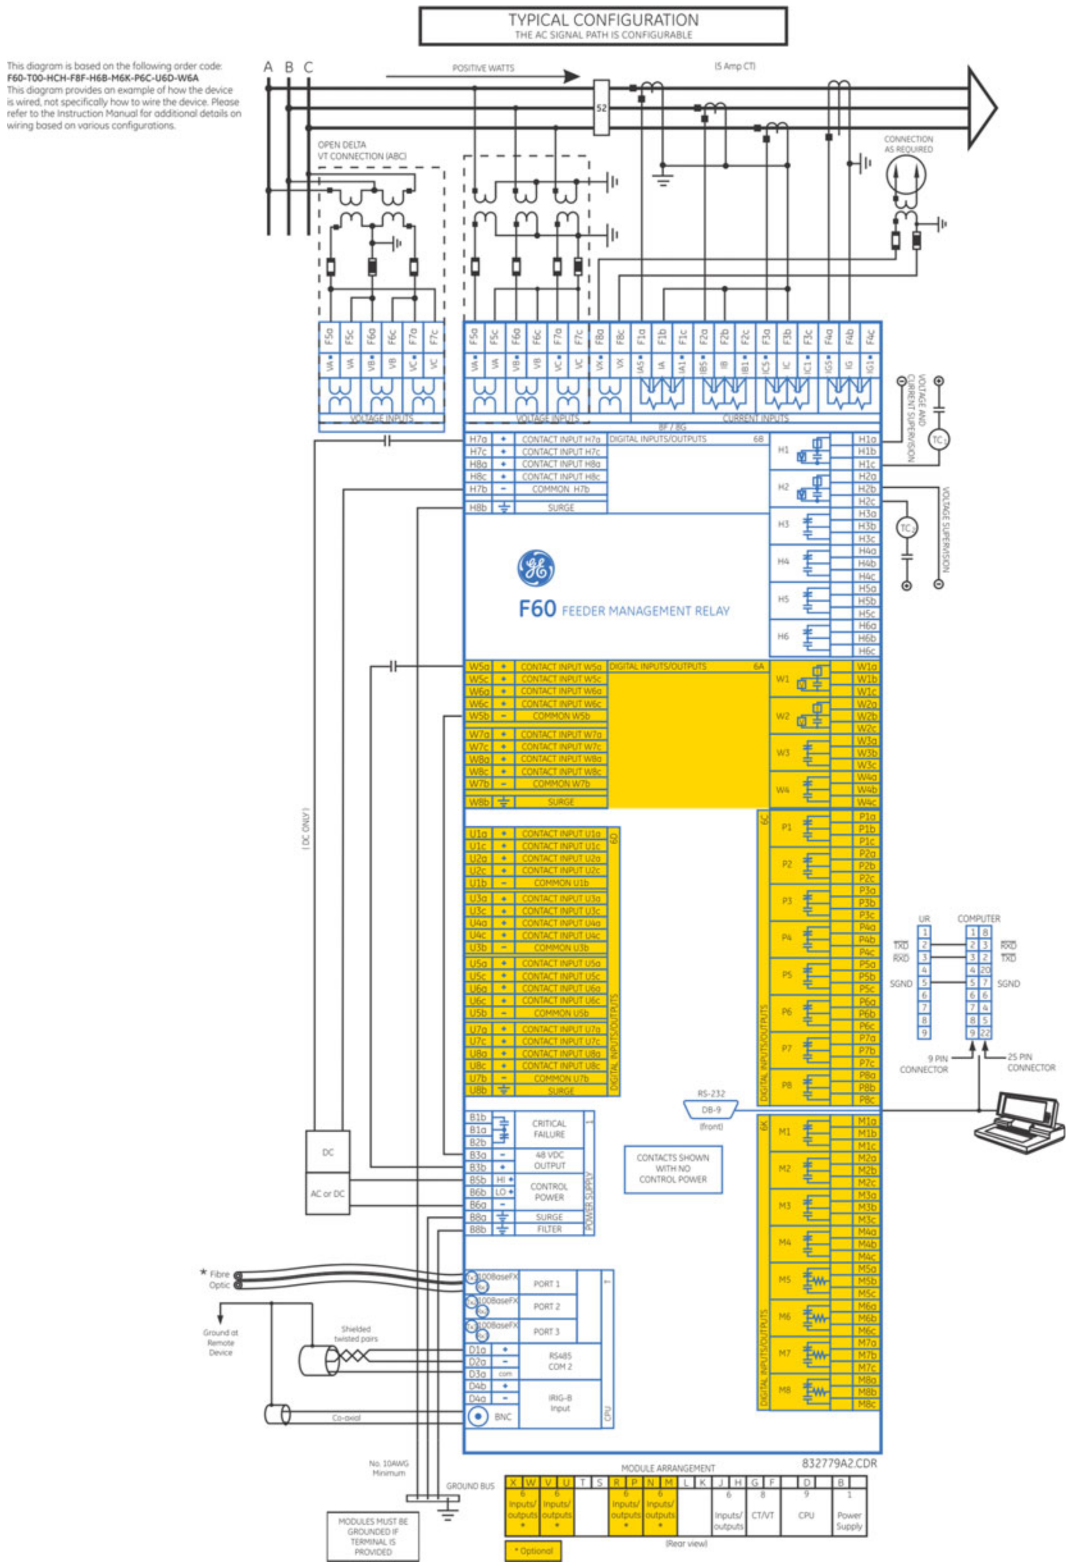

Figure 3–10: TYPICAL WIRING DIAGRAM (T MODULE SHOWN FOR CPU)

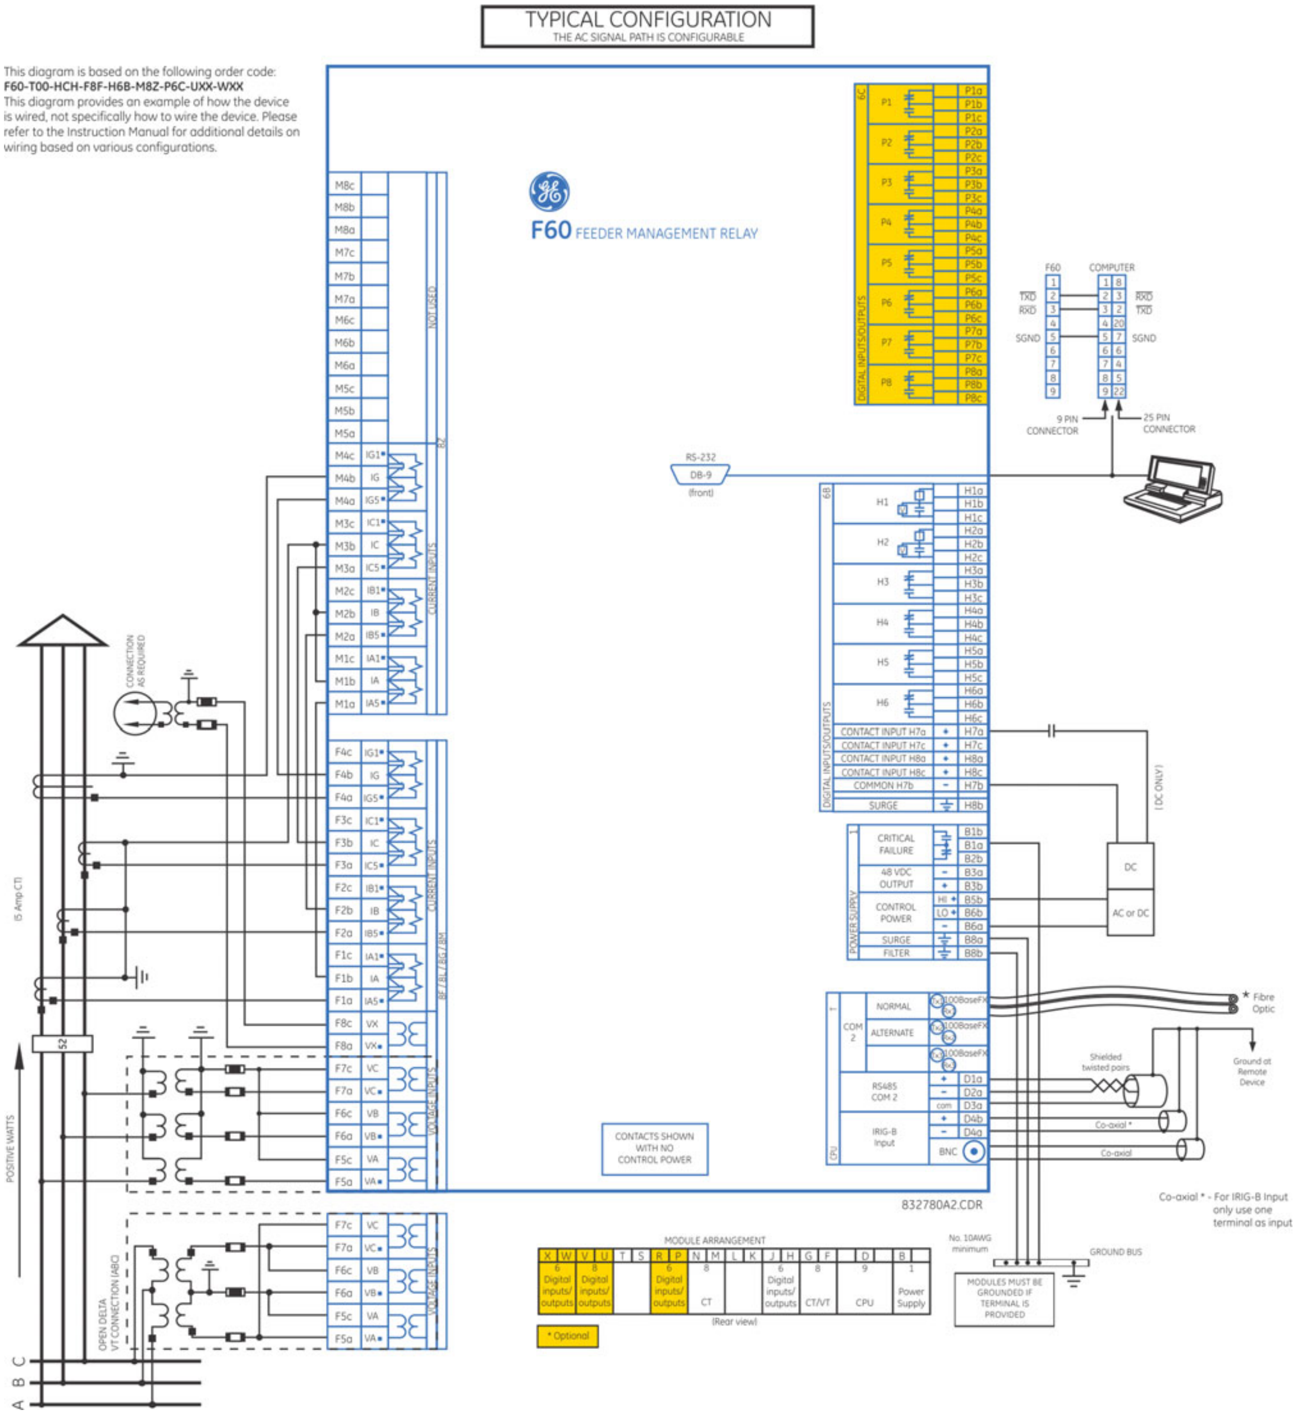

Figure 3–11: TYPICAL WIRING DIAGRAM WITH HIGH-IMPEDANCE DETECTION (T MODULE SHOWN FOR CPU)

3.2.2 DIELECTRIC STRENGTH

The dielectric strength of the UR-series module hardware is shown in the following table:

Table 3–1: DIELECTRIC STRENGTH OF UR-SERIES MODULE HARDWARE

MODULE TYPE	MODULE FUNCTION	TERMINALS		DIELECTRIC STRENGTH (AC)
		FROM	TO	
1	Power supply	High (+); Low (+); (–)	Chassis	2000 V AC for 1 minute
1	Power supply	48 V DC (+) and (–)	Chassis	2000 V AC for 1 minute
1	Power supply	Relay terminals	Chassis	2000 V AC for 1 minute
2	Reserved	N/A	N/A	N/A
3	Reserved	N/A	N/A	N/A
4	Reserved	N/A	N/A	N/A
5	Analog inputs/outputs	All except 8b	Chassis	< 50 V DC
6	Digital inputs/outputs	All	Chassis	2000 V AC for 1 minute
7	G.703	All except 2b, 3a, 7b, 8a	Chassis	2000 V AC for 1 minute
	RS422	All except 6a, 7b, 8a	Chassis	< 50 V DC
8	CT/VT	All	Chassis	2000 V AC for 1 minute
9	CPU	All	Chassis	2000 V AC for 1 minute

NOTICE Filter networks and transient protection clamps are used in the hardware to prevent damage caused by high peak voltage transients, radio frequency interference (RFI), and electromagnetic interference (EMI). These protective components can be damaged by application of the ANSI/IEEE C37.90 specified test voltage for a period longer than the specified one minute.

3.2.3 CONTROL POWER

NOTICE Control power supplied to the relay must be connected to the matching power supply range of the relay. If the voltage is applied to the wrong terminals, damage can occur.

NOTICE The F60 relay, like almost all electronic relays, contains electrolytic capacitors. These capacitors are well known to be subject to deterioration over time if voltage is not applied periodically. Deterioration can be avoided by powering the relays up once a year.

The power supply module can be ordered for two possible voltage ranges, with or without a redundant power option. Each range has a dedicated input connection for proper operation. The ranges are as shown below (see the *Specifications* section of chapter 2 for details):

- Low (LO) range: 24 to 48 V (DC only) nominal.
- High (HI) range: 125 to 250 V nominal.

The power supply module provides power to the relay and supplies power for dry contact input connections.

The power supply module provides 48 V DC power for dry contact input connections and a critical failure relay (see the *Typical wiring diagram* earlier). The critical failure relay is a form-C device that is energized once control power is applied and the relay has successfully booted up with no critical self-test failures. If on-going self-test diagnostic checks detect a critical failure (see the *Self-test Errors* section in chapter 7) or control power is lost, the relay is de-energize.

For high reliability systems, the F60 has a redundant option in which two F60 power supplies are placed in parallel on the bus. If one of the power supplies become faulted, the second power supply assumes the full load of the relay without any interruptions. Each power supply has a green LED on the front of the module to indicate it is functional. The critical fail relay of the module also indicates a faulted power supply.

An LED on the front of the control power module shows the status of the power supply:

LED INDICATION	POWER SUPPLY
CONTINUOUS ON	OK
ON / OFF CYCLING	Failure
OFF	Failure

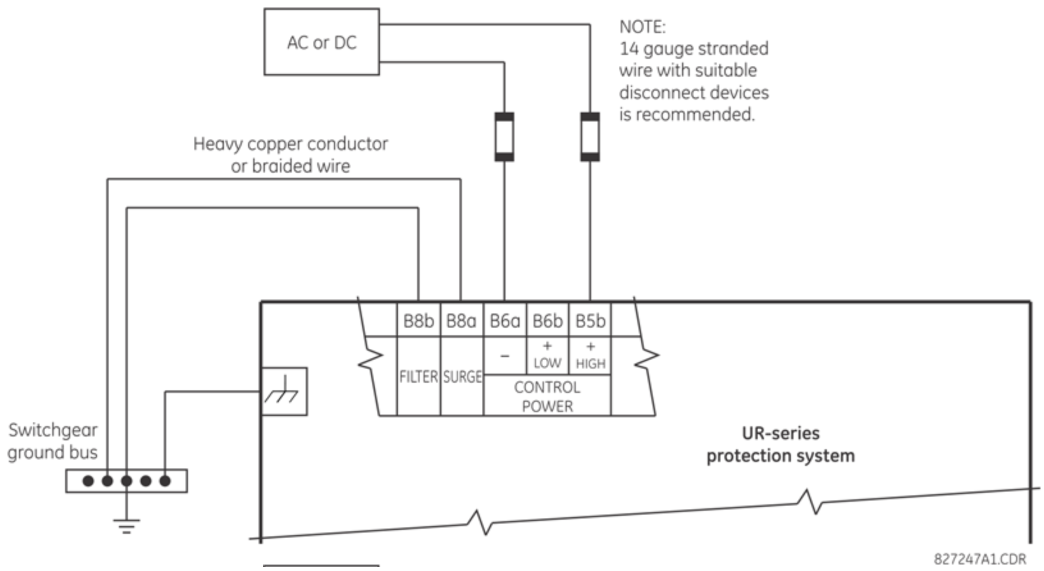

Figure 3–12: CONTROL POWER CONNECTION

3.2.4 CT AND VT MODULES

A CT/VT module can have voltage inputs on channels 1 through 4 inclusive, or channels 5 through 8 inclusive. Channels 1 and 5 are intended for connection to phase A, and are labeled as such in the relay. Likewise, channels 2 and 6 are intended for connection to phase B, and channels 3 and 7 are intended for connection to phase C.

Channels 4 and 8 are intended for connection to a single-phase source. For voltage inputs, these channel are labelled as auxiliary voltage (VX). For current inputs, these channels are intended for connection to a CT between system neutral and ground, and are labelled as ground current (IG).

NOTICE Verify that the connection made to the relay nominal current of 1 A or 5 A matches the secondary rating of the connected CTs. Unmatched CTs may result in equipment damage or inadequate protection.

CT/VT modules can be ordered with a standard ground current input that is the same as the phase current input. Each AC current input has an isolating transformer and an automatic shorting mechanism that shorts the input when the module is withdrawn from the chassis. There are no internal ground connections on the current inputs. Current transformers with 1 to 50000 A primaries and 1 A or 5 A secondaries may be used.

CT/VT modules with a sensitive ground input are also available. The ground CT input of the sensitive ground modules is ten times more sensitive than the ground CT input of standard CT/VT modules. However, the phase CT inputs and phase VT inputs are the same as those of regular CT/VT modules.

The above modules are available with enhanced diagnostics. These modules can automatically detect CT/VT hardware failure and take the relay out of service.

CT connections for both ABC and ACB phase rotations are identical as shown in the *Typical wiring diagram*.

The exact placement of a zero-sequence core balance CT to detect ground fault current is shown below. Twisted-pair cabling on the zero-sequence CT is recommended.

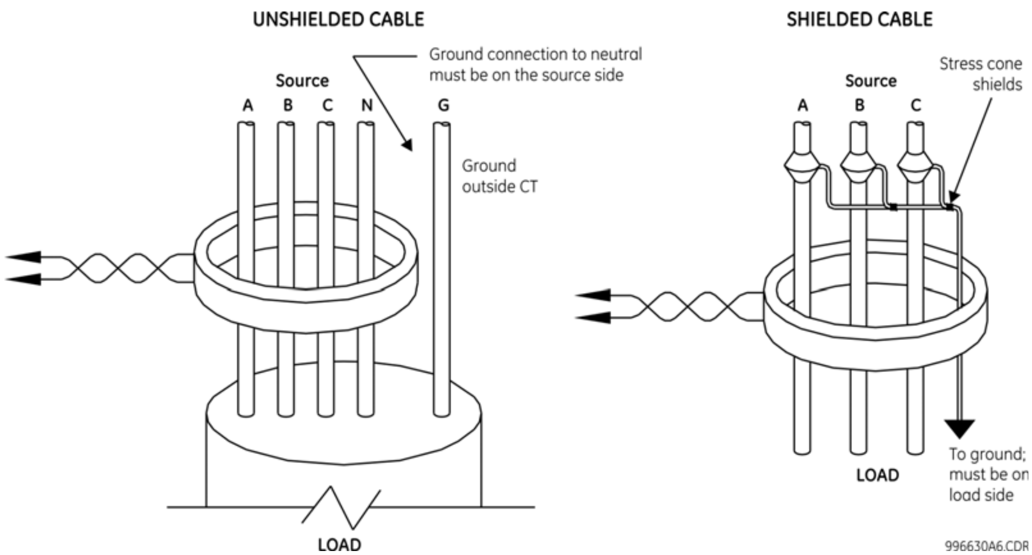

Figure 3–13: ZERO-SEQUENCE CORE BALANCE CT INSTALLATION

The phase voltage channels are used for most metering and protection purposes. The auxiliary voltage channel is used as input for the synchrocheck and volts-per-hertz features.

NOTE

Substitute the tilde "~" symbol with the slot position of the module in the following figure.

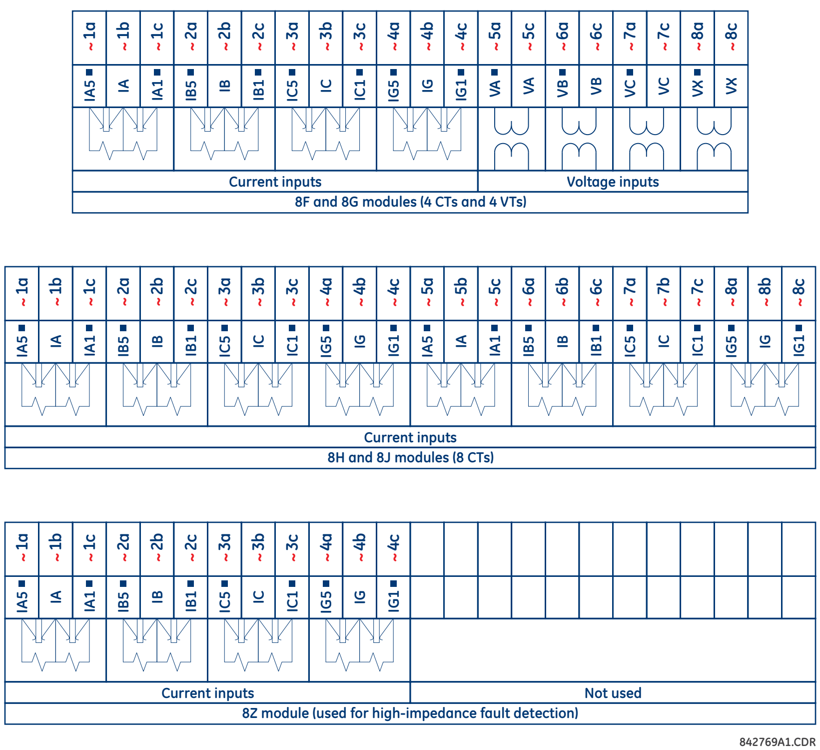

Figure 3–14: CT/VT MODULE WIRING

A relay configured for high impedance fault detection element includes two CT/VT modules: one type 8F, 8G, 8H, or 8J module and one type 8Z module. For correct operation of the high impedance fault detection element, the ground current terminals of the two CT modules must be connected to a ground current source, either a zero-sequence CT (see the *Typical wiring diagram with high impedance fault detection* earlier in this chapter) or, if a zero-sequence CT is not available, to the neutral conductor of the phase CTs (see diagram below).

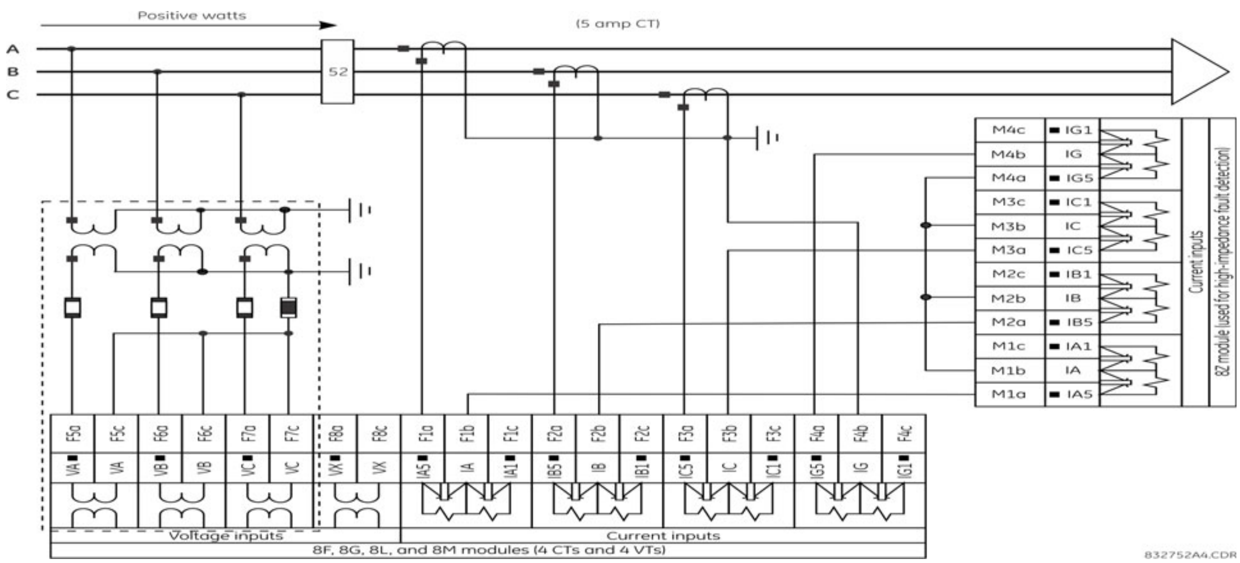

Figure 3–15: TYPICAL 8Z MODULE WIRING WITH PHASE CTS

3.2.5 PROCESS BUS MODULES

The F60 can be ordered with a process bus interface module. This module is designed to interface with the GE Multilin HardFiber system, allowing bidirectional IEC 61850 fiber optic communications with up to eight HardFiber merging units, known as Bricks. The HardFiber system has been designed to integrate seamlessly with the existing UR-series applications, including protection functions, FlexLogic, metering, and communications.

The IEC 61850 process bus system offers the following benefits:

- Reduces labor associated with design, installation, and testing of protection and control applications using the F60 by reducing the number of individual copper terminations
- Integrates seamlessly with existing F60 applications, since the IEC 61850 process bus interface module replaces the traditional CT/VT modules
- Communicates using open standard IEC 61850 messaging

For additional details on the HardFiber system, see GE publication GEK-113658: HardFiber Process Bus System Instruction Manual.

3.2.6 CONTACT INPUTS AND OUTPUTS

Every contact input/output module has 24 terminal connections. They are arranged as three terminals per row, with eight rows in total. A given row of three terminals can be used for the outputs of one relay. For example, for form-C relay outputs, the terminals connect to the normally open (NO), normally closed (NC), and common contacts of the relay. For a form-A output, there are options of using current or voltage detection for feature supervision, depending on the module ordered. The terminal configuration for contact inputs is different for the two applications.

The contact inputs are grouped with a common return. The F60 has two versions of grouping: four inputs per common return and two inputs per common return. When a contact input/output module is ordered, four inputs per common is used. The four inputs per common allows for high-density inputs in combination with outputs, with a compromise of four inputs sharing one common. If the inputs must be isolated per row, then two inputs per common return should be selected (4D module).

The tables and diagrams on the following pages illustrate the module types (6A, etc.) and contact arrangements that can be ordered for the relay. Since an entire row is used for a single contact output, the name is assigned using the module slot position and row number. However, since there are two contact inputs per row, these names are assigned by module slot position, row number, and column position.

Some form-A / solid-state relay outputs include circuits to monitor the DC voltage across the output contact when it is open, and the DC current through the output contact when it is closed. Each of the monitors contains a level detector whose output is set to logic "On = 1" when the current in the circuit is above the threshold setting. The voltage monitor is set to "On = 1" when the current is above about 1 to 2.5 mA, and the current monitor is set to "On = 1" when the current exceeds about 80 to 100 mA. The voltage monitor is intended to check the health of the overall trip circuit, and the current monitor can be used to seal-in the output contact until an external contact has interrupted current flow.

Block diagrams are shown as follows for form-A and solid-state relay outputs with optional voltage monitor, optional current monitor, and with no monitoring. The actual values shown for contact output 1 are the same for all contact outputs.

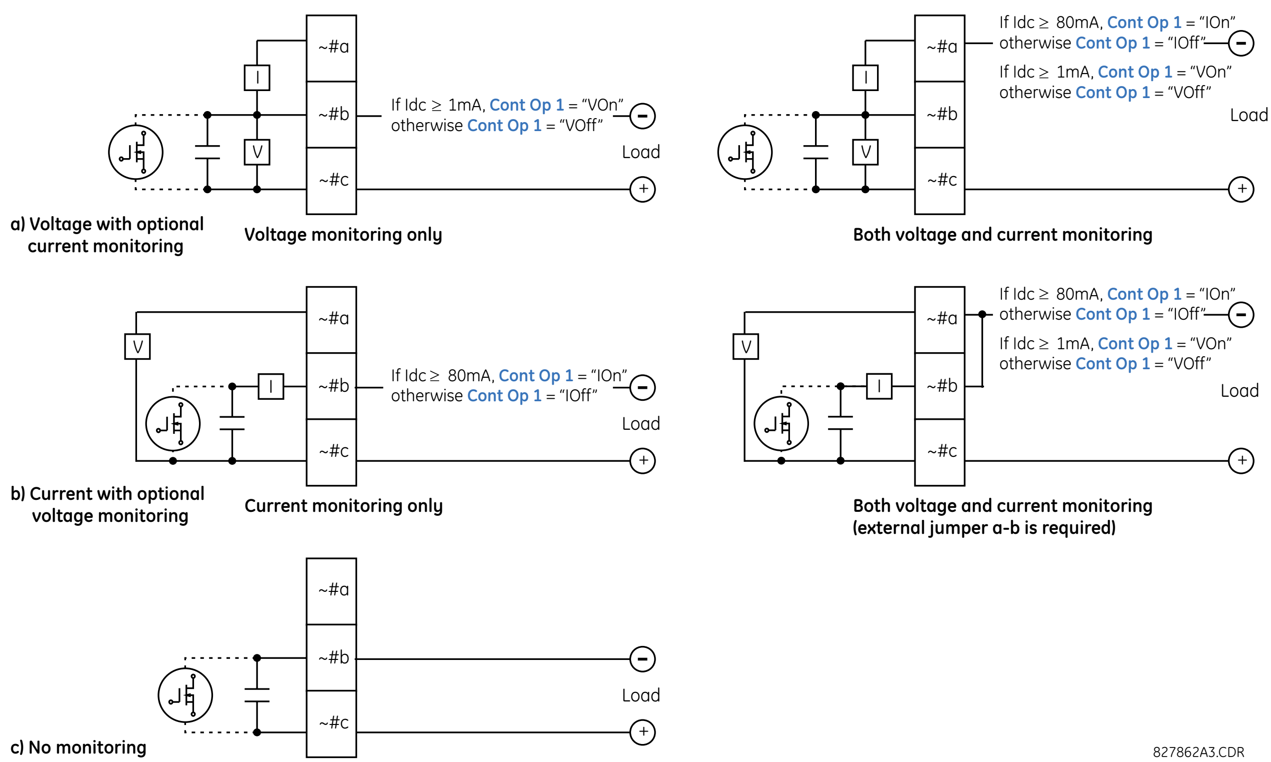

Figure 3–16: FORM-A AND SOLID-STATE CONTACT OUTPUTS WITH VOLTAGE AND CURRENT MONITORING

The operation of voltage and current monitors is reflected with the corresponding FlexLogic operands (CONT OP # VON, CONT OP # VOFF, and CONT OP # ION) which can be used in protection, control, and alarm logic. The typical application of the voltage monitor is breaker trip circuit integrity monitoring; a typical application of the current monitor is seal-in of the control command.

See the *Digital Elements* section of chapter 5 for an example of how form-A and solid-state relay contacts can be applied for breaker trip circuit integrity monitoring.

WARNING **Consider relay contacts unsafe to touch when the unit is energized. If the relay contacts need to be used for low voltage accessible applications, ensure proper insulation levels.**

NOTE

USE OF FORM-A AND SOLID-STATE RELAY OUTPUTS IN HIGH IMPEDANCE CIRCUITS

For form-A and solid-state relay output contacts internally equipped with a voltage measuring circuit across the contact, the circuit has an impedance that can cause a problem when used in conjunction with external high input impedance monitoring equipment such as modern relay test set trigger circuits. These monitoring circuits may continue to read the form-A contact as being closed after it has closed and subsequently opened, when measured as an impedance.

The solution is to use the voltage measuring trigger input of the relay test set, and connect the form-A contact through a voltage-dropping resistor to a DC voltage source. If the 48 V DC output of the power supply is used as a source, a 500 Ω, 10 W resistor is appropriate. In this configuration, the voltage across either the form-A contact or the resistor can be used to monitor the state of the output.

NOTE

Wherever a tilde "~" symbol appears, substitute with the slot position of the module; wherever a number sign "#" appears, substitute the contact number

NOTICE When current monitoring is used to seal-in the form-A and solid-state relay contact outputs, the FlexLogic operand driving the contact output should be given a reset delay of 10 ms to prevent damage of the output contact (in situations when the element initiating the contact output is bouncing, at values in the region of the pickup value).

Figure 3–17: CONTACT INPUT AND OUTPUT MODULE WIRING (1 of 2)

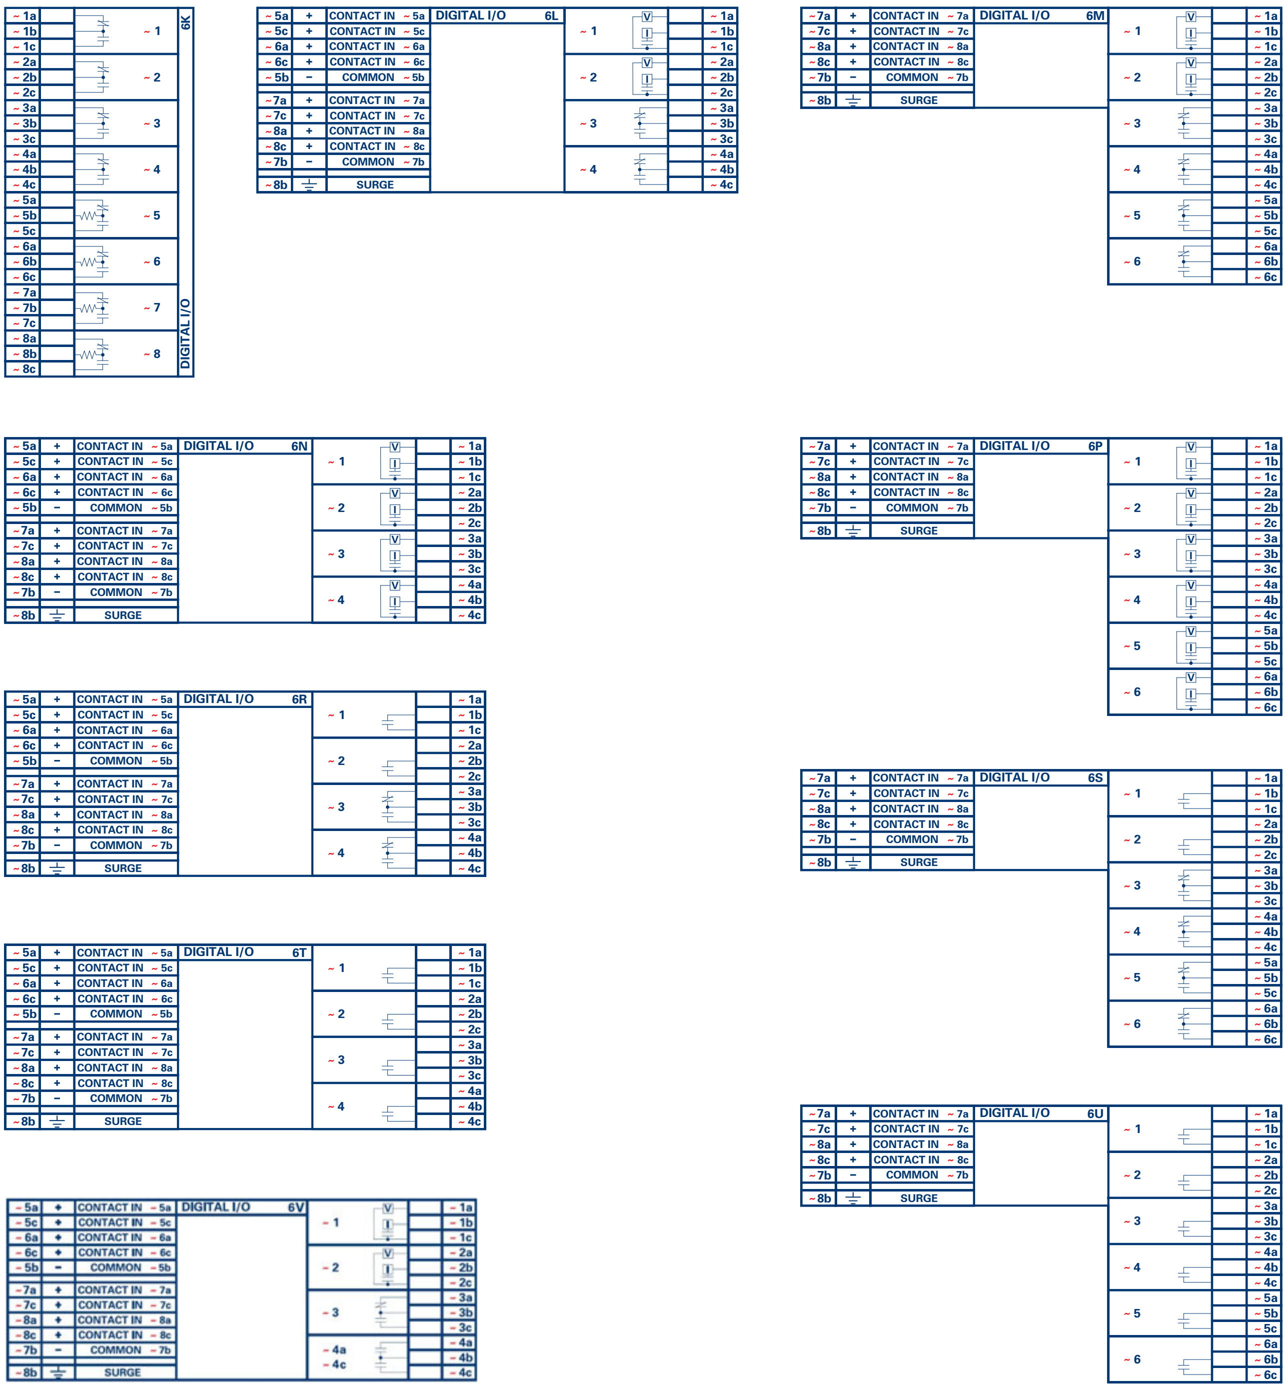

Figure 3–18: CONTACT INPUT AND OUTPUT MODULE WIRING (2 of 2)

NOTICE For proper functionality, observe correct polarity for all contact input and solid state output connections.

CONTACT INPUTS

A dry contact has one side connected to terminal B3b. This is the positive 48 V DC voltage rail supplied by the power supply module. The other side of the dry contact is connected to the required contact input terminal. Each contact input group has its own common (negative) terminal which must be connected to the DC negative terminal (B3a) of the power supply module. When a dry contact closes, a current of 1 to 3 mA flows through the associated circuit.

A wet contact has one side connected to the positive terminal of an external DC power supply. The other side of this contact is connected to the required contact input terminal. If a wet contact is used, then the negative side of the external source must be connected to the relay common (negative) terminal of each contact group. The maximum external source voltage for this arrangement is 300 V DC.

The voltage threshold at which each group of four contact inputs detects a closed contact input is programmable as 17 V DC for 24 V sources, 33 V DC for 48 V sources, 84 V DC for 110 to 125 V sources, and 166 V DC for 250 V sources.

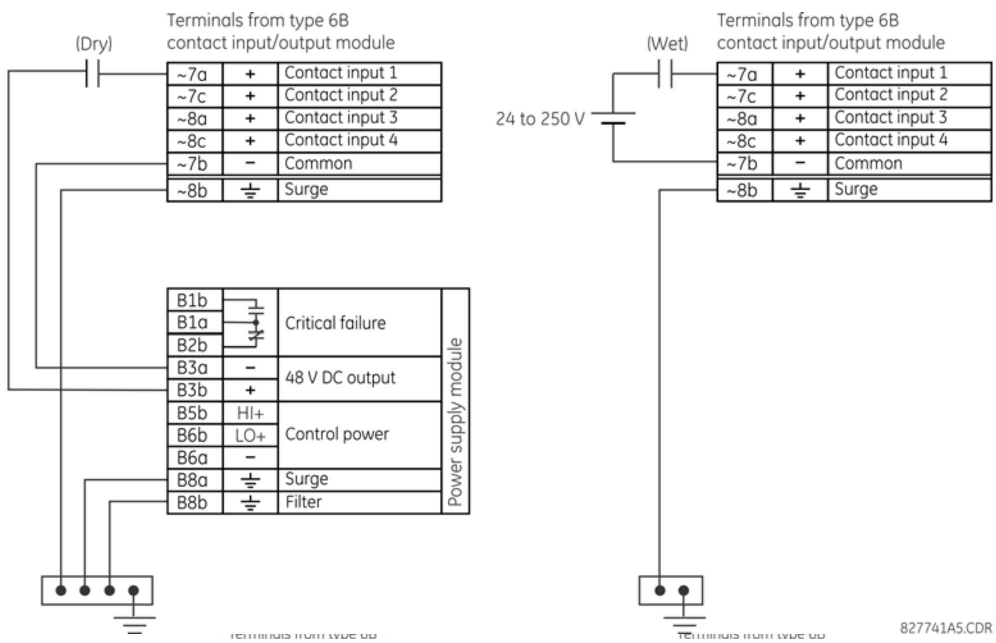

Figure 3–19: DRY AND WET CONTACT INPUT CONNECTIONS

NOTE: Wherever a tilde "~" symbol appears, substitute with the slot position of the module.

Contact outputs can be ordered as form-A or form-C. The form-A contacts can be connected for external circuit supervision. These contacts are provided with voltage and current monitoring circuits used to detect the loss of DC voltage in the circuit, and the presence of DC current flowing through the contacts when the form-A contact closes. If enabled, the current monitoring can be used as a seal-in signal to ensure that the form-A contact does not attempt to break the energized inductive coil circuit and weld the output contacts.

NOTE: There is no provision in the relay to detect a DC ground fault on 48 V DC control power external output. We recommend using an external DC supply.

USE OF CONTACT INPUTS WITH AUTO-BURNISHING

The contact inputs sense a change of the state of the external device contact based on the measured current. When external devices are located in a harsh industrial environment (either outdoor or indoor), their contacts can be exposed to various types of contamination. Normally, there is a thin film of insulating sulfidation, oxidation, or contaminates on the surface of the contacts, sometimes making it difficult or impossible to detect a change of the state. This film must be removed to establish circuit continuity – an impulse of higher than normal current can accomplish this.

The contact inputs with auto-burnish create a high current impulse when the threshold is reached to burn off this oxidation layer as a maintenance to the contacts. Afterwards the contact input current is reduced to a steady-state current. The impulse has a 5 second delay after a contact input changes state.

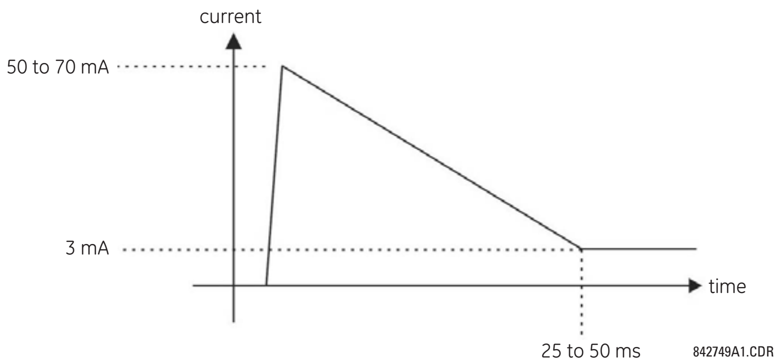

Figure 3–20: CURRENT THROUGH CONTACT INPUTS WITH AUTO-BURNISHING

Regular contact inputs limit current to less than 3 mA to reduce station battery burden. In contrast, contact inputs with auto-burnishing allow currents up to 50 to 70 mA at the first instance when the change of state was sensed. Then, within 25 to 50 ms, this current is slowly reduced to 3 mA as indicated above. The 50 to 70 mA peak current burns any film on the contacts, allowing for proper sensing of state changes. If the external device contact is bouncing, the auto-burnishing starts when external device contact bouncing is over.

Another important difference between the auto-burnishing input module and the regular input modules is that only two contact inputs have common ground, as opposed to four contact inputs sharing one common ground (refer to the *Contact Input and Output Module Wiring* diagrams). This is beneficial when connecting contact inputs to separate voltage sources. Consequently, the threshold voltage setting is also defined per group of two contact inputs.

The auto-burnish feature can be disabled or enabled using the DIP switches found on each daughter card. There is a DIP switch for each contact, for a total of 16 inputs.

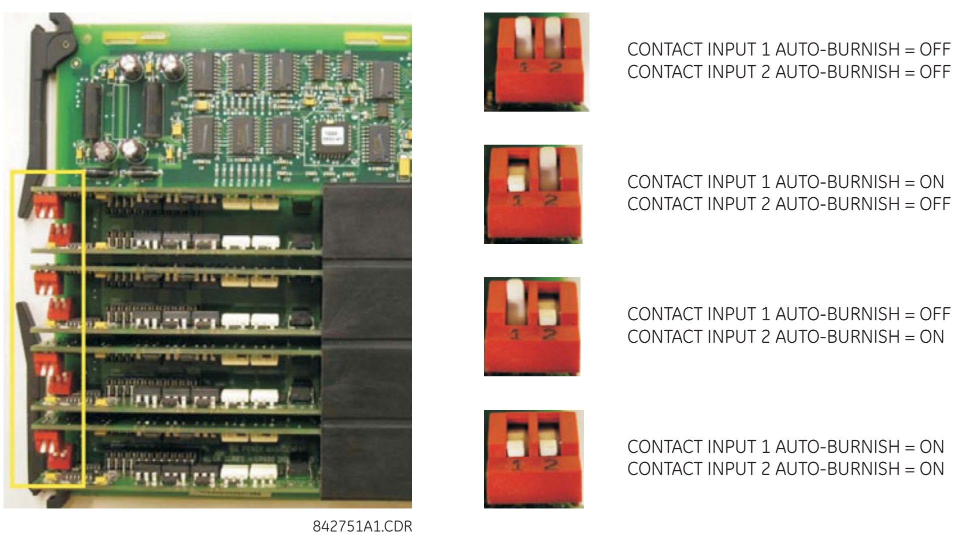

Figure 3–21: AUTO-BURNISH DIP SWITCHES

NOTE

The auto-burnish circuitry has an internal fuse for safety purposes. During regular maintenance, check the auto-burnish functionality using an oscilloscope.

3.2.7 TRANSDUCER INPUTS/OUTPUTS

Transducer input modules can receive input signals from external dcmA output transducers (dcmA In) or resistance temperature detectors (RTD). Hardware and software is provided to receive signals from these external transducers and convert these signals into a digital format for use as required.

Transducer output modules provide DC current outputs in several standard dcmA ranges. Software is provided to configure virtually any analog quantity used in the relay to drive the analog outputs.

Every transducer input/output module has a total of 24 terminal connections. These connections are arranged as three terminals per row with a total of eight rows. A given row can be used for either inputs or outputs, with terminals in column "a" having positive polarity and terminals in column "c" having negative polarity. Since an entire row is used for a single input/output channel, the name of the channel is assigned using the module slot position and row number.

Each module also requires that a connection from an external ground bus be made to terminal 8b. The current outputs require a twisted-pair shielded cable, where the shield is grounded at one end only. The figure below illustrates the transducer module types (5A, 5C, 5D, 5E, and 5F) and channel arrangements that can be ordered for the relay.

NOTE: Wherever a tilde "~" symbol appears, substitute with the slot position of the module.

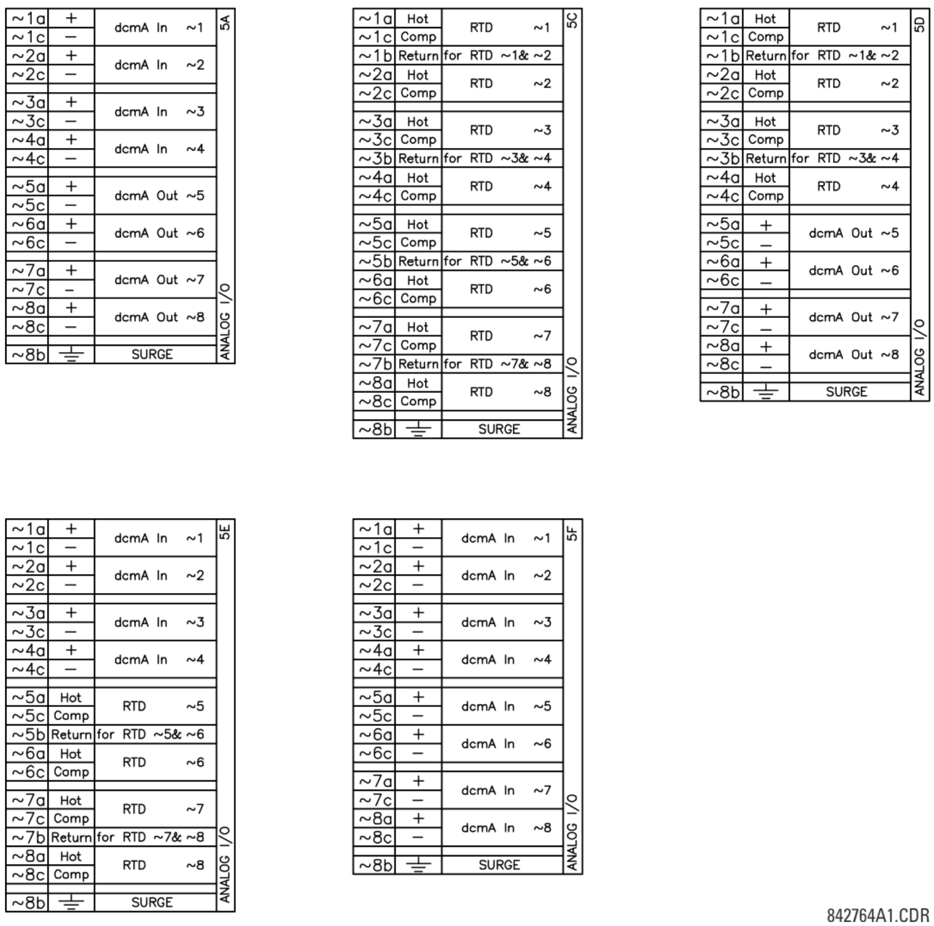

Figure 3–22: TRANSDUCER INPUT/OUTPUT MODULE WIRING

3.2.8 RS232 FACEPLATE PORT

A 9-pin RS232C serial port is located on the F60 faceplate for programming with a computer. All that is required to use this interface is a computer running the EnerVista UR Setup software provided with the relay. Cabling for the RS232 port is shown in the following figure for both 9-pin and 25-pin connectors.

NOTE: The baud rate for this port is fixed at **19200 bps**.

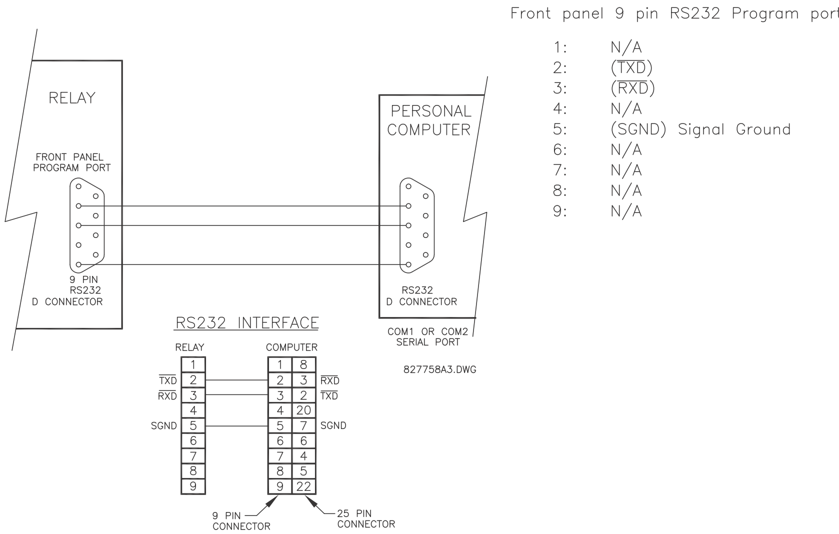

Figure 3–23: RS232 FACEPLATE PORT CONNECTION

3.2.9 CPU COMMUNICATION PORTS

a) OPTIONS

In addition to the faceplate RS232 port, the F60 provides a rear RS485 communication port.

NOTE: The CPU modules do not require a surge ground connection.

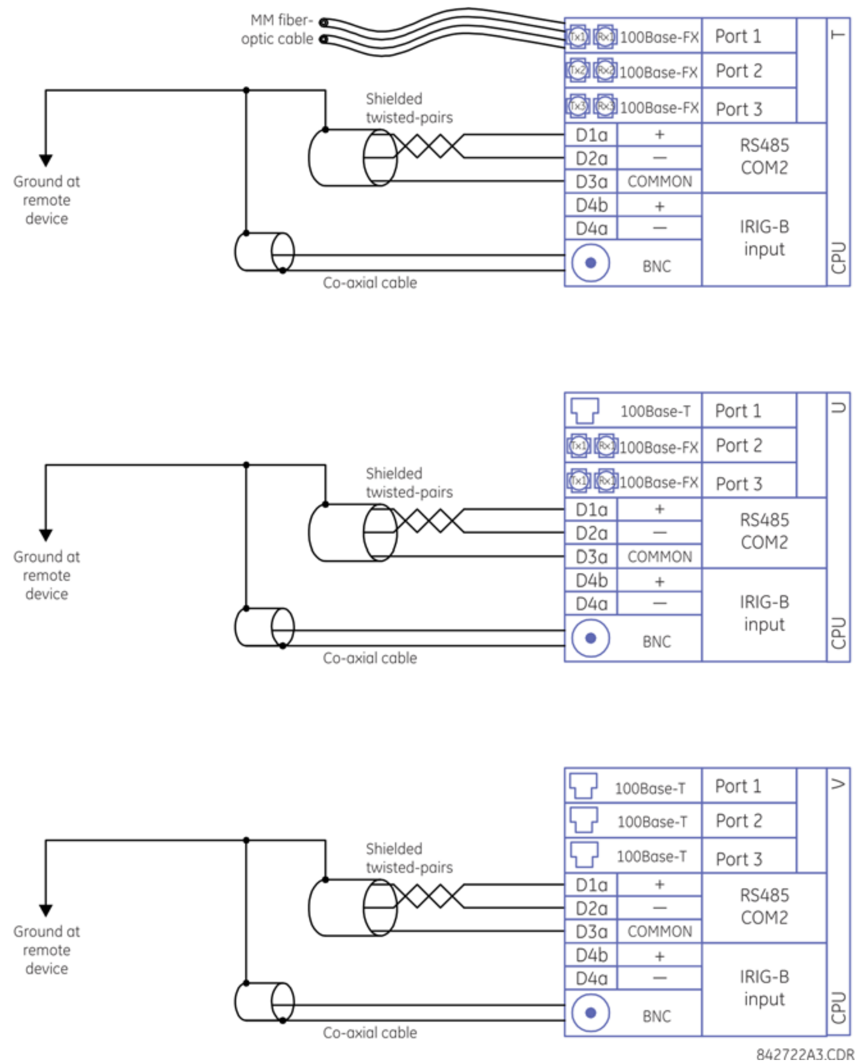

Figure 3–24: CPU MODULE COMMUNICATIONS WIRING

b) RS485 PORTS

RS485 data transmission and reception are accomplished over a single twisted pair with transmit and receive data alternating over the same two wires. Through the use of the port, continuous monitoring and control from a remote computer, SCADA system, or PLC is possible.

To minimize errors from noise, the use of shielded twisted pair wire is recommended. Correct polarity must also be observed. For instance, the relays must be connected with all RS485 "+" terminals connected together, and all RS485 "–" terminals connected together. Though data is transmitted over a two-wire twisted pair, all RS485 devices require a shared reference, or common voltage. This common voltage is implied to be a power supply common. Some systems allow the shield (drain wire) to be used as common wire and to connect directly to the F60 COM terminal (#3); others function correctly only if the common wire is connected to the F60 COM terminal, but insulated from the shield.

To avoid loop currents, ground the shield at only one point. If other system considerations require the shield to be grounded at more than one point, install resistors (typically 100 ohms) between the shield and ground at each grounding point. Each relay needs to be daisy-chained to the next one in the link. A maximum of 32 relays can be connected in this manner without exceeding driver capability. For larger systems, additional serial channels must be added. It is also possible to use commercially available repeaters to have more than 32 relays on a single channel. Avoid star or stub connections entirely.

Lightning strikes and ground surge currents can cause large momentary voltage differences between remote ends of the communication link. For this reason, surge protection devices are internally provided at both communication ports. An isolated power supply with an optocoupled data interface also acts to reduce noise coupling. To ensure maximum reliability, all equipment should have similar transient protection devices installed.

Terminate both ends of the RS485 circuit with an impedance as shown below.

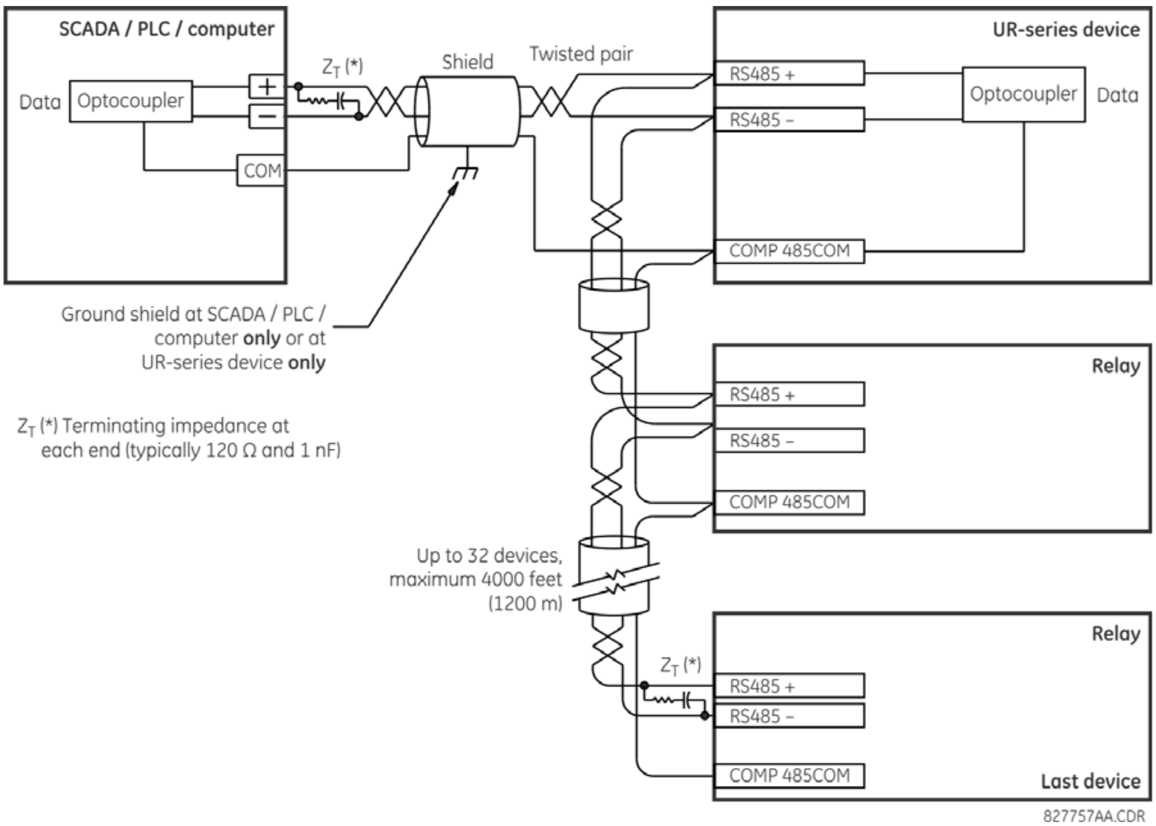

Figure 3–25: RS485 SERIAL CONNECTION

c) 100BASE-FX FIBER OPTIC PORTS

NOTE

Ensure that the dust covers are installed when the fiber is not in use. Dirty or scratched connectors can lead to high losses on a fiber link.

CAUTION

Observing any fiber transmitter output can injure the eye.

The fiber optic communication ports allow for fast and efficient communications between relays at 100 Mbps. Optical fiber can be connected to the relay supporting a wavelength of 1310 nm in multi-mode.

The fiber optic port is designed such that the response times do not vary for any core that is 100 µm or less in diameter, 62.5 µm for 100 Mbps. For optical power budgeting, splices are required every 1 km for the transmitter/receiver pair. When splicing optical fibers, the diameter and numerical aperture of each fiber must be the same.

3.2.10 IRIG-B

IRIG-B is a standard time code format that allows stamping of events to be synchronized among connected devices within 1 millisecond. The IRIG time code formats are serial, width-modulated codes that can be either DC level shifted or amplitude modulated (AM). Third party equipment is available for generating the IRIG-B signal; this equipment can use a GPS satellite system to obtain the time reference so that devices at different geographic locations can be synchronized.

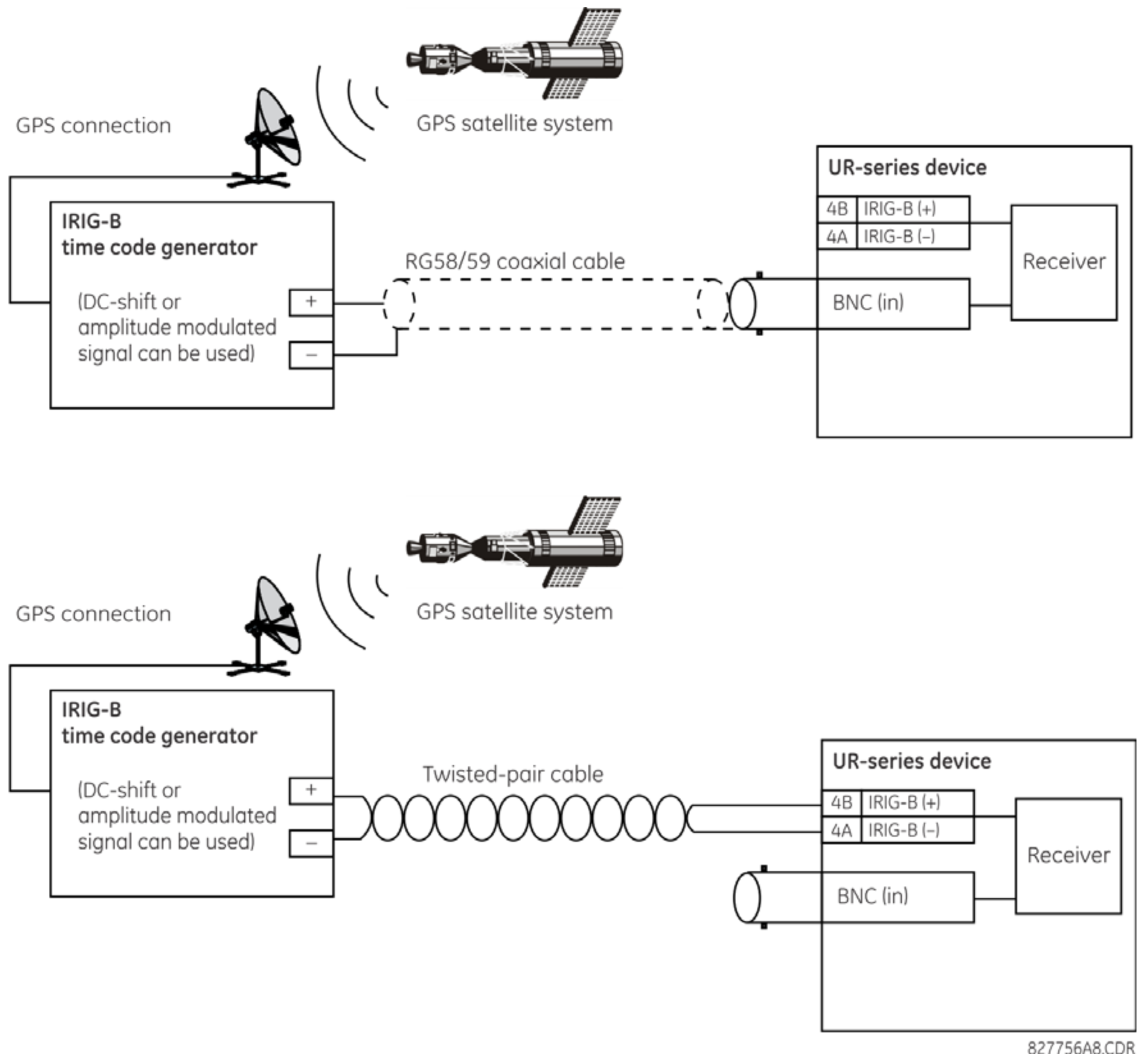

Figure 3–26: OPTIONS FOR THE IRIG-B CONNECTION

NOTE: Using an amplitude modulated receiver causes errors up to 1 ms in event time-stamping.

3.3.1 DESCRIPTION

The F60 direct inputs and outputs feature makes use of the type 7 series of communications modules, which allow direct messaging between devices.

The communications channels are normally connected in a ring configuration as shown in the following figure. The transmitter of one module is connected to the receiver of the next module. The transmitter of this second module is then connected to the receiver of the next module in the ring. This is continued to form a communications ring. The figure illustrates a ring of four UR-series relays with the following connections: UR1-Tx to UR2-Rx, UR2-Tx to UR3-Rx, UR3-Tx to UR4-Rx, and UR4-Tx to UR1-Rx. A maximum of sixteen (16) UR-series relays can be connected in a single ring

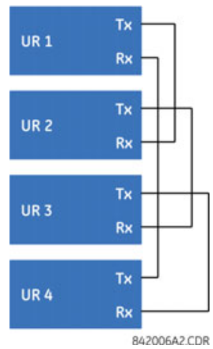

Figure 3–27: DIRECT INPUT AND OUTPUT SINGLE CHANNEL CONNECTION

The interconnection for dual-channel Type 7 communications modules is shown as follows. Two channel modules allow for a redundant ring configuration. That is, two rings can be created to provide an additional independent data path. The required connections are: UR1-Tx1 to UR2-Rx1, UR2-Tx1 to UR3-Rx1, UR3-Tx1 to UR4-Rx1, and UR4-Tx1 to UR1-Rx1 for the first ring; and UR1-Tx2 to UR4-Rx2, UR4-Tx2 to UR3-Rx2, UR3-Tx2 to UR2-Rx2, and UR2-Tx2 to UR1-Rx2 for the second ring.

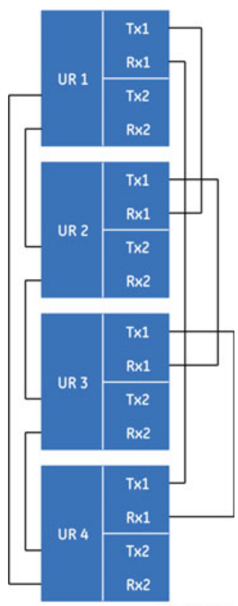

Figure 3–28: DIRECT INPUT AND OUTPUT DUAL CHANNEL CONNECTION

The following diagram shows the connection for three UR-series relays using two independent communication channels. UR1 and UR3 have single type 7 communication modules; UR2 has a dual-channel module. The two communication channels can be of different types, depending on the Type 7 modules used. To allow the direct input and output data to *crossover* from channel 1 to channel 2 on UR2, the **DIRECT I/O CHANNEL CROSSOVER** setting should be "Enabled" on UR2. This forces UR2 to forward messages received on Rx1 out Tx2, and messages received on Rx2 out Tx1.

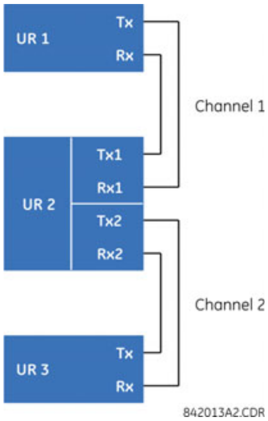

Figure 3–29: DIRECT INPUT AND OUTPUT SINGLE/DUAL CHANNEL COMBINATION CONNECTION

The interconnection requirements are described in further detail in this section for each specific variation of type 7 communications module. These modules are listed in the following table. All fiber modules use ST type connectors.

NOTE

Not all the direct input and output communications modules are applicable to the F60 relay. See the order codes tables in chapter 2 for the applicable options.

Table 3–3: CHANNEL COMMUNICATION OPTIONS (Sheet 1 of 2)

MODULE	SPECIFICATION
2A	C37.94SM, 1300 nm, single-mode, ELED, 1 channel single-mode
2B	C37.94SM, 1300 nm, single-mode, ELED, 2 channel single-mode
2E	Bi-phase, 1 channel
2F	Bi-phase, 2 channels
2G	IEEE C37.94, 820 nm, 128 kbps, multimode, LED, 1 channel
2H	IEEE C37.94, 820 nm, 128 kbps, multimode, LED, 2 channels
2I	Channel 1 - IEEE C37.94 MM, 64/128 kbps; Channel 2 - 1300 nm, single-mode
2J	Channel 1 - IEEE C37.94 MM, 64/128 kbps; Channel 2 - 1550 nm, single-mode
72	1550 nm, single-mode, laser, 1 channel
73	1550 nm, single-mode, laser, 2 channels
74	Channel 1 - RS422; channel 2 - 1550 nm, single-mode, laser
75	Channel 1 - G.703; channel 2 - 1550 nm, single-mode, laser
76	IEEE C37.94, 820 nm, 64 kbps, multimode, LED, 1 channel
77	IEEE C37.94, 820 nm, 64 kbps, multimode, LED, 2 channels
7A	820 nm, multimode, LED, 1 channel
7B	1300 nm, multimode, LED, 1 channel
7C	1300 nm, single-mode, ELED, 1 channel
7D	1300 nm, single-mode, laser, 1 channel
7E	Channel 1: G.703, Channel 2: 820 nm, multimode
7F	Channel 1: G.703, Channel 2: 1300 nm, multimode
7G	Channel 1: G.703, Channel 2: 1300 nm, single-mode ELED
7H	820 nm, multimode, LED, 2 channels
7I	1300 nm, multimode, LED, 2 channels
7J	1300 nm, single-mode, ELED, 2 channels
7K	1300 nm, single-mode, LASER, 2 channels
7L	Channel 1: RS422, channel: 820 nm, multimode, LED
7M	Channel 1: RS422, channel 2: 1300 nm, multimode, LED

Table 3–3: CHANNEL COMMUNICATION OPTIONS (Sheet 2 of 2)

MODULE	SPECIFICATION
7N	Channel 1: RS422, channel 2: 1300 nm, single-mode, ELED
7P	Channel 1: RS422, channel 2: 1300 nm, single-mode, laser
7Q	Channel 1: G.703, channel 2: 1300 nm, single-mode, laser
7R	G.703, 1 channel
7S	G.703, 2 channels
7T	RS422, 1 channel
7V	RS422, 2 channels, 2 clock inputs (N60 only)
7W	RS422, 2 channels

3.3.2 FIBER: LED AND ELED TRANSMITTERS

The following figure shows the configuration for the 7A, 7B, 7C, 7H, 7I, and 7J fiber-only modules.

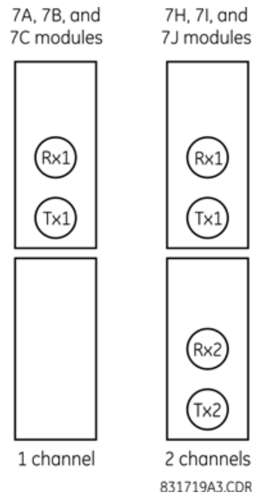

Figure 3–30: LED AND ELED FIBER MODULES

3.3.3 FIBER-LASER TRANSMITTERS

The following figure shows the configuration for the 72, 73, 7D, and 7K fiber-laser module.

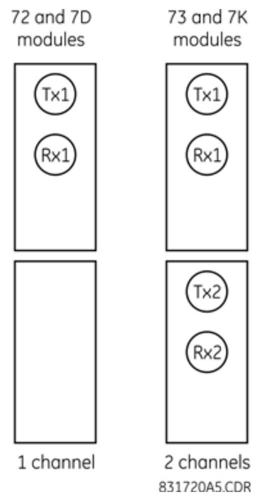

Figure 3–31: LASER FIBER MODULES

NOTICE When using a laser Interface, attenuators can be necessary to ensure that you do not exceed the maximum optical input power to the receiver.

3.3.4 G.703 INTERFACE

a) DESCRIPTION

The following figure shows the 64K ITU G.703 co-directional interface configuration.

NOTE: The G.703 module is fixed at 64 kbps. The SETTINGS > PRODUCT SETUP > DIRECT I/O > DIRECT I/O DATA RATE setting is not applicable to this module.

AWG 24 twisted shielded pair is recommended for external connections, with the shield grounded only at one end. Connecting the shield to pin X1a or X6a grounds the shield since these pins are internally connected to ground. Thus, if pin X1a or X6a is used, do not ground at the other end. This interface module is protected by surge suppression devices.

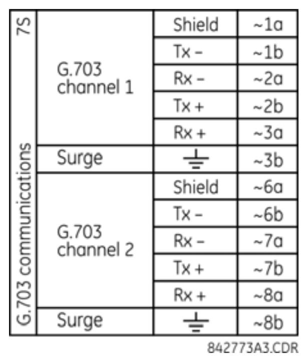

Figure 3–32: G.703 INTERFACE CONFIGURATION

The following figure shows the typical pin interconnection between two G.703 interfaces. For the actual physical arrangement of these pins, see the *Rear Terminal Layout* section earlier in this chapter. All pin interconnections are to be maintained for a connection to a multiplexer.

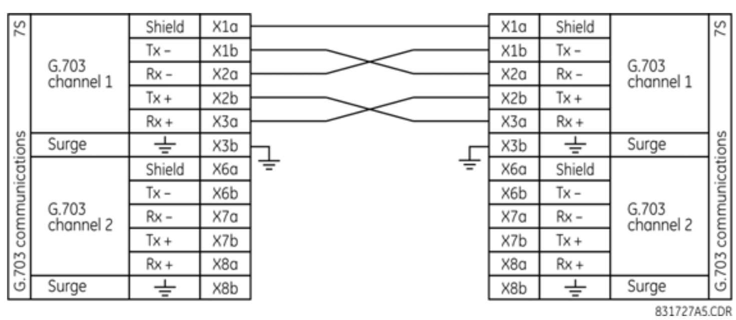

Figure 3–33: TYPICAL PIN INTERCONNECTION BETWEEN TWO G.703 INTERFACES

NOTE: Pin nomenclature can differ from one manufacturer to another. Therefore, it is not uncommon to see pinouts numbered TxA, TxB, RxA and RxB. In such cases, it can be assumed that “A” is equivalent to “+” and “B” is equivalent to “–”.

b) G.703 SELECTION SWITCH PROCEDURES

1. With the power to the relay off, remove the G.703 module (7R or 7S) as follows. Record the original location of the module to help ensure that the same or replacement module is inserted into the correct slot.
2. Simultaneously pull the ejector/inserter clips located at the top and at the bottom of each module in order to release the module for removal.
3. Remove the module cover screw.
4. Remove the top cover by sliding it towards the rear and then lift it upwards.
5. Set the timing selection switches (channel 1, channel 2) to the desired timing modes.
6. Replace the top cover and the cover screw.

7. Re-insert the G.703 module. Take care to ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module is fully inserted.

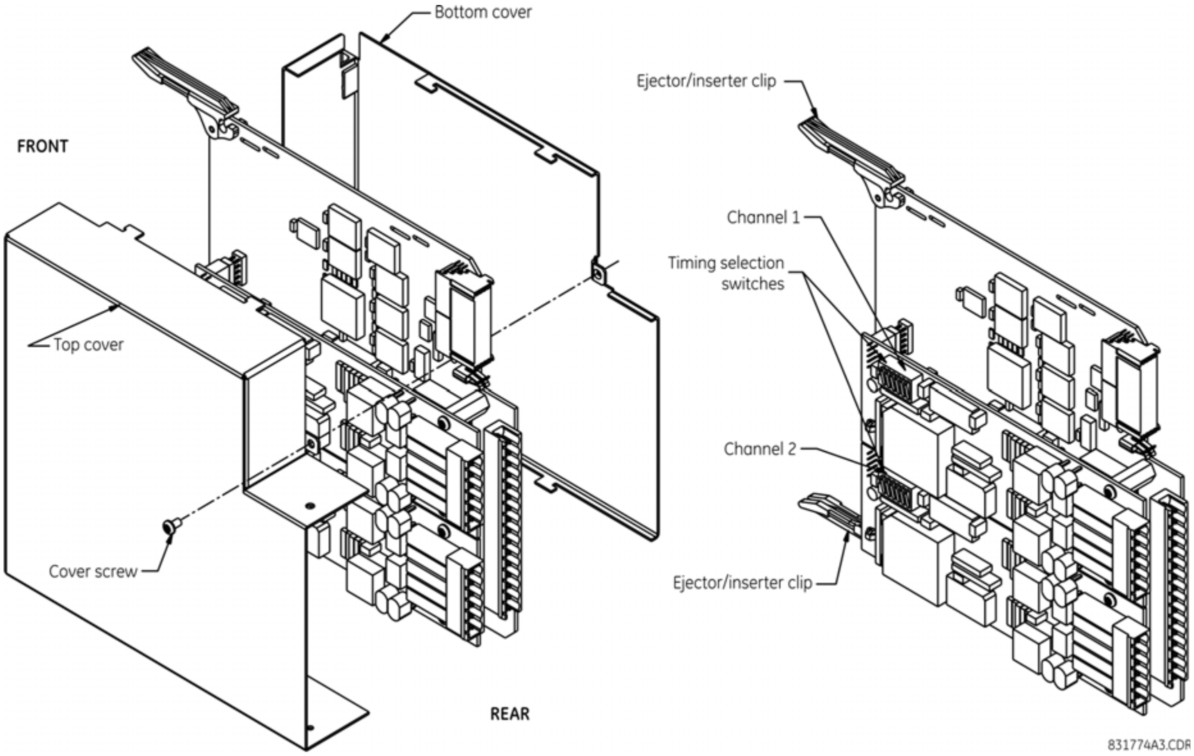

Figure 3–34: G.703 TIMING SELECTION SWITCH SETTING

Table 3–4: G.703 TIMING SELECTIONS

SWITCHES	FUNCTION
S1	OFF → octet timing disabled ON → octet timing 8 kHz
S5 and S6	S5 = OFF and S6 = OFF → loop timing mode S5 = ON and S6 = OFF → internal timing mode S5 = OFF and S6 = ON → minimum remote loopback mode S5 = ON and S6 = ON → dual loopback mode

c) G.703 OCTET TIMING

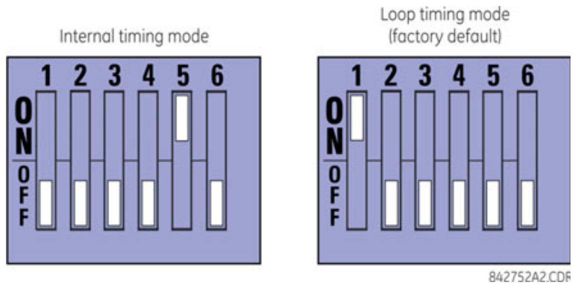
If octet timing is enabled (ON), this 8 kHz signal is asserted during the violation of bit 8 (LSB) necessary for connecting to higher order systems. When F60s are connected back-to-back, octet timing is disabled (OFF).

d) G.703 TIMING MODES

There are two timing modes for the G.703 module: internal timing mode and loop timing mode (default).

- **Internal Timing Mode:** The system clock is generated internally. Therefore, the G.703 timing selection should be in the internal timing mode for back-to-back (UR-to-UR) connections. For back-to-back connections, set for octet timing (S1 = OFF) and timing mode to internal timing (S5 = ON and S6 = OFF).
- **Loop Timing Mode:** The system clock is derived from the received line signal. Therefore, the G.703 timing selection should be in loop timing mode for connections to higher order systems. For connection to a higher order system (UR-to-multiplexer, factory defaults), set to octet timing (S1 = ON) and set timing mode to loop timing (S5 = OFF and S6 = OFF).

The switch settings for the internal and loop timing modes are shown below:



3

e) G.703 TEST MODES

In *minimum remote loopback* mode, the multiplexer is enabled to return the data from the external interface without any processing to assist in diagnosing G.703 line-side problems irrespective of clock rate. Data enters from the G.703 inputs, passes through the data stabilization latch which also restores the proper signal polarity, passes through the multiplexer and then returns to the transmitter. The differential received data is processed and passed to the G.703 transmitter module after which point the data is discarded. The G.703 receiver module is fully functional and continues to process data and passes it to the differential Manchester transmitter module. Since timing is returned as it is received, the timing source is expected to be from the G.703 line side of the interface.

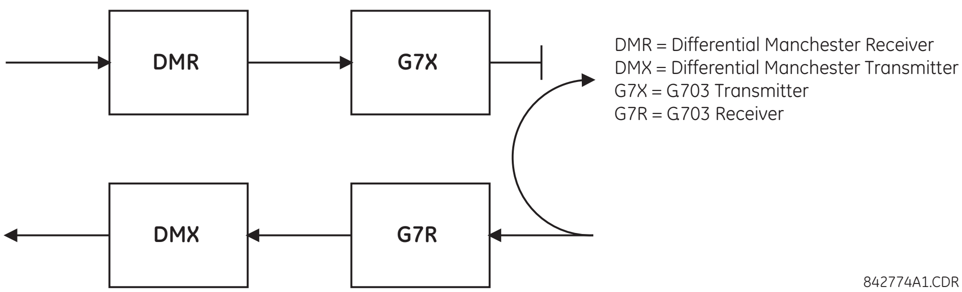


Figure 3–35: G.703 MINIMUM REMOTE LOOPBACK MODE

In *dual loopback mode*, the multiplexers are active and the functions of the circuit are divided into two with each receiver/ transmitter pair linked together to deconstruct and then reconstruct their respective signals. Differential Manchester data enters the Differential Manchester receiver module and then is returned to the differential Manchester transmitter module. Likewise, G.703 data enters the G.703 receiver module and is passed through to the G.703 transmitter module to be returned as G.703 data. Because of the complete split in the communications path and because, in each case, the clocks are extracted and reconstructed with the outgoing data, in this mode there must be two independent sources of timing. One source lies on the G.703 line side of the interface while the other lies on the differential Manchester side of the interface.

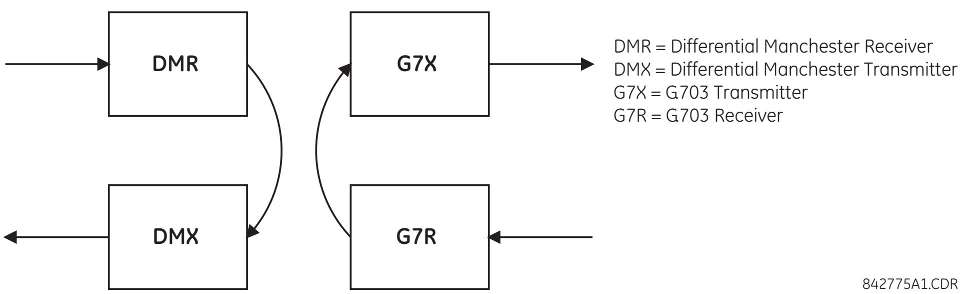

Figure 3–36: G.703 DUAL LOOPBACK MODE

3.3.5 RS422 INTERFACE

a) DESCRIPTION

There are two RS422 inter-relay communications modules available: single-channel RS422 (module 7T) and dual-channel RS422 (module 7W). The modules can be configured to run at 64 kbps or 128 kbps. AWG 20-24 twisted shielded pair cable is recommended for external connections. These modules are protected by optically-isolated surge suppression devices.

The shield pins (6a and 7b) are internally connected to the ground pin (8a). Proper shield termination is as follows:

- Site 1: Terminate shield to pins 6a or 7b or both.
- Site 2: Terminate shield to COM pin 2b.

Match the clock terminating impedance with the impedance of the line.

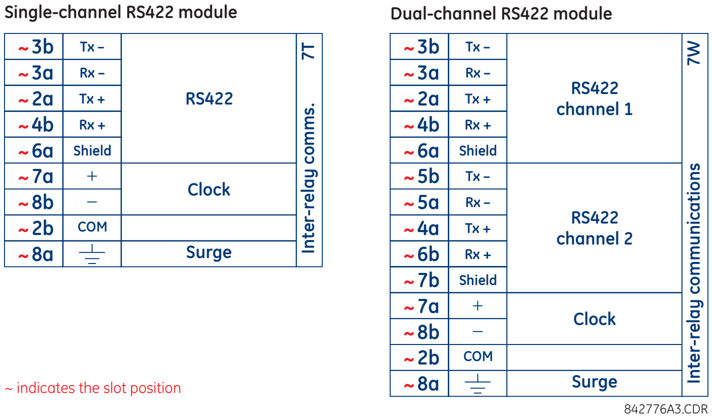

Figure 3–37: RS422 INTERFACE CONNECTIONS

The following figure shows the typical pin interconnection between two single-channel RS422 interfaces installed in slot W. All pin interconnections are to be maintained for a connection to a multiplexer.

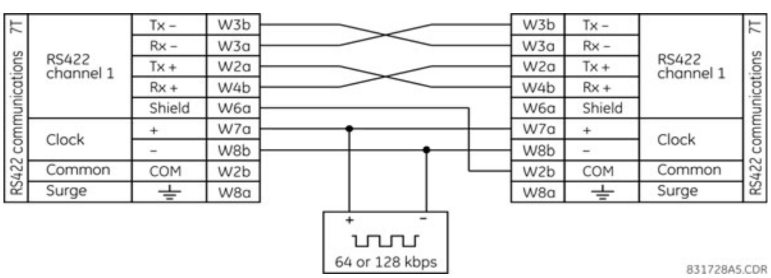

Figure 3–38: TYPICAL PIN INTERCONNECTION BETWEEN TWO RS422 INTERFACES

b) TWO-CHANNEL APPLICATION VIA MULTIPLEXERS

The RS422 interface can be used for single channel or two channel applications over SONET/SDH or multiplexed systems. When used in single-channel applications, the RS422 interface links to higher order systems in a typical fashion observing transmit (Tx), receive (Rx), and send timing (ST) connections. However, when used in two-channel applications, certain criteria must be followed since there is one clock input for the two RS422 channels. The system functions correctly when the following connections are observed and your data module has a terminal timing feature. Terminal timing is a common feature to most synchronous data units that allows the module to accept timing from an external source. Using the terminal timing feature, two channel applications can be achieved if these connections are followed: The send timing outputs from the multiplexer (data module 1), connects to the clock inputs of the UR–RS422 interface in the usual fashion. In addition, the send timing outputs of data module 1 is also paralleled to the terminal timing inputs of data module 2. By using this configuration, the timing for both data modules and both UR–RS422 channels are derived from a single clock source. As a result, data sampling for both of the UR–RS422 channels is synchronized via the send timing leads on data module 1 as shown below. If the terminal timing feature is not available or this type of connection is not desired, the G.703 interface is a viable option that does not impose timing restrictions.

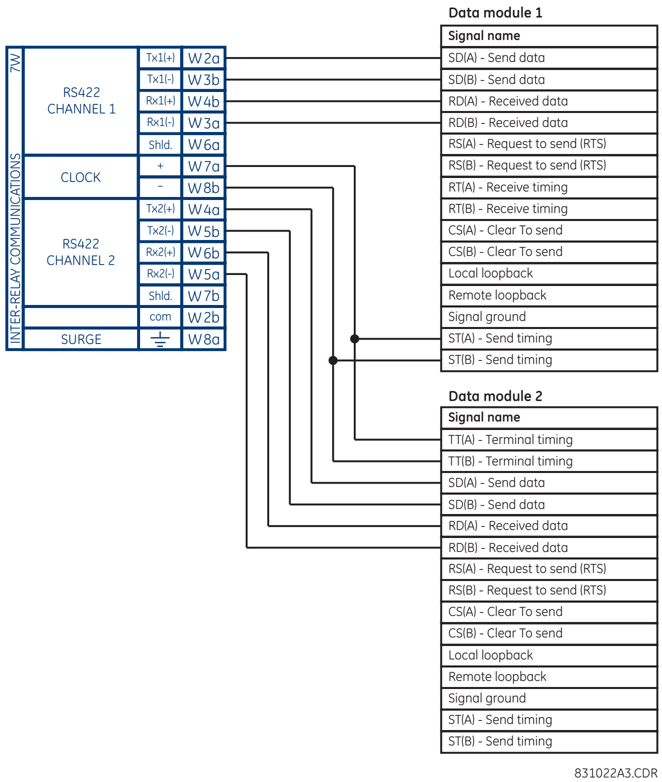

Figure 3–39: TIMING CONFIGURATION FOR RS422 TWO-CHANNEL, THREE-TERMINAL APPLICATION

Data module 1 provides timing to the F60 RS422 interface via the ST(A) and ST(B) outputs. Data module 1 also provides timing to data module 2 TT(A) and TT(B) inputs via the ST(A) and AT(B) outputs. The data module pin numbers have been omitted in the figure above since they vary by manufacturer.

c) TRANSMIT TIMING

The RS422 interface accepts one clock input for transmit timing. It is important that the rising edge of the 64 kHz transmit timing clock of the multiplexer interface is sampling the data in the center of the transmit data window. Therefore, it is important to confirm clock and data transitions to ensure proper system operation. For example, the following figure shows the positive edge of the Tx clock in the center of the Tx data bit.

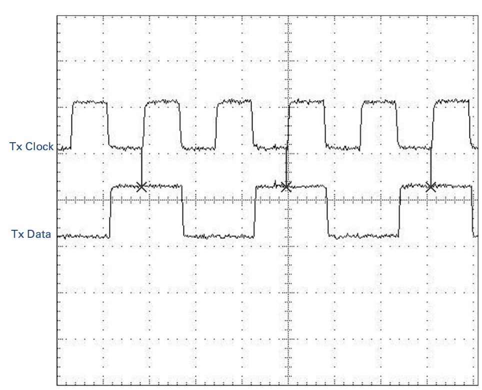

Figure 3–40: CLOCK AND DATA TRANSITIONS

d) RECEIVE TIMING

The RS422 interface utilizes NRZI-MARK modulation code and; therefore, does not rely on an Rx clock to recapture data. NRZI-MARK is an edge-type, invertible, self-clocking code.

To recover the Rx clock from the data-stream, an integrated DPLL (digital phase lock loop) circuit is utilized. The DPLL is driven by an internal clock, which is 16-times over-sampled, and uses this clock along with the data-stream to generate a data clock that can be used as the SCC (serial communication controller) receive clock.

3.3.6 RS422 AND FIBER INTERFACE

The following figure shows the combined RS422 plus fiberoptic interface configuration at 64K baud. The 7L, 7M, 7N, 7P, and 74 modules are used in two-terminal with a redundant channel or three-terminal configurations where channel 1 is employed via the RS422 interface (possibly with a multiplexer) and channel 2 via direct fiber.

AWG 20-24 twisted shielded pair is recommended for external RS422 connections and ground the shield only at one end. For the direct fiber channel, address power budget issues properly.

NOTICE When using a LASER Interface, attenuators can be necessary to ensure that you do not exceed maximum optical input power to the receiver.

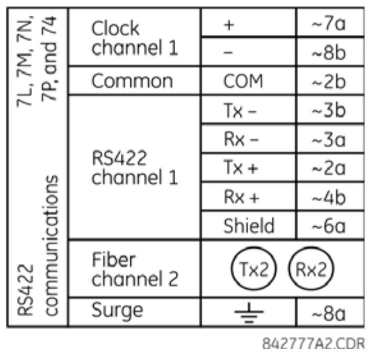

Figure 3–41: RS422 AND FIBER INTERFACE CONNECTION

Connections shown above are for multiplexers configured as DCE (data communications equipment) units.

3.3.7 G.703 AND FIBER INTERFACE

The figure below shows the combined G.703 plus fiberoptic interface configuration at 64 kbps. The 7E, 7F, 7G, 7Q, and 75 modules are used in configurations where channel 1 is employed via the G.703 interface (possibly with a multiplexer) and channel 2 via direct fiber. AWG 24 twisted shielded pair is recommended for external G.703 connections connecting the shield to pin 1a at one end only. For the direct fiber channel, address power budget issues properly. See previous sections for additional details on the G.703 and fiber interfaces.

NOTICE When using a laser Interface, attenuators can be necessary to ensure that you do not exceed the maximum optical input power to the receiver.

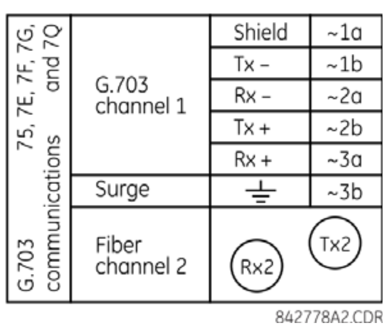

Figure 3–42: G.703 AND FIBER INTERFACE CONNECTION

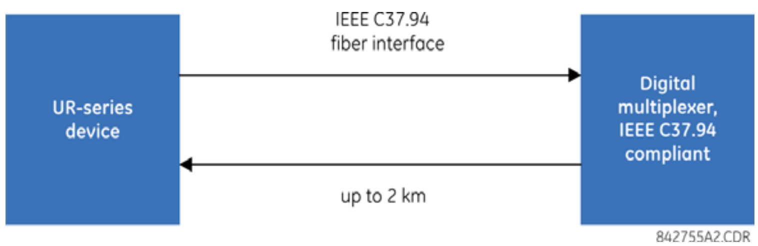
3.3.8 IEEE C37.94 INTERFACE

The UR-series IEEE C37.94 communication modules (modules types 2G, 2H, 2I, 2J, 76, and 77) are designed to interface with IEEE C37.94 compliant digital multiplexers or an IEEE C37.94 compliant interface converter for use with direct input and output applications. The IEEE C37.94 standard defines a point-to-point optical link for synchronous data between a multiplexer and a teleprotection device. This data is typically 64 kbps, but the standard provides for speeds up to 64*n* kbps, where *n* = 1, 2,…, 12. The UR-series C37.94 communication modules are either 64 kbps (with *n* fixed at 1) for 128 kbps (with *n* fixed at 2). The frame is a valid International Telecommunications Union (ITU-T) recommended G.704 pattern from the standpoint of framing and data rate. The frame is 256 bits and is repeated at a frame rate of 8000 Hz, with a resultant bit rate of 2048 kbps.

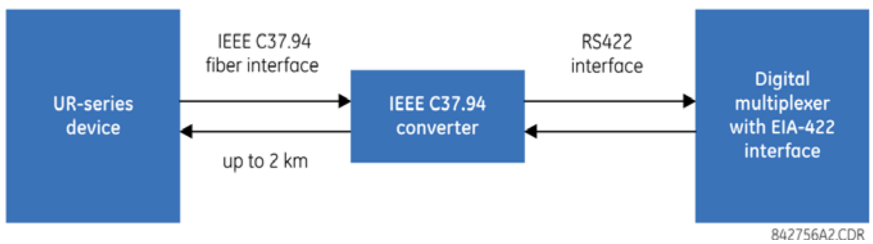
The specifications for the module are as follows:.

- IEEE standard: C37.94 for 1 × 128 kbps optical fiber interface (for 2G and 2H modules) or C37.94 for 2 × 64 kbps optical fiber interface (for 76 and 77 modules)
- Fiber optic cable type: 50 mm or 62.5 mm core diameter optical fiber
- Fiber optic mode: multimode
- Fiber optic cable length: up to 2 km
- Fiber optic connector: type ST
- Wavelength: 830 ±40 nm
- Connection: as per all fiber optic connections, a Tx to Rx connection is required

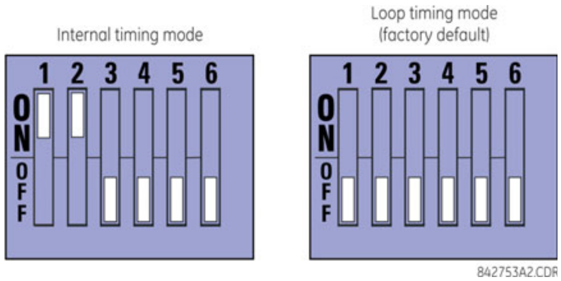
The UR-series C37.94 communication module can be connected directly to any compliant digital multiplexer that supports the IEEE C37.94 standard shown as follows.



The UR-series C37.94 communication module can be connected to the electrical interface (G.703, RS422, or X.21) of a non-compliant digital multiplexer via an optical-to-electrical interface converter that supports the IEEE C37.94 standard, shown as follows.



The UR-series C37.94 communication module has six switches to set the clock configuration. The following figure shows the functions of these control switches.



For the internal timing mode, the system clock is generated internally. Therefore, the timing switch selection should be internal timing for relay 1 and loop timed for relay 2. There must be only one timing source configured.

For the looped timing mode, the system clock is derived from the received line signal. Therefore, the timing selection should be in loop timing mode for connections to higher order systems.

The IEEE C37.94 communications module cover removal procedure is as follows:

1. With power to the relay off, remove the IEEE C37.94 module (type 2G, 2H, 2I, 2J, 76 or 77 module) as follows. Record the original location of the module to help ensure that the same or replacement module is inserted into the correct slot.
2. Simultaneously pull the ejector/inserter clips located at the top and at the bottom of each module in order to release the module for removal.
3. Remove the module cover screw.
4. Remove the top cover by sliding it towards the rear and then lift it upwards.
5. Set the timing selection switches (channel 1, channel 2) to the desired timing modes (see description above).
6. Replace the top cover and the cover screw.
7. Re-insert the IEEE C37.94 module. Take care to ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module is fully inserted.

3

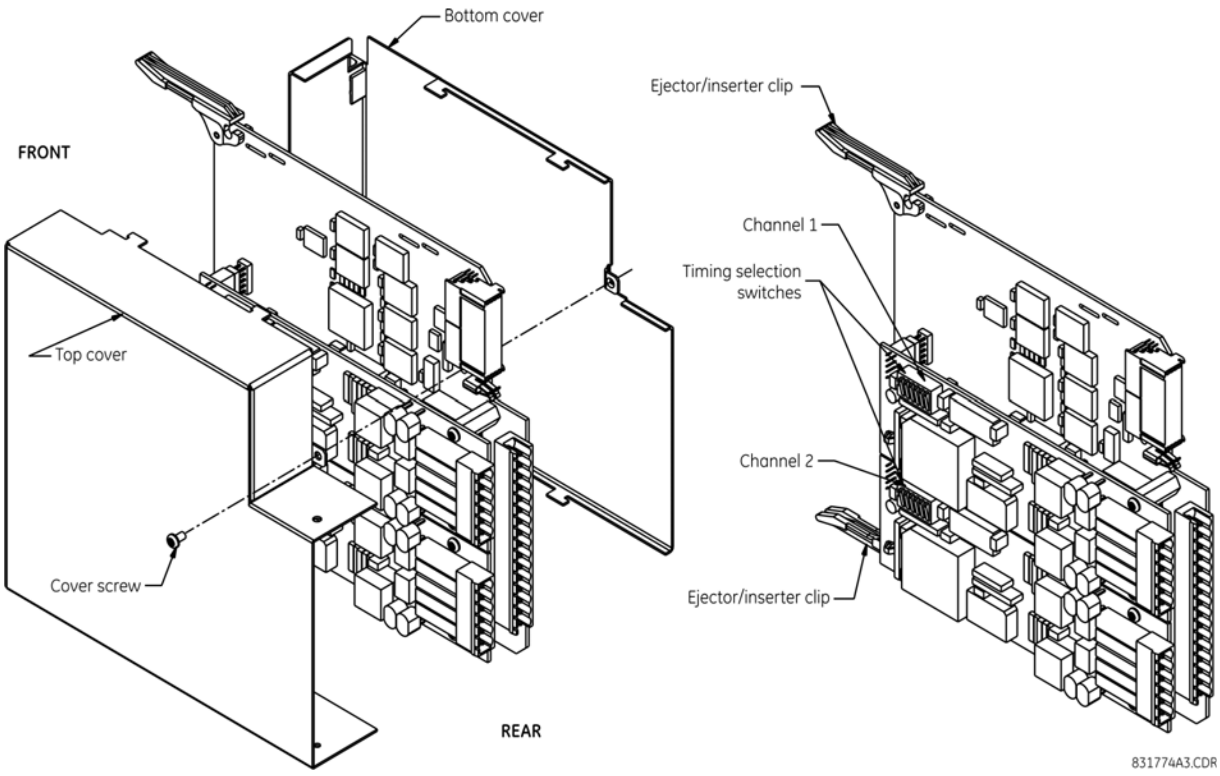


Figure 3–43: IEEE C37.94 TIMING SELECTION SWITCH SETTING

Modules shipped since January 2012 have status LEDs that indicate the status of the DIP switches, as shown in the following figure.

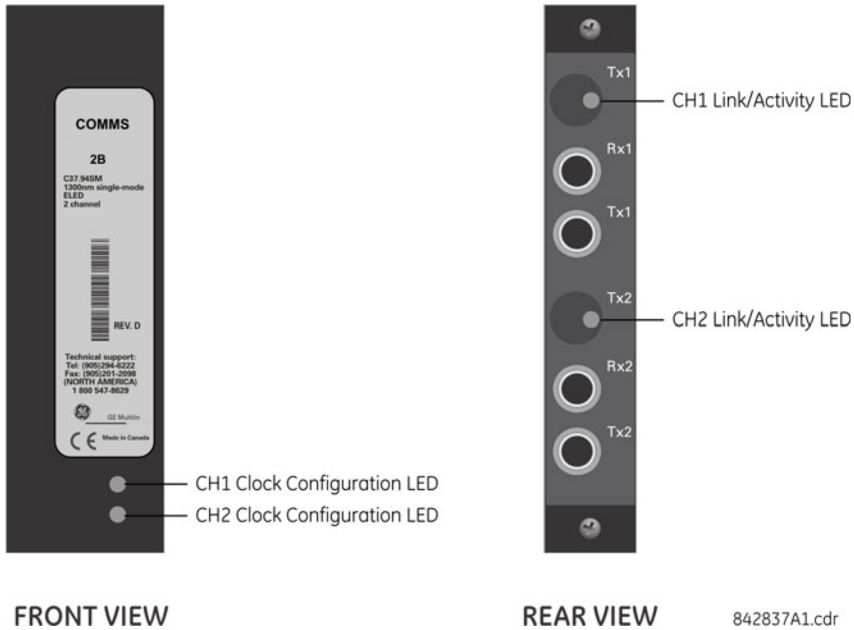

Figure 3–44: STATUS LEDS

The clock configuration LED status is as follows:

- Flashing green — loop timing mode while receiving a valid data packet
- Flashing yellow — internal mode while receiving a valid data packet
- Solid red — (switch to) internal timing mode while not receiving a valid data packet

The link/activity LED status is as follows:

- Flashing green — FPGA is receiving a valid data packet
- Solid yellow — FPGA is receiving a "yellow bit" and remains yellow for each "yellow bit"
- Solid red — FPGA is not receiving a valid packet or the packet received is invalid

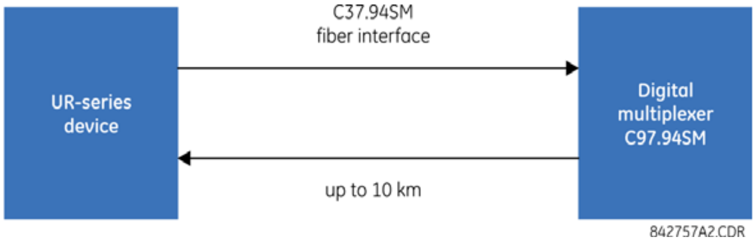
3.3.9 C37.94SM INTERFACE

The UR-series C37.94SM communication modules (2A and 2B) are designed to interface with modified IEEE C37.94 compliant digital multiplexers or IEEE C37.94 compliant interface converters that have been converted from 820 nm multi-mode fiber optics to 1300 nm ELED single-mode fiber optics. The IEEE C37.94 standard defines a point-to-point optical link for synchronous data between a multiplexer and a teleprotection device. This data is typically 64 kbps, but the standard provides for speeds up to 64*n* kbps, where *n* = 1, 2,…, 12. The UR-series C37.94SM communication module is 64 kbps only with *n* fixed at 1. The frame is a valid International Telecommunications Union (ITU-T) recommended G.704 pattern from the standpoint of framing and data rate. The frame is 256 bits and is repeated at a frame rate of 8000 Hz, with a resultant bit rate of 2048 kbps.

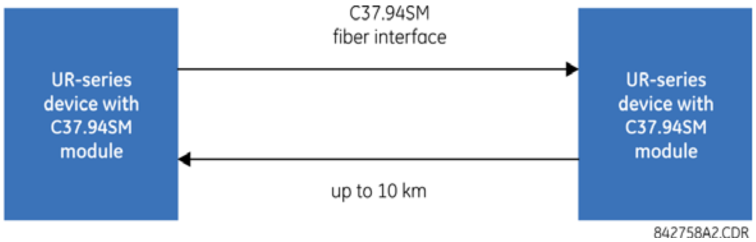
The specifications for the module are as follows:

- Emulated IEEE standard: emulates C37.94 for 1 × 64 kbps optical fiber interface (modules set to *n* = 1 or 64 kbps)
- Fiber optic cable type: 9/125 μm core diameter optical fiber
- Fiber optic mode: single-mode, ELED compatible with HP HFBR-1315T transmitter and HP HFBR-2316T receiver
- Fiber optic cable length: up to 11.4 km
- Fiber optic connector: type ST
- Wavelength: 1300 ±40 nm
- Connection: as per all fiber optic connections, a Tx to Rx connection is required

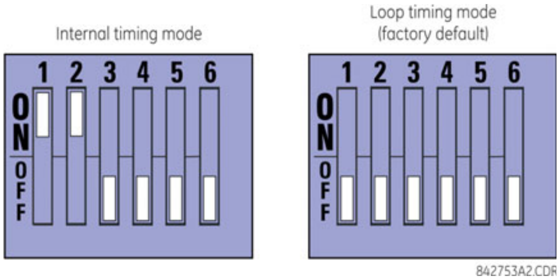
The UR-series C37.94SM communication module can be connected *directly* to any compliant digital multiplexer that supports C37.94SM as shown below.



It also can be connected **directly** to any other UR-series relay with a C37.94SM module as shown below.



The UR-series C37.94SM communication module has six switches that are used to set the clock configuration. The functions of these control switches are shown below.



For the internal timing mode, the system clock is generated internally. Therefore, the timing switch selection should be internal timing for relay 1 and loop timed for relay 2. There must be only one timing source configured.

For the looped timing mode, the system clock is derived from the received line signal. Therefore, the timing selection should be in loop timing mode for connections to higher order systems.

The C37.94SM communications module cover removal procedure is as follows:

1. With power to the relay off, remove the C37.94SM module (modules 2A or 2B) as follows. Record the original location of the module to help ensure that the same or replacement module is inserted into the correct slot.
2. Simultaneously pull the ejector/inserter clips located at the top and at the bottom of each module in order to release the module for removal.
3. Remove the module cover screw.
4. Remove the top cover by sliding it towards the rear and then lift it upwards.
5. Set the timing selection switches (channel 1, channel 2) to the desired timing modes (see description above).
6. Replace the top cover and the cover screw.
7. Re-insert the C37.94SM module. Take care to ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module is fully inserted.

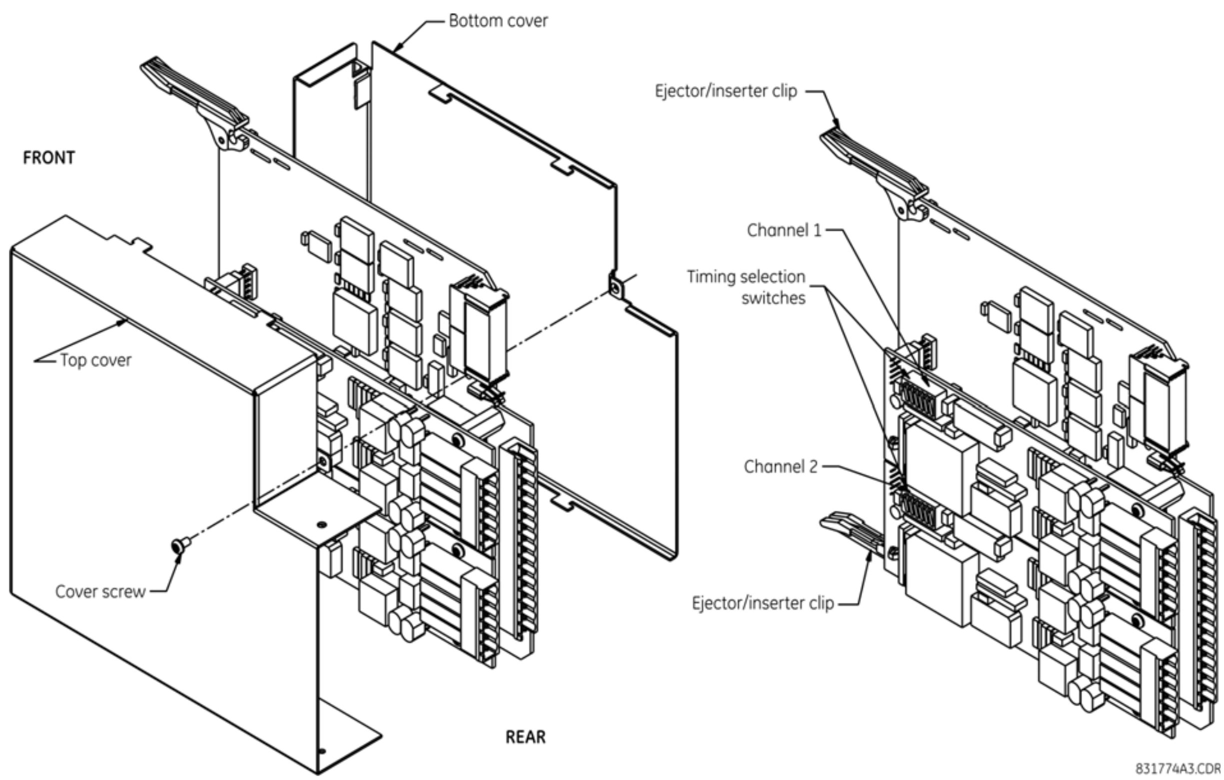


Figure 3–45: C37.94SM TIMING SELECTION SWITCH SETTING

Modules shipped since January 2012 have status LEDs that indicate the status of the DIP switches, as shown in the following figure.

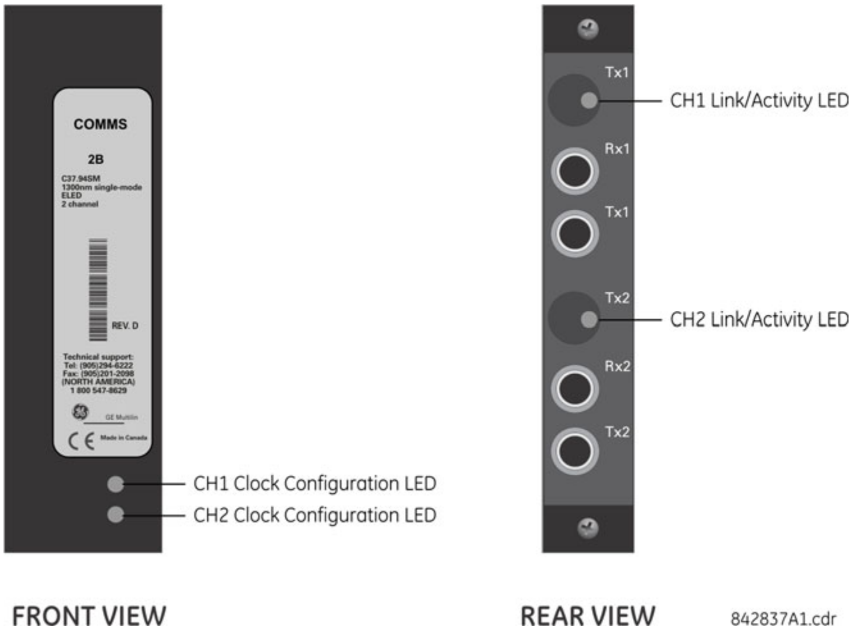

Figure 3–46: STATUS LEDS

The clock configuration LED status is as follows:

- Flashing green — loop timing mode while receiving a valid data packet
- Flashing yellow — internal mode while receiving a valid data packet
- Solid red — (switch to) internal timing mode while not receiving a valid data packet

The link/activity LED status is as follows:

- Flashing green — FPGA is receiving a valid data packet
- Solid yellow — FPGA is receiving a "yellow bit" and remains yellow for each "yellow bit"
- Solid red — FPGA is not receiving a valid packet or the packet received is invalid

4.1.1 INTRODUCTION

The EnerVista UR Setup software provides a graphical user interface (GUI) as one of two human interfaces to a UR device. The alternate human interface is implemented via the device's faceplate keypad and display (see the *Faceplate Interface* section in this chapter).

The EnerVista UR Setup software provides a single facility to configure, monitor, maintain, and troubleshoot the operation of relay functions, connected over local or wide area communication networks. It can be used while disconnected (offline) or connected (online) to a UR device. In offline mode, settings files can be created for eventual downloading to the device. In online mode, you can communicate with the device in real-time.

The EnerVista UR Setup software is provided with every F60 relay and runs on Microsoft Windows XP, 7, and Server 2008. This chapter provides a summary of the basic EnerVista UR Setup software interface features. The EnerVista UR Setup Help File provides details for getting started and using the EnerVista UR Setup software interface.

4.1.2 CREATING A SITE LIST

To start using the EnerVista UR Setup software, site and device definition are required. See the EnerVista UR Setup Help File or refer to the *EnerVista UR Setup Software* section in Chapter 1 for details.

4.1.3 ENERVISTA UR SETUP OVERVIEW

a) ENGAGING A DEVICE

The EnerVista UR Setup software can be used in online mode (relay connected) to directly communicate with the F60 relay. Communicating relays are organized and grouped by communication interfaces and into sites. Sites can contain any number of relays selected from the UR-series of relays.

b) USING SETTINGS FILES

The EnerVista UR Setup software interface supports three ways of handling changes to relay settings:

- In offline mode (relay disconnected) to create or edit relay settings files for later download to communicating relays
- While connected to a communicating relay to directly modify any relay settings via relay data view windows, and then save the settings to the relay
- You can create/edit settings files and then write them to the relay while the interface is connected to the relay

Settings files are organized on the basis of file names assigned by the user. A settings file contains data pertaining to the following types of relay settings:

- Device definition
- Product setup
- System setup
- FlexLogic
- Grouped elements
- Control elements
- Inputs/outputs
- Testing

Factory default values are supplied and can be restored after any changes.

The following communications settings are not transferred to the F60 with settings files:

Modbus Slave Address
Modbus IP Port Number
RS485 COM2 Baud Rate
RS485 COM2 Parity
COM2 Minimum Response Time

COM2 Selection
RRTD Slave Address
RRTD Baud Rate
IP Address
IP Subnet Mask
IEC61850 Config GOOSE ConfRev
IP Routing

When a settings file is loaded to a F60 that is in-service, the following sequence occurs:

1. The F60 takes itself out of service.
2. The F60 issues a **UNIT NOT PROGRAMMED** major self-test error.
3. The F60 closes the critical fail contact.

c) CREATING AND EDITING FLEXLOGIC

You create or edit a FlexLogic equation in order to customize the relay. You can subsequently view the automatically generated logic diagram.

d) VIEWING ACTUAL VALUES

You can view real-time relay data such as input/output status and measured parameters.

e) VIEWING TRIGGERED EVENTS

While the interface is in either online or offline mode, you can view and analyze data generated by triggered specified parameters, via one of the following:

- **Event recorder**

  The event recorder captures contextual data associated with the last 1024 events, listed in chronological order from most recent to oldest.

- **Oscillography**

  The oscillography waveform traces and digital states are used to provide a visual display of power system and relay operation data captured during specific triggered events.

f) FILE SUPPORT

- **Execution:** Any EnerVista UR Setup file that is opened launches the application or provides focus to the already opened application. If the file was a settings file (has a `URS` extension) that had been removed from the Settings List tree menu, it is added back to the Settings List tree menu.
- **Drag and Drop:** The Site List and Settings List control bar windows are each mutually a drag source and a drop target for device-order-code-compatible files or individual menu items. Also, the Settings List control bar window and any Windows Explorer directory folder are each mutually a file drag source and drop target.

  New files that are dropped into the Settings List window are added to the tree, which is automatically sorted alphabetically with respect to settings file names. Files or individual menu items that are dropped in the selected device menu in the Site List window are automatically sent to the online communicating device.

g) FIRMWARE UPGRADES

The firmware of a F60 device can be upgraded, locally or remotely, via the EnerVista UR Setup software. The corresponding instructions are provided by the EnerVista UR Setup Help file under the topic “Upgrading Firmware”.

NOTE

Modbus addresses assigned to firmware modules, features, settings, and corresponding data items (that is, default values, minimum/maximum values, data type, and item size) can change slightly from version to version of firmware. The addresses are rearranged when new features are added or existing features are enhanced or modified. The **EEPROM DATA ERROR** message displayed after upgrading/downgrading the firmware is a resettable, self-test message intended to inform users that the Modbus addresses have changed with the upgraded firmware. This message does not signal any problems when appearing after firmware upgrades.

4.1.4 ENERVISTA UR SETUP MAIN WINDOW

The EnerVista UR Setup software main window supports the following primary display components:

1. Title bar that shows the pathname of the active data view
2. Main window menu bar
3. Main window tool bar
4. Site list control bar window
5. Settings list control bar window
6. Device data view windows, with common tool bar
7. Settings file data view windows, with common tool bar
8. Workspace area with data view tabs
9. Status bar
10. Quick action hot links

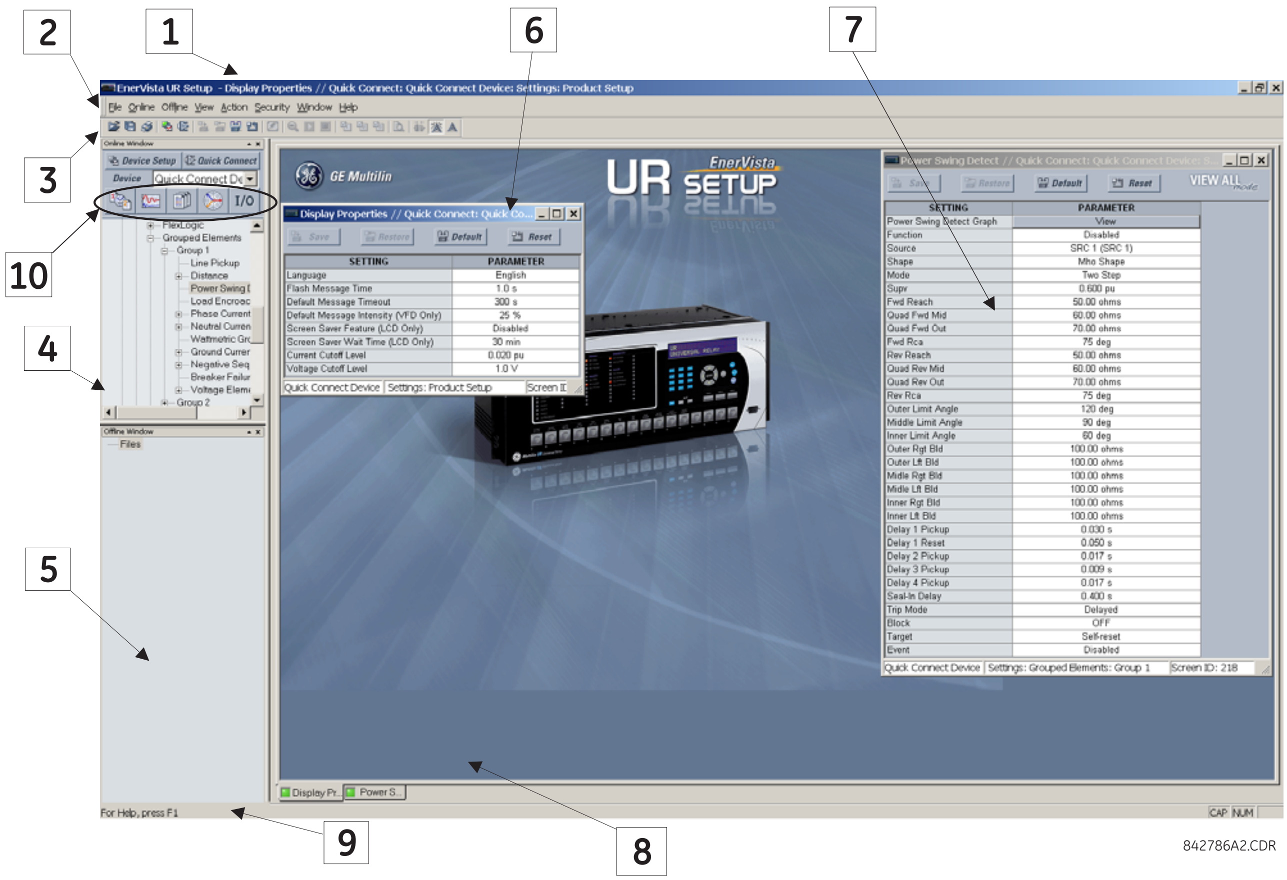

Figure 4–1: ENERVISTA UR SETUP SOFTWARE MAIN WINDOW

Extended EnerVista UR Setup Features

4.1.5 SETTINGS TEMPLATES

Setting file templates simplify the configuration and commissioning of multiple relays that protect similar assets. An example of this is a substation that has ten similar feeders protected by ten UR-series F60 relays.

In these situations, typically 90% or greater of the settings are identical between all devices. The templates feature allows engineers to configure and test these common settings, then lock them so that they are not available to users. For example, these locked down settings can be hidden from view for field engineers, allowing them to quickly identify and concentrate on the specific settings.

The remaining settings (typically 10% or less) can be specified as editable and be made available to field engineers installing the devices. These are settings such as protection element pickup values and CT and VT ratios.

The settings template mode allows the user to define which settings are visible in EnerVista UR Setup. Settings templates can be applied to both settings files (settings file templates) and online devices (online settings templates). The functionality is identical for both purposes.

Settings files conversion from previous firmware versions is supported.

a) ENABLING THE SETTINGS TEMPLATE

The settings file template feature is disabled by default. The following procedure describes how to enable the settings template for UR-series settings files.

1. Select a settings file from the offline window of the EnerVista UR Setup main screen.
2. Right-click the selected device or settings file and select the **Template Mode > Create Template** option.

The settings file template is now enabled and the file tree displayed in light blue. The settings file is now in template editing mode.

Alternatively, the settings template can also be applied to online settings. The following procedure describes this process.

1. Select an installed device from the online window of the EnerVista UR Setup main screen.
2. Right-click the selected device and select the **Template Mode > Create Template** option.

   The software prompts for a template password. This password is required to use the template feature and must be at least four characters in length.

3. Enter and re-enter the new password, then click **OK** to continue.

The online settings template is now enabled. The device is now in template editing mode.

b) EDITING THE SETTINGS TEMPLATE

The settings template editing feature allows the user to specify which settings are available for viewing and modification in EnerVista UR Setup. By default, all settings except the FlexLogic equation editor settings are locked.

1. Select an installed device or a settings file from the tree menu on the left of the EnerVista UR Setup main screen.
2. Select the **Template Mode > Edit Template** option to place the device in template editing mode.
3. Enter the template password then click **OK**.
4. Open the relevant settings windows that contain settings to be specified as viewable.

By default, all settings are specified as locked and displayed against a grey background. The icon on the upper right of the settings window also indicates that EnerVista UR Setup is in **EDIT mode**. The following example shows the phase time overcurrent settings window in edit mode.

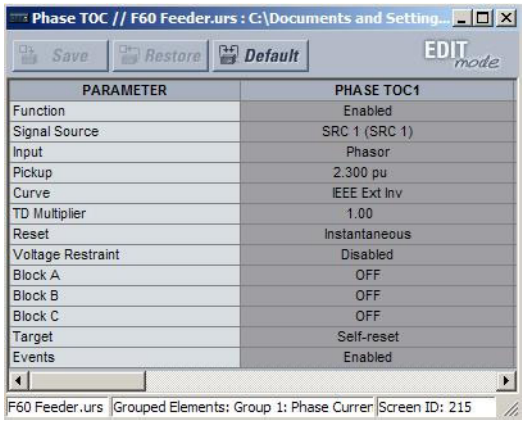

Figure 4–2: SETTINGS TEMPLATE VIEW, ALL SETTINGS SPECIFIED AS LOCKED

5. Specify the settings to make viewable by clicking them.

   The setting available to view is displayed against a yellow background as shown below.

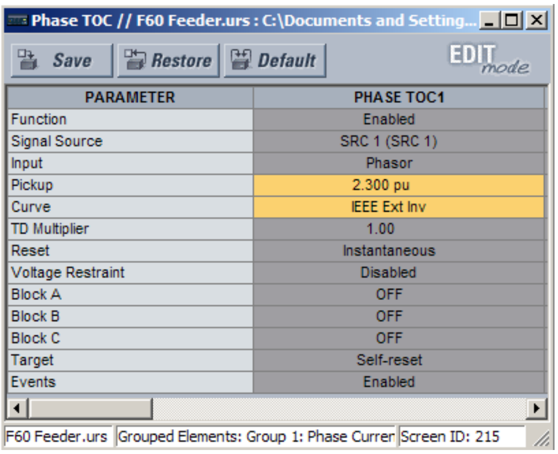

Figure 4–3: SETTINGS TEMPLATE VIEW, TWO SETTINGS SPECIFIED AS EDITABLE

6. Click on **Save** to save changes to the settings template.
7. Proceed through the settings tree to specify all viewable settings.

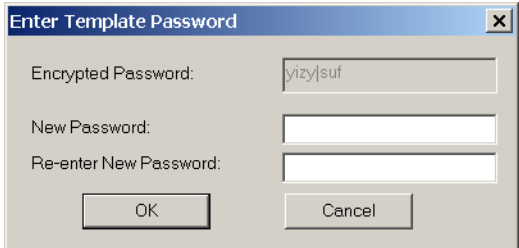
c) ADDING PASSWORD PROTECTION TO A TEMPLATE

It is highly recommended that templates be saved with password protection to maximize security.

The following procedure describes how to add password protection to a settings file template.

1. Select a settings file from the offline window on the left of the EnerVista UR Setup main screen.
2. Selecting the **Template Mode > Password Protect Template** option.

The software prompts for a template password. This password must be at least four characters in length.



3. Enter and re-enter the new password, then click **OK** to continue.

The settings file template is now secured with password protection.

NOTE: When templates are created for online settings, the password is added during the initial template creation step. It does not need to be added after the template is created.

d) VIEWING THE SETTINGS TEMPLATE

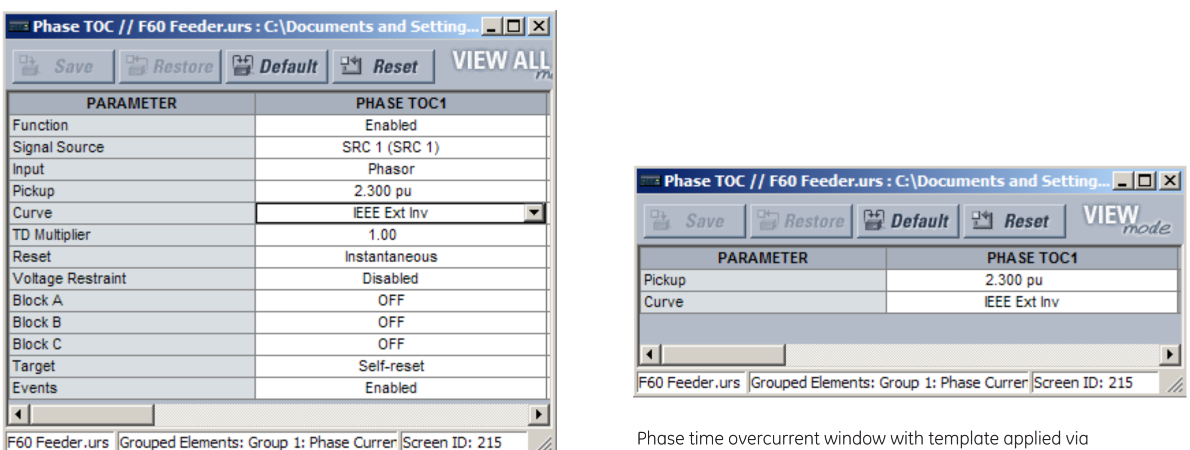
Once all necessary settings are specified for viewing, users are able to view the settings template on the online device or settings file. There are two ways to specify the settings view with the settings template feature:

- Display only those settings available for editing
- Display all settings, with settings not available for editing greyed-out

Use the following procedure to only display settings available for editing:

1. Select an installed device or a settings file from the tree menu on the left of the EnerVista UR Setup main screen.
2. Apply the template by selecting the **Template Mode > View In Template Mode** option.
3. Enter the template password then click **OK** to apply the template.

Once the template has been applied, users are limited to view and edit the settings specified by the template. The effect of applying the template to the phase time overcurrent settings is shown below.



Phase time overcurrent settings window without template applied.

Phase time overcurrent window with template applied via the **Template Mode > View In Template Mode** command. The template specifies that only the Pickup and Curve settings be available.

842858A1.CDR

Figure 4–4: APPLYING TEMPLATES VIA THE VIEW IN TEMPLATE MODE COMMAND

Viewing the settings in template mode also modifies the settings tree, showing only the settings categories that contain editable settings. The effect of applying the template to a typical settings tree view is shown below.

Typical settings tree view without template applied.

Typical settings tree view with template applied via the **Template Mode > View In Template Mode** command.

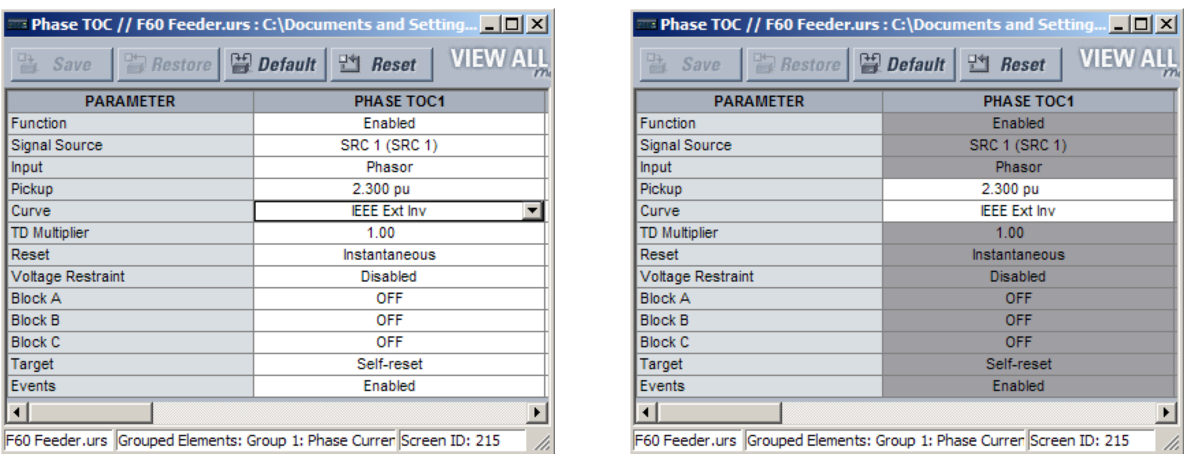
842860A1.CDR

Figure 4–5: APPLYING TEMPLATES VIA THE VIEW IN TEMPLATE MODE SETTINGS COMMAND

Use the following procedure to display settings available for editing and settings locked by the template.

1. Select an installed device or a settings file from the tree menu on the left of the EnerVista UR Setup main screen.
2. Apply the template by selecting the **Template Mode > View All Settings** option.
3. Enter the template password then click **OK** to apply the template.

Once the template has been applied, users are limited to edit the settings specified by the template, but all settings are shown. The effect of applying the template to the phase time overcurrent settings is shown below.



Phase time overcurrent settings window without template applied.

Phase time overcurrent window with template applied via the **Template Mode > View All Settings** command. The template specifies that only the Pickup and Curve settings be available.

842859A1.CDR

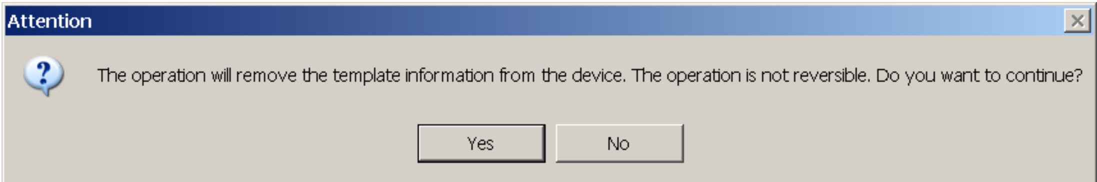
Figure 4–6: APPLYING TEMPLATES VIA THE VIEW ALL SETTINGS COMMAND

e) REMOVING THE SETTINGS TEMPLATE

It can be necessary at some point to remove a settings template. Once a template is removed, it cannot be reapplied and it is necessary to define a new settings template.

1. Select an installed device or settings file from the tree menu on the left of the EnerVista UR Setup main screen.
2. Select the **Template Mode > Remove Settings Template** option.
3. Enter the template password and click **OK** to continue.

4. Verify one more time that you want to remove the template by clicking **Yes**.



The EnerVista software removes all template information and all settings are available.

4.1.6 SECURING AND LOCKING FLEXLOGIC EQUATIONS

The UR allows users to secure parts or all of a FlexLogic equation, preventing unauthorized viewing or modification of critical FlexLogic applications. This is accomplished using the settings template feature to lock individual entries within FlexLogic equations.

Secured FlexLogic equations remain secure when files are sent to and retrieved from any UR-series device.

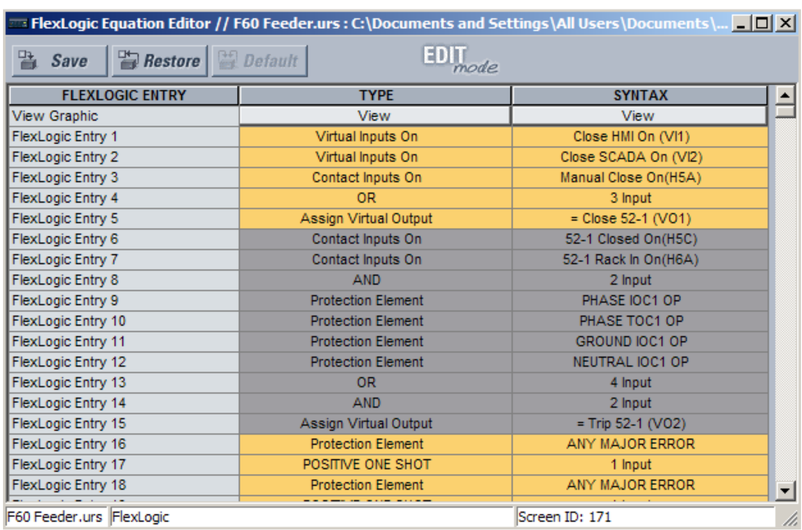
a) LOCKING FLEXLOGIC EQUATION ENTRIES

The following procedure describes how to lock individual entries of a FlexLogic equation.

1. Right-click the settings file or online device and select the **Template Mode > Create Template** item to enable the settings template feature.
2. Select the **FlexLogic > FlexLogic Equation Editor** settings menu item.

   By default, all FlexLogic entries are specified as viewable and displayed against a yellow background. The icon on the upper right of the window also indicates that EnerVista UR Setup is in **EDIT mode**.
3. Specify which entries to lock by clicking on them.

   The locked entries are displayed against a grey background as shown in the example below.

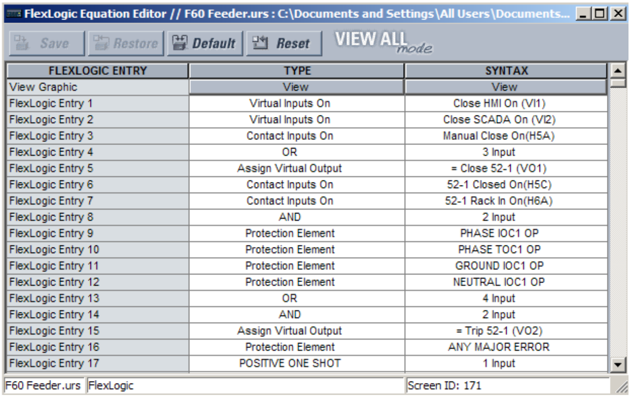


FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Virtual Inputs On	Close HMI On (VI1)
FlexLogic Entry 2	Virtual Inputs On	Close SCADA On (VI2)
FlexLogic Entry 3	Contact Inputs On	Manual Close On(H5A)
FlexLogic Entry 4	OR	3 Input
FlexLogic Entry 5	Assign Virtual Output	= Close 52-1 (VO1)
FlexLogic Entry 6	Contact Inputs On	52-1 Closed On(H5C)
FlexLogic Entry 7	Contact Inputs On	52-1 Rack In On(H6A)
FlexLogic Entry 8	AND	2 Input
FlexLogic Entry 9	Protection Element	PHASE IOC1 OP
FlexLogic Entry 10	Protection Element	PHASE TOC1 OP
FlexLogic Entry 11	Protection Element	GROUND IOC1 OP
FlexLogic Entry 12	Protection Element	NEUTRAL IOC1 OP
FlexLogic Entry 13	OR	4 Input
FlexLogic Entry 14	AND	2 Input
FlexLogic Entry 15	Assign Virtual Output	= Trip 52-1 (VO2)
FlexLogic Entry 16	Protection Element	ANY MAJOR ERROR
FlexLogic Entry 17	POSITIVE ONE SHOT	1 Input
FlexLogic Entry 18	Protection Element	ANY MAJOR ERROR

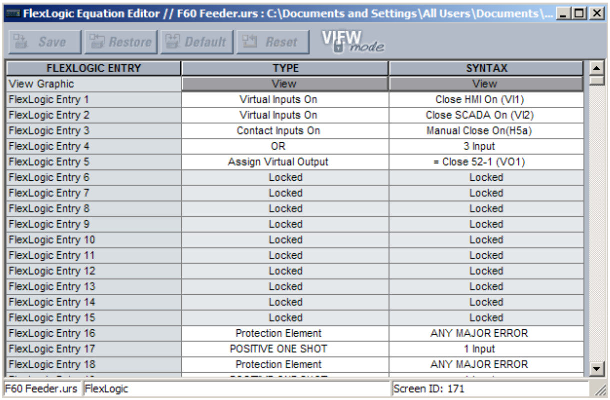
Figure 4–7: LOCKING FLEXLOGIC ENTRIES IN EDIT MODE

4. Click on **Save** to save and apply changes to the settings template.
5. Select the **Template Mode > View In Template Mode** option to view the template.
6. Apply a password to the template then click **OK** to secure the FlexLogic equation.

Once the template has been applied, users are limited to view and edit the FlexLogic entries not locked by the template. The effect of applying the template to the FlexLogic entries in the above procedure is shown below.



Typical FlexLogic™ entries without template applied.



Typical FlexLogic™ entries locked with template via the **Template Mode > View In Template Mode** command.

842861A1.CDR

Figure 4–8: LOCKING FLEXLOGIC ENTRIES THROUGH SETTING TEMPLATES

The FlexLogic entries are also shown as locked in the graphical view (as shown below) and on the front panel display.

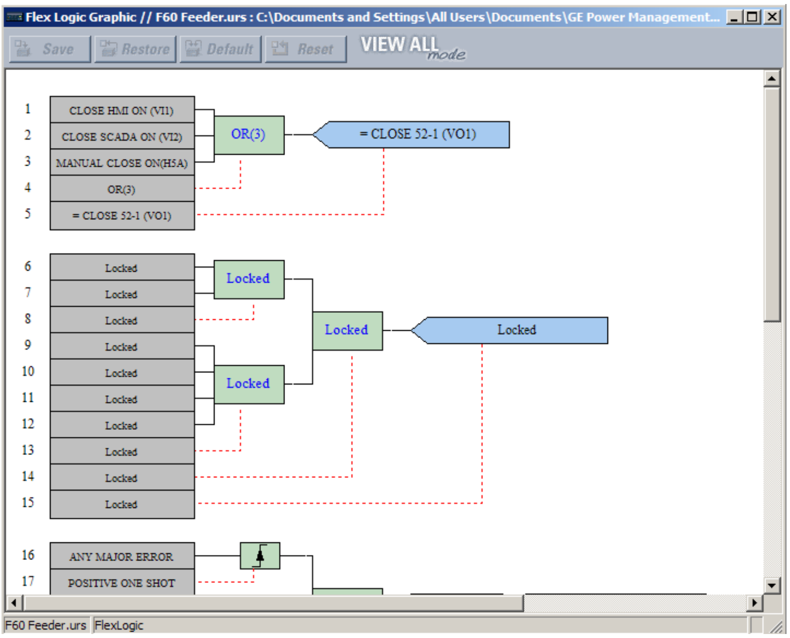


Figure 4–9: SECURED FLEXLOGIC IN GRAPHICAL VIEW

b) LOCKING FLEXLOGIC EQUATIONS TO A SERIAL NUMBER

A settings file and associated FlexLogic equations can also be locked to a specific UR serial number. Once the desired FlexLogic entries in a settings file have been secured, use the following procedure to lock the settings file to a specific serial number.

1. Select the settings file in the offline window.
2. Right-click on the file and select the **Edit Settings File Properties** item.

The following window is displayed.

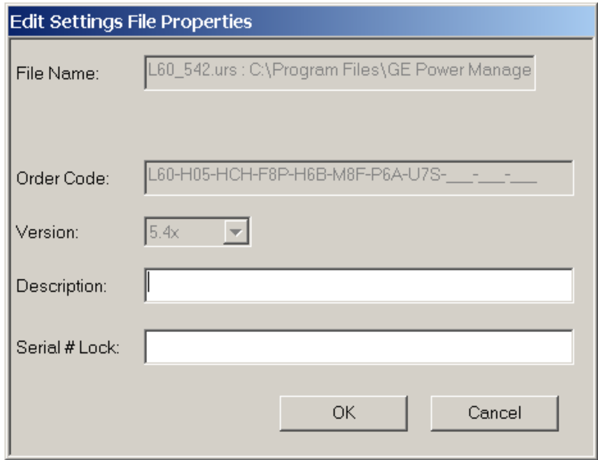

Figure 4–10: TYPICAL SETTINGS FILE PROPERTIES WINDOW

3. Enter the serial number of the F60 device to lock to the settings file in the **Serial # Lock** field.

The settings file and corresponding secure FlexLogic equations are now locked to the F60 device specified by the serial number.

4.1.7 SETTINGS FILE TRACEABILITY

A traceability feature for settings files allows the user to quickly determine if the settings in a F60 device have been changed since the time of installation from a settings file. When a settings file is transferred to a F60 device, the date, time, and serial number of the F60 are sent back to EnerVista UR Setup and added to the settings file on the local PC. This information can be compared with the F60 actual values at any later date to determine if security has been compromised.

The traceability information is only included in the settings file if a complete settings file is either transferred to the F60 device or obtained from the F60 device. Any partial settings transfers by way of drag and drop do not add the traceability information to the settings file.

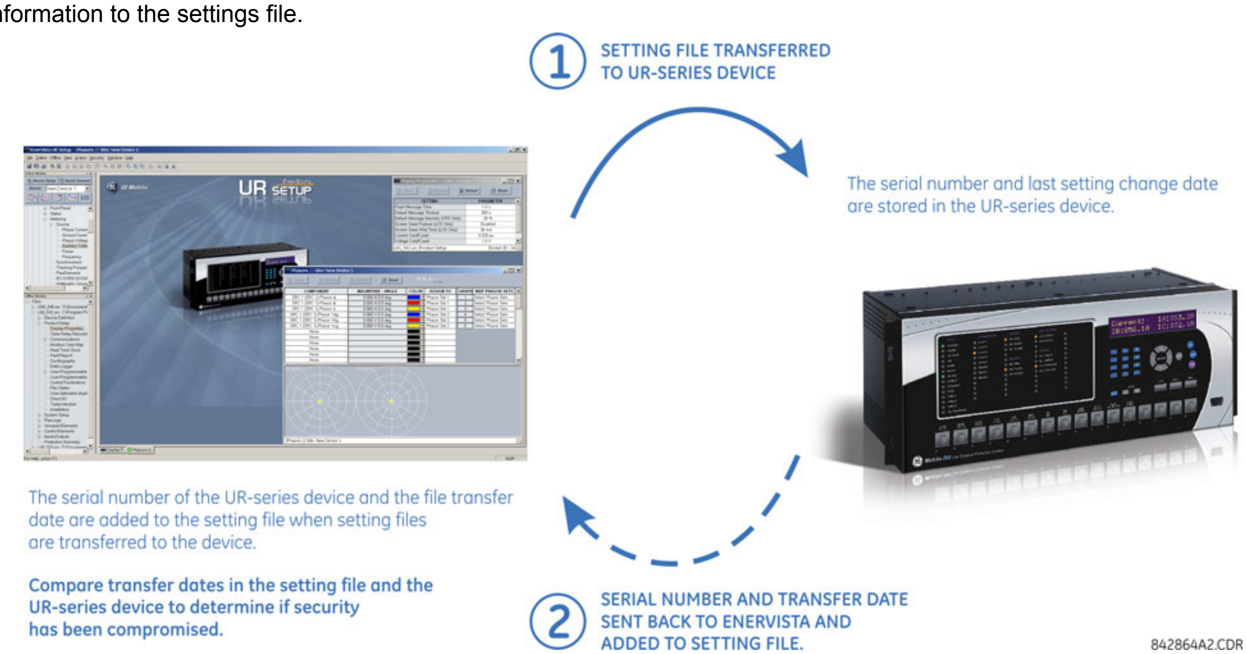

Figure 4–11: SETTINGS FILE TRACEABILITY MECHANISM

With respect to the above diagram, the traceability feature is used as follows.

1. The transfer date of a setting file written to a F60 is logged in the relay and can be viewed via EnerVista UR Setup or the front panel display. Likewise, the transfer date of a setting file saved to a local PC is logged in EnerVista UR Setup.
2. Comparing the dates stored in the relay and on the settings file at any time in the future indicates if any changes have been made to the relay configuration since the settings file was saved.

a) SETTINGS FILE TRACEABILITY INFORMATION

The serial number and file transfer date are saved in the settings files when they are sent to a F60 device.

The F60 serial number and file transfer date are included in the settings file device definition within the EnerVista UR Setup offline window as shown in the example below.

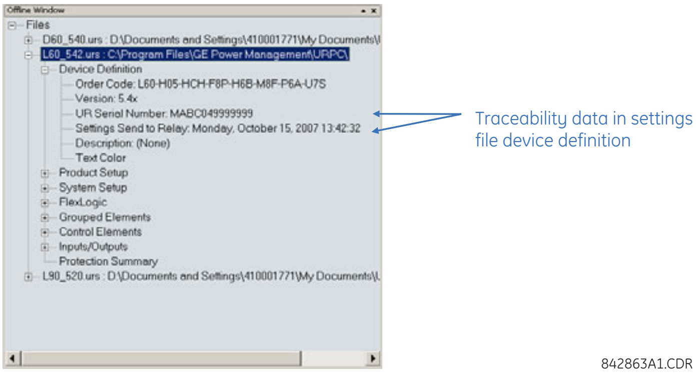

Figure 4–12: DEVICE DEFINITION SHOWING TRACEABILITY DATA

This information is also available in printed settings file reports as shown in the example below.

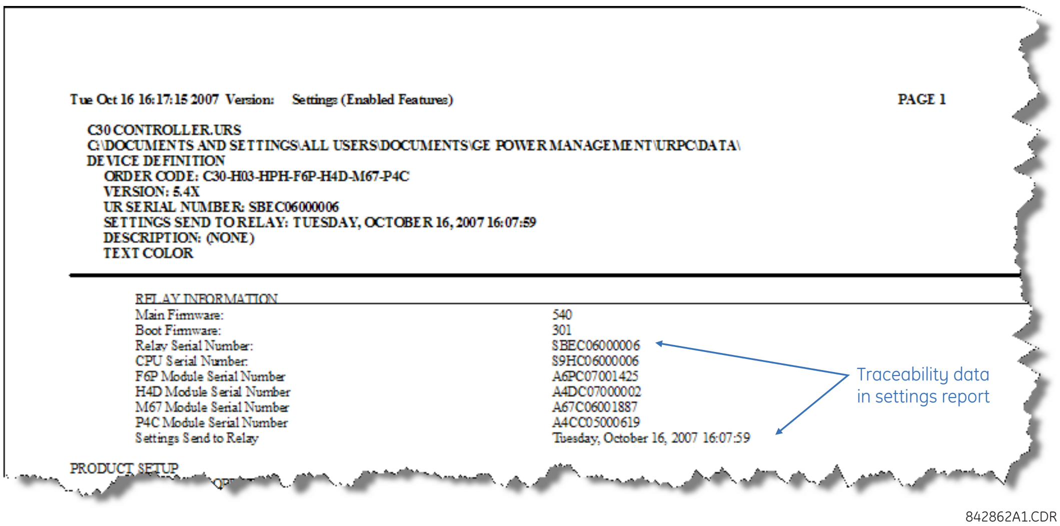

Figure 4–13: SETTINGS FILE REPORT SHOWING TRACEABILITY DATA

b) ONLINE DEVICE TRACEABILITY INFORMATION

The F60 serial number and file transfer date are available for an online device through the actual values. Select the **Actual Values > Product Info > Model Information** menu item within the EnerVista UR Setup online window as shown in the example below.

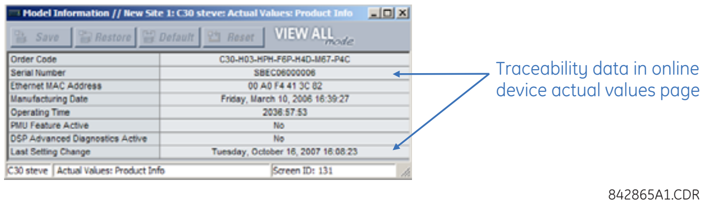

Figure 4–14: TRACEABILITY DATA IN ACTUAL VALUES WINDOW

This information is also available from the front panel display through the following actual values:

ACTUAL VALUES ⇨⇩ PRODUCT INFO ⇨ MODEL INFORMATION ⇨⇩ SERIAL NUMBER
ACTUAL VALUES ⇨⇩ PRODUCT INFO ⇨ MODEL INFORMATION ⇨⇩ LAST SETTING CHANGE

4

c) ADDITIONAL TRACEABILITY RULES

The following additional rules apply for the traceability feature

- If the user changes any settings within the settings file in the offline window, then the traceability information is removed from the settings file.
- If the user creates a new settings file, then no traceability information is included in the settings file.
- If the user converts an existing settings file to another revision, then any existing traceability information is removed from the settings file.
- If the user duplicates an existing settings file, then any traceability information is transferred to the duplicate settings file.

4.2.1 FACEPLATE

a) ENHANCED FACEPLATE

The front panel interface is one of two supported interfaces, the other interface being EnerVista UR Setup software. The front panel interface consists of LED panels, an RS232 port, keypad, LCD display, control pushbuttons, and optional user-programmable pushbuttons.

The faceplate is hinged to allow easy access to the removable modules.

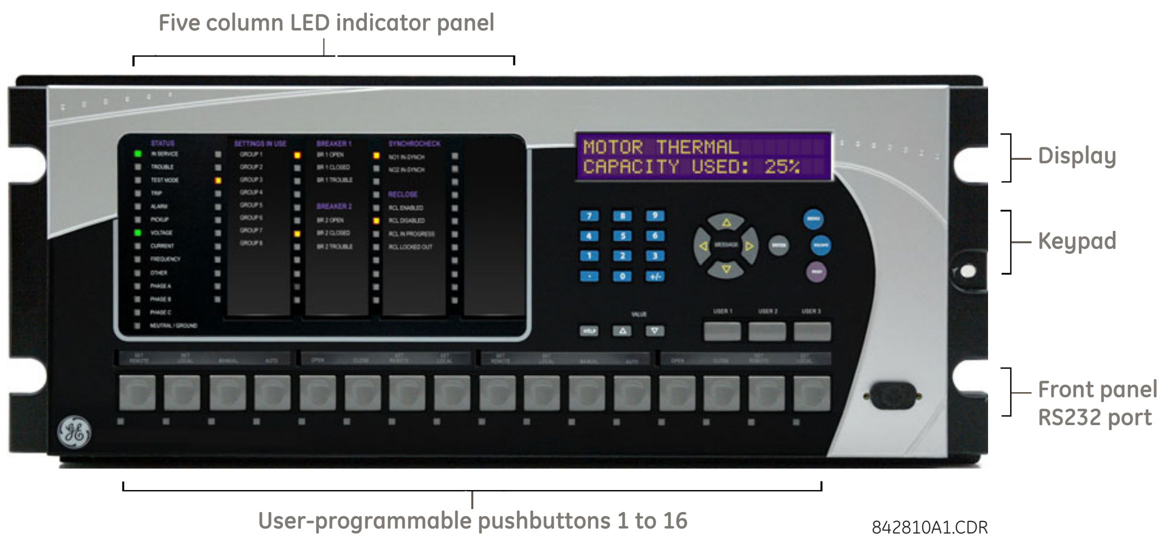

Figure 4–15: UR-SERIES ENHANCED FACEPLATE

b) STANDARD FACEPLATE

There are two interfaces: the front panel and the EnerVista UR Setup software. The front panel interface consists of LED panels, an RS232 port, keypad, LCD display, control pushbuttons, and optional user-programmable pushbuttons.

The faceplate is hinged to allow easy access to the removable modules. There is also a removable dust cover that fits over the faceplate that must be removed in order to access the keypad panel. The following figure shows the horizontal arrangement of the faceplate panels.

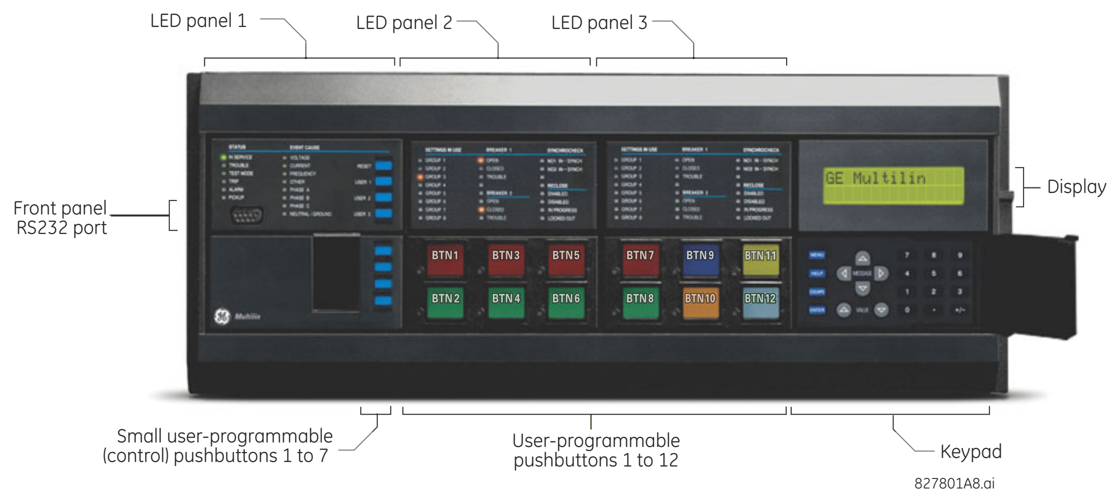

Figure 4–16: UR-SERIES STANDARD HORIZONTAL FACEPLATE PANELS

The following figure shows the vertical arrangement of the faceplate panels for relays ordered with the vertical option.

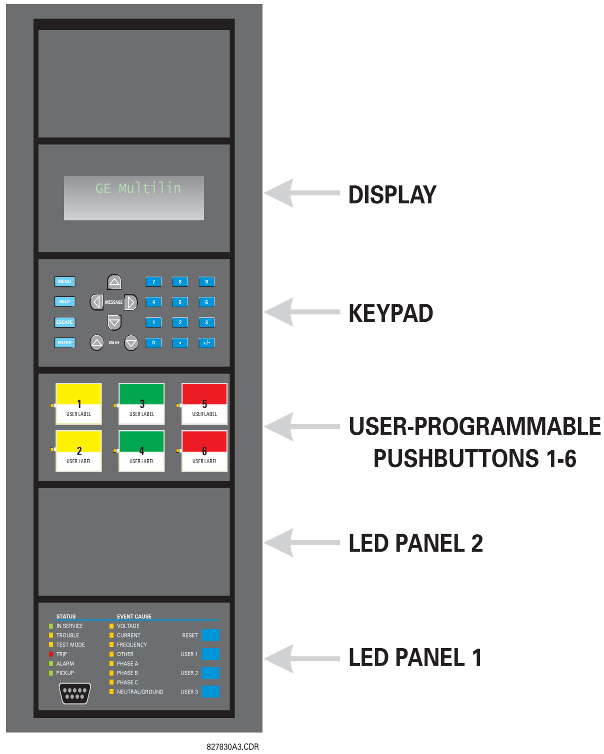

Figure 4–17: UR-SERIES STANDARD VERTICAL FACEPLATE PANELS

4.2.2 LED INDICATORS

a) ENHANCED FACEPLATE

The enhanced front panel display provides five columns of LED indicators. The first column contains 14 status and event cause LEDs, and the next four columns contain the 48 user-programmable LEDs.

The RESET key is used to reset any latched LED indicator or target message, once the condition has been cleared (these latched conditions can also be reset via the **SETTINGS ⇨⇩ INPUT/OUTPUTS ⇨⇩ RESETTING** menu). The RS232 port is intended for connection to a portable PC.

The USER keys are used by the breaker control feature.

Figure 4–18: TYPICAL LED INDICATOR PANEL FOR ENHANCED FACEPLATE

The status indicators in the first column are described below.

- **IN SERVICE**: This LED indicates that control power is applied, all monitored inputs, outputs, and internal systems are OK, and that the device has been programmed.

- **TROUBLE**: This LED indicates that the relay has detected an internal problem.
- **TEST MODE**: This LED indicates that the relay is in test mode.
- **TRIP**: This LED indicates that the FlexLogic operand serving as a trip switch has operated. This indicator always latches; as such, a reset command must be initiated to allow the latch to be reset.
- **ALARM**: This LED indicates that the FlexLogic operand serving as an alarm switch has operated. This indicator is never latched.
- **PICKUP**: This LED indicates that an element is picked up. This indicator is never latched.

The event cause indicators in the first column are described below.

Events cause LEDs are turned on or off by protection elements that have their respective target setting selected as either “Enabled” or “Latched”. If a protection element target setting is “Enabled”, then the corresponding event cause LEDs remain on as long as operate operand associated with the element remains asserted. If a protection element target setting is “Latched”, then the corresponding event cause LEDs turn on when the operate operand associated with the element is asserted and remain on until the RESET button on the front panel is pressed after the operand is reset.

All elements that are able to discriminate faulted phases can independently turn off or on the phase A, B or C LEDs. This includes phase instantaneous overcurrent, phase undervoltage, etc. This means that the phase A, B, and C operate operands for individual protection elements are ORed to turn on or off the phase A, B or C LEDs.

- **VOLTAGE**: This LED indicates voltage was involved.
- **CURRENT**: This LED indicates current was involved.
- **FREQUENCY**: This LED indicates frequency was involved.
- **OTHER**: This LED indicates a composite function was involved.
- **PHASE A**: This LED indicates phase A was involved.
- **PHASE B**: This LED indicates phase B was involved.
- **PHASE C**: This LED indicates phase C was involved.
- **NEUTRAL/GROUND**: This LED indicates that neutral or ground was involved.

The user-programmable LEDs consist of 48 amber LED indicators in four columns. The operation of these LEDs is user-defined. Support for applying a customized label beside every LED is provided. Default labels are shipped in the label package of every F60, together with custom templates. The default labels can be replaced by user-printed labels.

User customization of LED operation is of maximum benefit in installations where languages other than English are used to communicate with operators. Refer to the *User-programmable LEDs* section in chapter 5 for the settings used to program the operation of the LEDs on these panels.

b) STANDARD FACEPLATE

The standard faceplate consists of three panels with LED indicators, keys, and a communications port. The RESET key is used to reset any latched LED indicator or target message, once the condition has been cleared (these latched conditions can also be reset via the **SETTINGS ⇨⇩ INPUT/OUTPUTS ⇨⇩ RESETTING** menu). The RS232 port is for connection to a computer.

The USER keys are used by the breaker control feature.

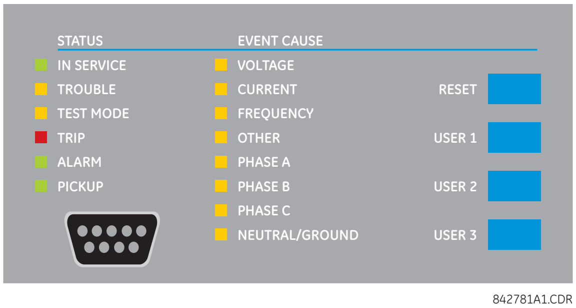

Figure 4–19: LED PANEL 1

STATUS INDICATORS:

- **IN SERVICE**: Indicates that control power is applied; all monitored inputs/outputs and internal systems are OK; the relay has been programmed.
- **TROUBLE**: Indicates that the relay has detected an internal problem.
- **TEST MODE**: Indicates that the relay is in test mode.
- **TRIP**: Indicates that the selected FlexLogic operand serving as a Trip switch has operated. This indicator always latches; the reset command must be initiated to allow the latch to be reset.
- **ALARM**: Indicates that the selected FlexLogic operand serving as an Alarm switch has operated. This indicator is never latched.
- **PICKUP**: Indicates that an element is picked up. This indicator is never latched.

EVENT CAUSE INDICATORS:

Events cause LEDs are turned on or off by protection elements that have their respective target setting selected as either "Enabled" or "Latched". If a protection element target setting is "Enabled", then the corresponding event cause LEDs remain on as long as operate operand associated with the element remains asserted. If a protection element target setting is "Latched", then the corresponding event cause LEDs turn on when the operate operand associated with the element is asserted and remain on until the RESET button on the front panel is pressed after the operand is reset.

All elements that are able to discriminate faulted phases can independently turn off or on the phase A, B or C LEDs. This includes phase instantaneous overcurrent, phase undervoltage, etc. This means that the phase A, B, and C operate operands for individual protection elements are ORed to turn on or off the phase A, B or C LEDs.

- **VOLTAGE**: Indicates voltage was involved.
- **CURRENT**: Indicates current was involved.
- **FREQUENCY**: Indicates frequency was involved.
- **OTHER**: Indicates a composite function was involved.
- **PHASE A**: Indicates phase A was involved.
- **PHASE B**: Indicates phase B was involved.
- **PHASE C**: Indicates phase C was involved.
- **NEUTRAL/GROUND**: Indicates that neutral or ground was involved.

USER-PROGRAMMABLE INDICATORS:

The second and third provide 48 amber LED indicators whose operation is controlled by the user. Support for applying a customized label beside every LED is provided.

User customization of LED operation is of maximum benefit in installations where languages other than English are used to communicate with operators. Refer to the *User-programmable LEDs* section in chapter 5 for the settings used to program the operation of the LEDs on these panels.

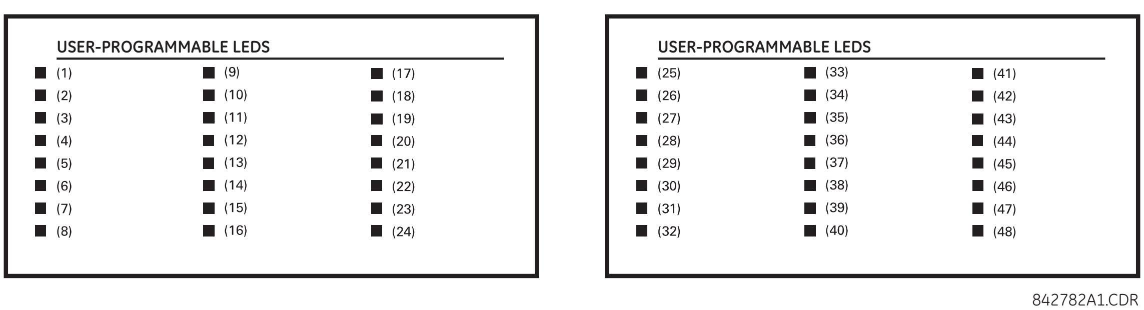

Figure 4–20: LED PANELS 2 AND 3 (INDEX TEMPLATE)

DEFAULT LABELS FOR LED PANEL 2:

The default labels are intended to represent:

- **GROUP 1...6**: The illuminated GROUP is the active settings group.
- **BREAKER 1(2) OPEN**: The breaker is open.
- **BREAKER 1(2) CLOSED**: The breaker is closed.
- **BREAKER 1(2) TROUBLE**: A problem related to the breaker has been detected.
- **SYNCHROCHECK NO1(2) IN-SYNCH**: Voltages have satisfied the synchrocheck element.
- **RECLOSE ENABLED**: The recloser is operational.
- **RECLOSE DISABLED**: The recloser is not operational.
- **RECLOSE IN PROGRESS**: A reclose operation is in progress.
- **RECLOSE LOCKED OUT**: The recloser is not operational and requires a reset.

NOTE

Firmware revisions 2.9x and earlier support eight user setting groups; revisions 3.0x and higher support six setting groups. For convenience of users using earlier firmware revisions, the relay panel shows eight setting groups. Please note that the LEDs, despite their default labels, are fully user-programmable.

The relay is shipped with the default label for the LED panel 2. The LEDs, however, are not pre-programmed. To match the pre-printed label, the LED settings must be entered as shown in the *User-programmable LEDs* section of chapter 5. The LEDs are fully user-programmable. The default labels can be replaced by user-printed labels for both panels as explained in the following section.

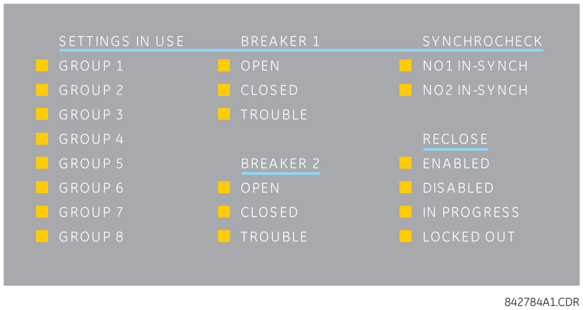

Figure 4–21: LED PANEL 2 (DEFAULT LABELS)

4.2.3 CUSTOM LABELING OF LEDS

a) ENHANCED FACEPLATE

The following procedure requires these pre-requisites:

- EnerVista UR Setup software is installed and operational
- The F60 settings have been saved to a settings file
- The F60 front panel label cutout sheet (GE Multilin part number 1006-0047) has been downloaded from http://www.gedigitalenergy.com/products/support/ur/URLEDenhanced.doc and printed
- Small-bladed knife

To create custom LED labels for the enhanced front panel display:

1. Start the EnerVista UR Setup software.

2. Select the **Front Panel Report** item at the bottom of the menu tree for the settings file. The front panel report window displays.

Figure 4–22: FRONT PANEL REPORT WINDOW

3. Enter the text to appear next to each LED and above each user-programmable pushbuttons in the fields provided.
4. Feed the F60 front panel label cutout sheet into a printer and press the **Print** button in the front panel report window.
5. When printing is complete, fold the sheet along the perforated lines and punch out the labels.
6. Remove the F60 label insert tool from the package and bend the tabs as described in the following procedures. These tabs are used for removal of the default and custom LED labels.

NOTE

It is important that the tool be used EXACTLY as shown below, with the printed side containing the GE part number facing the user.

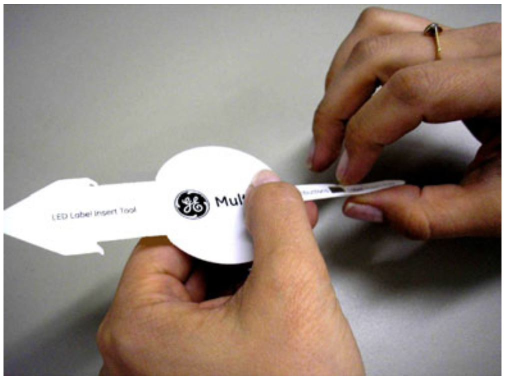
The label package shipped with every F60 contains the three default labels shown below, the custom label template sheet, and the label removal tool.

If the default labels are suitable for your application, insert them in the appropriate slots and program the LEDs to match them. If you require custom labels, follow the procedures below to remove the original labels and insert the new ones.

The following procedure describes how to setup and use the label removal tool.

1. Bend the tabs at the left end of the tool upwards as shown below.

2. Bend the tab at the center of the tool tail as shown below.



The following procedure describes how to remove the LED labels from the F60 enhanced front panel and insert the custom labels.

1. Use the knife to lift the LED label and slide the label tool underneath. Make sure the bent tabs are pointing away from the relay.

2. Slide the label tool under the LED label until the tabs snap out as shown below. This attaches the label tool to the LED label.

3. Remove the tool and attached LED label as shown below.

4. Slide the new LED label inside the pocket until the text is properly aligned with the LEDs, as shown below.

The following procedure describes how to remove the user-programmable pushbutton labels from the F60 enhanced front panel and insert the custom labels.

1. Use the knife to lift the pushbutton label and slide the tail of the label tool underneath, as shown below. Make sure the bent tab is pointing away from the relay.

2. Slide the label tool under the user-programmable pushbutton label until the tabs snap out as shown below. This attaches the label tool to the user-programmable pushbutton label.

3. Remove the tool and attached user-programmable pushbutton label as shown below.

4. Slide the new user-programmable pushbutton label inside the pocket until the text is properly aligned with the buttons, as shown below.

4

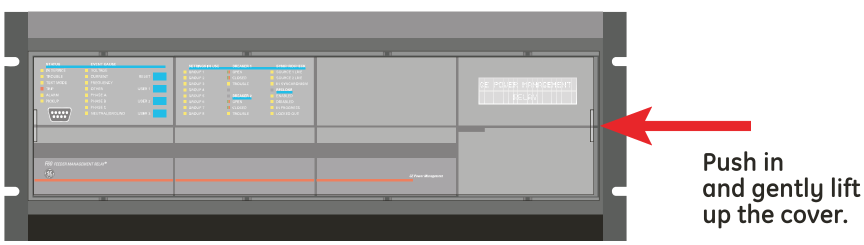
b) STANDARD FACEPLATE

Custom labeling of an LED-only panel is facilitated through a Microsoft Word file available from the following URL:

http://www.gedigitalenergy.com/products/support/ur/GET-8494A.doc

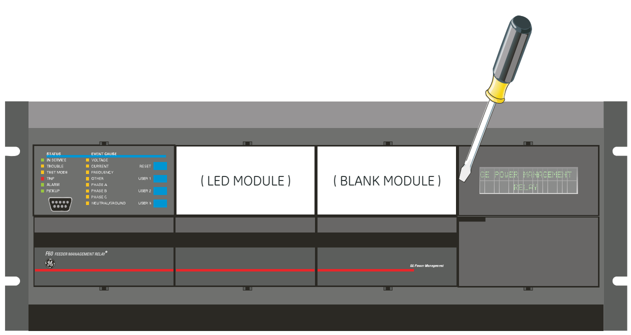
This file provides templates and instructions for creating appropriate labeling for the LED panel. The following procedures are contained in the downloadable file. The panel templates provide relative LED locations and located example text (x) edit boxes. The following procedure demonstrates how to install/uninstall the custom panel labeling.

1. Remove the clear Lexan Front Cover (GE Multilin part number: 1501-0014).



842771A1.CDR

2. Pop out the LED module and/or the blank module with a screwdriver as shown below. Be careful not to damage the plastic covers.



842722A1.CDR

3. Place the left side of the customized module back to the front panel frame, then snap back the right side.
4. Put the clear Lexan front cover back into place.

The following items are required to customize the F60 display module:

- Black and white or color printer (color preferred)
- Microsoft Word 97 or later software for editing the template
- 1 each of: 8.5" x 11" white paper, exacto knife, ruler, custom display module (GE Multilin Part Number: 1516-0069), and a custom module cover (GE Multilin Part Number: 1502-0015)

The following procedure describes how to customize the F60 display module:

1. Open the LED panel customization template with Microsoft Word. Add text in places of the **LED x** text placeholders on the template(s). Delete unused place holders as required.
2. When complete, save the Word file to your computer for future use.
3. Print the template(s) to a local printer.
4. From the printout, cut-out the Background Template from the three windows, using the cropmarks as a guide.
5. Put the Background Template on top of the custom display module (GE Multilin Part Number: 1513-0069) and snap the clear custom module cover (GE Multilin Part Number: 1502-0015) over it and the templates.

4.2.4 DISPLAY

All messages are displayed on a backlit liquid crystal display (LCD) to make them visible under poor lighting conditions. While the keypad and display are not actively being used, the display defaults to user-defined messages. Any high-priority event-driven message automatically overrides the default message and appears on the display.

4.2.5 BREAKER CONTROL

a) INTRODUCTION

The F60 can interface with associated circuit breakers. In many cases the application monitors the state of the breaker, that can be presented on faceplate LEDs, along with a breaker trouble indication. Breaker operations can be manually initiated from faceplate keypad or automatically initiated from a FlexLogic operand. A setting is provided to assign names to each breaker; this user-assigned name is used for the display of related flash messages. These features are provided for two breakers; the user can use only those portions of the design relevant to a single breaker, which must be breaker 1.

For the following discussion it is assumed the **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ BREAKERS ⇨ BREAKER 1(2) ⇨ BREAKER FUNCTION** setting is "Enabled" for each breaker.

b) CONTROL MODE SELECTION AND MONITORING

Installations can require that a breaker is operated in the three-pole only mode (3-pole), or in the one and three-pole (1-pole) mode, selected by setting. If the mode is selected as three-pole, a single input tracks the breaker open or closed position. If the mode is selected as one-pole, all three breaker pole states must be input to the relay. These inputs must be in agreement to indicate the position of the breaker.

For the following discussion it is assumed the **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ BREAKERS ⇨ BREAKER 1(2) ⇨⇩ BREAKER 1(2) PUSH BUTTON CONTROL** setting is “Enabled” for each breaker.

c) FACEPLATE (USER KEY) CONTROL

After the 30 minute interval during which command functions are permitted after a correct command password, the user cannot open or close a breaker via the keypad. The following discussions begin from the not-permitted state.

d) CONTROL OF TWO BREAKERS

For the following example setup, the `(Name)` field represents the user-programmed variable name.

For this application (setup shown below), the relay is connected and programmed for both breaker 1 and breaker 2. The USER 1 key performs the selection of which breaker is to be operated by the USER 2 and USER 3 keys. The USER 2 key is used to manually close the breaker and the USER 3 key is used to manually open the breaker.

ENTER COMMAND PASSWORD	This message appears when the USER 1, USER 2, or USER 3 key is pressed and a **COMMAND PASSWORD** is required; i.e. if **COMMAND PASSWORD** is enabled and no commands have been issued within the last 30 minutes.
Press USER 1 To Select Breaker	This message appears if the correct password is entered or if none is required. This message displays for 30 seconds or until the USER 1 key is pressed again.
BKR1-(Name) SELECTED USER 2=CLS/USER 3=OP	This message is displayed after the USER 1 key is pressed for the second time. Three possible actions can be performed from this state within 30 seconds as per items **(1)**, **(2)** and **(3)** below:
(1) USER 2 OFF/ON To Close BKR1-(Name)	If the USER 2 key is pressed, this message appears for 20 seconds. If the USER 2 key is pressed again within that time, a signal is created that can be programmed to operate an output relay to close breaker 1.
(2) USER 3 OFF/ON To Open BKR1-(Name)	If the USER 3 key is pressed, this message appears for 20 seconds. If the USER 3 key is pressed again within that time, a signal is created that can be programmed to operate an output relay to open breaker 1.
(3) BKR2-(Name) SELECTED USER 2=CLS/USER 3=OP	If the USER 1 key is pressed at this step, this message appears showing that a different breaker is selected. Three possible actions can be performed from this state as per **(1)**, **(2)** and **(3)**. Repeatedly pressing the USER 1 key alternates between available breakers. Pressing keys other than USER 1, 2, or 3 at any time aborts the breaker control function.

4

e) CONTROL OF ONE BREAKER

For this application the relay is connected and programmed for breaker 1 only. Operation for this application is identical to that described above for two breakers.

4.2.6 KEYPAD

Display messages are organized into pages under the following headings: actual values, settings, commands, and targets. The MENU key navigates through these pages. Each heading page is divided further into logical subgroups.

The MESSAGE keys navigate through the subgroups. The VALUE keys increment or decrement numerical setting values when in programming mode. These keys also scroll through alphanumeric values in the text edit mode. Alternatively, values can be entered with the numeric keypad.

The decimal key initiates and advances to the next character in text edit mode or enters a decimal point.

The HELP key can be pressed at any time for context-sensitive help messages.

The ENTER key stores altered setting values.

When entering an IP address on the front panel, key in the first sequence of the number, then press the • key for the decimal place. For example, for 127.0.0.1, press 127, then •, then 0, then •, then 0, then •, then 1. To save the address, press the ENTER key.

4.2.7 MENUS

a) NAVIGATION

Press the MENU key to select a header display page (top-level menu). The header title appears momentarily followed by a header display page menu item. Each press of the MENU key advances through the following main heading pages:

- Actual values
- Settings
- Commands
- Targets

- User displays (when enabled)

b) HIERARCHY

The setting and actual value messages are arranged hierarchically. The header display pages are indicated by double scroll bar characters (■■), while sub-header pages are indicated by single scroll bar characters (■). The header display pages represent the highest level of the hierarchy and the sub-header display pages fall below this level. The MESSAGE UP and DOWN keys move within a group of headers, sub-headers, setting values, or actual values. Continually pressing the MESSAGE RIGHT key from a header display displays specific information for the header category. Conversely, continually pressing the MESSAGE LEFT key from a setting value or actual value display returns to the header display.

c) EXAMPLE MENU NAVIGATION

■■ ACTUAL VALUES ■■ STATUS	Press the MENU key until the header for the first Actual Values page appears. This page contains system and relay status information. Repeatedly press the MESSAGE keys to display the other actual value headers.
⇩	
■■ SETTINGS ■■ PRODUCT SETUP	Press the MENU key until the header for the first page of Settings appears. This page contains settings to configure the relay.
⇩	
■■ SETTINGS ■■ SYSTEM SETUP	Press the MESSAGE DOWN key to move to the next Settings page. This page contains settings for System Setup. Repeatedly press the MESSAGE UP and DOWN keys to display the other setting headers and then back to the first Settings page header.
⇩	
■ PASSWORD ■ SECURITY	From the Settings page one header (Product Setup), press the MESSAGE RIGHT key once to display the first sub-header (Password Security).
⇩	
ACCESS LEVEL: Restricted	Press the MESSAGE RIGHT key once more and this will display the first setting for Password Security. Pressing the MESSAGE DOWN key repeatedly will display the remaining setting messages for this sub-header.
⇩	
■ PASSWORD ■ SECURITY	Press the MESSAGE LEFT key once to move back to the first sub-header message.
⇩	
■ DISPLAY ■ PROPERTIES	Pressing the MESSAGE DOWN key displays the second setting sub-header associated with the Product Setup header.
⇩	
FLASH MESSAGE TIME: 1.0 s	Press the MESSAGE RIGHT key once more to display the first setting for Display Properties.
⇩	
DEFAULT MESSAGE INTENSITY: 25%	To view the remaining settings associated with the Display Properties subheader, repeatedly press the MESSAGE DOWN key. The last message appears as shown.

4

4.2.8 CHANGING SETTINGS

a) ENTERING NUMERICAL DATA

Each numerical setting has its own minimum, maximum, and increment value associated with it. These parameters define what values are acceptable for a setting.

```
FLASH MESSAGE
TIME:   1.0 s
```

For example, select the SETTINGS ⇨ PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨ FLASH MESSAGE TIME setting.

⇩

```
MINIMUM:    0.5
MAXIMUM:   10.0
```

Press the HELP key to view the minimum and maximum values. Press the HELP key again to view the next context sensitive help message.

Two methods of editing and storing a numerical setting value are available.

- **0 to 9 and decimal point**: The relay numeric keypad works the same as that of any electronic calculator. A number is entered one digit at a time. The leftmost digit is entered first and the rightmost digit is entered last. Pressing the MESSAGE LEFT key or pressing the ESCAPE key, returns the original value to the display.
- **VALUE keys**: The VALUE UP key increments the displayed value by the step value, up to the maximum value allowed. While at the maximum value, pressing the VALUE UP key again allows the setting selection to continue upward from the minimum value. The VALUE DOWN key decrements the displayed value by the step value, down to the minimum value. While at the minimum value, pressing the VALUE DOWN key again allows the setting selection to continue downward from the maximum value.

```
FLASH MESSAGE
TIME:   2.5 s
```

As an example, set the flash message time setting to 2.5 seconds. Press the appropriate numeric keys in the sequence “2 . 5". The display message changes as the digits are being entered.

⇩

```
NEW SETTING
HAS BEEN STORED
```

Until ENTER is pressed, editing changes are not registered by the relay. Therefore, press ENTER to store the new value in memory. This flash message momentarily appears as confirmation of the storing process. Numerical values which contain decimal places are rounded-off if more decimal place digits are entered than specified by the step value.

b) ENTERING ENUMERATION DATA

Enumeration settings have data values which are part of a set, whose members are explicitly defined by a name. A set is comprised of two or more members.

```
ACCESS LEVEL:
Restricted
```

For example, the selections available for **ACCESS LEVEL** are "Restricted", "Command", "Setting", and "Factory Service".

Enumeration type values are changed using the VALUE keys. The VALUE UP key displays the next selection while the VALUE DOWN key displays the previous selection.

```
ACCESS LEVEL:
Setting
```

If the **ACCESS LEVEL** needs to be "Setting", press the VALUE keys until the proper selection is displayed. Press HELP at any time for the context sensitive help messages.

⇩

```
NEW SETTING
HAS BEEN STORED
```

Changes are not registered by the relay until the ENTER key is pressed. Pressing ENTER stores the new value in memory. This flash message momentarily appears as confirmation of the storing process.

c) ENTERING ALPHANUMERIC TEXT

Text settings have data values which are fixed in length, but user-defined in character. They can be upper case letters, lower case letters, numerals, and a selection of special characters.

There are several places where text messages can be programmed to allow the relay to be customized for specific applications. One example is the Message Scratchpad. Use the following procedure to enter alphanumeric text messages.

For example: to enter the text, “Breaker #1”.

1. Press the decimal point to enter text edit mode.
2. Press the VALUE keys until the character 'B' appears; press the decimal key to advance the cursor to the next position.
3. Repeat step 2 for the remaining characters: r,e,a,k,e,r, ,#,1.
4. Press ENTER to store the text.
5. If you have any problem, press HELP to view context sensitive help. Flash messages appear sequentially for several seconds each. For the case of a text setting message, pressing HELP displays how to edit and store new values.

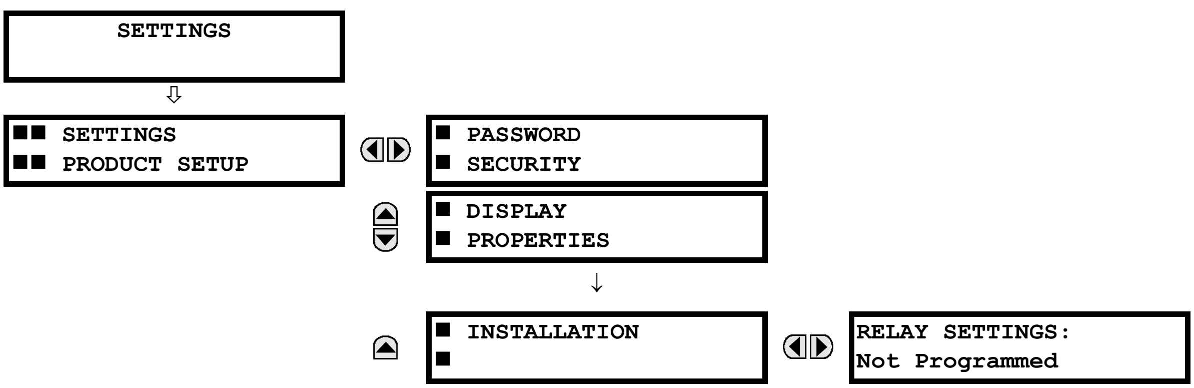
d) ACTIVATING THE RELAY

```
RELAY SETTINGS:
Not Programmed
```

When the relay is powered up, the Trouble LED is on, the In Service LED off, and this message displayed, indicating the relay is in the "Not Programmed" state and is safeguarding (output relays blocked) against the installation of a relay whose settings have not been entered. This message remains until the relay is explicitly put in the "Programmed" state.

To change the **RELAY SETTINGS**: "Not Programmed" mode to "Programmed", proceed as follows:

1. Press the MENU key until the **SETTINGS** header flashes momentarily and the **PRODUCT SETUP** message appears on the display.
2. Press the MESSAGE RIGHT key until the **PASSWORD SECURITY** message appears on the display.
3. Press the MESSAGE DOWN key until the **INSTALLATION** message appears on the display.
4. Press the MESSAGE RIGHT key until the **RELAY SETTINGS: Not Programmed** message is displayed.



5. After the **RELAY SETTINGS: Not Programmed** message appears on the display, press the VALUE keys change the selection to "Programmed".
6. Press the ENTER key.

```
RELAY SETTINGS:        RELAY SETTINGS:        NEW SETTING
Not Programmed         Programmed             HAS BEEN STORED
```

7. When the "NEW SETTING HAS BEEN STORED" message appears, the relay is in "Programmed" state and the In Service LED turns on.

e) ENTERING INITIAL PASSWORDS

The information in this section refers to password security. For information on how to set or change CyberSentry passwords, see the Settings > Product Setup > Security > CyberSentry section in the next chapter.

The F60 supports password entry from a local or remote connection.

Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the faceplate RS232 connection. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

To enter the initial setting (or command) password, proceed as follows:

1. Press the MENU key until the **SETTINGS** header flashes momentarily and the **PRODUCT SETUP** message appears on the display.
2. Press the MESSAGE RIGHT key until the **ACCESS LEVEL** message appears on the display.
3. Press the MESSAGE DOWN key until the **CHANGE LOCAL PASSWORDS** message appears on the display.
4. Press the MESSAGE RIGHT key until the **CHANGE SETTING PASSWORD** or **CHANGE COMMAND PASSWORD** message appears on the display.

```
■■ PASSWORD          ACCESS LEVEL:
■■ SECURITY          Restricted

                     ■ CHANGE LOCAL       CHANGE COMMAND
                     ■ PASSWORDS          PASSWORD: No

                                          CHANGE SETTING
                                          PASSWORD: No

                                          ENCRYPTED COMMAND
                                          PASSWORD: ---------

                                          ENCRYPTED SETTING
                                          PASSWORD: ---------
```

5. After the **CHANGE...PASSWORD** message appears on the display, press the VALUE UP or DOWN key to change the selection to "Yes".
6. Press the ENTER key and the display prompts you to **ENTER NEW PASSWORD**.
7. Type in a numerical password (up to 10 characters) and press the ENTER key.
8. When the **VERIFY NEW PASSWORD** is displayed, re-type in the same password and press ENTER.

```
CHANGE SETTING
PASSWORD: No

CHANGE SETTING        ENTER NEW                VERIFY NEW
PASSWORD: Yes         PASSWORD: ##########     PASSWORD: ##########

                                               NEW PASSWORD
                                               HAS BEEN STORED
```

9. When the **NEW PASSWORD HAS BEEN STORED** message appears, your new Setting (or Command) Password will be active.

4

f) CHANGING EXISTING PASSWORD

To change an existing password, follow the instructions in the previous section with the following exception. A message prompts you to type in the existing password (for each security level) before a new password can be entered.

g) INVALID PASSWORD ENTRY

When an incorrect command or setting password has been entered via the faceplate interface three times within a 3-minute time span, the LOCAL ACCESS DENIED FlexLogic operand is set to "On" and the F60 does not allow settings or command level access via the faceplate interface for the next five minutes, or in the event that an incorrect Command Or Setting password has been entered via the any external communications interface three times within a 3-minute time span, the REMOTE ACCESS DENIED FlexLogic operand is set to "On" and the F60 does not allow settings or command access via the any external communications interface for the next five minutes.

In the event that an incorrect Command or Setting password has been entered via the any external communications interface three times within a three-minute time span, the REMOTE ACCESS DENIED FlexLogic operand is set to “On” and the F60 does not allow Settings or Command access via the any external communications interface for the next ten minutes. The REMOTE ACCESS DENIED FlexLogic operand is set to “Off” after the expiration of the ten-minute timeout.

5.1.2 INTRODUCTION TO ELEMENTS

5

In the design of UR relays, the term *element* is used to describe a feature that is based around a comparator. The comparator is provided with an input (or set of inputs) that is tested against a programmed setting (or group of settings) to determine if the input is within the defined range that will set the output to logic 1, also referred to as *setting the flag*. A single comparator may make multiple tests and provide multiple outputs; for example, the time overcurrent comparator sets a pickup flag when the current input is above the setting and sets an operate flag when the input current has been at a level above the pickup setting for the time specified by the time-current curve settings. All comparators use analog parameter actual values as the input.

NOTE

The exception to the above rule are the digital elements, which use logic states as inputs.

Elements are arranged into two classes, *grouped* and *control*. Each element classed as a grouped element is provided with six alternate sets of settings, in setting groups numbered 1 through 6. The performance of a grouped element is defined by the setting group that is active at a given time. The performance of a control element is independent of the selected active setting group.

The main characteristics of an element are shown on the element logic diagram. This includes the inputs, settings, fixed logic, and the output operands generated (abbreviations used on scheme logic diagrams are defined in Appendix F).

Some settings for current and voltage elements are specified in per-unit (pu) calculated quantities:

pu quantity = (actual quantity) / (base quantity)

For current elements, the *base quantity* is the nominal secondary or primary current of the CT.

Where the current source is the sum of two CTs with different ratios, the base quantity will be the common secondary or primary current to which the sum is scaled (that is, normalized to the larger of the two rated CT inputs). For example, if CT1 = 300 / 5 A and CT2 = 100 / 5 A, then in order to sum these, CT2 is scaled to the CT1 ratio. In this case, the base quantity will be 5 A secondary or 300 A primary.

For voltage elements the base quantity is the nominal primary voltage of the protected system which corresponds (based on VT ratio and connection) to secondary VT voltage applied to the relay.

For example, on a system with a 13.8 kV nominal primary voltage and with 14400:120 V delta-connected VTs, the secondary nominal voltage (1 pu) would be:

$$\frac{13800}{14400} \times 120 = 115 \text{ V} \quad \textbf{(EQ 5.1)}$$

For wye-connected VTs, the secondary nominal voltage (1 pu) would be:

$$\frac{13800}{14400} \times \frac{120}{\sqrt{3}} = 66.4 \text{ V} \quad \textbf{(EQ 5.2)}$$

Many settings are common to most elements and are discussed below:

- **FUNCTION setting:** This setting programs the element to be operational when selected as "Enabled". The factory default is "Disabled". Once programmed to "Enabled", any element associated with the function becomes active and all options become available.
- **NAME setting:** This setting is used to uniquely identify the element.
- **SOURCE setting:** This setting is used to select the parameter or set of parameters to be monitored.
- **PICKUP setting:** For simple elements, this setting is used to program the level of the measured parameter above or below which the pickup state is established. In more complex elements, a set of settings may be provided to define the range of the measured parameters which will cause the element to pickup.
- **PICKUP DELAY setting:** This setting sets a time-delay-on-pickup, or on-delay, for the duration between the pickup and operate output states.
- **RESET DELAY setting:** This setting is used to set a time-delay-on-dropout, or off-delay, for the duration between the Operate output state and the return to logic 0 after the input transits outside the defined pickup range.
- **BLOCK setting:** The default output operand state of all comparators is a logic 0 or "flag not set". The comparator remains in this default state until a logic 1 is asserted at the RUN input, allowing the test to be performed. If the RUN input changes to logic 0 at any time, the comparator returns to the default state. The RUN input is used to supervise the comparator. The BLOCK input is used as one of the inputs to RUN control.
- **TARGET setting:** This setting is used to define the operation of an element target message. When set to **"**Disabled**"**, no target message or illumination of a faceplate LED indicator is issued upon operation of the element. When set to "Self-Reset", the target message and LED indication follow the operate state of the element, and self-resets once the operate element condition clears. When set to "Latched", the target message and LED indication will remain visible after the element output returns to logic 0 until a RESET command is received by the relay.
- **EVENTS setting:** This setting is used to control whether the pickup, dropout or operate states are recorded by the event recorder. When set to "Disabled", element pickup, dropout or operate are not recorded as events. When set to "Enabled", events are created for:

  (Element) PKP (pickup)
  (Element) DPO (dropout)
  (Element) OP (operate)

  The DPO event is created when the measure and decide comparator output transits from the pickup state (logic 1) to the dropout state (logic 0). This could happen when the element is in the operate state if the reset delay time is not 0.

5.1.3 INTRODUCTION TO AC SOURCES

a) BACKGROUND

The F60 may be used on systems with breaker-and-a-half or ring bus configurations. In these applications, each of the two three-phase sets of individual phase currents (one associated with each breaker) can be used as an input to a breaker failure element. The sum of both breaker phase currents and 3I_0 residual currents may be required for the circuit relaying and metering functions. For a three-winding transformer application, it may be required to calculate watts and vars for each of three windings, using voltage from different sets of VTs. These requirements can be satisfied with a single UR, equipped with sufficient CT and VT input channels, by selecting the parameter to measure. A mechanism is provided to specify the AC parameter (or group of parameters) used as the input to protection/control comparators and some metering elements.

Selection of the parameter(s) to measure is partially performed by the design of a measuring element or protection/control comparator by identifying the type of parameter (fundamental frequency phasor, harmonic phasor, symmetrical component, total waveform RMS magnitude, phase-phase or phase-ground voltage, etc.) to measure. The user completes the process by selecting the instrument transformer input channels to use and some of the parameters calculated from these channels. The input parameters available include the summation of currents from multiple input channels. For the summed currents of phase, 3I_0, and ground current, current from CTs with different ratios are adjusted to a single ratio before summation.

A mechanism called a *source* configures the routing of CT and VT input channels to measurement sub-systems. Sources, in the context of UR series relays, refer to the logical grouping of current and voltage signals such that one source contains all the signals required to measure the load or fault in a particular power apparatus. A given source may contain all or some of the following signals: three-phase currents, single-phase ground current, three-phase voltages and an auxiliary voltage from a single VT for checking for synchronism.

To illustrate the concept of sources, as applied to current inputs only, consider the breaker-and-a-half scheme below. In this application, the current flows as shown by the arrows. Some current flows through the upper bus bar to some other location or power equipment, and some current flows into transformer winding 1. The current into winding 1 is the phasor sum (or difference) of the currents in CT1 and CT2 (whether the sum or difference is used depends on the relative polarity of the CT connections). The same considerations apply to transformer winding 2. The protection elements require access to the net current for transformer protection, but some elements may need access to the individual currents from CT1 and CT2.

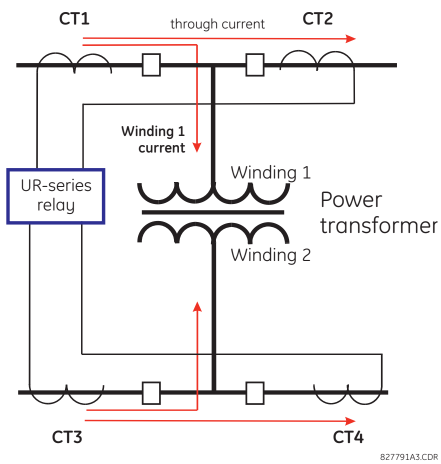

Figure 5–1: BREAKER-AND-A-HALF SCHEME

In conventional analog or electronic relays, the sum of the currents is obtained from an appropriate external connection of all CTs through which any portion of the current for the element being protected could flow. Auxiliary CTs are required to perform ratio matching if the ratios of the primary CTs to be summed are not identical. In the UR series of relays, provisions have been included for all the current signals to be brought to the UR device where grouping, ratio correction and summation are applied internally via configuration settings.

A major advantage of using internal summation is that the individual currents are available to the protection device; for example, as additional information to calculate a restraint current, or to allow the provision of additional protection features that operate on the individual currents such as breaker failure.

Given the flexibility of this approach, it becomes necessary to add configuration settings to the platform to allow the user to select which sets of CT inputs will be added to form the net current into the protected device.

The internal grouping of current and voltage signals forms an internal source. This source can be given a specific name through the settings, and becomes available to protection and metering elements in the UR platform. Individual names can be given to each source to help identify them more clearly for later use. For example, in the scheme shown in the above diagram, the user configures one source to be the sum of CT1 and CT2 and can name this source as “Wdg1 I”.

Once the sources have been configured, the user has them available as selections for the choice of input signal for the protection elements and as metered quantities.

b) CT/VT MODULE CONFIGURATION

CT and VT input channels are contained in CT/VT modules. The type of input channel can be phase/neutral/other voltage, phase/ground current, or sensitive ground current. The CT/VT modules calculate total waveform RMS levels, fundamental frequency phasors, symmetrical components and harmonics for voltage or current, as allowed by the hardware in each channel. These modules may calculate other parameters as directed by the CPU module.

A CT/VT module contains up to eight input channels, numbered 1 through 8. The channel numbering corresponds to the module terminal numbering 1 through 8 and is arranged as follows: Channels 1, 2, 3 and 4 are always provided as a group, hereafter called a “bank,” and all four are either current or voltage, as are channels 5, 6, 7 and 8. Channels 1, 2, 3 and 5, 6, 7 are arranged as phase A, B and C respectively. Channels 4 and 8 are either another current or voltage.

Banks are ordered sequentially from the block of lower-numbered channels to the block of higher-numbered channels, and from the CT/VT module with the lowest slot position letter to the module with the highest slot position letter, as follows:

INCREASING SLOT POSITION LETTER -->		
CT/VT MODULE 1	**CT/VT MODULE 2**	**CT/VT MODULE 3**
< bank 1 >	< bank 3 >	< bank 5 >
< bank 2 >	< bank 4 >	< bank 6 >

The UR platform allows for a maximum of six sets of three-phase voltages and six sets of three-phase currents. The result of these restrictions leads to the maximum number of CT/VT modules in a chassis to three. The maximum number of sources is six. A summary of CT/VT module configurations is shown below.

ITEM	**MAXIMUM NUMBER**
CT/VT Module	2
CT Bank (3 phase channels, 1 ground channel)	4
VT Bank (3 phase channels, 1 auxiliary channel)	2

c) CT/VT INPUT CHANNEL CONFIGURATION

Upon relay startup, configuration settings for every bank of current or voltage input channels in the relay are automatically generated from the order code. Within each bank, a channel identification label is automatically assigned to each bank of channels in a given product. The *bank* naming convention is based on the physical location of the channels, required by the user to know how to connect the relay to external circuits. Bank identification consists of the letter designation of the slot in which the CT/VT module is mounted as the first character, followed by numbers indicating the channel, either 1 or 5.

For three-phase channel sets, the number of the lowest numbered channel identifies the set. For example, F1 represents the three-phase channel set of F1/F2/F3, where F is the slot letter and 1 is the first channel of the set of three channels.

Upon startup, the CPU configures the settings required to characterize the current and voltage inputs, and will display them in the appropriate section in the sequence of the banks (as described above) as follows for a maximum configuration: F1, F5, M1, M5, U1, and U5.

The above section explains how the input channels are identified and configured to the specific application instrument transformers and the connections of these transformers. The specific parameters to be used by each measuring element and comparator, and some actual values are controlled by selecting a specific source. The source is a group of current and voltage input channels selected by the user to facilitate this selection. With this mechanism, a user does not have to make multiple selections of voltage and current for those elements that need both parameters, such as a distance element or a watt calculation. It also gathers associated parameters for display purposes.

The basic idea of arranging a source is to select a point on the power system where information is of interest. An application example of the grouping of parameters in a source is a transformer winding, on which a three phase voltage is measured, and the sum of the currents from CTs on each of two breakers is required to measure the winding current flow.

5.2.1 SECURITY

a) SECURITY OVERVIEW

The following security features are available:

- Password security — Basic security present in the default offering of the product
- EnerVista security — Role-based access to various EnerVista software screens and configuration elements. The feature is available in the default offering of the product and only in the EnerVista software.
- CyberSentry security — Advanced security options available as a software option. When purchased, the options are automatically enabled, and the default Password security and EnerVista security are disabled.

b) LOST PASSWORD

If all passwords are lost, recovery is possible by resetting the unit to default values.

To reset the unit after a lost password:

1. Email GE customer service at multilin.tech@ge.com with the serial number and using a recognizable corporate email account. Customer service provides a code to reset the relay to the factory defaults.
2. Enter the reset code on the front panel, under **Commands > Commands Relay Maintenance > Service Command**.
3. Change the default password of ChangeMe1# as outlined in the *Setting Up CyberSentry and Changing Default Password* section in the first chapter.

c) PASSWORD REQUIREMENTS

A user account requires an alpha-numeric password that meets the following requirements:

- Password is case-sensitive
- Password cannot contain the user account name or parts of the user account that exceed two consecutive characters
- Password must be 6 to 20 characters in length
- Password must contain characters from three of the following four categories:

  - English uppercase characters (A through Z)

  - English lowercase characters (a through z)

  - Base 10 digits (0 through 9)

  - Non-alphabetic characters (for example, ~, !, @, #, $,%, &)

d) PASSWORD SECURITY

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY

■ SECURITY ■	◀▶	ACCESS LEVEL: Restricted	Range: Restricted, Command, Setting, Factory Service (for factory use only)
MESSAGE	▲▼	■ CHANGE LOCAL ■ PASSWORDS	See page 5-9.
MESSAGE	▲▼	■ ACCESS ■ SUPERVISION	See page 5-10.
MESSAGE	▲▼	■ DUAL PERMISSION ■ SECURITY ACCESS	See page 5-11.
MESSAGE	▲	PASSWORD ACCESS EVENTS: Disabled	Range: Disabled, Enabled

The F60 supports password entry from a local or remote connection.

Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the through the faceplate RS232 port. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

When entering a settings or command password via EnerVista or any serial interface, the user must enter the corresponding connection password. If the connection is to the back of the F60, the remote password must be used. If the connection is to the RS232 port of the faceplate, the local password must be used.

The **PASSWORD ACCESS EVENTS** settings allows recording of password access events in the event recorder.

The local setting and command sessions are initiated by the user through the front panel display and are disabled either by the user or by timeout (via the setting and command level access timeout settings). The remote setting and command sessions are initiated by the user through the EnerVista UR Setup software and are disabled either by the user or by timeout.

The state of the session (local or remote, setting or command) determines the state of the following FlexLogic operands.

- ACCESS LOC SETG OFF: Asserted when local setting access is disabled
- ACCESS LOC SETG ON: Asserted when local setting access is enabled
- ACCESS LOC CMND OFF: Asserted when local command access is disabled
- ACCESS LOC CMND ON: Asserted when local command access is enabled
- ACCESS REM SETG OFF: Asserted when remote setting access is disabled
- ACCESS REM SETG ON: Asserted when remote setting access is enabled
- ACCESS REM CMND OFF: Asserted when remote command access is disabled
- ACCESS REM CMND ON: Asserted when remote command access is enabled

NOTE: A command or setting write operation is required to update the state of all the remote and local security operands shown above.

5

LOCAL PASSWORDS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩ CHANGE LOCAL PASSWORDS

■ CHANGE LOCAL ■ PASSWORDS		CHANGE COMMAND PASSWORD: No	*Range: No, Yes*
	MESSAGE	CHANGE SETTING PASSWORD: No	*Range: No, Yes*
	MESSAGE	ENCRYPTED COMMAND PASSWORD: ----------	*Range: 0 to 9999999999* *Note: ---------- indicates no password*
	MESSAGE	ENCRYPTED SETTING PASSWORD: ----------	*Range: 0 to 9999999999* *Note: ---------- indicates no password*

Proper password codes are required to enable each access level. When a **CHANGE COMMAND PASSWORD** or **CHANGE SETTING PASSWORD** setting is programmed to “Yes” via the front panel interface, the following message sequence is invoked:

1. ENTER NEW PASSWORD: ____________.
2. VERIFY NEW PASSWORD: ____________.
3. NEW PASSWORD HAS BEEN STORED.

To gain write access to a “Restricted” setting, program the **ACCESS LEVEL** setting in the main security menu to “Setting” and then change the setting, or attempt to change the setting and follow the prompt to enter the programmed password. If the password is correctly entered, access is allowed. Access automatically reverts to the “Restricted” level according to the access level timeout setting values.

NOTE: If the setting and command passwords are identical, then this one password allows access to both commands and settings.

NOTE: If a remote connection is established, local passcodes are not visible.

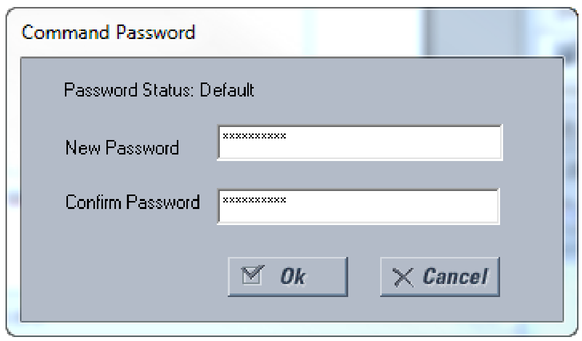
REMOTE PASSWORDS

The remote password settings are visible only from a remote connection via the EnerVista UR Setup software.

Proper passwords are required to enable each command or setting level access.

To set the command or setting password:

1. In the EnerVista software, navigate to **Settings > Product Setup > Security** menu item to open the remote password settings window.
2. Click the command or setting password **Change** button.
3. Enter the new password in the **New Password** field. Requirements are outlined in the *Password Requirements* section at the beginning of the chapter. When an original password has already been used, enter it in the **Enter Password** field and click the **Send Password to Device** button.
4. Re-enter the password in the **Confirm Password** field.
5. Click the **OK** button. The password is checked to ensure that is meets requirements.



NOTE: If you establish a local connection to the relay (serial), you cannot view remote passcodes.

ACCESS SUPERVISION

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩ ACCESS SUPERVISION

■ ACCESS ■ SUPERVISION		■ ACCESS LEVEL ■ TIMEOUTS	
	MESSAGE	INVALID ATTEMPTS BEFORE LOCKOUT: 3	Range: 2 to 5 in steps of 1
	MESSAGE	PASSWORD LOCKOUT DURATION: 5 min	Range: 5 to 60 minutes in steps of 1

The following access supervision settings are available.

- **INVALID ATTEMPTS BEFORE LOCKOUT**: This setting specifies the number of times an incorrect password can be entered within a three-minute time span before lockout occurs. When lockout occurs, the LOCAL ACCESS DENIED or REMOTE ACCESS DENIED FlexLogic operands are set to “On”. These operands are returned to the “Off” state upon expiration of the lockout.
- **PASSWORD LOCKOUT DURATION**: This setting specifies the time that the F60 will lockout password access after the number of invalid password entries specified by the **INVALID ATTEMPTS BEFORE LOCKOUT** setting has occurred.

The F60 provides a means to raise an alarm upon failed password entry. Should password verification fail while accessing a password-protected level of the relay (either settings or commands), the UNAUTHORIZED ACCESS FlexLogic operand is asserted. The operand can be programmed to raise an alarm via contact outputs or communications. This feature can be used to protect against both unauthorized and accidental access attempts.

The UNAUTHORIZED ACCESS operand is reset with the **COMMANDS ⇨⇩ CLEAR RECORDS ⇨⇩ RESET UNAUTHORIZED ALARMS** command. Therefore, to apply this feature with security, the command level should be password-protected. The operand does not generate events or targets.

If events or targets are required, the UNAUTHORIZED ACCESS operand can be assigned to a digital element programmed with event logs or targets enabled.

The access level timeout settings are shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩ ACCESS SUPERVISION ⇨ ACCESS LEVEL TIMEOUTS

■ ACCESS LEVEL ■ TIMEOUTS	◀▶	COMMAND LEVEL ACCESS TIMEOUT: 5 min	*Range: 5 to 480 minutes in steps of 1*
MESSAGE	▲	SETTING LEVEL ACCESS TIMEOUT: 30 min	*Range: 5 to 480 minutes in steps of 1*

These settings allow the user to specify the length of inactivity required before returning to the restricted access level. Note that the access level will set as restricted if control power is cycled.

- **COMMAND LEVEL ACCESS TIMEOUT**: This setting specifies the length of inactivity (no local or remote access) required to return to restricted access from the command password level.
- **SETTING LEVEL ACCESS TIMEOUT**: This setting specifies the length of inactivity (no local or remote access) required to return to restricted access from the command password level.

DUAL PERMISSION SECURITY ACCESS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩ DUAL PERMISSION SECURITY ACCESS

■ DUAL PERMISSION ■ SECURITY ACCESS	◀▶	LOCAL SETTING AUTH: On	*Range: selected FlexLogic operands (see below)*
MESSAGE	▲▼	REMOTE SETTING AUTH: On	*Range: FlexLogic operand*
MESSAGE	▲	ACCESS AUTH TIMEOUT: 30 min.	*Range: 5 to 480 minutes in steps of 1*

The dual permission security access feature provides a mechanism for customers to prevent unauthorized or unintended upload of settings to a relay through the local or remote interfaces interface.

The following settings are available through the local (front panel) interface only.

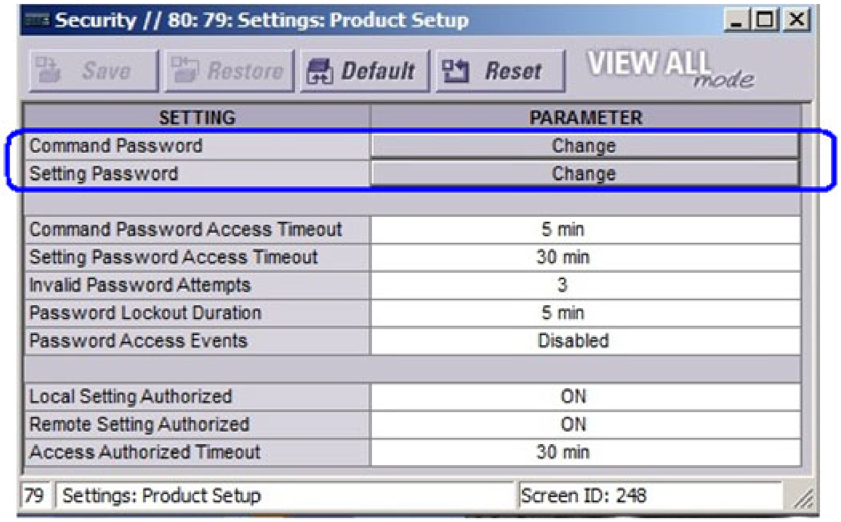
- **LOCAL SETTING AUTH**: This setting is used for local (front panel or RS232 interface) setting access supervision. Valid values for the FlexLogic operands are either “On” (default) or any physical “Contact Input ~~ On” value.

  If this setting is “On“, then local setting access functions as normal; that is, a local setting password is required. If this setting is any contact input on FlexLogic operand, then the operand must be asserted (set as on) prior to providing the local setting password to gain setting access.

  If setting access is *not* authorized for local operation (front panel or RS232 interface) and the user attempts to obtain setting access, then the **UNAUTHORIZED ACCESS** message is displayed on the front panel.
- **REMOTE SETTING AUTH**: This setting is used for remote (Ethernet or RS485 interfaces) setting access supervision.

  If this setting is “On” (the default setting), then remote setting access functions as normal; that is, a remote password is required). If this setting is “Off”, then remote setting access is blocked even if the correct remote setting password is provided. If this setting is any other FlexLogic operand, then the operand must be asserted (set as on) prior to providing the remote setting password to gain setting access.
- **ACCESS AUTH TIMEOUT**: This setting represents the timeout delay for local setting access. This setting is applicable when the **LOCAL SETTING AUTH** setting is programmed to any operand except “On”. The state of the FlexLogic operand is continuously monitored for an off-to-on transition. When this occurs, local access is permitted and the timer programmed with the **ACCESS AUTH TIMEOUT** setting value is started. When this timer expires, local setting access is immediately denied. If access is permitted and an off-to-on transition of the FlexLogic operand is detected, the timeout is restarted. The status of this timer is updated every 5 seconds.

The following settings are available through the remote (EnerVista UR Setup) interface only. Select the **Settings > Product Setup > Security** menu item to display the security settings window.



The **Remote Settings Authorized** setting is used for remote (Ethernet or RS485 interfaces) setting access supervision. If this setting is "On" (the default setting), then remote setting access functions as normal; that is, a remote password is required). If this setting is "Off", then remote setting access is blocked even if the correct remote setting password is provided. If this setting is any other FlexLogic operand, then the operand must be asserted (set as on) prior to providing the remote setting password to gain setting access.

The **Access Authorized Timeout** setting represents the timeout delay remote setting access. This setting is applicable when the **Remote Settings Authorized** setting is programmed to any operand except "On" or "Off". The state of the FlexLogic operand is continuously monitored for an off-to-on transition. When this occurs, remote setting access is permitted and the timer programmed with the **Access Authorized Timeout** setting value is started. When this timer expires, remote setting access is immediately denied. If access is permitted and an off-to-on transition of the FlexLogic operand is detected, the timeout is restarted. The status of this timer is updated every 5 seconds.

e) ENERVISTA SECURITY

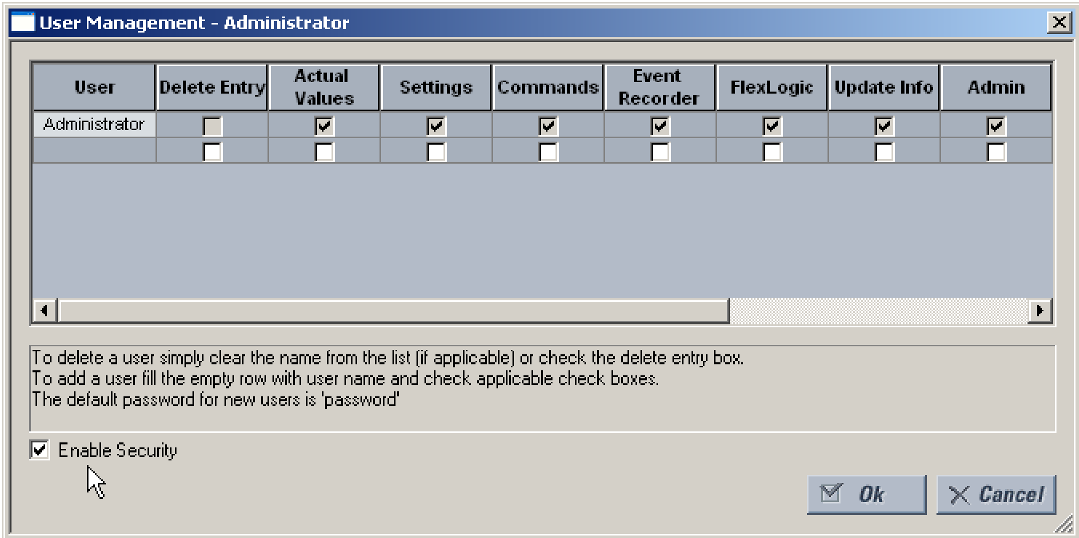
ENABLING THE SECURITY MANAGEMENT SYSTEM

The EnerVista security system allows an administrator to manage access privileges of multiple users to the EnerVista application.

It is disabled by default to allow the administrator direct access to the EnerVista software immediately after installation. When security is disabled, all users have administrator access. GE recommends enabling the EnerVista security before placing the device in service.

To enable the security system and require password use:

1. Select the **Security > User Management** menu item to open the user management window.



2. Check the **Enable Security** box in the lower-left corner to enable the security management system.

Security is now enabled for the EnerVista UR Setup software. Upon starting the software, users are now required to enter a username and password.

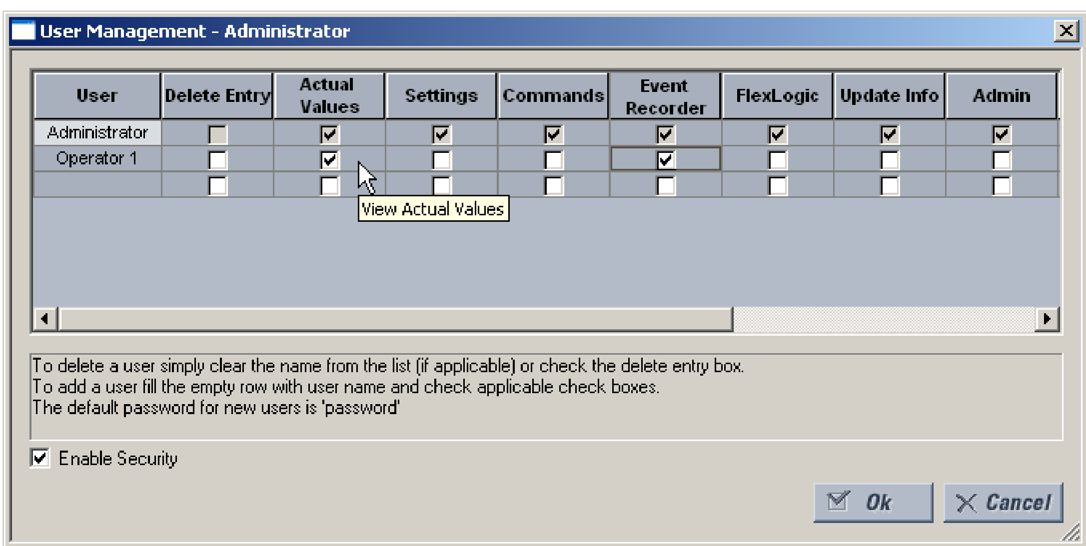
ADDING A NEW USER

The following pre-requisites are required to add user accounts to the EnerVista security management system:

- The user adding the account must have administrator rights
- The EnerVista security management system must be enabled (previous section)

To add user accounts:

1. Select the **Security > User Management** menu item to open the user management window.
2. Enter a username in the **User** field. The username must be 4 to 20 characters in length.
3. Select the user access rights by enabling the check box of one or more of the fields.



The table outlines access rights.

Table 5–1: ACCESS RIGHTS SUMMARY

FIELD	DESCRIPTION
Delete Entry	Deletes the user account when exiting the user management window
Actual Values	Allows the user to read actual values
Settings	Allows the user to read setting values
Commands	Allows the user to execute commands
Event Recorder	Allows the user to use the digital fault recorder
FlexLogic	Allows the user to read FlexLogic values
Update Info	Allows the user to write to any function to which they have read privileges. When any of the Settings, Event Recorder, and FlexLogic check boxes are enabled by themselves, the user is granted read access. When any of them are enabled in conjunction with the Update Info box, they are granted read and write access. The user is not granted write access to functions that are not checked, even if the Update Info field is checked.
Admin	The user is an EnerVista UR Setup administrator, therefore receiving all of the administrative rights. Exercise caution when granting administrator rights.

4. Click **OK** to add the user account to the security management system.

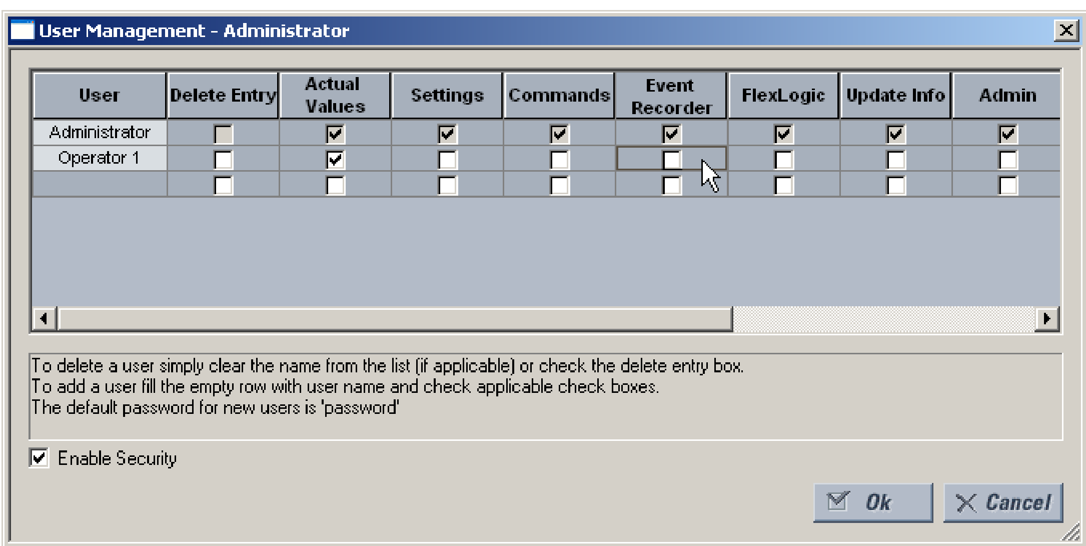
MODIFYING USER PRIVILEGES

The following pre-requisites are required to modify user privileges in the EnerVista security management system:

- The user modifying the privileges must have administrator rights
- The EnerVista security management system must be enabled

To modify user privileges:

1. Select the **Security > User Management** menu item to open the user management window.
2. Locate the username in the **User** field.
3. Modify the user access rights by enabling or disabling one or more of the check boxes.



The table outlines access rights.

Table 5–2: ACCESS RIGHTS SUMMARY

FIELD	DESCRIPTION
Delete Entry	Deletes the user account when exiting the user management window
Actual Values	Allows the user to read actual values
Settings	Allows the user to read setting values
Commands	Allows the user to execute commands

Table 5–2: ACCESS RIGHTS SUMMARY

FIELD	DESCRIPTION
Event Recorder	Allows the user to use the digital fault recorder
FlexLogic	Allows the user to read FlexLogic values
Update Info	Allows the user to write to any function to which they have read privileges. When any of the Settings, Event Recorder, and FlexLogic check boxes are enabled by themselves, the user is granted read access. When any of them are enabled in conjunction with the Update Info box, they are granted read and write access. The user is not granted write access to functions that are not checked, even if the Update Info field is checked.
Admin	The user is an EnerVista UR Setup administrator, therefore receiving all of the administrative rights. Exercise caution when granting administrator rights.

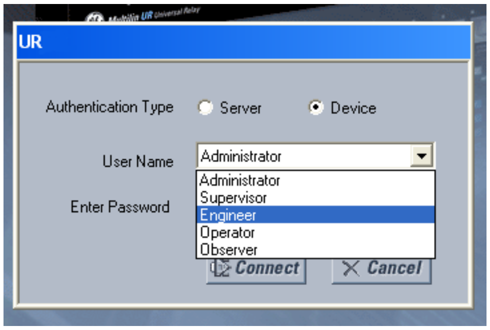
4. Click **OK** to save the changes.

f) CYBERSENTRY SECURITY

The EnerVista software provides the means to configure and authenticate UR using either server or device or authentication. Access to various functionality depends on user role.

The login screen of EnerVista has two options for access to the UR, server and device authentication.

Figure 5–2: LOGIN SCREEN FOR CYBERSENTRY



When the "Server" Authentication Type option is selected, the UR uses the RADIUS server and not its local authentication database to authenticate the user.

When the "Device" button is selected, the UR uses its local authentication database and not the RADIUS server to authenticate the user. In this case, it uses built-in roles (Administrator, Engineer, Supervisor, Operator, Observer) as login accounts and the associated passwords are stored on the UR device. In this case, access is not user-attributable. In cases where user-attributable access is required, especially for auditable processes for compliance reasons, use server authentication (RADIUS) only.

No password or security information is displayed in plain text by the EnerVista software or UR device, nor are they ever transmitted without cryptographic protection.

5

CYBERSENTRY SETTINGS THROUGH ENERVISTA

CyberSentry security settings are configured under **Device > Settings > Product Setup > Security**.

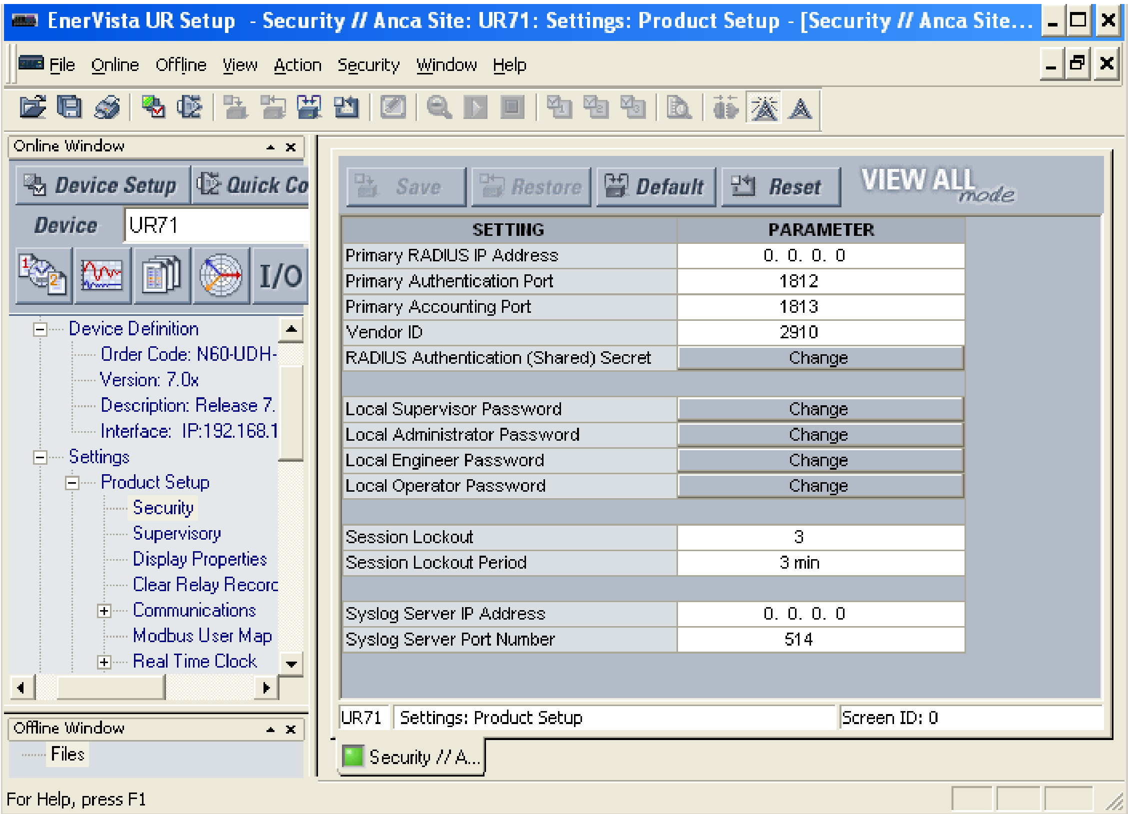


Figure 5–3: CYBERSENTRY SECURITY PANEL

For the **Device > Settings > Product Setup > Supervisory** option, the panel looks like the following.

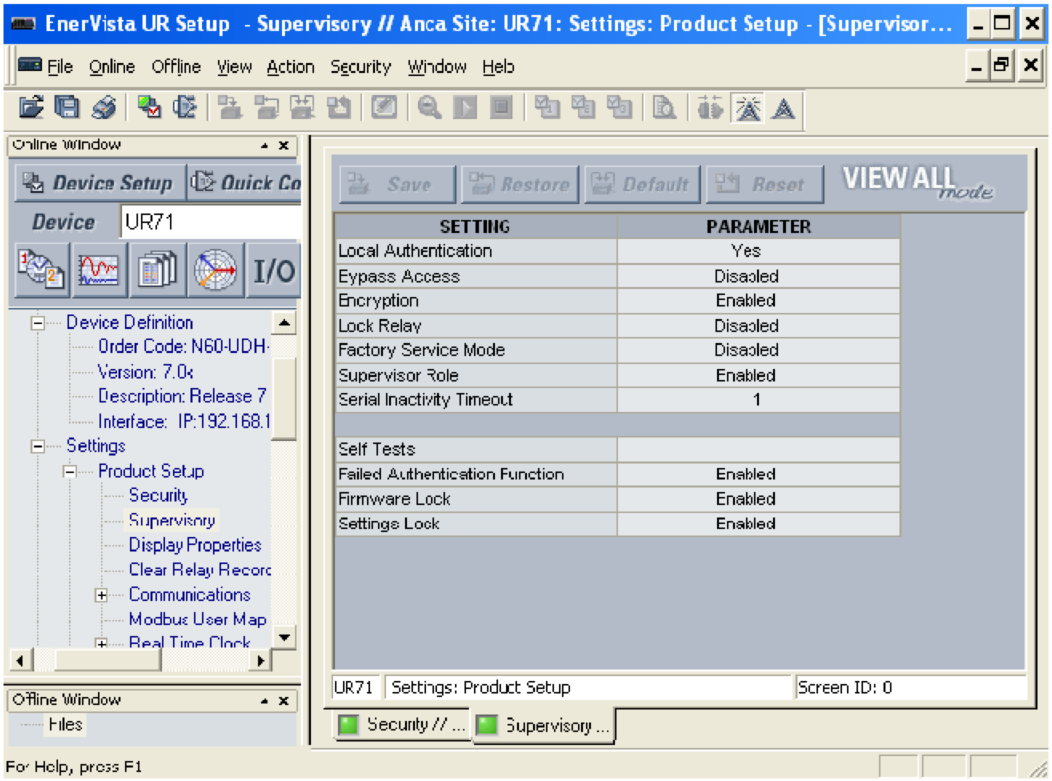

Figure 5–4: SUPERVISORY PANEL

For the Security panel, the following settings are available.

RADIUS Server Settings

SETTING NAME	DESCRIPTION	MIN	MAX	DEFAULT	UNITS	MINIMUM PERMISSION
Primary RADIUS IP Address	IP address of the main RADIUS server. Default value indicates no Primary RADIUS server is configured, and hence RADIUS is disabled.	0.0.0.0	223.255.255.254	0.0.0.0	-	Administrator
Primary Authentication Port	RADIUS authentication port	1	65535	1812	-	Administrator
Primary Accounting Port	RADIUS accounting port	1	65535	1813	-	Administrator
Vendor ID	An identifier that specifies RADIUS vendor-specific attributes used with the protocol			Value that represents General Electric		Administrator
RADIUS Authentication (Shared) Secret	Shared secret used in authentication. It displays as asterisks. This setting must meet the CyberSentry password requirements.	See the *Password Requirements* section	See the following password section for requirements	N/A	-	Administrator
RADIUS Authentication Method	Authentication method used by RADIUS server. Currently fixed to EAP-TTLS.	EAP-TTLS	EAP-TTLS	EAP-TTLS	-	Administrator
Timeout	Timeout in seconds between re-transmission requests	0	9999	10	sec	Administrator
Retries	Number of retries before giving up	0	9999	3	-	Administrator

Confirm RADIUS Authentication (Shared) Secret	Confirmation of the shared secret. The entry displays as asterisks.	See the *Password Requirements* section	245 characters	N/A	-	Administrator

General Security Settings

SETTING NAME	DESCRIPTION	MIN	MAX	DEFAULT	UNITS	MINIMUM PERMISSION
Session Lockout	Number of failed authentications before the device blocks subsequent authentication attempts for the lockout period	0 (lockout disabled)	99	3	-	Administrator
Session Lockout Period	The period in minutes that a user is prevented from logging in after being locked out	0 (no period)	9999	3	min	Administrator
Syslog Server IP Address	The IP address of the target Syslog server to which all security events are transmitted	0.0.0.0	223.255.255.254	0.0.0.0	-	Administrator
Syslog Server Port Number	The UDP port number of the target syslog server to which all security events are transmitted	1	65535	514	-	Administrator
Device Authentication	When enabled, local device authentication with roles is allowed. When disabled, the UR only authenticates to the AAA server (RADIUS). **NOTE:** Administrator and Supervisor (if still enabled) remain active even after device authentication is disabled. The only permission for local Administrator is to re-enable device authentication when device authentication is disabled. To re-enable device authentication, the Supervisor unlocks the device for setting changes, and then the Administrator can re-enable device authentication.	Disabled	Enabled	Enabled	-	Administrator
Firmware Locked	Indicates if the device receives firmware upgrades. If Yes and the firmware upgrade attempt is made, the device denies the upgrade and displays an error message that the lock is set. On each firmware upgrade, this setting goes back to the default.	No	Yes	Yes	-	Administrator
Factory Service Mode	When enabled (checkbox selected), the device can go into factory service mode. To enable, Supervisor authentication is necessary.	Disabled	Enabled	Disabled	-	Supervisor (Administrator when Supervisor is disabled)
Restore to Defaults	Sets the device to factory defaults	No	Yes	No	-	Administrator
Supervisor role	When enabled (checkbox selected), the Supervisor role is active. To enable, Administrator authentication is necessary. When disabled, the Supervisor role is inactive. To disable, Supervisor authentication is necessary.	Disabled	Enabled	Enabled	-	Administrator to enable and Supervisor to disable
RADIUS user names	Ensure that RADIUS user names are not the same as local/device role names	See RADIUS server documents	See RADIUS server documents		-	Administrator
Password	Local/device roles except for Observer are password-protected. All RADIUS users are password-protected.	See the *Password Requirements* section	See the following password section for requirements	Change Me1#	Text	The specified role and Administrator, except for Supervisor, where it is only itself

Security Alarm Settings

SETTING NAME	DESCRIPTION / DETAILS	MIN	MAX	DEFAULT	UNITS	MINIMUM PERMISSIONS
Failed Authentications	A threshold number indicating when an alarm is set off to indicate too many failed authentication attempts	0 (disabled)	99	3	-	Administrator
Firmware lock	A Boolean value indicating if the device can receive a firmware upgrade. If Yes and a firmware upgrade attempt is made, the device alarm activates. If No the device alarm does not activate. On each firmware upgrade this setting goes back to the default.	No	Yes	Yes	-	Administrator
Settings lock	A Boolean value indicating if the device can accept any settings changes. If Yes and a settings change attempt is made, the device alarm activates. If No, the device alarm does not activate.	No	Yes	Yes	-	Supervisor (Administrator if Supervisor has been disabled)

CYBERSENTRY SETTINGS THROUGH THE FRONT PANEL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY

■ SECURITY ■	LOGIN: None	Range: Administrator, Engineer, Supervisor, Operator, Factory (for factory use only), None
MESSAGE	■ CHANGE LOCAL ■ PASSWORDS	See page 5-20.
MESSAGE	■ SESSION ■ SETTINGS	See page 5-20.
MESSAGE	■ RESTORE DEFAULTS ■	See page 5-20.
MESSAGE	■ SUPERVISORY ■	See page 5-21.
MESSAGE	SYSLOG IP ADDRESS: 0.0.0.0	Range: 0.0.0.0, 255.255.255.255
MESSAGE	SYSLOG PORT NUMBER: 514	Range: 1 to 65535

LOGIN: This setting is applicable for *Device Authentication* only. This setting allows a user to login with a specific role, see descriptions below. For the Supervisor role, the “Supervisor Role” setting should be enabled.

Whenever a new role is logged in, the user is prompted with a display to enter a password. Passwords must obey the requirements specified at the beginning of the chapter in the Password Requirements section.The UR device supports five roles. All roles have their corresponding passwords. The Observer role is the only role that does not require a password.

The roles are defined as follows:

- Administrator: Complete read and write access to all settings and commands. This role does not allow concurrent access. This role has an operand to indicate when it is logged on.
- Engineer: Complete read and write access to all settings and commands with the exception of configuring Security settings and Firmware upgrades. This role does not allow concurrent access.
- Operator: The Operator has read/write access to all settings under the command menu/section. This role does not exist offline.
- Supervisor: This is only an approving role. This role’s authentication commits setting changes submitted by Administrator or Engineer. The Supervisor role authenticates to unlock the UR relay for setting changes and not approve changes after the fact. Only Supervisor can set the Settings and Firmware Lock in the Security Settings. This role also has the ability to forcefully logoff any other role and clear the security event log. This role can also be disabled, but only through a Supervisor authentication. When this role is disabled its permissions are assigned to the Administrator role.

- Observer: This role has read only access to all UR settings. This role allows unlimited concurrent access but it has no download access to any files on the device. Observer is the default role if no authentication has been done to the device. This role displays as "None" on the front panel.

NOTE: The Factory service role is not available and is intended for factory use only.

Local Passwords

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩ CHANGE LOCAL PASSWORDS

■ CHANGE LOCAL ■ PASSWORDS	◁▷	LOGIN: None	Range: 20 Alphanumeric Characters
MESSAGE	△▽	NEW PASSWORD:	Range: 20 Alphanumeric Characters
MESSAGE	△	CONFIRM PASSWORD:	Range: 20 Alphanumeric Characters

The Change Local Passwords menu is shown on the front panel and Enervista on a successful login of Administrator role.

The “login setting” in this menu is similar to the login setting described in **PATH: SETTINGS > PRODUCT SETUP > SECURITY** except for the factory role.

Passwords are stored in text format. No encryption is applied.

NOTE **Notes:**

- In Device Authentication mode, the Observer role does not have a password associated with it. In Server Authentication mode the Observer role requires a password.
- The default password is “ChangeMe1#”.
- Once the passwords are set, the Administrator with Supervisor approval can change the role associated password.
- In CyberSentry, password encryption is not supported.

Session Settings

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩ SESSION SETTINGS

■ SESSION ■ SETTINGS	◁▷	SESSION LOCKOUT: 3	Range: 0 to 99
MESSAGE	△	SESSION LOCKOUT PERIOD: 3 min	Range: 0 to 9999 minutes

The following session settings are available.

- **SESSION LOCKOUT**: This setting specifies the number of failed authentications (the default is three and the maximum is 99) before the device blocks subsequent authentication attempts for the lockout period. A value of zero means lockout is disabled.
- **SESSION LOCKOUT PERIOD**: This setting specifies the period of time in minutes of a lockout period (the default is three and the maximum is 9999). A value of 0 means that there is no lockout period.

Restore Defaults

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩ RESTORE DEFAULTS

■ RESTORE DEFAULTS ■	◁▷	LOAD FACTORY DEFAULTS: No	Range: Yes, No

- **LOAD FACTORY DEFAULTS**: This setting is used to reset all the settings, communication and security passwords. An Administrator role is used to change this setting and a Supervisor role (if not disabled) approves it.

Supervisory

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨ ⇩SUPERVISORY

■ SUPERVISORY ■	DEVICE AUTHENTICATION:Yes	Range: Yes, No
MESSAGE	BYPASS ACCESS: Disabled	Range: Local, Remote, Local and Remote, Disabled
MESSAGE	LOCK RELAY: Disabled	Range: Enabled, Disabled
MESSAGE	FACTORY SERVICE: MODE: Disabled	Range: Enabled, Disabled
MESSAGE	■ SELF TESTS ■	See below
MESSAGE	SUPERVISOR ROLE: Disabled	Range: Enabled, Disabled
MESSAGE	SERIAL INACTIVITY TIMEOUT: 1 min	Range: 1 to 9999 minutes

The Supervisory menu settings are available for Supervisor role only or if the Supervisor role is disabled then for the Administrator role only.

Device Authentication: This setting is enabled by default, meaning "Yes" is selected. When enabled, Device Authentication with roles is enabled. When this setting is disabled, the UR only authenticates to the AAA server (Radius). However, the Administrator and Supervisor (when enabled) remain active even after device authentication is disabled and their only permission is to re-enable device authentication. To re-enable device authentication, the Supervisor unlocks the device for setting changes, then the Administrator re-enables device authentication.

Bypass Access: The bypass security feature provides an easier access, with no authentication and encryption for those special situations when this is considered safe. Only the Supervisor, or the Administrator when the Supervisor role is disabled, can enable this feature.

MODE	FRONT PANEL OR SERIAL (RS232, RS485)	ETHERNET
Normal mode	Authentication — Role Based Access Control (RBAC) and passwords in clear	Authentication — RBAC and passwords encrypted SSH tunneling
Bypass access mode	No passwords for allowed RBAC levels	No passwords for allowed RBAC levels No SSH tunneling

The bypass options are as follows:

- Local — Bypasses authentication for push buttons, keypad, RS232, and RS485
- Remote — Bypasses authentication for Ethernet
- Local and Remote — Bypasses authentication for push buttons, keypad, RS232, RS485, and Ethernet

Lock Relay: This setting uses a Boolean value (Enable/Disable) to indicate if the device accepts setting changes and whether the device can receive a firmware upgrade. This setting can be changed only by the Supervisor role, if it is enabled or by the Administrator if the Supervisor role is disabled. The Supervisor role enables this setting for the relay to start accepting setting changes or command changes or firmware upgrade. After all the setting changes are applied or commands executed, the Supervisor disables to lock setting changes.

Example: If this setting is "Yes" and an attempt is made to change settings or upgrade the firmware, the UR device denies the setting changes and denies upgrading the firmware. If this setting is "No", the UR device accepts setting changes and firmware upgrade.

This role is disabled by default.

Factory Service Mode: When enabled (meaning "Yes" is selected) the device can go into factory service mode. For this setting to become enabled a Supervisor authentication is necessary. The default value is Disabled.

Supervisor Role: When enabled (meaning "Yes" is selected) the Supervisor role is active. When "No" is selected this role is disabled. To disabled this setting a Supervisor authentication is necessary. If disabled, the Supervisor role is not allowed to log on. In this case the Administrator can change the settings under the Supervisory menu.

If enabled, Supervisor authentication is required to change the settings in the Supervisory menu. If the Supervisor disables his role after authentication, the Supervisor session remains valid until he switches to another role using MMI or until he ends the current Supervisor session if using communications.

This role is disabled by default.

Serial Inactivity Timeout: The role logged via a serial port is auto logged off after the Serial Inactivity timer times out. A separate timer is maintained for RS232 and RS485 connections. The default value is 1 minute.

a) SELF TESTS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩SUPERVISORY ⇨SELF TESTS

■ SELF TESTS ■	◀▶	■ FAILED ■ AUTHENTICATE	See below
	MESSAGE ▲▼	FIRMWARE LOCK: Enabled	*Range: Enabled, Disabled*
	MESSAGE ▲▼	SETTINGS LOCK: Enabled	*Range: Enabled, Disabled*

Failed Authentications: If this setting is Enabled then the number of failed authentications is compared with the Session lockout threshold. When the Session lockout threshold is exceeded, this minor alarm indication comes up.

Firmware Lock: If this setting is Enabled then any firmware upgrade operation attempt when the “LOCK FIRMWARE UPGRADE” setting is set to “Yes” brings up this self test alarm.

Settings Lock: If this setting is Enabled then an unauthorized write attempt to a setting for a given role activates this self test.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩SUPERVISORY ⇨SELF TESTS ⇨FAILED AUTHENTICATE

■ FAILED ■ AUTHENTICATE	◀▶	FAILED AUTHENTICATE: Enabled	*Range: Enabled, Disabled*

CYBERSENTRY SETUP

When first using CyberSentry security, use the following procedure for set up.

1. Log in to the relay as Administrator by using the Value keys on the front panel to enter the default password "ChangeMe1#". Note that the "Lock relay" setting needs to be disabled in the **Security > Supervisory** menu. When this setting is disabled, configuration and firmware upgrade are possible. By default, this setting is disabled.
2. Enable the Supervisor role if you have a need for it.
3. Make any required changes in configuration, such as setting a valid IP address for communication over Ethernet.
4. Log out of the Administrator account by choosing None.

Next, device or server authentication can be chosen on the login screen, but the choice is available only in EnerVista. Use device authentication to log in using the five pre-configured roles (Administrator, Supervisor, Engineer, Operator, Observer). When using a serial connection, only device authentication is supported. When server authentication is required, characteristics for communication with a RADIUS server must be configured. This is possible only in the EnerVista software. The RADIUS server itself also must be configured. The appendix called RADIUS Server gives an example of how to setup a simple RADIUS server. Once both the RADIUS server and the parameters for connecting UR to the server have been configured, you can choose server authentication on the login screen of EnerVista.

NOTICE The use of CyberSentry for devices communicating through an Ethernet-to-RS485 gateway is not supported. Because these gateways do not support the secure protocols necessary to communicate with such devices, the connection cannot be established. Use the device as a non-CyberSentry device.

NOTICE Users logged in through the front panel are not timed out and cannot be forcefully logged out by a supervisor. Roles logged in through the front panel that do no allow multiple instances (Administrator, Supervisor, Engineer, Operator) must switch to None (equivalent to a logout) when they are done in order to log out.

NOTICE For all user roles except Observer, only one instance can be logged in at one time, for both login by front panel and software.

To configure server authentication:

1. In the EnerVista software, choose device authentication and log in as Administrator.
2. Configure the following RADIUS server parameters: IP address, authentication port, shared secret, and vendor ID.
3. On the RADIUS server, configure the user accounts. Do not use the five pre-defined roles as user names (Administrator, Supervisor, Engineer, Operator, Observer) in the RADIUS server. If you do, the UR relay automatically provides the authentication from the device.
4. In the EnerVista software, choose server authentication and log in using the user name and password configured on the RADIUS server for server authentication login.
5. After making any required changes, log out.

NOTICE When changing settings offline, ensure that only settings permitted by the role that performs the settings download are changed because only those changes are applied.

Pushbuttons (both user-control buttons and user-programmable buttons) located on the front panel can be pressed by an Administrator or Engineer role. This also applies to the reset button, which resets targets, where targets are errors displayed on the front panel or the Targets panel of the EnerVista software. The reset button has special behavior in that it allows these two roles to press it even when they are logged in through the RS232 port and not through the front panel.

To reset the security event log and self-test operands:

1. Log in as Supervisor (if the role is enabled) or Administrator (if the Supervisor role is disabled) and execute a clear security command under **Commands > Security > Clear Security**.

5

5.2.2 DISPLAY PROPERTIES

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES

■ DISPLAY ■ PROPERTIES	◁▷	LANGUAGE: English	*Range: English; English, French; English, Russian; English, Chinese; English, German (range dependent on order code)*
MESSAGE	⇧⇩	FLASH MESSAGE TIME: 1.0 s	*Range: 0.5 to 10.0 s in steps of 0.1*
MESSAGE	⇧⇩	DEFAULT MESSAGE TIMEOUT: 300 s	*Range: 10 to 900 s in steps of 1*
MESSAGE	⇧⇩	DEFAULT MESSAGE INTENSITY: 25 %	*Range: 25%, 50%, 75%, 100% Visible only if a VFD is installed*
MESSAGE	⇧⇩	SCREEN SAVER FEATURE: Disabled	*Range: Disabled, Enabled Visible only if an LCD is installed*
MESSAGE	⇧⇩	SCREEN SAVER WAIT TIME: 30 min	*Range: 1 to 65535 min. in steps of 1 Visible only if an LCD is installed*
MESSAGE	⇧⇩	CURRENT CUT-OFF LEVEL: 0.020 pu	*Range: 0.002 to 0.020 pu in steps of 0.001*
MESSAGE	⇧	VOLTAGE CUT-OFF LEVEL: 1.0 V	*Range: 0.1 to 1.0 V secondary in steps of 0.1*

Some relay messaging characteristics can be modified to suit different situations using the display properties settings.

- **LANGUAGE**: This setting selects the language used to display settings, actual values, and targets. The range is dependent on the order code of the relay.
- **FLASH MESSAGE TIME**: Flash messages are status, warning, error, or information messages displayed for several seconds in response to certain key presses during setting programming. These messages override any normal messages. The duration of a flash message on the display can be changed to accommodate different reading rates.
- **DEFAULT MESSAGE TIMEOUT**: If the keypad is inactive for a period of time, the relay automatically reverts to a default message. The inactivity time is modified via this setting to ensure messages remain on the screen long enough during programming or reading of actual values.
- **DEFAULT MESSAGE INTENSITY**: To extend phosphor life in the vacuum fluorescent display, the brightness can be attenuated during default message display. During keypad interrogation, the display always operates at full brightness.
- **SCREEN SAVER FEATURE** and **SCREEN SAVER WAIT TIME**: These settings are only visible if the F60 has a liquid crystal display (LCD) and control its backlighting. When the **SCREEN SAVER FEATURE** is "Enabled", the LCD backlighting is turned off after the **DEFAULT MESSAGE TIMEOUT** followed by the **SCREEN SAVER WAIT TIME**, providing that no keys have been pressed and no target messages are active. When a keypress occurs or a target becomes active, the LCD backlighting is turned on.
- **CURRENT CUT-OFF LEVEL**: This setting modifies the current cut-off threshold. Very low currents (1 to 2% of the rated value) are very susceptible to noise. Some customers prefer very low currents to display as zero, while others prefer the current be displayed even when the value reflects noise rather than the actual signal. The F60 applies a cut-off value to the magnitudes and angles of the measured currents. If the magnitude is below the cut-off level, it is substituted with zero. This applies to phase and ground current phasors as well as true RMS values and symmetrical components. The cut-off operation applies to quantities used for metering, protection, and control, as well as those used by communications protocols. Note that the cut-off level for the sensitive ground input is 10 times lower that the **CURRENT CUT-OFF LEVEL** setting value. Raw current samples available via oscillography are not subject to cut-off.

5

- **VOLTAGE CUT-OFF LEVEL**: This setting modifies the voltage cut-off threshold. Very low secondary voltage measurements (at the fractional volt level) can be affected by noise. Some customers prefer these low voltages to be displayed as zero, while others prefer the voltage to be displayed even when the value reflects noise rather than the actual signal. The F60 applies a cut-off value to the magnitudes and angles of the measured voltages. If the magnitude is below the cut-off level, it is substituted with zero. This operation applies to phase and auxiliary voltages, and symmetrical components. The cut-off operation applies to quantities used for metering, protection, and control, as well as those used by communications protocols. Raw samples of the voltages available via oscillography are not subject cut-off.

The **CURRENT CUT-OFF LEVEL** and the **VOLTAGE CUT-OFF LEVEL** are used to determine the metered power cut-off levels. The power cut-off level is calculated as shown below. For Delta connections:

$$\text{3-phase power cut-off} = \frac{\sqrt{3} \times \textbf{CURRENT CUT-OFF LEVEL} \times \textbf{VOLTAGE CUT-OFF LEVEL} \times \text{VT primary} \times \text{CT primary}}{\text{VT secondary}} \quad \textbf{(EQ 5.3)}$$

For Wye connections:

$$\text{3-phase power cut-off} = \frac{3 \times \textbf{CURRENT CUT-OFF LEVEL} \times \textbf{VOLTAGE CUT-OFF LEVEL} \times \text{VT primary} \times \text{CT primary}}{\text{VT secondary}} \quad \textbf{(EQ 5.4)}$$

$$\text{per-phase power cut-off} = \frac{\textbf{CURRENT CUT-OFF LEVEL} \times \textbf{VOLTAGE CUT-OFF LEVEL} \times \text{VT primary} \times \text{CT primary}}{\text{VT secondary}} \quad \textbf{(EQ 5.5)}$$

where VT primary = VT secondary × VT ratio and CT primary = CT secondary × CT ratio.

For example, given the following settings:

CURRENT CUT-OFF LEVEL: "0.02 pu"
VOLTAGE CUT-OFF LEVEL: "1.0 V"
PHASE CT PRIMARY: "100 A"
PHASE VT SECONDARY: "66.4 V"
PHASE VT RATIO: "208.00 : 1"
PHASE VT CONNECTION: "Delta".

We have:

CT primary = "100 A", and
VT primary = **PHASE VT SECONDARY** x **PHASE VT RATIO** = 66.4 V x 208 = 13811.2 V

The power cut-off is therefore:

power cut-off = (**CURRENT CUT-OFF LEVEL** × **VOLTAGE CUT-OFF LEVEL** × CT primary × VT primary)/VT secondary
= ($\sqrt{3}$ × 0.02 pu × 1.0 V × 100 A × 13811.2 V) / 66.4 V
= 720.5 watts

Any calculated power value below this cut-off will not be displayed. As well, the three-phase energy data will not accumulate if the total power from all three phases does not exceed the power cut-off.

NOTE: Lower the VOLTAGE CUT-OFF LEVEL and CURRENT CUT-OFF LEVEL with care as the relay accepts lower signals as valid measurements. Unless dictated otherwise by a specific application, the default settings of "0.02 pu" for CURRENT CUT-OFF LEVEL and "1.0 V" for VOLTAGE CUT-OFF LEVEL are recommended.

5.2.3 CLEAR RELAY RECORDS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ CLEAR RELAY RECORDS

■ CLEAR RELAY ■ RECORDS		CLEAR FAULT REPORTS: Off	Range: FlexLogic operand
	MESSAGE	CLEAR EVENT RECORDS: Off	Range: FlexLogic operand
	MESSAGE	CLEAR OSCILLOGRAPHY? No	Range: FlexLogic operand
	MESSAGE	CLEAR DATA LOGGER: Off	Range: FlexLogic operand
	MESSAGE	CLEAR ARC AMPS 1: Off	Range: FlexLogic operand
	MESSAGE	CLEAR ARC AMPS 2: Off	Range: FlexLogic operand
	MESSAGE	CLEAR DEMAND: Off	Range: FlexLogic operand
	MESSAGE	CLEAR ENERGY: Off	Range: FlexLogic operand
	MESSAG	CLEAR HIZ RECORDS: Off	Range: FlexLogic operand
	MESSAGE	RESET UNAUTH ACCESS: Off	Range: FlexLogic operand
	MESSAGE	CLEAR DIR I/O STATS: Off	Range: FlexLogic operand. Valid only for units with Direct I/O module.

Selected records can be cleared from user-programmable conditions with FlexLogic operands. Assigning user-programmable pushbuttons to clear specific records are typical applications for these commands. Since the F60 responds to rising edges of the configured FlexLogic operands, they must be asserted for at least 50 ms to take effect.

Clearing records with user-programmable operands is not protected by the command password. However, user-programmable pushbuttons are protected by the command password. Thus, if they are used to clear records, the user-programmable pushbuttons can provide extra security if required.

For example, to assign user-programmable pushbutton 1 to clear demand records, the following settings should be applied.

1. Assign the clear demand function to pushbutton 1 by making the following change in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ CLEAR RELAY RECORDS** menu:

   CLEAR DEMAND: "PUSHBUTTON 1 ON"

2. Set the properties for user-programmable pushbutton 1 by making the following changes in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE PUSHBUTTONS ⇨ USER PUSHBUTTON 1** menu:

PUSHBUTTON 1 FUNCTION: "Self-reset"
PUSHBTN 1 DROP-OUT TIME: "0.20 s"

5.2.4 COMMUNICATIONS

b) SERIAL PORTS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨ SERIAL PORTS

■ SERIAL PORTS ■		RS485 COM2 BAUD RATE: 19200	Range: 300, 1200, 2400, 4800, 9600, 14400, 19200, 28800, 33600, 38400, 57600, 115200 bit/s
	MESSAGE	RS485 COM2 PARITY: Even	Range: None, Odd, Even
	MESSAGE	RS485 COM2 RESPONSE MIN TIME: 0 ms	Range: 0 to 1000 ms in steps of 10

RS485 COM2 BAUD RATE and **PARITY**: The F60 is equipped with up to two independent serial communication ports. The faceplate RS232 port is intended for local use and is fixed at 19200 bit/s baud and even parity. The rear COM2 port is RS485 and has settings for baud rate and parity. It is important that these parameters agree with the settings used on the computer or other equipment that is connected to these ports. Any of these ports can be connected to a computer running EnerVista

UR Setup. This software can download and upload setting files, view measured parameters, and upgrade the relay firmware. A maximum of 32 relays can be daisy-chained and connected to a DCS, PLC, or computer using the RS485 ports. If IEC 60870-103 is chosen as the protocol, valid baud rates are 9600 and 19200 bit/s, and valid parity is Even.

RS485 COM2 RESPONSE MIN TIME: This setting specifies the minimum time before the rear RS485 port transmits after receiving data from a host. This feature allows operation with hosts that hold the RS485 transmitter active for some time after each transmission.

c) ETHERNET NETWORK TOPOLOGY

When using more than one Ethernet port, configure each to belong to a different network or subnet using the IP addresses and mask, else communication becomes unpredictable when more than one port is configured to the same subnet.

Example 1

IP1/Mask1: 10.1.1.2/255.255.255.0 (where LAN 1 is 10.1.1.x/255.255.255.0)

IP2/Mask2: 10.2.1.2/255.255.255.0 (where LAN2 is 10.2.1.x/255.255.255.0)

IP3/Mask3: 10.3.1.2/255.255.255.0 (where LAN3 is 10.3.1.x/255.255.255.0)

Example 2

IP1/Mask1: 10.1.1.2/255.0.0.0 (where LAN1 is 10.x.x.x/255.0.0.0)

IP2/Mask2: 11.1.1.2/255.0.0.0 (where LAN2 is 11.x.x.x/255.0.0.0)

IP3/Mask3: 12.1.1.2/255.0.0.0 (where LAN3 is 12.x.x.x/255.0.0.0)

Example 3 — Incorrect

IP1/Mask1: 10.1.1.2/255.0.0.0

IP2/Mask2: 10.2.1.2/255.0.0.0

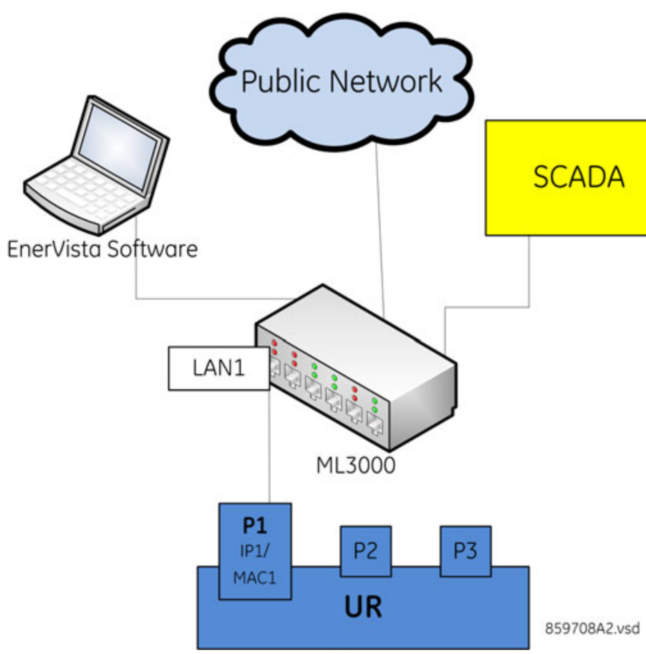
IP3/Mask3: 10.3.1.2/255.0.0.0

This example is incorrect because the mask of 255.0.0.0 used for the three IP addresses makes them belong to the same network of 10.x.x.x.

Single LAN, No Redundancy

The topology shown in the following figure allows communications to SCADA, local configuration/monitoring through EnerVista, and access to the public network shared on the same LAN. No redundancy is provided.

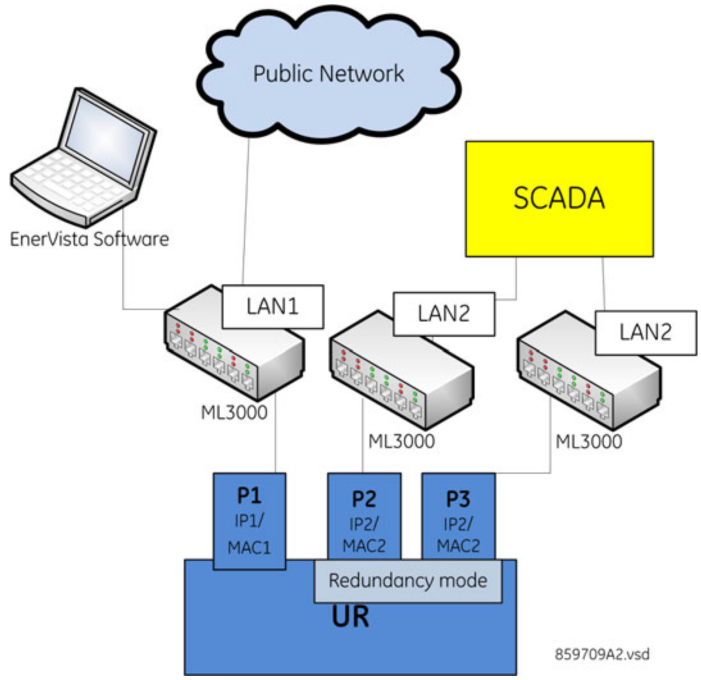
Figure 5–5: NETWORK CONFIGURATION FOR SINGLE LAN



Multiple LANS, with Redundancy

The topology in the following figure provides local configuration/monitoring through EnerVista software and access to the public network shared on LAN1, to which port 1 (P1) is connected. There is no redundancy provided on LAN1. Communications to SCADA is provided through LAN2 and LAN3, to which P2 and respectively P3 are connected and configured to work in redundant mode. In this configuration, P3 uses the IP and MAC address of P2.

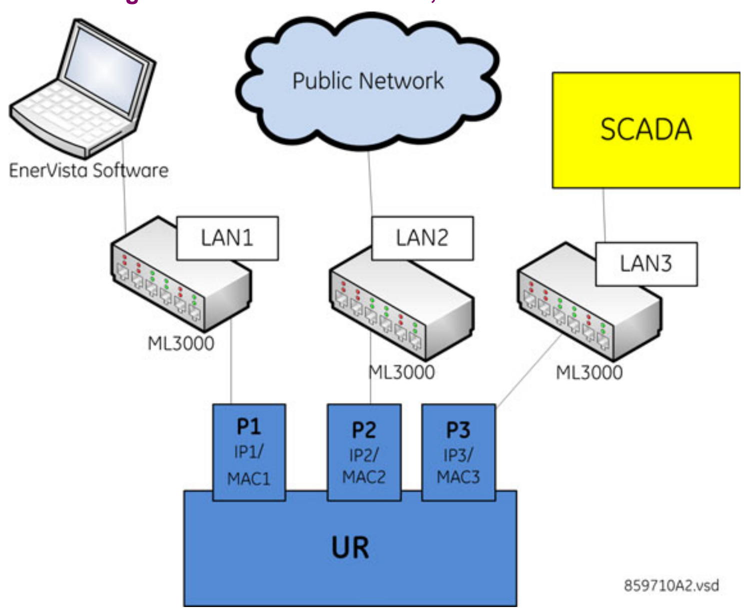
Figure 5–6: MULTIPLE LANS, WITH REDUNDANCY



Multiple LANS, No Redundancy

The following topology provides local configuration/monitoring through EnerVista software on LAN1, to which port 1 (P1) is connected, access to the public network on LAN2, to which port 2 (P2) is connected and communications with SCADA on LAN3, to which port 3 (P3) is connected. There is no redundancy.

Figure 5–7: MULTIPLE LANS, NO REDUNDANCY



5

d) NETWORK

As outlined in the previous section, when using more than one Ethernet port, configure each to belong to a different network or subnet using the IP addresses and mask. Configure the network IP and subnet settings before configuring the routing settings.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ NETWORK 1(3)

Menu		Setting	Range
■ NETWORK PORT 1 ■		PRT1 IP ADDRESS: 127.0.0.1	*Range: Standard IPV4 address format*
	MESSAGE	PRT1 SUBNET IP MASK: 255.0.0.0	*Range: Standard IPV4 address format*
	MESSAGE	PRT1 GOOSE ENABLED: Enabled	*Range: Enabled, Disabled*
■ NETWORK PORT 2 ■		PRT2 IP ADDRESS: 127.0.0.1	*Range: Standard IPV4 address format*
	MESSAGE	PRT2 SUBNET IP MASK: 255.0.0.0	*Range: Standard IPV4 address format*
	MESSAGE	PRT2 REDUNDANCY: None	*Range: None, Failover, PRP* *None, Failover (if no PRP license)*
	MESSAGE	PRT2 PRP MCST ADDR: 01-15-4E-00-01-00	*Range: 01-15-4E-00-01-00 to 01-15-4E-00-01-FF*
	MESSAGE	PRT2 GOOSE ENABLED: Enabled	*Range: Enabled, Disabled*
■ NETWORK PORT 3 ■		PRT3 IP ADDRESS: 127.0.0.1	*Range: Standard IPV4 address format*
	MESSAGE	PRT3 SUBNET IP MASK: 255.0.0.0	*Range: Standard IPV4 address format*
	MESSAGE	PRT3 GOOSE ENABLED: Enabled	*Range: Enabled, Disabled*

The IP addresses are used with the DNP, Modbus/TCP, IEC 61580, IEC 60870-5-104, TFTP, HTTP, and PRP protocols. The next section explains PRP.

NOTE

Do not set more than one protocol to the same TCP/UDP port number, as this results in unreliable operation of those protocols.

PRT1 (2 OR 3) IP ADDRESS: This setting sets the ports IPv4 address in standard IPV4 format. This setting is valid on port 3 if port 2 **REDUNDANCY** is set to None.

PRT1 (2 OR 3) SUBNET MASK: This setting sets the ports IPv4 subnet mask in standard IPV4 format. This setting is valid on port 3 if port 2 **REDUNDANCY** is set to None.

PRT2 REDUNDANCY is available when the hardware has multiple ports (modules T, U, and V). It determines if ports 2 and 3 operate in redundant or independent mode. If a license for PRP was purchased, the options are None, Failover, and PRP. If a license for PRP was not purchased, the available options are None and Failover. In non-redundant mode (**REDUNDANCY** set to None), ports 2 and 3 operate independently with their own MAC, IP, and mask addresses. If **REDUNDANCY** is set to Failover, the operation of ports 2 and 3 is as follows:

- Ports 2 and 3 use the port 2 MAC address, IP address, and mask
- The configuration fields for IP address and mask on port 3 are hidden

- Port 3 is in standby mode and does not actively communicate on the Ethernet network but monitors its link to the Multilink switch. If port 2 detects a problem with the link, communications is switched to Port 3. Port 3 is, in effect, acting as a redundant or backup link to the network for port 2. Once Port 2 detects that the link between port 2 and the switch is good, communications automatically switch back to port 2 and port 3 goes back into standby mode.

If **REDUNDANCY** is set to PRP, the operation of ports 2 and 3 is as follows:

- Ports 2 and 3 use the port 2 MAC address, IP address, and mask
- The configuration fields for IP address and mask on port 3 are overwritten with those from port 2. This is visible on the front panel but not displayed in the EnerVista software.
- Port 2 **MCST ADDRESS** field is visible
- The port 2 PTP function still uses only port 2 and the port 3 PTP function still uses only port 3. The relay still synchronizes to whichever port has the best master. When ports 2 and 3 see the same master, as is typically the case for PRP networks, the port with the better connectivity is used.

NOTE: The two ports must be connected to completely independent LANS with no single point of failure, such as common power supplies that feed switches on both LANS.

For this setting change to take effect, restart the unit.

PRT2 PRP MCST ADDR: This setting allows the user to change the multicast address used by the PRP supervision frames. The setting applies to UR CPUs that support multiple ports (T, U, and V). This setting is available if the hardware has multiple ports and **REDUNDANCY** is set to PRP.

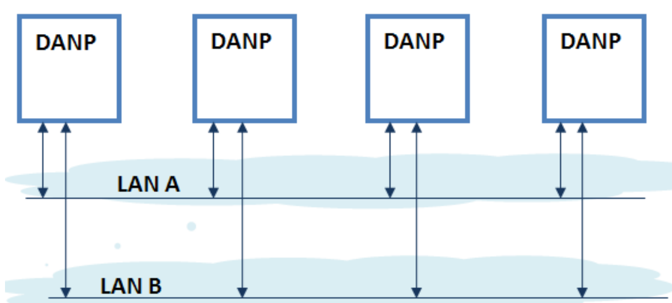
5

e) PARALLEL REDUNDANCY PROTOCOL (PRP)

The Parallel Redundancy Protocol (PRP) defines a redundancy protocol for high availability in substation automation networks. It applies to networks based on Ethernet technology (ISO/IEC 8802-3) and is based on the second edition (July 2012) of the IEC 62439-3, clause 4.

PRP is designed to provide seamless recovery in case of a single failure in the network, by using a combination of LAN duplication and frame duplication technique. Identical frames are sent on two completely independent networks that connect source and destination. Under normal circumstances both frames reach the destination and one of them is sent up the OSI stack to the destination application, while the second one is discarded. If an error occurs in one of the networks and traffic is prevented from flowing on that path, connectivity is still provided through the other network to ensure continuous communication. Take care when designing the two LANs, so that no single point of failure (such as a common power supply) is encountered, as such scenarios can bring down both LANs simultaneously.

Figure 5–8: EXAMPLE OF PARALLEL REDUNDANT NETWORK



PRP uses specialized nodes called doubly attached nodes (DANPs) for handling the duplicated frames. DANPs devices have an additional module, called Link Redundancy Entity (LRE). LRE is responsible for duplicating frames and adding the specific PRP trailer when sending the frames out on the LAN, as well as making decisions on received frames as to which one is sent up the OSI stack to the application layer and which one is discarded. LRE is responsible for making PRP transparent to the higher layers of the stack. There is a second type of specialized device used in PRP networks, called RedBox, with the role of connecting Single Attached Nodes (SANs) to a redundant network.

UR relays implement only the DANP functionality. The RedBox functionality is not implemented.

The original standard IEC 62439-3 (2010) was amended to align PRP with the High-availability Seamless Redundancy (HSR) protocol. To achieve this, the original PRP was modified at the cost of losing compatibility with the PRP 2010 version. The revised standard IEC 62439-3 (2012) is commonly referred to as PRP-1, while the original standard is PRP-0. The UR relays support only PRP-1.

The relay implements PRP on two of its Ethernet ports, specifically Port 2 and 3 of the CPU module. Use the previous section (network port configuration) to configure PRP.

PRP is purchased as a separate option. If purchased (valid order code), PRP can be enabled in configuration through a setting available on the network configuration menu, REDUNDANCY, which already has the capability of enabling failover redundancy. The options on this setting must be changed to accommodate two types of redundancy: failover and PRP. When REDUNDANCY is set to either failover or PRP, the ports dedicated for PRP (Port 2 and 3) operate in redundant mode. In this mode, Port 3 uses the Mac, IP address, and mask of Port 2.

f) ROUTING

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ ROUTING 1(6)

```
■ IPV4 ROUTING           IPV4 DEFAULT ROUTE
■ TABLE

              MESSAGE    IPV4 STATIC
                         NETWORK ROUTE 1
                               ↓
              MESSAGE    IPV4 STATIC
                         NETWORK ROUTE 6
```

A default route and a maximum number of six static routes can be configured.

The default route is used as the last choice when no other route towards a given destination is found.

```
■ IPV4 DEFAULT ROUTE     GATEWAY ADDRESS      Range: Standard IPV4 unicast address format
■                        127.0.0.1
```

```

■ NETWORK ROUTE 1        127.0.0.1

              MESSAGE    RT1 NET MASK:        Range: Standard IPV4 subnet mask format
                         255.0.0.0

              MESSAGE    RT1 GATEWAY:         Range: Standard IPV4 unicast address format
                         127.0.0.1
```

Configure the network IP and subnet settings before configuring the routing settings.

ADDING AND DELETING STATIC ROUTES

Host routes are not supported at present.

The routing table configuration is available on the serial port and front panel. This is a deliberate decision, to avoid loss of connectivity when remotely configuring the UR.

By default the value of the destination field is 127.0.0.1 for all static routes (1 to 6). This is equivalent to saying that the static routes are not configured. When the destination address is 127.0.0.1, the mask and gateway must be also kept on default values.

By default, the value of the route gateway address is 127.0.0.1. This means the default route is not configured.

To add a route:

1. Use any of the static network route entries numbered 1 to 6 to configure a static network route. Once a route destination is configured for any of the entries 1 to 6, that entry becomes a static route and it must meet all the rules listed in the next section, General Conditions to be Satisfied by Static Routes.

2. To configure the default route, enter a default gateway address. Once a default gateway address is configured, it must be validated against condition 2 of the General Conditions to be Satisfied by Static Routes.

To delete a route:

1. Replace the route destination with the default loopback address (127.0.0.1). When deleting a route, the mask and gateway must be also brought back to default values.
2. Delete the default route by replacing the default gateway with the default value 127.0.0.1.

GENERAL CONDITIONS TO BE SATISFIED BY STATIC ROUTES

The following rules must be adhered to for routing to work.

- The route destination must not be a connected network.
- The route gateway must be on a connected network. This rule applies to the gateway address of the default route as well.
- The route mask has IP mask format. In binary this is a set of contiguous bits of 1 from left to right, followed by one or more contiguous bits of 0.
- The route destination and mask must match. This means that the result of the "and" bitwise operation between the RtDestination and RtMask must equal RtDestination.
  Example of good configuration: RtDestination = 10.1.1.0; Rt Mask = 255.255.255.0
  Example of bad configuration: RtDestination = 10.1.1.1; Rt Mask = 255.255.255.0

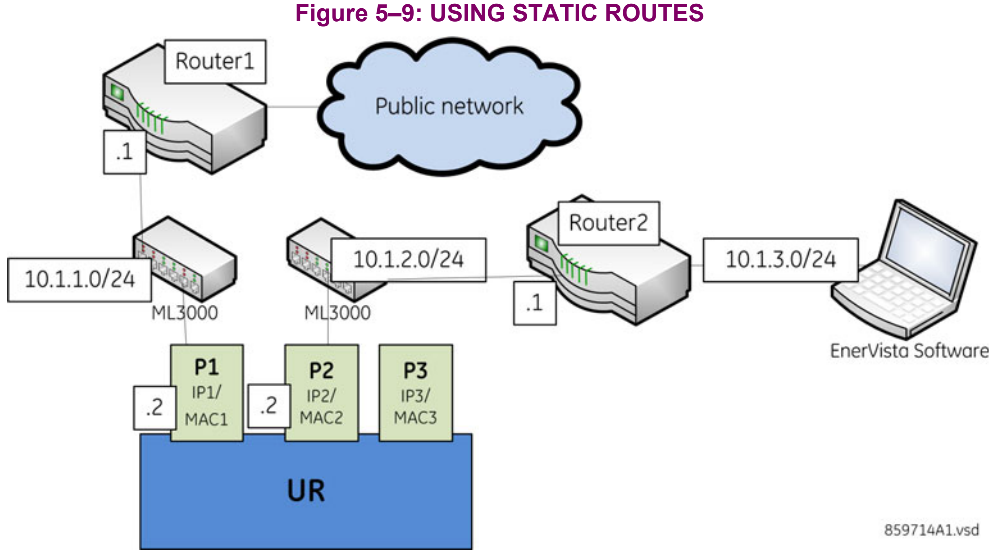
ROUTING BEHAVIOR COMPARED TO PREVIOUS RELEASES

Prior to release 7.10, the UR did not have an explicit manner of configuring routes. The only available route was the default route configured as part of the network settings (port gateway IP address). This limited the ability to route to specific destinations, particularly if these destinations were reachable through a different interface than the one on which the default gateway was.

Starting with UR 7.10, up to six static network routes can be configured in addition to a default route. The default route configuration was also moved from the network settings into the routing section.

The figure shows an example of topology that benefits from the addition of static routes.

Figure 5–9: USING STATIC ROUTES



In the figure, the UR connects through the following two Ethernet ports:

- Port 1 (IP address 10.1.1.2) connects the UR to LAN 10.1.1.0/24 and to the Internet through Router1. Router 1 has an interface on 10.1.1.0/24 and the IP address of this interface is 10.1.1.1.
- Port 2 (IP address 10.1.2.2) connects the UR to LAN 10.1.2.0/24 and to the EnerVista software through Router 2. Router 2 has an interface on 10.1.2.0/24 and the IP address of this interface is 10.1.2.1.

The configuration before release 7.10 was as follows:

- PRT1 IP ADDRESS = 10.1.1.2
  PRT1 SUBNET IP MASK = 255.255.255.0
  PRT1 GWY IP ADDRESS = 10.1.1.1
  PRT2 IP ADDRESS = 10.1.2.2
  PRT2 SUBNET IP MASK = 255.255.255.0

The behavior before release 7.10 was as follows. When sending packets to EnerVista, the UR noticed that the destination was not on a connected network and it tried to find a route to destination. Since the default route was the only route it knew, it used it. Yet EnerVista was on a private network, which was not reachable through Router 1. Hence a destination unreachable message was received from the router.

The configuration starting release 7.10 is as follows:

- PRT1 IP ADDRESS = 10.1.1.2
  PRT1 SUBNET IP MASK = 255.255.255.0
  PRT2 IP ADDRESS = 10.1.2.2
  PRT2 SUBNET IP MASK = 255.255.255.0
  IPV4 DEFAULT ROUTE: GATEWAY ADDRESS = 10.1.1.1
  STATIC NETWORK ROUTE 1: RT1 DESTINATION = 10.1.3.0/24; RT1 NET MASK = 255.255.255.0; and RT1 GATEWAY = 10.1.2.1

The behavior since release 7.10 is as follows. There is one added static network route to the destination 10.1.3.0/24, where a laptop running EnerVista is located. This static route uses a different gateway (10.1.2.1) than the default route. This gateway is the address of Router 2, which has knowledge about 10.1.3.0 and is able to route packets coming from UR and destined to EnerVista.

SHOW ROUTES AND ARP TABLES

This feature is available on the Web interface, where the main menu contains an additional Communications menu and two submenus:

- Routing Table
- ARP Table

The tables outline the information displayed when the two submenus are selected.

Table 5–3: ROUTING TABLE INFORMATION

FIELD	DESCRIPTION
Destination	The IP address of the remote network to which this route points
Mask	The network mask for the destination
Gateway	The IP address of the next router to the remote network
Interface	Interface through which the specified network can be reached

Table 5–4: IP ARP INFORMATION

FIELD	DESCRIPTION
IP Address	The network address that corresponds to Hardware Address
Age (min)	Age, in minutes, of the cache entry. A hyphen (-) means the address is local.
Hardware Address	LAN hardware address, a MAC address that corresponds to network address
Type	Dynamic or Static
Interface	Interface to which this address mapping has been assigned

g) MODBUS PROTOCOL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ MODBUS PROTOCOL

```
■ MODBUS PROTOCOL
■
```

	MODBUS SLAVE ADDRESS: 254	*Range: 0 to 254 in steps of 1*
MESSAGE	MODBUS TCP PORT NUMBER: 502	*Range: 0 to 65535 in steps of 1*

5

The serial communication ports utilize the Modbus protocol, unless configured for DNP operation (see descriptions below). This allows the EnerVista UR Setup software to be used. The UR operates as a Modbus slave device only. When using Modbus protocol on the RS232 port, the F60 responds regardless of the **MODBUS SLAVE ADDRESS** programmed. For the RS485 port, each F60 must have a unique address from 1 to 254. Address 0 is the broadcast address which all Modbus slave devices listen to. Addresses do not have to be sequential, but no two devices can have the same address or conflicts resulting in errors will occur. Generally, each device added to the link should use the next higher address starting at 1. See Appendix B for more information on the Modbus protocol.

A value of 0 closes the port. When the Modbus port is set to 0, communicate with the relay using the front panel or serial port.

NOTE

When a 0 value is involved in a change, the changes to the MODBUS TCP PORT NUMBER setting take effect when the F60 is restarted.

h) PROTOCOL

Select among DNP3.0, IEC60870-104, and IEC60870-103, with DNP being the default. For any change to take effect, restart the unit.

The table captures all possible combinations of protocols.

Table 5–5: PORT AND PROTOCOL COMBINATIONS

PROTOCOL	PORT: CHANNEL	RS232	RS485	ETHERNET

5

The F60 supports the Distributed Network Protocol (DNP) version 3.0. The F60 can be used as a DNP slave device connected to multiple DNP masters (usually an RTU or a SCADA master station). Since the F60 maintains two sets of DNP data change buffers and connection information, two DNP masters can actively communicate with the F60 at one time.

NOTE

The IEC 60870-5-104 and DNP protocols cannot be used simultaneously. When the IEC 60870-5-104 FUNCTION setting is set to “Enabled”, the DNP protocol is not operational. When this setting is changed it does not become active until power to the relay has been cycled (off-to-on).

The DNP Channels sub-menu is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP PROTOCOL ⇨ DNP CHANNELS

		Setting	Range
■ DNP CHANNELS ■	◀▶	DNP CHANNEL 1 PORT: NETWORK	Range: NONE, COM2 - RS485, FRONT PANEL - RS232, NETWORK - TCP, NETWORK - UDP
MESSAGE	▲	DNP CHANNEL 2 PORT: COM2 - RS485	Range: NONE, COM2 - RS485, FRONT PANEL - RS232, NETWORK - TCP, NETWORK - UDP

The **DNP CHANNEL 1 PORT** and **DNP CHANNEL 2 PORT** settings select the communications port assigned to the DNP protocol for each channel. Once DNP is assigned to a serial port, DNP is the only protocol running on that port; Modbus or IEC 60870-5-103 are disabled. If DNP is assigned to RS485, the protocol must be set to DNP on the serial port configuration as well, for the change to take effect. When this setting is set to “Network - TCP”, the DNP protocol can be used over TCP/IP on channels 1 or 2. When this value is set to “Network - UDP”, the DNP protocol can be used over UDP/IP on channel 1 only. See the DNP appendix for information on the DNP protocol.

NOTE

Changes to these settings take effect when power has been cycled to the relay.

The **DNP NETWORK CLIENT ADDRESS** settings can force the F60 to respond to a maximum of five specific DNP masters. The settings in this sub-menu are shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP PROTOCOL ⇨ DNP NETWORK CLIENT ADDRESSES

■ DNP NETWORK ■ CLIENT ADDRESSES	◀▶	CLIENT ADDRESS 1: 0.0.0.0	Range: standard IP address
MESSAGE	▲▼	CLIENT ADDRESS 2: 0.0.0.0	Range: standard IP address
MESSAGE	▲▼	CLIENT ADDRESS 3: 0.0.0.0	Range: standard IP address
MESSAGE	▲▼	CLIENT ADDRESS 4: 0.0.0.0	Range: standard IP address
MESSAGE	▲	CLIENT ADDRESS 5: 0.0.0.0	Range: standard IP address

The **DNP UNSOL RESPONSE FUNCTION** should be “Disabled” for RS485 applications since there is no collision avoidance mechanism. The **DNP UNSOL RESPONSE TIMEOUT** sets the time the F60 waits for a DNP master to confirm an unsolicited response. The **DNP UNSOL RESPONSE MAX RETRIES** setting determines the number of times the F60 retransmits an unsolicited response without receiving confirmation from the master; a value of “255” allows infinite re-tries. The **DNP UNSOL RESPONSE DEST ADDRESS** is the DNP address to which all unsolicited responses are sent. The IP address to which unsolicited responses are sent is determined by the F60 from the current TCP connection or the most recent UDP message.

The DNP scale factor settings are numbers used to scale analog input point values. These settings group the F60 analog input data into the following types: current, voltage, power, energy, power factor, and other. Each setting represents the scale factor for all analog input points of that type. For example, if the **DNP VOLTAGE SCALE FACTOR** setting is set to “1000”, all DNP analog input points that are voltages will be returned with values 1000 times smaller (for example, a value of 72000 V on the F60 will be returned as 72). These settings are useful when analog input values must be adjusted to fit within certain ranges in DNP masters. Note that a scale factor of 0.1 is equivalent to a multiplier of 10 (that is, the value will be 10 times larger).

The **DNP DEFAULT DEADBAND** settings determine when to trigger unsolicited responses containing analog input data. These settings group the F60 analog input data into the following types: current, voltage, power, energy, power factor, and other. Each setting represents the default deadband value for all analog input points of that type. For example, to trigger unsolicited responses from the F60 when any current values change by 15 A, the **DNP CURRENT DEFAULT DEADBAND** setting should be set to “15”. Note that these settings are the deadband default values. DNP object 34 points can be used to change deadband values, from the default, for each individual DNP analog input point. Whenever power is removed and re-applied to the F60, the default deadbands will be in effect.

The **DNP TIME SYNC IIN PERIOD** setting determines how often the Need Time Internal Indication (IIN) bit is set by the F60. Changing this time allows the DNP master to send time synchronization commands more or less often, as required.

The **DNP MESSAGE FRAGMENT SIZE** setting determines the size, in bytes, at which message fragmentation occurs. Large fragment sizes allow for more efficient throughput; smaller fragment sizes cause more application layer confirmations to be necessary which can provide for more robust data transfer over noisy communication channels.

NOTE

When the DNP data points (analog inputs and/or binary inputs) are configured for Ethernet-enabled relays, check the “DNP Points Lists” F60 web page to view the points lists. This page can be viewed with a web browser by entering the F60 IP address to access the F60 “Main Menu”, then by selecting the “Device Information Menu” > “DNP Points Lists” menu item.

The **DNP OBJECT 1 DEFAULT VARIATION** to **DNP OBJECT 32 DEFAULT VARIATION** settings allow the user to select the DNP default variation number for object types 1, 2, 20, 21, 22, 23, 30, and 32. The default variation refers to the variation response when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. See the *DNP Implementation* section in the DNP appendix.

The DNP binary outputs typically map one-to-one to IED data points. That is, each DNP binary output controls a single physical or virtual control point in an IED. In the F60 relay, DNP binary outputs are mapped to virtual inputs. However, some legacy DNP implementations use a mapping of one DNP binary output to two physical or virtual control points to support the concept of trip/close (for circuit breakers) or raise/lower (for tap changers) using a single control point. That is, the DNP master can operate a single point for both trip and close, or raise and lower, operations. The F60 can be configured to support paired control points, with each paired control point operating two virtual inputs. The **DNP NUMBER OF PAIRED CONTROL POINTS** setting allows configuration of from 0 to 32 binary output paired controls. Points not configured as paired operate on a one-to-one basis.

The **DNP ADDRESS** setting is the DNP slave address. This number identifies the F60 on a DNP communications link. Each DNP slave should be assigned a unique address.

The **DNP TCP CONNECTION TIMEOUT** setting specifies a time delay for the detection of dead network TCP connections. If there is no data traffic on a DNP TCP connection for greater than the time specified by this setting, the connection will be aborted by the F60. This frees up the connection to be re-used by a client.

NOTE: Relay power must be re-cycled after changing the **DNP TCP CONNECTION TIMEOUT** setting for the changes to take effect.

j) DNP / IEC 60870-5-104 POINT LISTS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP / IEC104 POINT LISTS

■ DNP / IEC104 ■ POINT LISTS	◁▷	■ BINARY INPUT / MSP ■ POINTS	Range: see sub-menu below
	MESSAGE △	■ ANALOG INPUT / MME ■ POINTS	Range: see sub-menu below

The binary and analog inputs points for the DNP protocol, or the MSP and MME points for IEC 60870-5-104 protocol, can configured to a maximum of 256 points. The value for each point is user-programmable and can be configured by assigning FlexLogic operands for binary inputs / MSP points or FlexAnalog parameters for analog inputs / MME points.

The menu for the binary input points (DNP) or MSP points (IEC 60870-5-104) is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP / IEC104 POINT LISTS ⇨ BINARY INPUT / MSP POINTS

■ BINARY INPUT / MSP ■ POINTS	◁▷	Point: 0 Off	Range: FlexLogic operand
	MESSAGE △	Point: 1 Off	Range: FlexLogic operand
		↓	
	MESSAGE △	Point: 255 Off	Range: FlexLogic operand

Up to 256 binary input points can be configured for the DNP or IEC 60870-5-104 protocols. The points are configured by assigning an appropriate FlexLogic operand. See the *Introduction to FlexLogic* section in this chapter for the full range of assignable operands.

The menu for the analog input points (DNP) or MME points (IEC 60870-5-104) is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP / IEC104 POINT LISTS ⇨⇩ ANALOG INPUT / MME POINTS

■ ANALOG INPUT / MME ■ POINTS	◁▷	Point: 0 Off	Range: any FlexAnalog parameter
	MESSAGE △	Point: 1 Off	Range: any FlexAnalog parameter
		↓	
	MESSAGE △	Point: 255 Off	Range: any FlexAnalog parameter

Up to 256 analog input points can be configured for the DNP or IEC 60870-5-104 protocols. The analog point list is configured by assigning an appropriate FlexAnalog parameter to each point. Refer to Appendix A: *FlexAnalog Parameters* for the full range of assignable parameters.

NOTE

The DNP / IEC 60870-5-104 point lists always begin with point 0 and end at the first "Off" value. Since DNP / IEC 60870-5-104 point lists must be in one continuous block, any points assigned after the first "Off" point are ignored.

NOTE

Changes to the DNP / IEC 60870-5-104 point lists will not take effect until the F60 is restarted.

k) IEC 61850 PROTOCOL

SOFTWARE OPTION

The F60 Feeder Protection System is provided with optional IEC 61850 communications capability. This feature is specified as a software option at the time of ordering. See the *Order Codes* section in chapter 2 for details.

NOTICE

Use independent ports for IEC 61850 communication and take care when configuring the settings, else loss of protection or misoperation of the relay can result.

The F60 supports the Manufacturing Message Specification (MMS) protocol as specified by IEC 61850. MMS is supported over two protocol stacks: TCP/IP over Ethernet. The F60 operates as an IEC 61850 server. The *Remote Inputs and Outputs* section in this chapter describe the peer-to-peer GSSE/GOOSE message scheme.

The GSSE/GOOSE configuration main menu is divided into two areas: transmission and reception.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION

■ GSSE / GOOSE ■ CONFIGURATION		■ TRANSMISSION ■
	MESSAGE	■ RECEPTION ■

The main transmission menu is shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION

■ TRANSMISSION ■	◁▷	■ GENERAL ■	
	MESSAGE	■ GSSE ■	
	MESSAGE	■ FIXED GOOSE ■	
	MESSAGE	■ CONFIGURABLE ■ GOOSE	

The general transmission settings are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨ GENERAL

■ GENERAL ■	◁▷	DEFAULT GSSE/GOOSE UPDATE TIME: 60 s	*Range: 1 to 60 s in steps of 1*

The **DEFAULT GSSE/GOOSE UPDATE TIME** sets the time between GSSE or GOOSE messages when there are no remote output state changes to be sent. When remote output data changes, GSSE or GOOSE messages are sent immediately. This setting controls the steady-state *heartbeat* time interval.

5

The **DEFAULT GSSE/GOOSE UPDATE TIME** setting is applicable to GSSE, fixed F60 GOOSE, and configurable GOOSE.

The GSSE settings are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ GSSE

■ GSSE ■	◁▷	GSSE FUNCTION: Enabled	*Range: Enabled, Disabled*
	MESSAGE	GSSE ID: GSSEOut	*Range: 65-character ASCII string*
	MESSAGE	DESTINATION MAC: 000000000000	*Range: standard MAC address*

These settings are applicable to GSSE only. If the fixed GOOSE function is enabled, GSSE messages are not transmitted.

The **GSSE ID** setting represents the IEC 61850 GSSE application ID name string sent as part of each GSSE message. This string identifies the GSSE message to the receiving device. In F60 releases previous to 5.0x, this name string was represented by the **RELAY NAME** setting.

The fixed GOOSE settings are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ FIXED GOOSE

■ FIXED GOOSE ■	◁▷	GOOSE FUNCTION: Disabled	*Range: Enabled, Disabled*
MESSAGE	△▽	GOOSE ID: GOOSEOut	*Range: 65-character ASCII string*
MESSAGE	△▽	DESTINATION MAC: 000000000000	*Range: standard MAC address*
MESSAGE	△▽	GOOSE VLAN PRIORITY: 4	*Range: 0 to 7 in steps of 1*
MESSAGE	△▽	GOOSE VLAN ID: 0	*Range: 0 to 4095 in steps of 1*
MESSAGE	△	GOOSE ETYPE APPID: 0	*Range: 0 to 16383 in steps of 1*

These settings are applicable to fixed (DNA/UserSt) GOOSE only.

The **GOOSE ID** setting represents the IEC 61850 GOOSE application ID (GoID) name string sent as part of each GOOSE message. This string identifies the GOOSE message to the receiving device. In revisions previous to 5.0x, this name string was represented by the **RELAY NAME** setting.

The **DESTINATION MAC** setting allows the destination Ethernet MAC address to be set. This address must be a multicast address; the least significant bit of the first byte must be set. In F60 releases previous to 5.0x, the destination Ethernet MAC address was determined automatically by taking the sending MAC address (that is, the unique, local MAC address of the F60) and setting the multicast bit.

The **GOOSE VLAN PRIORITY** setting indicates the Ethernet priority of GOOSE messages. This allows GOOSE messages to have higher priority than other Ethernet data. The **GOOSE ETYPE APPID** setting allows the selection of a specific application ID for each GOOSE sending device. This value can be left at its default if the feature is not required. Both the **GOOSE VLAN PRIORITY** and **GOOSE ETYPE APPID** settings are required by IEC 61850.

The configurable GOOSE settings are shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1(8)

■ CONFIGURABLE ■ GOOSE 1		CONFIG GSE 1 FUNCTION: Enabled	Range: Enabled, Disabled

MESSAGE		CONFIG GSE 1 DST MAC: 000000000000	Range: standard MAC address
MESSAGE		CONFIG GSE 1 VLAN PRIORITY: 4	Range: 0 to 7 in steps of 1
MESSAGE		CONFIG GSE 1 VLAN ID: 0	Range: 0 to 4095 in steps of 1
MESSAGE		CONFIG GSE 1 ETYPE APPID: 0	Range: 0 to 16383 in steps of 1
MESSAGE		CONFIG GSE 1 CONFREV: 1	Range: 0 to 4294967295 in steps of 1
MESSAGE		CONFIG GSE 1 RESTRANS CURVE: Relaxed	Range: Aggressive, Medium, Relaxed, Heartbeat
MESSAGE		■ CONFIG GSE 1 ■ DATASET ITEMS	Range: 64 data items; each can be set to all valid MMS data item references for transmitted data

The configurable GOOSE settings allow the F60 to be configured to transmit a number of different datasets within IEC 61850 GOOSE messages. Up to eight different configurable datasets can be configured and transmitted. This is useful for intercommunication between F60 IEDs and devices from other manufacturers that support IEC 61850.

The configurable GOOSE feature allows for the configuration of the datasets to be transmitted or received from the F60. The F60 supports the configuration of eight (8) transmission and reception datasets, allowing for the optimization of data transfer between devices.

Items programmed for dataset 1 and 2 will have changes in their status transmitted as soon as the change is detected. Datasets 1 and 2 should be used for high-speed transmission of data that is required for applications such as transfer tripping, blocking, and breaker fail initiate. At least one digital status value needs to be configured in the required dataset to enable transmission of configured data. Configuring analog data only to dataset 1 or 2 will not activate transmission.

Items programmed for datasets 3 through 8 will have changes in their status transmitted at a maximum rate of every 100 ms. Datasets 3 through 8 will regularly analyze each data item configured within them every 100 ms to identify if any changes have been made. If any changes in the data items are detected, these changes will be transmitted through a GOOSE message. If there are no changes detected during this 100 ms period, no GOOSE message will be sent.

For all datasets 1 through 8, the integrity GOOSE message will still continue to be sent at the pre-configured rate even if no changes in the data items are detected.

The GOOSE functionality was enhanced to prevent the relay from flooding a communications network with GOOSE messages due to an oscillation being created that is triggering a message.

The F60 has the ability of detecting if a data item in one of the GOOSE datasets is erroneously oscillating. This can be caused by events such as errors in logic programming, inputs improperly being asserted and de-asserted, or failed station components. If erroneously oscillation is detected, the F60 will stop sending GOOSE messages from the dataset for a minimum period of one second. Should the oscillation persist after the one second time-out period, the F60 will continue to block transmission of the dataset. The F60 will assert the **MAINTENANCE ALERT: GGIO Ind XXX oscill** self-test error message on the front panel display, where **XXX** denotes the data item detected as oscillating.

For versions 5.70 and higher, the F60 supports four retransmission schemes: aggressive, medium, relaxed, and heartbeat. The aggressive scheme is only supported in fast type 1A GOOSE messages (GOOSEOut 1 and GOOSEOut 2). For slow GOOSE messages (GOOSEOut 3 to GOOSEOut 8) the aggressive scheme is the same as the medium scheme.

The details about each scheme are shown in the following table.

Table 5–6: GOOSE RETRANSMISSION SCHEMES

SCHEME	SQ NUM	TIME FROM THE EVENT	TIME BETWEEN MESSAGES	COMMENT	TIME ALLOWED TO LIVE IN MESSAGE
Aggressive	0	0 ms	0 ms	Event	2000 ms
	1	4 ms	4 ms	T1	2000 ms
	2	8 ms	4 ms	T1	2000 ms
	3	16 ms	8 ms	T2	Heartbeat * 4.5

The configurable GOOSE feature is recommended for applications that require GOOSE data transfer between UR-series IEDs and devices from other manufacturers. Fixed GOOSE is recommended for applications that require GOOSE data transfer between UR-series IEDs.

IEC 61850 GOOSE messaging contains a number of configurable parameters, all of which must be correct to achieve the successful transfer of data. It is critical that the configured datasets at the transmission and reception devices are an exact match in terms of data structure, and that the GOOSE addresses and name strings match exactly. Manual configuration is possible, but third-party substation configuration software may be used to automate the process. The EnerVista UR Setup software can produce IEC 61850 ICD files and import IEC 61850 SCD files produced by a substation configurator (as outlined in the IEC 61850 appendix).

The following example illustrates the configuration required to transfer IEC 61850 data items between two devices. The general steps required for transmission configuration are:

1. Configure the transmission dataset.
2. Configure the GOOSE service settings.
3. Configure the data.

The general steps required for reception configuration are:

1. Configure the reception dataset.
2. Configure the GOOSE service settings.
3. Configure the data.

This example shows how to configure the transmission and reception of three IEC 61850 data items: a single point status value, its associated quality flags, and a floating point analog value.

The following procedure illustrates the transmission configuration.

1. Configure the transmission dataset by making the following changes in the **PRODUCT SETUP ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1 ⇨⇩ CONFIG GSE 1 DATASET ITEMS** settings menu:
   – Set **ITEM 1** to "GGIO1.ST.Ind1.q" to indicate quality flags for GGIO1 status indication 1.
   – Set **ITEM 2** to "GGIO1.ST.Ind1.stVal" to indicate the status value for GGIO1 status indication 1.
   – Set **ITEM 3** to "MMXU1.MX.Hz.mag.f" to indicate the analog frequency magnitude for MMXU1 (the metered frequency for SRC1).

   The transmission dataset now contains a quality flag, a single point status Boolean value, and a floating point analog value. The reception dataset on the receiving device must exactly match this structure.
2. Configure the GOOSE service settings by making the following changes in the **PRODUCT SETUP ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1** settings menu:
   – Set **CONFIG GSE 1 FUNCTION** to "Enabled".
   – Set **CONFIG GSE 1 ID** to an appropriate descriptive string (the default value is "GOOSEOut_1").
   – Set **CONFIG GSE 1 DST MAC** to a multicast address (for example, 01 00 00 12 34 56).
   – Set the **CONFIG GSE 1 VLAN PRIORITY**; the default value of "4" is OK for this example.
   – Set the **CONFIG GSE 1 VLAN ID** value; the default value is "0", but some switches may require this value to be "1".
   – Set the **CONFIG GSE 1 ETYPE APPID** value. This setting represents the ETHERTYPE application ID and must match the configuration on the receiver (the default value is "0").
   – Set the **CONFIG GSE 1 CONFREV** value. This value changes automatically as described in IEC 61850 part 7-2. For this example it can be left at its default value.
3. Configure the data by making the following changes in the **PRODUCT SETUP ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨ GGIO1 STATUS CONFIGURATION** settings menu:
   – Set **GGIO1 INDICATION 1** to a FlexLogic operand used to provide the status of GGIO1.ST.Ind1.stVal (for example, a contact input, virtual input, a protection element status, etc.).
4. Configure the MMXU1 Hz Deadband by making the following changes in the **PRODUCT SETUP ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ MMXU DEADBANDS⇨⇩ MMXU1 DEADBANDS** settings menu:
   – Set **MMXU1 HZ DEADBAND** to "0.050%". This will result in an update to the MMXU1.MX.mag.f analog value with a change greater than 45 mHz, from the previous MMXU1.MX.mag.f value, in the source frequency.

The F60 must be rebooted (control power removed and re-applied) before these settings take effect.

The following procedure illustrates the reception configuration.

1. Configure the reception dataset by making the following changes in the **PRODUCT SETUP ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨⇩ RECEPTION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1 ⇨⇩ CONFIG GSE 1 DATASET ITEMS** settings menu:
   – Set **ITEM 1** to "GGIO3.ST.Ind1.q" to indicate quality flags for GGIO3 status indication 1.
   – Set **ITEM 2** to "GGIO3.ST.Ind1.stVal" to indicate the status value for GGIO3 status indication 1.
   – Set **ITEM 3** to "GGIO3.MX.AnIn1.mag.f" to indicate the analog magnitude for GGIO3 analog input 1.

   The reception dataset now contains a quality flag, a single point status Boolean value, and a floating point analog value. This matches the transmission dataset configuration above.
2. Configure the GOOSE service settings by making the following changes in the **INPUTS/OUTPUTS ⇨⇩ REMOTE DEVICES ⇨⇩ REMOTE DEVICE 1** settings menu:
   – Set **REMOTE DEVICE 1 ID** to match the GOOSE ID string for the transmitting device. Enter "GOOSEOut_1".

– Set **REMOTE DEVICE 1 ETYPE APPID** to match the ETHERTYPE application ID from the transmitting device. This is "0" in the example above.

– Set the **REMOTE DEVICE 1 DATASET** value. This value represents the dataset number in use. Since we are using configurable GOOSE 1 in this example, program this value as "GOOSEIn 1".

3. Configure the Boolean data by making the following changes in the **INPUTS/OUTPUTS ⇨⇩ REMOTE INPUTS ⇨⇩ REMOTE INPUT 1** settings menu:

– Set **REMOTE IN 1 DEVICE** to "GOOSEOut_1".

– Set **REMOTE IN 1 ITEM** to "Dataset Item 2". This assigns the value of the GGIO3.ST.Ind1.stVal single point status item to remote input 1.

4. Configure the analog data by making the following changes in the **INPUTS/OUTPUTS ⇨⇩ IEC 61850 GOOSE ANALOG INPUTS** settings menu:

– Set the **IEC61850 GOOSE ANALOG INPUT 1 DEFAULT VALUE** to "60.000".

– Enter "Hz" for the **IEC61850 GOOSE ANALOG INPUT 1 UNITS** setting.

The GOOSE analog input 1 can now be used as a FlexAnalog value in a FlexElement or in other settings. The F60 must be rebooted (control power removed and re-applied) before these settings take effect.

The value of GOOSE analog input 1 in the receiving device will be determined by the MMXU1.MX.Hz.mag.f value in the sending device. This MMXU value is determined by the source 1 frequency value and the MMXU Hz deadband setting of the sending device.

Remote input 1 can now be used in FlexLogic equations or other settings. The F60 must be rebooted (control power removed and re-applied) before these settings take effect.

The value of remote input 1 (Boolean on or off) in the receiving device will be determined by the GGIO1.ST.Ind1.stVal value in the sending device. The above settings will be automatically populated by the EnerVista UR Setup software when a complete SCD file is created by third party substation configurator software.

For intercommunication between F60 IEDs, the fixed (DNA/UserSt) dataset can be used. The DNA/UserSt dataset contains the same DNA and UserSt bit pairs that are included in GSSE messages. All GOOSE messages transmitted by the F60 (DNA/UserSt dataset and configurable datasets) use the IEC 61850 GOOSE messaging services (for example, VLAN support).

NOTE

Set the **CONFIG GSE 1 FUNCTION** function to "Disabled" when configuration changes are required. Once changes are entered, return the **CONFIG GSE 1 FUNCTION** to "Enabled" and restart the unit for changes to take effect.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1(8) ⇨⇩ CONFIG GSE 1(64) DATA ITEMS

■ CONFIG GSE 1 ■ DATASET ITEMS		ITEM 1: GGIO1.ST.Ind1.stVal	*Range: all valid MMS data item references for transmitted data*
	MESSAGE	ITEM 2: GGIO1.ST.IndPos1.stV	*Range: all valid MMS data item references for transmitted data*
	MESSAGE	ITEM 3: None	*Range: all valid MMS data item references for transmitted data*
		↓	
	MESSAGE	ITEM 64: None	*Range: all valid MMS data item references for transmitted data*

To create a configurable GOOSE dataset that contains an IEC 61850 Single Point Status indication and its associated quality flags, the following dataset items can be selected: "GGIO1.ST.Ind1.stVal" and "GGIO1.ST.Ind1.q". The F60 will then create a dataset containing these two data items. The status value for GGIO1.ST.Ind1.stVal is determined by the FlexLogic operand assigned to GGIO1 indication 1. Changes to this operand will result in the transmission of GOOSE messages containing the defined dataset.

The main reception menu is applicable to configurable GOOSE only and contains the configurable GOOSE dataset items for reception:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ RECEPTION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1(16) ⇨⇩ CONFIG GSE 1(32) DATA ITEMS

■ CONFIG GSE 1 ■ DATASET ITEMS	◀▶	ITEM 1: GGIO3.ST.Ind1.stVal	Range: all valid MMS data item references for transmitted data
MESSAGE	▲▼	ITEM 2: GGIO3.ST.IndPos1.stV	Range: all valid MMS data item references for transmitted data
MESSAGE	▲▼	ITEM 3: None	Range: all valid MMS data item references for transmitted data
		↓	
MESSAGE	▲	ITEM 32: None	Range: all valid MMS data item references for transmitted data

The configurable GOOSE settings allow the F60 to be configured to receive a number of different datasets within IEC 61850 GOOSE messages. Up to sixteen different configurable datasets can be configured for reception. This is useful for intercommunication between F60 IEDs and devices from other manufacturers that support IEC 61850.

For intercommunication between F60 IEDs, the fixed (DNA/UserSt) dataset can be used. The DNA/UserSt dataset contains the same DNA and UserSt bit pairs that are included in GSSE messages.

5

To set up a F60 to receive a configurable GOOSE dataset that contains two IEC 61850 single point status indications, the following dataset items can be selected (for example, for configurable GOOSE dataset 1): “GGIO3.ST.Ind1.stVal” and “GGIO3.ST.Ind2.stVal”. The F60 will then create a dataset containing these two data items. The Boolean status values from these data items can be utilized as remote input FlexLogic operands. First, the **REMOTE DEVICE 1(16) DATASET** setting must be set to contain dataset “GOOSEIn 1” (that is, the first configurable dataset). Then **REMOTE IN 1(16) ITEM** settings must be set to “Dataset Item 1” and “Dataset Item 2”. These remote input FlexLogic operands will then change state in accordance with the status values of the data items in the configured dataset.

Double-point status values may be included in the GOOSE dataset. Received values are populated in the GGIO3.ST.IndPos1.stVal and higher items.

Floating point analog values originating from MMXU logical nodes may be included in GOOSE datasets. Deadband (non-instantaneous) values can be transmitted. Received values are used to populate the GGIO3.MX.AnIn1 and higher items. Received values are also available as FlexAnalog parameters (GOOSE analog In1 and up).

NOTE

GGIO3.MX.AnIn1 to GGIO3.MX.AnIn32 can only be used once for all sixteen reception datasets.

The main menu for the IEC 61850 server configuration is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ SERVER CONFIGURATION

■ SERVER ■ CONFIGURATION	IED NAME: IECDevice	Range: up to 32 alphanumeric characters
MESSAGE	LD INST: LDInst	Range: up to 32 alphanumeric characters
MESSAGE	IEC/MMS TCP PORT NUMBER: 102	Range: 0 to 65535 in steps of 1
MESSAGE	INCLUDE NON-IEC DATA: Enabled	Range: Disabled, Enabled
MESSAGE	SERVER SCANNING: Disabled	Range: Disabled, Enabled
MESSAGE	LOCATION: LPHD DC PHV- Nam Location	Range: up to 80 alphanumeric characters
MESSAGE	LATITUDE:	Range: -90.000 to 90.000 deg in steps of 0.001 deg
MESSAGE	LONGITUDE:	Range: -180.000 to 180.000 deg in steps of 0.001 deg
MESSAGE	ALTITUDE:	Range: 0 to 10,0000 m in steps of 1 m

The **IED NAME** and **LD INST** settings represent the MMS domain name (IEC 61850 logical device) where all IEC/MMS logical nodes are located. Valid characters for these values are upper and lowercase letters, numbers, and the underscore (_) character, and the first character in the string must be a letter. This conforms to the IEC 61850 standard. The **LOCATION** is a variable string and can be composed of ASCII characters. This string appears within the PhyName of the LPHD node.

The **IEC/MMS TCP PORT NUMBER** setting allows the user to change the TCP port number for MMS connections. The **INCLUDE NON-IEC DATA** setting determines whether or not the "UR" MMS domain will be available. This domain contains a large number of UR-series specific data items that are not available in the IEC 61850 logical nodes. This data does not follow the IEC 61850 naming conventions. For communications schemes that strictly follow the IEC 61850 standard, this setting should be "Disabled".

NOTE

When a 0 value is involved in a change, the changes to the **IEC/MMS TCP PORT NUMBER** setting take effect when the F60 is restarted.

The **SERVER SCANNING** feature should be set to "Disabled" when IEC 61850 client/server functionality is not required. IEC 61850 has two modes of functionality: GOOSE/GSSE inter-device communication and client/server communication. If the GOOSE/GSSE functionality is required without the IEC 61850 client server feature, then server scanning can be disabled to increase CPU resources. When server scanning is disabled, there is no updating of the IEC 61850 logical node status values in the F60. Clients are still able to connect to the server (F60 relay), but most data values are not updated. This setting does not affect GOOSE/GSSE operation.

NOTE

Changes to the **IED NAME** setting, **LD INST** setting, and GOOSE dataset take effect when the F60 is restarted.

The main menu for the IEC 61850 logical node name prefixes is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ IEC 61850 LOGICAL NODE NAME PREFIXES

```
■ IEC 61850 LOGICAL          ■ PIOC LOGICAL NODE
■ NODE NAME PREFIXES         ■ NAME PREFIXES

              MESSAGE        ■ PTOC LOGICAL NODE
                             ■ NAME PREFIXES
                                     ↓
              MESSAGE        ■ PTRC LOGICAL NODE
                             ■ NAME PREFIXES
```

The IEC 61850 logical node name prefix settings are used to create name prefixes to uniquely identify each logical node. For example, the logical node “PTOC1” may have the name prefix “abc”. The full logical node name will then be “abcMMXU1”. Valid characters for the logical node name prefixes are upper and lowercase letters, numbers, and the underscore (_) character, and the first character in the prefix must be a letter. This conforms to the IEC 61850 standard.

Changes to the logical node prefixes will not take effect until the F60 is restarted.

The main menu for the IEC 61850 MMXU deadbands is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ MMXU DEADBANDS

```
■ MMXU DEADBANDS             ■ MMXU1 DEADBANDS
■                            ■

              MESSAGE        ■ MMXU2 DEADBANDS
                             ■

              MESSAGE        ■ MMXU3 DEADBANDS
                             ■

              MESSAGE        ■ MMXU4 DEADBANDS
                             ■
```

The MMXU deadband settings represent the deadband values used to determine when the update the MMXU “mag” and “cVal” values from the associated “instmag” and “instcVal” values. The “mag” and “cVal” values are used for the IEC 61850 buffered and unbuffered reports. These settings correspond to the associated “db” data items in the CF functional constraint of the MMXU logical node, as per the IEC 61850 standard. According to IEC 61850-7-3, the db value “shall represent the percentage of difference between the maximum and minimum in units of 0.001%”. Thus, it is important to know the maximum value for each MMXU measured quantity, since this represents the 100.00% value for the deadband.

The minimum value for all quantities is 0; the maximum values are as follows:

- phase current: 46 × phase CT primary setting
- neutral current: 46 × ground CT primary setting
- voltage: 275 × VT ratio setting
- power (real, reactive, and apparent): 46 × phase CT primary setting × 275 × VT ratio setting
- frequency: 90 Hz
- power factor: 2

The GGIO1 status configuration points are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ GGIO1 STATUS CONFIGURATION

■ GGIO1 STATUS ■ CONFIGURATION		NUMBER OF STATUS POINTS IN GGIO1: 8	Range: 8 to 128 in steps of 8
	MESSAGE	GGIO1 INDICATION 1 Off	Range: FlexLogic operand
	MESSAGE	GGIO1 INDICATION 2 Off	Range: FlexLogic operand
	MESSAGE	GGIO1 INDICATION 3 Off	Range: FlexLogic operand
		↓	
	MESSAGE	GGIO1 INDICATION 128 Off	Range: FlexLogic operand

The **NUMBER OF STATUS POINTS IN GGIO1** setting specifies the number of “Ind” (single point status indications) that are instantiated in the GGIO1 logical node. Changes to the **NUMBER OF STATUS POINTS IN GGIO1** setting will not take effect until the F60 is restarted.

The GGIO2 control configuration points are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ GGIO2 CONTROL CONFIGURATION ⇨ GGIO2 CF SPSCO 1(64)

■ GGIO2 CF SPCSO 1 ■		GGIO2 CF SPCSO 1 CTLMODEL: 1	Range: 0, 1, or 2

The GGIO2 control configuration settings are used to set the control model for each input. The available choices are “0” (status only), “1” (direct control), and “2” (SBO with normal security). The GGIO2 control points are used to control the F60 virtual inputs.

The GGIO4 analog configuration points are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ GGIO4 ANALOG CONFIGURATION

■ GGIO4 ANALOG ■ CONFIGURATION		NUMBER OF ANALOG POINTS IN GGIO4: 8	Range: 4 to 32 in steps of 4
	MESSAGE	■ GGIO4 ANALOG 1 ■ MEASURED VALUE	
	MESSAGE	■ GGIO4 ANALOG 2 ■ MEASURED VALUE	
	MESSAGE	■ GGIO4 ANALOG 3 ■ MEASURED VALUE	
		↓	
	MESSAGE	■ GGIO4 ANALOG 32 ■ MEASURED VALUE	

The **NUMBER OF ANALOG POINTS** setting determines how many analog data points will exist in GGIO4. When this value is changed, the F60 must be rebooted in order to allow the GGIO4 logical node to be re-instantiated and contain the newly configured number of analog points.

The measured value settings for each of the 32 analog values are shown below.

PATH: SETTINGS ⇨ PRODUCT... ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ GGIO4 ANALOG CONFIGURATION ⇨ GGIO4 ANALOG 1(32) MEASURED VALUE

■ GGIO4 ANALOG 1 ■ MEASURED VALUE		ANALOG IN 1 VALUE: Off	*Range: any FlexAnalog value*
	MESSAGE	ANALOG IN 1 DB: 0.000	*Range: 0.000 to 100.000 in steps of 0.001*
	MESSAGE	ANALOG IN 1 MIN: 0.000	*Range: –1000000000.000 to 1000000000.000 in steps of 0.001*
	MESSAGE	ANALOG IN 1 MAX: 0.000	*Range: –1000000000.000 to 1000000000.000 in steps of 0.001*

These settings are configured as follows.

- **ANALOG IN 1 VALUE**: This setting selects the FlexAnalog value to drive the instantaneous value of each GGIO4 analog status value (GGIO4.MX.AnIn1.instMag.f).
- **ANALOG IN 1 DB**: This setting specifies the deadband for each analog value. Refer to IEC 61850-7-1 and 61850-7-3 for details. The deadband is used to determine when to update the deadbanded magnitude from the instantaneous magnitude. The deadband is a percentage of the difference between the maximum and minimum values.
- **ANALOG IN 1 MIN**: This setting specifies the minimum value for each analog value. Refer to IEC 61850-7-1 and 61850-7-3 for details. This minimum value is used to determine the deadband. The deadband is used in the determination of the deadbanded magnitude from the instantaneous magnitude.
- **ANALOG IN 1 MAX**: This setting defines the maximum value for each analog value. Refer to IEC 61850-7-1 and 61850-7-3 for details. This maximum value is used to determine the deadband. The deadband is used in the determination of the deadbanded magnitude from the instantaneous magnitude.

NOTE

Note that the **ANALOG IN 1 MIN** and **ANALOG IN 1 MAX** settings are stored as IEEE 754 / IEC 60559 floating point numbers. Because of the large range of these settings, not all values can be stored. Some values may be rounded to the closest possible floating point number.

The GGIO5 integer configuration points are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ GGIO5 ANALOG CONFIGURATION

■ GGIO5 UINTEGER ■ CONFIGURATION		GGIO5 UINT In 1: Off	*Range: Off, any FlexInteger™ parameter*
	MESSAGE	GGIO5 UINT In 2: Off	*Range: Off, any FlexInteger parameter*
	MESSAGE	GGIO5 UINT In 3: Off	*Range: Off, any FlexInteger parameter*
		↓	
	MESSAGE	GGIO5 UINT 1n 16: Off	*Range: Off, any FlexInteger parameter*

The GGIO5 logical node allows IEC 61850 client access to integer data values. This allows access to as many as 16 unsigned integer value points, associated timestamps, and quality flags. The method of configuration is similar to that of GGIO1 (binary status values). The settings allow the selection of FlexInteger values for each GGIO5 integer value point.

It is intended that clients use GGIO5 to access generic integer values from the F60. Additional settings are provided to allow the selection of the number of integer values available in GGIO5 (1 to 16), and to assign FlexInteger values to the GGIO5 integer inputs. The following setting is available for all GGIO5 configuration points.

- **GGIO5 UINT IN 1 VALUE**: This setting selects the FlexInteger value to drive each GGIO5 integer status value (GGIO5.ST.UIntIn1). This setting is stored as an 32-bit unsigned integer value.

The report control configuration settings are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ REPORT CONTROL CONFIGURATION ⇨ CONFIGURABLE REPORT 1 ⇨ REPORT 1 DATASET ITEMS

■ REPORT 1 ■ DATASET ITEMS		ITEM 1:	*Range: all valid MMS data item references*
	MESSAGE	ITEM 2:	*Range: as shown above*
	MESSAGE	ITEM 3:	*Range: as shown above*
		↓	
	MESSAGE	ITEM 64:	*Range: as shown above*

To create the dataset for logical node LN, program the **ITEM 1** to **ITEM 64** settings to a value from the list of IEC 61850 data attributes supported by the F60. Changes to the dataset will only take effect when the F60 is restarted. It is recommended to use reporting service from logical node LLN0 if a user needs some (but not all) data from already existing GGIO1, GGIO4, and MMXU4 points and their quantity is not greater than 64 minus the number items in this dataset.

The breaker configuration settings are shown below. Changes to these values take effect when the UR is restarted:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ XCBR CONFIGURATION

■ XCBR ■ CONFIGURATION	XCBR1 ST.LOC OPERAND Off	Range: FlexLogic operand
	↓	
MESSAGE	XCBR6 ST.LOC OPERAND Off	Range: FlexLogic operand

MESSAGE	XCBR1 SYNCCHECK CLS: Off	Range: FlexLogic operand
	↓	
MESSAGE	XCBR6 SYNCCHECK CLS: Off	Range: FlexLogic operand
MESSAGE	XCBR1 INTERLOCK OPN: Off	Range: FlexLogic operand
	↓	
MESSAGE	XCBR6 INTERLOCK OPN: Off	Range: FlexLogic operand
MESSAGE	XCBR1 INTERLOCK CLS: Off	Range: FlexLogic operand
	↓	
MESSAGE	XCBR6 INTERLOCK CLS: Off	Range: FlexLogic operand
MESSAGE	XCBR1 Pos ctlModel: 2	Range: 0 to 4 (as per IEC 61850-7-3, ctlModel)
	↓	
MESSAGE	XCBR6 Pos ctlModel: 2	Range: 0 to 4 (as per IEC 61850-7-3, ctlModel)
MESSAGE	XCBR1 Pos sboTimeout: 30 s	Range: 2 to 60 seconds
	↓	
MESSAGE	XCBR6 Pos sboTimeout: 30 s	Range: 2 to 60 seconds

The XCBR1 ST.LOC OPERAND setting is used to inhibit 61850 control commands to close or open breaker through UR Breaker Control element. See the Breaker Control element logic diagram for more information.

The CLEAR XCBR1 OpCnt setting allows clearing the breaker operating counter. As breakers operate by opening and closing, the XCBR operating counter status attribute (OpCnt) increments with every operation. Frequent breaker operation can result in very large OpCnt values over time. This setting allows the OpCnt to be reset to “0” for XCBR1.

The XCBR1 SYNCCHECK CLS setting is used to supervise a close command with a synchrocheck condition within XCBR logical node. If a Close with SynchroCheck is requested (through a SelectWithValue service) and the SynchroCheck condition is not satisfied, a Negative Response (-Rsp) is issued with the REASON CODE of Blocked-by-synchrocheck.

The XCBR1 INTERLOCK OPN/CLS settings are used to assign an operand, which is linked into the EnaOpn or EnaCls INTERLOCKED inputs respectively of the XCBR. When this operand is asserted, XCBR logical node inhibits execution of the open and close commands respectively. If select before operate (SBO) with Extended Security is requested and Interlock condition exists, the UR responds with a Negative response (-Rsp) with the Reason Code Blocked-by-interlocking.

The XCBR1 Pos ctlModel setting is used to select control model per IEC 61850-7-3. The following control models are supported by URs:

0 — Status only

1 — Direct control with normal security (direct-operate)

2 — SBO control with normal security (operate-once)

3 — Direct control with enhanced security (direct-operate)

4 — SBO control with enhanced security (operate-once)

See IEC 61850-7-2 for complete details on these control models.

The XCBR1 Pos sboTimeout setting is used to select SBO timeout value. To be successful, the IEC 61850 "operate" command must be executed after the "select" command within the XCBR1 Pos sboTimeout setting value.

The disconnect switch configuration settings are shown below. Changes to these values will not take effect until the UR is restarted:

MESSAGE	CLEAR XSWI2 OpCnt: No	Range: No, Yes
MESSAGE	CLEAR XSWI3 OpCnt: No	Range: No, Yes
	↓	
MESSAGE	CLEAR XSWI24 OpCnt: No	Range: No, Yes

The CLEAR XSWI1 OpCnt setting represents the disconnect switch operating counter. As disconnect switches operate by opening and closing, the XSWI operating counter status attribute (OpCnt) increments with every operation. Frequent switch operation may result in very large OpCnt values over time. This setting allows the OpCnt to be reset to “0” for XSWI1.

NOTE: Since GSSE/GOOSE messages are multicast Ethernet by specification, they are not usually be forwarded by network routers. However, GOOSE messages may be forwarded by routers if the router has been configured for VLAN functionality.

l) WEB SERVER HTTP PROTOCOL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ WEB SERVER HTTP PROTOCOL

■ WEB SERVER ■ HTTP PROTOCOL	◀▶	HTTP TCP PORT NUMBER: 80	*Range: 0 to 65535 in steps of 1*

The F60 contains an embedded web server and is capable of transferring web pages to a web browser such as Internet Explorer or Firefox. The web pages are organized as a series of menus that can be accessed starting at the F60 “Main Menu”. Web pages are available showing DNP and IEC 60870-5-104 points lists, Modbus registers, event records, fault reports, and so on. First connect the UR and a computer to an Ethernet network, then enter the IP address of the F60 into the “Address” box of the web browser.

NOTE: When the port is set to 0, the change takes effect when the F60 is restarted.

m) TFTP PROTOCOL

5

The Trivial File Transfer Protocol (TFTP) can be used to transfer files from the F60 over a network. The F60 operates as a TFTP server. TFTP client software is available from various sources, including Microsoft Windows NT. The `dir.txt` file obtained from the F60 contains a list and description of all available files (event records, oscillography, etc.).

NOTE: When the **TFTP MAIN UDP PORT NUMBER** is set to 0, the change takes effect when the F60 is restarted.

MESSAGE	△	IEC REDUNDANCY ENABLED: No	Range: No, Yes

The F60 supports the IEC 60870-5-104 protocol. The F60 can be used as an IEC 60870-5-104 slave device connected to a maximum of two masters (usually either an RTU or a SCADA master station). Since the F60 maintains two sets of IEC 60870-5-104 data change buffers, no more than two masters should actively communicate with the F60 at one time.

The **IEC ------- DEFAULT THRESHOLD** settings are used to determine when to trigger spontaneous responses containing M_ME_NC_1 analog data. These settings group the F60 analog data into types: current, voltage, power, energy, and other. Each setting represents the default threshold value for all M_ME_NC_1 analog points of that type. For example, to trigger spontaneous responses from the F60 when any current values change by 15 A, the **IEC CURRENT DEFAULT THRESHOLD** setting should be set to 15. Note that these settings are the default values of the deadbands. P_ME_NC_1 (parameter of measured value, short floating point value) points can be used to change threshold values, from the default, for each individual M_ME_NC_1 analog point. Whenever power is removed and re-applied to the F60, the default thresholds are in effect.

The **IEC REDUNDANCY** setting decides whether multiple client connections are accepted or not. If redundancy is set to Yes, two simultaneous connections can be active at any given time.

NOTE

When the IEC port number is set to 0, the change takes effect when the F60 is restarted.

NOTE

The IEC 60870-5-104 and DNP protocols cannot be used simultaneously. When the IEC 60870-5-104 FUNCTION setting is set to “Enabled”, the DNP protocol does not operate. When this setting is changed, it takes effect when power to the relay is cycled (off-to-on).

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 60870-5-104 PROTOCOL ⇨⇩ IEC NETWORK CLIENT ADDRESSES

■ IEC NETWORK ■ CLIENT ADDRESSES		CLIENT ADDRESS 1: 0.0.0.0	Range: Standard IPV4 address format

	MESSAGE	CLIENT ADDRESS 4: 0.0.0.0	Range: Standard IPV4 address format
	MESSAGE	CLIENT ADDRESS 5: 0.0.0.0	Range: Standard IPV4 address format

The UR can specify a maximum of five clients for its IEC 104 connections. These are IP addresses for the controllers to which the UR can connect.

A maximum of two simultaneous connections are supported at any given time.

o) EGD PROTOCOL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ EGD PROTOCOL

■ EGD PROTOCOL ■		■ FAST PROD EXCH 1 ■ CONFIGURATION
	MESSAGE	■ SLOW PROD EXCH 1 ■ CONFIGURATION
	MESSAGE	■ SLOW PROD EXCH 2 ■ CONFIGURATION

The F60 Feeder Protection System is provided with optional Ethernet Global Data (EGD) communications capability. This feature is specified as a software option at the time of ordering. See the *Order Codes* section in chapter 2 for details.

The relay supports one fast Ethernet Global Data (EGD) exchange and two slow EGD exchanges. There are 20 data items in the fast-produced EGD exchange and 50 data items in each slow-produced exchange.

Ethernet Global Data (EGD) is a suite of protocols used for the real-time transfer of data for display and control purposes. The relay can be configured to ‘produce’ EGD data exchanges, and other devices can be configured to ‘consume’ EGD data exchanges. The number of produced exchanges (up to three), the data items in each exchange (up to 50), and the exchange production rate can be configured.

EGD cannot be used to transfer data between UR-series relays. The relay supports EGD production only. An EGD exchange will not be transmitted unless the destination address is non-zero, and at least the first data item address is set to a valid Modbus register address. Note that the default setting value of “0” is considered invalid.

The settings menu for the fast EGD exchange is shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ EGD PROTOCOL ⇨ FAST PROD EXCH 1 CONFIGURATION

■ FAST PROD EXCH 1 ■ CONFIGURATION	◀▶	EXCH 1 FUNCTION: Disable	*Range: Disable, Enable*
	MESSAGE ▲▼	EXCH 1 DESTINATION: 0.0.0.0	*Range: standard IP address*

		↓	
	MESSAGE ▲	EXCH 1 DATA ITEM 20: 0	*Range: 0 to 65535 in steps of 1 (Modbus register address range)*

Fast exchanges (50 to 1000 ms) are generally used in control schemes. The F60 has one fast exchange (exchange 1) and two slow exchanges (exchange 2 and 3).

The settings menu for the slow EGD exchanges is shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ EGD PROTOCOL ⇨ SLOW PROD EXCH 1(2) CONFIGURATION

■ SLOW PROD EXCH 1 ■ CONFIGURATION	◀▶	EXCH 1 FUNCTION: Disable	*Range: Disable, Enable*
	MESSAGE ▲▼	EXCH 1 DESTINATION: 0.0.0.0	*Range: standard IP address*
	MESSAGE ▲▼	EXCH 1 DATA RATE: 1000 ms	*Range: 500 to 1000 ms in steps of 1*
	MESSAGE ▲▼	EXCH 1 DATA ITEM 1: 0	*Range: 0 to 65535 in steps of 1 (Modbus register address range in decimal)*
	MESSAGE ▲▼	EXCH 1 DATA ITEM 2: 0	*Range: 0 to 65535 in steps of 1 (Modbus register address range in decimal)*
	MESSAGE ▲▼	EXCH 1 DATA ITEM 3: 0	*Range: 0 to 65535 in steps of 1 (Modbus register address range in decimal)*
		↓	
	MESSAGE ▲	EXCH 1 DATA ITEM 50: 0	*Range: 0 to 65535 in steps of 1 (Modbus register address range in decimal)*

Slow EGD exchanges (500 to 1000 ms) are generally used for the transfer and display of data items. The settings for the fast and slow exchanges are described below:

- **EXCH 1 DESTINATION**: This setting specifies the destination IP address of the produced EGD exchange. This is usually unicast or broadcast.
- **EXCH 1 DATA RATE**: This setting specifies the rate at which this EGD exchange is transmitted. If the setting is 50 ms, the exchange data will be updated and sent once every 50 ms. If the setting is 1000 ms, the exchange data will be updated and sent once per second. EGD exchange 1 has a setting range of 50 to 1000 ms. Exchanges 2 and 3 have a setting range of 500 to 1000 ms.

- **EXCH 1 DATA ITEM 1 to 20/50**: These settings specify the data items that are part of this EGD exchange. Almost any data from the F60 memory map can be configured to be included in an EGD exchange. The settings are the starting Modbus register address for the data item in decimal format. Refer to *Appendix B* for the complete Modbus memory map. Note that the Modbus memory map displays shows addresses in hexadecimal format. as such, it will be necessary to convert these values to decimal format before entering them as values for these setpoints.

  To select a data item to be part of an exchange, it is only necessary to choose the starting Modbus address of the item. That is, for items occupying more than one Modbus register (for example, 32 bit integers and floating point values), only the first Modbus address is required. The EGD exchange configured with these settings contains the data items up to the first setting that contains a Modbus address with no data, or 0. That is, if the first three settings contain valid Modbus addresses and the fourth is 0, the produced EGD exchange will contain three data items.

p) IEC 60870-5-103 PROTOCOL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 60870-5-103

■ IEC103 ■ PROTOCOL		IEC103 COMMON ADDRESS OF ASDU: 0	*Range: 0 to 254 in steps of 1*
	MESSAGE	IEC103 SYNC TIMEOUT: 1	*Range: 1 to 1440 min in steps of 1*
	MESSAGE	■ IEC103 INPUTS ■ BINARY	*Range: see sub-menu below*
	MESSAGE	■ IEC103 INPUTS ■ MEASURANDS	*Range: see sub-menu below*
	MESSAGE	■ IEC103 COMMANDS ■	*Range: see sub-menu below*

The F60 Feeder Protection System is provided with optional IEC 60870-5-103 communications capability. This feature is specified as a software option at the time of ordering. See the *Order Codes* section in chapter 2 for details.

IEC103 COMMON ADDRESS OF ASDU: This setting uniquely defines this F60 on the serial line. Select an ID between 0 and 254. This ID does not need to be in sequential order for all stations that communicate with a controller, but it is recommended. Note that RS485 only allows a maximum of 32 slave stations on a communication line, so the entire range of 254 addresses is never exhausted.

IEC103 SYNC TIMEOUT: This setting defines the time that the F60 waits for a synchronization message. The F60 synchronizes its clock using all available sources, with the source synching more frequently overwriting the time of the other sources. Since the synchronization message received from the IEC 60870-5-103 master is less frequent than IRIG-B, PTP, or SNTP, its time is overwritten by these three sources, if any of them is active. If the synchronization timeout occurs and none of IRIG-B, PTP, or SNTP is active, the F60 sets the invalid bit in the time stamp of a time-tagged message.

The settings for the remaining menus are outlined as follows.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC60870-5-103 ⇨ IEC103 INPUTS BINARY

■ IEC103 INPUTS ■ BINARY		■ POINT 0 ■	*Range: see sub-menu below*
	MESSAGE	■ POINT 1 ■	*Range: see sub-menu below*
		↓	
	MESSAGE	■ POINT 95 ■	*Range: see sub-menu below*

■ POINT 0 ■		POINT 0 FUN 0	Range: 0 to 255 in steps of 1

	MESSAGE	POINT 95 INF 0	Range: 0 to 255 in steps of 1
	MESSAGE	POINT 95 Input Off	Range: FlexLogic operand

The binary input points are mapped using elements from a list of possible FlexLogic operands. A maximum of 96 binary inputs (points) can be mapped this way.

The IEC60870-5-103 point list always starts with point 0 and ends at the first "Off" value. Since the IEC 60870-5-103 point list must be in a continuous block, any points assigned after the first "Off" point are ignored.

For each defined point, set appropriate values for the Function Type (FUN) and Information Number (INF), which form the Information Object Identifier field of the ASDU, as defined in IEC60870-5-103.

The binary input points are sent as Class 1 data. They are sent either as a response to a general interrogation received from the controller or reported spontaneously. Spontaneous transmission occurs as a response to cyclic Class 2 requests. If the F60 wants to transmit Class 1 data at that time, it demands access for Class 1 data transmission (ACD=1 in the control field of the response).

The configuration menu allows a maximum of four ASDUs containing measurands.

Measurands are sent as a response to Class 2 requests, which are cyclic requests coming from the master.

TYPE IDENTIFICATION (TYP): The configuration field TYP indicates how many measurands are present in the corresponding ASDU. Each ASDU can take either 4 or 9 measurands maximum, depending on the type identification (3 respectively 9).

FUNCTION TYPE (FUN) AND INFORMATION NUMBER (INF): These two fields form the Information Object Identifier of the ASDU as defined in IEC60870-103.

SCAN TIMEOUT (SCAN TOUT): This is the cyclic period used by the F60 to decide when a measurand ASDU is included in a response. The measurand is sent as response to a Class 2 request when the corresponding timeout expires. The default value 0 means 500 ms.

ANALOG #: This field contains the actual measurand to be sent in the response to the master. The measurands can be mapped using elements from a list of FlexAnalog operands. The measurands sent are voltage, current, power, power factor, and frequency. If any other FlexAnalog is chosen, the F60 sends 0 instead of its value. Note that the power is transmitted in KW, not W. Measurands are transmitted as ASDU 3 or ASDU 9 (type identification value set to measurands I, respectively measurands II).

Each IEC60870-5-103 measurands list ends at the first unconfigured ("Off") value. Any measurand assigned after the first "Off" value is ignored.

At least one measurand per ASDU must be configured in order to configure the following ASDU. For example, the user can configure only one measurand for each ASDU, but the user is not allowed to skip ASDU2 and configure measurands in ASDU3.

ANALOG # FACTOR AND OFFSET: For each measurand included in the ASDU, a factor and offset can also be configured. The factor and offset allow for scaling to be performed on measurands. The final measurement sent to the IEC60870-103 master is then "a*x + b", where x is the measurand, a is the multiplying factor and b is the offset. The master has to perform the reversed operation in order to retrieve the actual value if such scaling is done. By default a = 1 and b = 0, so no scaling is done if these values are left at their defaults. Examples of when scaling is appropriate are as follows:

5

- If the measured value contains decimals and it is important to preserve the resolution. Since the format for transmitting the measurand does not permit decimals, a factor a>1 can be applied before transmission. For example, a frequency F=59.9Hz can be transmitted as Ft = 10 * F = 10 * 59.9 = 599. In this case a = 10, b = 0. The master receives 599 and has to divide by 10 to retrieve the real value 59.9.
- If the measured value is larger than what fits in the format defined in IEC103. The format defined in the standard allows for signed integers up to 4095. By offsetting, unsigned integers up to 4096 + 4095 = 8191 are supported. Scaling using factors <1 can be required in such cases. The calculation is outlined in the IEC60870-5-103 appendix. Two examples follow, where you decide factors a and b.

  Example 1: Nominal power Pn = 100MW = 100000KW (power is transmitted in KW)

  Since P can be both positive and negative:

  Transmitted power Pt = (4095/(Pn*2.4)) * P = (4095/(100000 * 2.4)) * P

  = 0.017 * P

  a = 0.017

  b = 0

  Pt = 0.017 * P

  For a max power 100000KW * 2.4 = 240000KW, we transmit

  Pt = 0.017 * 240000 = 4080

  A value above 240 MW is indicated by overflow.

  Example 2: Nominal voltage Vn = 500000V

  Since RMS voltage V can be only positive:

  Transmitted voltage Vt = (8191/(Vn*2.4)) * V - 4096 =

  = (8191/(500000 * 2.4)) * V - 4096 = 0.0068 * V - 4096 a = 0.0068

Since the step is in increments of 0.001, we round it at:

a = 0.006

b = -4096

Vt = 0.006 * V - 4096

For max voltage 500000V * 2.4 = 1200000V, we transmit

Vt = 0.006 * 1200000 - 4096 = 7200 - 4096 = 3104

5.2.6 REAL TIME CLOCK

a) MAIN MENU

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ REAL TIME CLOCK

■ REAL TIME ■ CLOCK	◁▷	SYNCRONIZING SOURCE: None	Range: None, PP/IRIG-B/PTP/SNTP, IRIG-B/PP/PTP/SNTP, PP/PTP/IRIG-B/SNTP
MESSAGE	△▽	REAL TIME CLOCK EVENTS: Disabled	Range:Enabled, Disabled
MESSAGE	△▽	IRIG-B SIGNAL TYPE: None	Range:None, DC Shift, Amplitude Modulated
MESSAGE	△▽	■ PRECISION TIME ■ PROTOCOL (1588)	See below
MESSAGE	△▽	■ SNTP PROTOCOL ■	See below
MESSAGE	△	■ LOCAL TIME ■	See below

The relay contains a real time clock (RTC) to create timestamps for communications protocols as well as for historical data, such as event records and oscillography. When the relay restarts, the RTC initializes from an onboard battery-backed clock, which has the same accuracy as an electronic watch, approximately ±1 minute per month (~23 ppm). Once the RTC is synchronized with the Precision Time Protocol (PTP), IRIG-B, or SNTP, its accuracy approaches that of the synchronizing time delivered to the relay.

The **SYNCHRONIZING SOURCE** setting configures the priority sequence of the time synchronization source, to determine which of the available external time sources to use for time synchronization. A setting of None causes the RTC and the synchrophasor clock to free-run. A setting of PP/IRIG-B/PTP/SNTP, IRIG-B/PP/PTP/SNTP, or PP/PTP/IRIG-B/SNTP causes the relay to track the first source named that is enabled and operational, or free-run if none of these are available. Here, PP means a time source that is strictly compliant with PP, and PTP means a time source that is not strictly compliant with PP. When a time source fails or recovers, the relay automatically transfers synchronization as required by this setting.

SCADA protocols, such as IEC 60870-5-103, IEC 60870-5-104, Modbus, and DNP, are low accuracy time synchronization methods. If none of the higher accuracy methods (IRIG-B, PTP, SNTP) is active, the F60 updates its clock when one of the SCADA time synchronizations is done.

The UR clock is updated by all sources active in the device, including IEC 60870-5-103. This means that whenever a time synchronization message is received through any of the active protocols, the UR clock updates. However, given that IEC 60870-5-103, IEC 60870-5-104, Modbus, and DNP are low accuracy time synchronization methods, their impact is insignificant when better accuracy time protocols, such as IRIG-B, PTP, and SNTP, are active in the system.

See the **COMMANDS ⇨SET DATE AND TIME** menu section of this manual to manually set the RTC.

The **REAL TIME CLOCK EVENTS** setting allows changes to the date and/or time to be captured in the event record. The event records the RTC time before the adjustment.

To enable IRIG-B synchronization, the input **IRIG-B SIGNAL TYPE** must be set to DC Shift or Amplitude Modulated. IRIG-B synchronization can be disabled by making this setting None.

To configure and enable PTP and/or SNTP, or to set local time parameters (for example time zone, daylight savings), use the following sections.

b) PRECISION TIME PROTOCOL (1588)

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ REAL TIME CLOCK ⇨⇩ PRECISION TIME PROTOCOL (1588) ⇨⇩ PTP PORT 1(3)

MESSAGE	PORT 1 PTP FUNCTION: Disabled	*Range: Enabled, Disabled*
MESSAGE	PORT 1 PATH DELAY ADDER: 00000 ns	*Range: 0 to 60 000 ns in steps of 1*
MESSAGE	PORT 1 PATH DELAY ASYMMETRY: 0000 ns	*Range: –1 000 to +1 000 ns in steps of 1*

The UR supports the Precision Time Protocol (PTP) specified in IEEE Std 1588 2008 using the Power Profile (PP) specified in IEEE Std C37.238 2011. This enables the relay to synchronize to the international time standard over an Ethernet network that implements PP.

The relay can be configured to operate on some PTP networks that are not strictly PP. Time accuracy can be less than specified for a PP network. Tolerated deviations from strict PP include 1) missing declaration of PP compliance in the messages, 2) connection to a network device that does not support the PTP peer delay mechanism, 3) jitter substantially greater than 1 µs in received event messages, and 4) certain non-compliant announce and sync message update rates.

NOTE: The relay implements PTP according to IEEE Std 1588 2008 and the equivalent IEC 61588:2009(E), sometimes referred to as version 2 PTP. It does not support the previous version of the standard (version 1).

PTP is a protocol that allows multiple clocks in a network to synchronize with one another. It permits synchronization accuracies better than 1 ns, but this requires each and every component in the network achieve very high levels of accuracy and a very high baud rate, faster than normally used for relay communications. When operating over a generic Ethernet network, time error may amount to 1 ms or more. PP is a profile of PTP which specifies a limited subset of PTP suitable for use in power system protection, control, automation and data communication applications, and thereby facilitates interoperability between different vendor's clocks and switches. PP specifies a worst-case delivered time error of less than 1 µs over a 16-hop network.

In a PTP system and in a PP system, the clocks automatically organize themselves into a master-slave synchronization hierarchy with the "best" clock available making itself the "grandmaster" at the top of the hierarchy; all others make themselves "slaves" and track the grandmaster. Typically the grandmaster clock receives its time from GPS satellites or some other link to the international time standard. If the grandmaster fails, the next "best" clock available in the domain assumes the grandmaster role. Should a clock on starting up discover it is "better" that the present grandmaster, it assumes the grandmaster role and the previous grandmaster reverts to slave.

Time messages issued by the grandmaster are delayed as they pass through the network both due to the finite speed of the signal in the interconnecting fiber or wire. Each clock and switch implementing PP measures the propagation delay to each of its PP neighbors, and compensates for these delays in the time received. Each network device implementing PP measures the processing delay it introduces in each time message and compensates for this delay in the time it transmits. As a result, the time delivered to end-devices such as the UR are virtually identical to the grandmaster time. Should one of the network devices in the hierarchy not fully implement PP, the associated propagation delay and/or latency may not be compensated for, and the time received at the end-device could be in error by more than 100 µs.

See the **Settings > Product Setup > Real Time Clock** section of this manual for a description of when time values received via PTP are used to update the relay's real time clock.

The following settings are available for configuring the relay for PTP.

STRICT POWER PROFILE

- Power profile (IEEE Std C37.238 2011) requires that the relay only select as a grandmaster power profile compliant clocks, that the delivered time have worst-case error of ±1 µs, and that the peer delay mechanism be implemented. With the strict power profile setting enabled, the relay will only select as master clocks displaying the IEEE_C37_238 identification codes. It will use a port only when the peer delay mechanism is operational. With the strict power profile setting disabled, the relay will use clocks without the power profile identification when no power profile clocks are present, and will use ports even if the peer delay mechanism is non-operational.
- This setting applies to all of the relay's PTP capable ports.

PTP DOMAIN NUMBER

- This setting should be set to the domain number of the grandmaster-capable clock(s) to be synchronized to. A network may support multiple time distribution domains, each distinguished with a unique domain number. More commonly, there is a single domain using the default domain number zero.
- This setting applies to all of the relay's PTP capable ports.

PTP VLAN PRIORITY

- This setting selects the value of the priority field in the 802.1Q VLAN tag in request messages issued by the relay's peer delay mechanism. In compliance with PP the default VLAN priority is 4, but it is recommended that in accordance with PTP it be set to 7.
- Depending on the characteristics of the device to which the relay is directly linked, VLAN Priority may have no effect.
- This setting applies to all of the relay's PTP capable ports.

PTP VLAN ID

- This setting selects the value of the ID field in the 802.1Q VLAN tag in request messages issued by the relay's peer delay mechanism. It is provided in compliance with PP. As these messages have a destination address that indicates they are not to be bridged, their VLAN ID serves no function, and so may be left at its default value.
- Depending on the characteristics of the device to which the relay is directly linked, VLAN ID may have no effect.
- This setting applies to all of the relay's PTP capable ports.

PORT 1 ... 3 FUNCTION

- While this port setting is selected to disabled, PTP is disabled on this port. The relay does not generate or listen to PTP messages on this port.

PORT 1 ... 3 PATH DELAY ADDER

- The time delivered by PTP is advanced by the time value in this setting prior to the time being used to synchronize the relay's real time clock. This is to compensate to the extent practical for time delivery delays not compensated for in the network. In a fully compliant PP network, the peer delay and the processing delay mechanisms compensate for all the delays between the grandmaster and the relay. In such networks, this setting should be zero.
- In networks containing one or more switches and/or clocks that do not implement both of these mechanisms, not all delays are compensated, so the time of message arrival at the relay will be later than the time indicated in the message. This setting can be used to approximately compensate for this delay. However, as the relay is not aware of network switching that dynamically changes the amount of uncompensated delay, there is no setting that will always completely correct for uncompensated delay. A setting can be chosen that will reduce worst-case error to half of the range between minimum and maximum uncompensated delay, if these values are known.

PORT 1 ... 3 PATH DELAY ASYMMETRY

- This setting corresponds to "delayAsymmetry" in PTP, which is used by the peer delay mechanism to compensate for any difference in the propagation delay between the two directions of a link. Except in unusual cases, the two fibers are of essentially identical length and composition, so this setting should be set to zero.
- In unusual cases where the length of the link is different in different directions, this setting should be set to the number of nanoseconds the Ethernet propagation delay to the relay is longer than the mean of path propagation delays to and from the relay. For instance, if it is known say from the physical length of the fibers and the propagation speed in the fibers that the delay from the relay to the Ethernet switch it is connected to is 9 000 ns and the that the delay from the switch to the relay is 11 000 ns, then the mean delay is 10 000 ns, and the path delay asymmetry is 11000 - 10000 = +1000 ns.

5

c) SNTP PROTOCOL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ REAL TIME CLOCK ⇨⇩ SNTP PROTOCOL

■ SNTP PROTOCOL ■	◀▶	SNTP FUNCTION: Disabled	*Range: Enabled, Disabled*
MESSAGE	▲▼	SNTP SERVER IP ADDR: 0.0.0.0	*Range: Standard IP address format*
MESSAGE	▲	SNTP UDP PORT NUMBER: 123	*Range: 0 to 65535 in steps of 1*

The F60 supports the Simple Network Time Protocol specified in RFC-2030. With SNTP, the F60 can obtain clock time over an Ethernet network. The F60 acts as an SNTP client to receive time values from an SNTP/NTP server, usually a dedicated product using a GPS receiver to provide an accurate time. Unicast SNTP is supported. The UR-series relays do not support the broadcast, multicast or anycast SNTP functionality.

The **SNTP FUNCTION** setting enables or disabled the SNTP feature on the F60.

To use SNTP, **SNTP SERVER IP ADDR** must be set to the SNTP/NTP server IP address. Once this address is set and **SNTP FUNCTION** is "Enabled", the F60 attempts to obtain time values from the SNTP/NTP server. Since many time values are obtained and averaged, it generally takes three to four minutes until the F60 clock is closely synchronized with the SNTP/NTP server. It takes up to two minutes for the F60 to signal an SNTP self-test error if the server is offline.

The **SNTP UDP PORT NUMBER** is 123 for normal SNTP operation. If SNTP is not required, close the port by setting it to 0.

NOTE

When the **SNTP UDP PORT NUMBER** is set to 0, the change takes effect when the F60 is restarted.

d) LOCAL TIME

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ REAL TIME CLOCK ⇨⇩ LOCAL TIME

		Setting	Range
■ LOCAL TIME ■	◁▷	LOCAL TIME OFFSET FROM UTC: 0.0 hrs	Range: –24.0 to 24.0 hrs in steps of 0.5

MESSAGE	△▽	DST STOP MONTH: January	Range: January to December (all months)
MESSAGE	△▽	DST STOP DAY: Sunday	Range: Sunday to Saturday (all days of the week)
MESSAGE	△▽	DST STOP DAY INSTANCE: First	Range: First, Second, Third, Fourth, Last
MESSAGE	△▽	DST STOP HOUR: 2	Range: 0 to 23

The UR device maintains two times: local time and Universal Coordinated Time (UTC). Local time can be provided by IRIG-B signals. UTC time is provided by SNTP servers.

The real-time clock (RTC) and communication protocol times are not correct unless Local Time is configured for the current location. When the RTC is synchronized with IRIG-B, Local Time must be configured for the current location or else the timestamps may not be accurate. Furthermore, times reported in historical records and communication protocols may be incorrect if the Local Time setting is not configured properly.

The **LOCAL TIME OFFSET FROM UTC** setting is used to specify the local time zone offset from UTC (Greenwich Mean Time) in hours. Time zones in the eastern hemisphere have positive values; time zones in the western hemisphere have negative values. A value of zero causes the relay to use UTC for local time. This setting has two uses. When the system RTC is synchronized with a communications protocol providing only local time or it is free-running, the offset setting is used to calculate UTC from the local time these provide. When the RTC is synchronized with a communications protocol providing only UTC (such as PTP or SNTP), the time offset setting is used to determine local time from the UTC provided. PTP ALTERNATE_TIME_OFFSET_INDICATOR TLVs are not used to calculate local time. When a communications protocol other than PTP provides UTC to local time offset (meaning IRIG-B), that offset is used instead of the local time and daylight time settings.

The **DAYLIGHT SAVINGS TIME (DST)** settings can be used to allow the relay to follow the DST rules of the local time zone. Note that when IRIG-B time synchronization is active, the local time in the IRIG-B signal contains any daylight savings time offset and so the DST settings are ignored.

5.2.7 FAULT REPORTS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ FAULT REPORTS ⇨ FAULT REPORT 1

The F60 relay supports one fault report and an associated fault locator. The signal source and trigger condition, as well as the characteristics of the line or feeder, are entered in this menu.

The fault report stores data, in non-volatile memory, pertinent to an event when triggered. The captured data contained in the `FaultReport.txt` file includes:

- Fault report number.
- Name of the relay, programmed by the user.
- Firmware revision of the relay.
- Date and time of trigger.
- Name of trigger (specific operand).
- Line or feeder ID via the name of a configured signal source.
- Active setting group at the time of trigger.
- Pre-fault current and voltage phasors (two cycles before either a 50DD disturbance associated with fault report source or the trigger operate). Once a disturbance is detected, pre-fault phasors hold for 3 seconds waiting for the fault report trigger. If trigger does not occur within this time, the values are cleared to prepare for the next disturbance.
- Fault current and voltage phasors (one cycle after the trigger).
- Elements operated at the time of triggering.
- Events: 9 before trigger and 7 after trigger (only available via the relay webpage).
- Fault duration times for each breaker (created by the breaker arcing current feature).

The captured data also includes the fault type and the distance to the fault location, as well as the reclose shot number (when applicable) To include fault duration times in the fault report, the user must enable and configure breaker arcing current feature for each of the breakers. Fault duration is reported on a per-phase basis.

The relay allows locating faults, including ground faults, from delta-connected VTs. In this case, the missing zero-sequence voltage is substituted either by the externally provided neutral voltage (broken delta VT) connected to the auxiliary voltage channel of a VT bank, or by the zero-sequence voltage approximated as a voltage drop developed by the zero-sequence current, and user-provided zero-sequence equivalent impedance of the system behind the relay.

The trigger can be any FlexLogic operand, but in most applications it is expected to be the same operand, usually a virtual output, that is used to drive an output relay to trip a breaker. To prevent the overwriting of fault events, the disturbance detector should not be used to trigger a fault report. A FAULT RPT TRIG event is automatically created when the report is triggered.

If a number of protection elements are ORed to create a fault report trigger, the first operation of any element causing the OR gate output to become high triggers a fault report. However, If other elements operate during the fault and the first operated element has not been reset (the OR gate output is still high), the fault report is not triggered again. Considering the reset time of protection elements, there is very little chance that fault report can be triggered twice in this manner. As the fault report must capture a usable amount of pre and post-fault data, it can not be triggered faster than every 20 ms.

Each fault report is stored as a file; the relay capacity is fifteen (15) files. An sixteenth (16th) trigger overwrites the oldest file.

The EnerVista UR Setup software is required to view all captured data. The relay faceplate display can be used to view the date and time of trigger, the fault type, the distance location of the fault, and the reclose shot number.

The **FAULT REPORT 1 SOURCE** setting selects the source for input currents and voltages and disturbance detection.

The **FAULT 1 REPORT TRIG** setting assigns the FlexLogic operand representing the protection element/elements requiring operational fault location calculations. The distance to fault calculations are initiated by this signal. The **FAULT REPORT 1 Z1 MAG** and **FAULT REPORT 1 Z0 MAG** impedances are entered in secondary ohms.

The **FAULT REPORT 1 VT SUBSTITUTION** setting shall be set to “None” if the relay is fed from wye-connected VTs. If delta-connected VTs are used, and the relay is supplied with the neutral (3V0) voltage, this setting shall be set to “V0”. The method is still exact, as the fault locator would combine the line-to-line voltage measurements with the neutral voltage measurement to re-create the line-to-ground voltages. See the **ACTUAL VALUES ⇨⇩ RECORDS ⇨ FAULT REPORTS** menu for additional details. It required to configure the delta and neutral voltages under the source indicated as input for the fault report. Also, the relay will check if the auxiliary signal configured is marked as “Vn” by the user (under VT setup), and inhibit the fault location if the auxiliary signal is labeled differently.

If the broken-delta neutral voltage is not available to the relay, an approximation is possible by assuming the missing zero-sequence voltage to be an inverted voltage drop produced by the zero-sequence current and the user-specified equivalent zero-sequence system impedance behind the relay: $V0 = -Z0 \times I0$. In order to enable this mode of operation, the **FAULT REPORT 1 VT SUBSTITUTION** setting shall be set to “I0”.

The **FAULT REP 1 SYSTEM Z0 MAG** and **FAULT REP 1 SYSTEM Z0 ANGLE** settings are used only when the **VT SUBSTITUTION** setting value is “I0”. The magnitude is to be entered in secondary ohms. This impedance is an average system equivalent behind the relay. It can be calculated as zero-sequence Thevenin impedance at the local bus with the protected line/feeder disconnected. The method is accurate only if this setting matches perfectly the actual system impedance during the fault. If the system exhibits too much variability, this approach is questionable and the fault location results for single-line-to-ground faults shall be trusted with accordingly. It should be kept in mind that grounding points in vicinity of the installation impact the system zero-sequence impedance (grounded loads, reactors, zig-zag transformers, shunt capacitor banks, etc.).

5.2.8 OSCILLOGRAPHY

a) MAIN MENU

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ OSCILLOGRAPHY

```
■ OSCILLOGRAPHY

MESSAGE	■ DIGITAL CHANNELS ■	
MESSAGE	■ ANALOG CHANNELS ■	

5

Oscillography records contain waveforms captured at the sampling rate as well as other relay data at the point of trigger. Oscillography records are triggered by a programmable FlexLogic operand. Multiple oscillography records may be captured simultaneously.

The **NUMBER OF RECORDS** is selectable, but the number of cycles captured in a single record varies considerably based on other factors such as sample rate and the number of operational modules. There is a fixed amount of data storage for oscillography; the more data captured, the less the number of cycles captured per record. See the **ACTUAL VALUES ⇨⇩ RECORDS ⇨⇩ OSCILLOGRAPHY** menu to view the number of cycles captured per record. The following table provides sample configurations with corresponding cycles/record. The minimum number of oscillographic records is three.

Table 5–8: OSCILLOGRAPHY CYCLES/RECORD EXAMPLE

RECORDS	CT/VTS	SAMPLE RATE	DIGITALS	ANALOGS	CYCLES/ RECORD
3	1	8	0	0	14663
3	1	16	16	0	6945
8	1	16	16	0	3472
8	1	16	16	4	2868
8	2	16	16	4	1691
8	2	16	63	16	1221
8	2	32	63	16	749
8	2	64	63	16	422
32	2	64	63	16	124

A new record may automatically overwrite an older record if **TRIGGER MODE** is set to “Automatic Overwrite”.

Set the **TRIGGER POSITION** to a percentage of the total buffer size (for example, 10%, 50%, 75%, etc.). A trigger position of 25% consists of 25% pre- and 75% post-trigger data. The **TRIGGER SOURCE** is always captured in oscillography and may be any FlexLogic parameter (element state, contact input, virtual output, etc.). The relay sampling rate is 64 samples per cycle.

The **AC INPUT WAVEFORMS** setting determines the sampling rate at which AC input signals (that is, current and voltage) are stored. Reducing the sampling rate allows longer records to be stored. This setting has no effect on the internal sampling rate of the relay which is always 64 samples per cycle; that is, it has no effect on the fundamental calculations of the device.

NOTE

When changes are made to the oscillography settings, all existing oscillography records will be CLEARED.

b) DIGITAL CHANNELS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ OSCILLOGRAPHY ⇨⇩ DIGITAL CHANNELS

```
■ DIGITAL CHANNELS              DIGITAL CHANNEL  1:     Range: FlexLogic operand
■                               Off

                     MESSAGE    DIGITAL CHANNEL  2:     Range: FlexLogic operand
                                Off

                     MESSAGE    DIGITAL CHANNEL  3:     Range: FlexLogic operand
                                Off
                                        ↓
                     MESSAGE    DIGITAL CHANNEL 63:     Range: FlexLogic operand
                                Off
```

A **DIGITAL 1(63) CHANNEL** setting selects the FlexLogic operand state recorded in an oscillography trace. The length of each oscillography trace depends in part on the number of parameters selected here. Parameters set to “Off” are ignored. Upon startup, the relay will automatically prepare the parameter list.

c) ANALOG CHANNELS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ OSCILLOGRAPHY ⇨⇩ ANALOG CHANNELS

```
■ ANALOG CHANNELS               ANALOG CHANNEL  1:      Range: Off, any FlexAnalog parameter
■                               Off                            See Appendix A for complete list.

                     MESSAGE    ANALOG CHANNEL  2:      Range: Off, any FlexAnalog parameter
                                Off                            See Appendix A for complete list.

                     MESSAGE    ANALOG CHANNEL  3:      Range: Off, any FlexAnalog parameter
                                Off                            See Appendix A for complete list.
                                        ↓
                     MESSAGE    ANALOG CHANNEL 16:      Range: Off, any FlexAnalog parameter
                                Off                            See Appendix A for complete list.
```

These settings select the metering actual value recorded in an oscillography trace. The length of each oscillography trace depends in part on the number of parameters selected here. Parameters set to “Off” are ignored. The parameters available in a given relay are dependent on:

- The type of relay,
- The type and number of CT/VT hardware modules installed, and
- The type and number of analog input hardware modules installed.

Upon startup, the relay will automatically prepare the parameter list. A list of all possible analog metering actual value parameters is presented in Appendix A: *FlexAnalog parameters*. The parameter index number shown in any of the tables is used to expedite the selection of the parameter on the relay display. It can be quite time-consuming to scan through the list of parameters via the relay keypad and display - entering this number via the relay keypad will cause the corresponding parameter to be displayed.

All eight CT/VT module channels are stored in the oscillography file. The CT/VT module channels are named as follows:

<slot_letter><terminal_number>—<I or *V><phase A*, *B*, or *C*, or *4th input>*

The fourth current input in a bank is called IG, and the fourth voltage input in a bank is called VX. For example, F2-IB designates the IB signal on terminal 2 of the CT/VT module in slot F.

If there are no CT/VT modules and analog input modules, no analog traces will appear in the file; only the digital traces will appear.

NOTE

The source harmonic indices appear as oscillography analog channels numbered from 0 to 23. These correspond directly to the to the 2nd to 25th harmonics in the relay as follows:

Analog channel 0 ↔ 2nd harmonic
Analog channel 1 ↔ 3rd harmonic
...
Analog channel 23 ↔ 25th harmonic

5.2.9 DATA LOGGER

PATH: SETTINGS ⇨⇩ PRODUCT SETUP ⇨⇩ DATA LOGGER

■ DATA LOGGER ■		DATA LOGGER MODE: Continuous	Range: Continuous, Trigger
	MESSAGE	DATA LOGGER TRIGGER: Off	Range: FlexLogic operand
	MESSAGE	DATA LOGGER RATE: 60000 ms	Range: 15 to 3600000 ms in steps of 1
	MESSAGE	DATA LOGGER CHNL 1: Off	Range: Off, any FlexAnalog parameter. See Appendix A: FlexAnalog Parameters for complete list.
	MESSAGE	DATA LOGGER CHNL 2: Off	Range: Off, any FlexAnalog parameter. See Appendix A: FlexAnalog Parameters for complete list.
	MESSAGE	DATA LOGGER CHNL 3: Off	Range: Off, any FlexAnalog parameter. See Appendix A: FlexAnalog Parameters for complete list.
		↓	
	MESSAGE	DATA LOGGER CHNL 16: Off	Range: Off, any FlexAnalog parameter. See Appendix A: FlexAnalog Parameters for complete list.
	MESSAGE	DATA LOGGER CONFIG: 0 CHNL x 0.0 DAYS	Range: Not applicable - shows computed data only

The data logger samples and records up to 16 analog parameters at a user-defined sampling rate. This recorded data may be downloaded to EnerVista UR Setup and displayed with *parameters* on the vertical axis and *time* on the horizontal axis. All data is stored in non-volatile memory, meaning that the information is retained when power to the relay is lost.

For a fixed sampling rate, the data logger can be configured with a few channels over a long period or a larger number of channels for a shorter period. The relay automatically partitions the available memory between the channels in use. Example storage capacities for a system frequency of 60 Hz are shown in the following table.

Table 5–9: DATA LOGGER STORAGE CAPACITY EXAMPLE

SAMPLING RATE	CHANNELS	DAYS	STORAGE CAPACITY
15 ms	1	0.1	954 s
	8	0.1	120 s
	9	0.1	107 s
	16	0.1	60 s
1000 ms	1	0.7	65457 s
	8	0.1	8182 s
	9	0.1	7273 s
	16	0.1	4091 s
60000 ms	1	45.4	3927420 s
	8	5.6	490920 s
	9	5	436380 s
	16	2.8	254460 s
3600000 ms	1	2727.5	235645200 s
	8	340.9	29455200 s
	9	303	26182800 s

NOTE

Changing any setting affecting data logger operation will clear any data that is currently in the log.

- **DATA LOGGER MODE**: This setting configures the mode in which the data logger will operate. When set to “Continuous”, the data logger will actively record any configured channels at the rate as defined by the **DATA LOGGER RATE**. The data logger will be idle in this mode if no channels are configured. When set to “Trigger”, the data logger will begin to record any configured channels at the instance of the rising edge of the **DATA LOGGER TRIGGER** source FlexLogic operand. *The data logger will ignore all subsequent triggers* and will continue to record data until the active record is full. Once the data logger is full a **CLEAR DATA LOGGER** command is required to clear the data logger record before a new record can be started. Performing the **CLEAR DATA LOGGER** command will also stop the current record and reset the data logger to be ready for the next trigger.
- **DATA LOGGER TRIGGER**: This setting selects the signal used to trigger the start of a new data logger record. Any FlexLogic operand can be used as the trigger source. The **DATA LOGGER TRIGGER** setting only applies when the mode is set to “Trigger”.
- **DATA LOGGER RATE:** This setting selects the time interval at which the actual value data will be recorded.
- **DATA LOGGER CHNL 1(16):** This setting selects the metering actual value that is to be recorded in Channel 1(16) of the data log. The parameters available in a given relay are dependent on: the type of relay, the type and number of CT/VT hardware modules installed, and the type and number of Analog Input hardware modules installed. Upon startup, the relay will automatically prepare the parameter list. A list of all possible analog metering actual value parameters is shown in Appendix A: *FlexAnalog Parameters*. The parameter index number shown in any of the tables is used to expedite the selection of the parameter on the relay display. It can be quite time-consuming to scan through the list of parameters via the relay keypad/display – entering this number via the relay keypad will cause the corresponding parameter to be displayed.
- **DATA LOGGER CONFIG:** This display presents the total amount of time the Data Logger can record the channels not selected to “Off” without over-writing old data.

5.2.10 DEMAND

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ DEMAND

■ DEMAND ■		CRNT DEMAND METHOD: Thermal Exponential	*Range: Thermal Exponential, Block Interval, Rolling Demand*
	MESSAGE	POWER DEMAND METHOD: Thermal Exponential	*Range: Thermal Exponential, Block Interval, Rolling Demand*
	MESSAGE	DEMAND INTERVAL: 15 MIN	*Range: 5, 10, 15, 20, 30, 60 minutes*
	MESSAGE	DEMAND TRIGGER: Off	*Range: FlexLogic operand Note: for calculation using Method 2a*

The relay measures current demand on each phase, and three-phase demand for real, reactive, and apparent power. Current and Power methods can be chosen separately for the convenience of the user. Settings are provided to allow the user to emulate some common electrical utility demand measuring techniques, for statistical or control purposes. If the **CRNT DEMAND METHOD** is set to "Block Interval" and the **DEMAND TRIGGER** is set to “Off”, Method 2 is used (see below). If **DEMAND TRIGGER** is assigned to any other FlexLogic operand, Method 2a is used (see below).

The relay can be set to calculate demand by any of three methods as described below:

CALCULATION METHOD 1: THERMAL EXPONENTIAL

This method emulates the action of an analog peak recording thermal demand meter. The relay measures the quantity (RMS current, real power, reactive power, or apparent power) on each phase every second, and assumes the circuit quantity remains at this value until updated by the next measurement. It calculates the 'thermal demand equivalent' based on the following equation:

$$d(t) = D(1 - e^{-kt}) \quad \textbf{(EQ 5.6)}$$

where: d = demand value after applying input quantity for time t (in minutes)
D = input quantity (constant), and k = 2.3 / thermal 90% response time.

The 90% thermal response time characteristic of 15 minutes is illustrated below. A setpoint establishes the time to reach 90% of a steady-state value, just as the response time of an analog instrument. A steady state value applied for twice the response time will indicate 99% of the value.

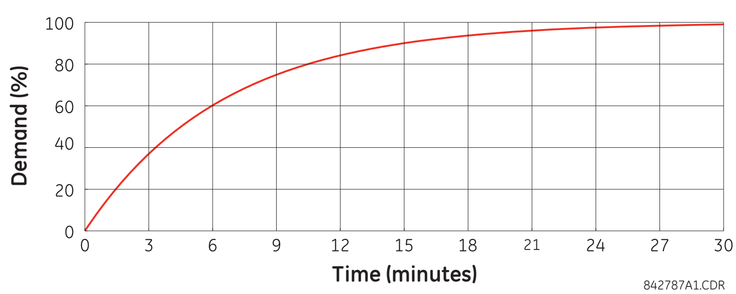

Figure 5–10: THERMAL DEMAND CHARACTERISTIC

CALCULATION METHOD 2: BLOCK INTERVAL

This method calculates a linear average of the quantity (RMS current, real power, reactive power, or apparent power) over the programmed demand time interval, starting daily at 00:00:00 (i.e. 12:00 am). The 1440 minutes per day is divided into the number of blocks as set by the programmed time interval. Each new value of demand becomes available at the end of each time interval.

CALCULATION METHOD 2a: BLOCK INTERVAL (with Start Demand Interval Logic Trigger)

This method calculates a linear average of the quantity (RMS current, real power, reactive power, or apparent power) over the interval between successive Start Demand Interval logic input pulses. Each new value of demand becomes available at the end of each pulse. Assign a FlexLogic operand to the **DEMAND TRIGGER** setting to program the input for the new demand interval pulses.

NOTE

If no trigger is assigned in the **DEMAND TRIGGER** setting and the **CRNT DEMAND METHOD** is "Block Interval", use calculating method #2. If a trigger is assigned, the maximum allowed time between 2 trigger signals is 60 minutes. If no trigger signal appears within 60 minutes, demand calculations are performed and available and the algorithm resets and starts the new cycle of calculations. The minimum required time for trigger contact closure is 20 µs.

CALCULATION METHOD 3: ROLLING DEMAND

This method calculates a linear average of the quantity (RMS current, real power, reactive power, or apparent power) over the programmed demand time interval, in the same way as Block Interval. The value is updated every minute and indicates the demand over the time interval just preceding the time of update.

5.2.11 USER-PROGRAMMABLE LEDS

a) MAIN MENU

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE LEDS

■ USER-PROGRAMMABLE ■ LEDS	◁▷	■ LED TEST ■	See below
	MESSAGE	■ TRIP & ALARM ■ LEDS	See page 5–77.
	MESSAGE	■ USER-PROGRAMMABLE ■ LED1	See page 5–77.
	MESSAGE	■ USER-PROGRAMMABLE ■ LED2	
		↓	
	MESSAGE	■ USER-PROGRAMMABLE ■ LED48	

The 48 amber LEDs on relay panels 2 and 3 can be customized to illuminate when a selected FlexLogic operand is in the logic 1 state. The trip and alarm LEDs on panel 1 can also be customized in a similar manner. To ensure correct functionality of all LEDs, an LED test feature is also provided.

b) LED TEST

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE LEDS ⇨ LED TEST

■ LED TEST ■	◁▷	LED TEST FUNCTION: Disabled	*Range: Disabled, Enabled.*
	MESSAGE	LED TEST CONTROL: Off	*Range: FlexLogic operand*

When enabled, the LED test can be initiated from any digital input or user-programmable condition such as user-programmable pushbutton. The control operand is configured under the **LED TEST CONTROL** setting. The test covers all LEDs, including the LEDs of the optional user-programmable pushbuttons.

The test consists of three stages.

1. All 62 LEDs on the relay are illuminated. This is a quick test to verify if any of the LEDs is “burned”. This stage lasts as long as the control input is on, up to a maximum of 1 minute. After 1 minute, the test will end.
2. All the LEDs are turned off, and then one LED at a time turns on for 1 second, then back off. The test routine starts at the top left panel, moving from the top to bottom of each LED column. This test checks for hardware failures that lead to more than one LED being turned on from a single logic point. This stage can be interrupted at any time.
3. All the LEDs are turned on. One LED at a time turns off for 1 second, then back on. The test routine starts at the top left panel moving from top to bottom of each column of the LEDs. This test checks for hardware failures that lead to more than one LED being turned off from a single logic point. This stage can be interrupted at any time.

When testing is in progress, the LEDs are controlled by the test sequence, rather than the protection, control, and monitoring features. However, the LED control mechanism accepts all the changes to LED states generated by the relay and stores the actual LED states (on or off) in memory. When the test completes, the LEDs reflect the actual state resulting from relay response during testing. The reset pushbutton will not clear any targets when the LED Test is in progress.

A dedicated FlexLogic operand, LED TEST IN PROGRESS, is set for the duration of the test. When the test sequence is initiated, the LED TEST INITIATED event is stored in the event recorder.

The entire test procedure is user-controlled. In particular, stage 1 can last as long as necessary, and stages 2 and 3 can be interrupted. The test responds to the position and rising edges of the control input defined by the **LED TEST CONTROL** setting. The control pulses must last at least 250 ms to take effect. The following diagram explains how the test is executed.

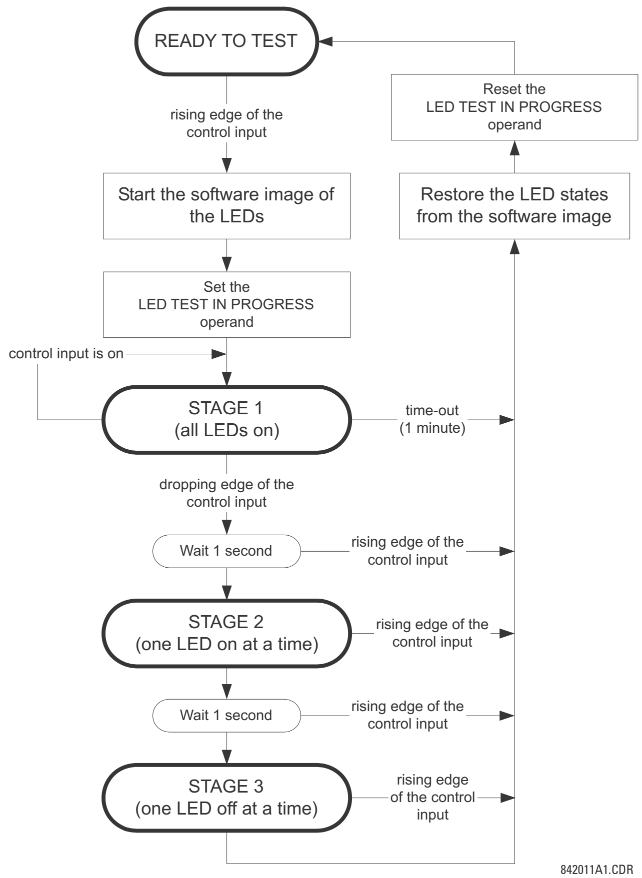

Figure 5–11: LED TEST SEQUENCE

APPLICATION EXAMPLE 1:

Assume one needs to check if any of the LEDs is “burned” through user-programmable pushbutton 1. The following settings should be applied. Configure user-programmable pushbutton 1 by making the following entries in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE PUSHBUTTONS ⇨ USER PUSHBUTTON 1** menu:

PUSHBUTTON 1 FUNCTION: “Self-reset”
PUSHBTN 1 DROP-OUT TIME: “0.10 s”

Configure the LED test to recognize user-programmable pushbutton 1 by making the following entries in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE LEDS ⇨ LED TEST** menu:

LED TEST FUNCTION: “Enabled”
LED TEST CONTROL: “PUSHBUTTON 1 ON”

The test will be initiated when the user-programmable pushbutton 1 is pressed. The pushbutton should remain pressed for as long as the LEDs are being visually inspected. When finished, the pushbutton should be released. The relay will then automatically start stage 2. At this point forward, test may be aborted by pressing the pushbutton.

APPLICATION EXAMPLE 2:

Assume one needs to check if any LEDs are "burned" as well as exercise one LED at a time to check for other failures. This is to be performed via user-programmable pushbutton 1.

After applying the settings in application example 1, hold down the pushbutton as long as necessary to test all LEDs. Next, release the pushbutton to automatically start stage 2. Once stage 2 has started, the pushbutton can be released. When stage 2 is completed, stage 3 will automatically start. The test may be aborted at any time by pressing the pushbutton.

c) TRIP AND ALARM LEDS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE LEDS ⇨⇩ TRIP & ALARM LEDS

■ TRIP & ALARM LEDS ■	TRIP LED INPUT: Off	Range: FlexLogic operand
MESSAGE	ALARM LED INPUT: Off	Range: FlexLogic operand

The trip and alarm LEDs are in the first LED column (enhanced faceplate) and on LED panel 1 (standard faceplate). Each indicator can be programmed to become illuminated when the selected FlexLogic operand is in the logic 1 state.

d) USER-PROGRAMMABLE LED 1(48)

5.2.12 USER-PROGRAMMABLE SELF-TESTS

For user-programmable self-tests for CyberSentry, use the **Setup > Security > Supervisory** menu instead.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE SELF TESTS

■ USER-PROGRAMMABLE ■ SELF TESTS	DIRECT RING BREAK FUNCTION: Enabled	Range: Disabled, Enabled. Valid for units equipped with Direct Input/Output module.
MESSAGE	DIRECT DEVICE OFF FUNCTION: Enabled	Range: Disabled, Enabled. Valid for units equipped with Direct Input/Output module.
MESSAGE	REMOTE DEVICE OFF FUNCTION: Enabled	Range: Disabled, Enabled.
MESSAGE	FIRST ETHERNET FAIL FUNCTION: Disabled	Range: Disabled, Enabled.
MESSAGE	SEC. ETHERNET FAIL FUNCTION: Disabled	Range: Disabled, Enabled.
MESSAGE	THIRD ETHERNET FAIL FUNCTION: Disabled	Range: Disabled, Enabled.
MESSAGE	BATTERY FAIL FUNCTION: Enabled	Range: Disabled, Enabled.
MESSAGE	SNTP FAIL FUNCTION: Enabled	Range: Disabled, Enabled.
MESSAGE	IRIG-B FAIL FUNCTION: Enabled	Range: Disabled, Enabled.
MESSAGE	PTP FAIL FUNCTION: Enabled	Range: Disabled, Enabled.
MESSAGE	SFP MODULE FAIL FUNCTION: Disabled	Range: Disabled, Enabled.

All major self-test alarms are reported automatically with their corresponding FlexLogic operands, events, and targets. Most of the minor alarms can be disabled if desired.

5

When in the Disabled mode, minor alarms do not assert a FlexLogic operand, write to the event recorder, or display target messages. Moreover, they do not trigger the **ANY MINOR ALARM** or **ANY SELF-TEST** messages. When in Enabled mode, minor alarms continue to function along with other major and minor alarms. See the *Relay Self-tests* section in chapter 7 for information on major and minor self-test alarms.

5.2.13 CONTROL PUSHBUTTONS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ CONTROL PUSHBUTTONS ⇨ CONTROL PUSHBUTTON 1(7)

■ CONTROL ■ PUSHBUTTON 1	◀▶	CONTROL PUSHBUTTON 1 FUNCTION: Disabled	*Range: Disabled, Enabled*
MESSAGE	▲	CONTROL PUSHBUTTON 1 EVENTS: Disabled	*Range: Disabled, Enabled*

There are three standard control pushbuttons, labeled USER 1, USER 2, and USER 3, on the standard and enhanced front panels. These are user-programmable and can be used for various applications such as performing an LED test, switching setting groups, and invoking and scrolling though user-programmable displays.

Firmware revisions 3.2x and older use these three pushbuttons for manual breaker control. This functionality has been retained – if the breaker control feature is configured to use the three pushbuttons, they cannot be used as user-programmable control pushbuttons.

The location of the control pushbuttons are shown in the following figures.

Figure 5–12: CONTROL PUSHBUTTONS (ENHANCED FACEPLATE)

An additional four control pushbuttons are included on the standard faceplate when the F60 is ordered with the 12 user-programmable pushbutton option.

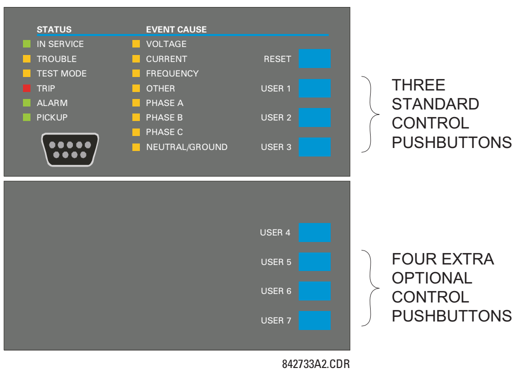

Figure 5–13: CONTROL PUSHBUTTONS (STANDARD FACEPLATE)

Control pushbuttons are not typically used for critical operations and are not protected by the control password. However, by supervising their output operands, the user can dynamically enable or disable control pushbuttons for security reasons.

Each control pushbutton asserts its own FlexLogic operand. These operands should be configured appropriately to perform the desired function. The operand remains asserted as long as the pushbutton is pressed and resets when the pushbutton is released. A dropout delay of 100 ms is incorporated to ensure fast pushbutton manipulation will be recognized by various features that may use control pushbuttons as inputs.

An event is logged in the event record (as per user setting) when a control pushbutton is pressed. No event is logged when the pushbutton is released. The faceplate keys (including control keys) cannot be operated simultaneously – a given key must be released before the next one can be pressed.

The control pushbuttons become user-programmable only if the breaker control feature is not configured for manual control via the USER 1 through 3 pushbuttons as shown below. If configured for manual control, breaker control typically uses the larger, optional user-programmable pushbuttons, making the control pushbuttons available for other user applications.

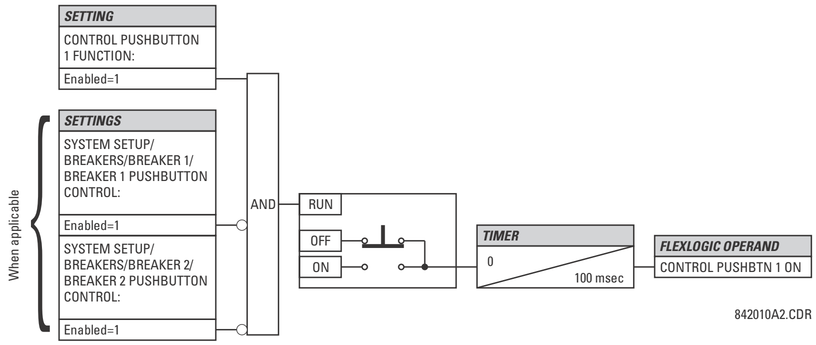

Figure 5–14: CONTROL PUSHBUTTON LOGIC

5.2.14 USER-PROGRAMMABLE PUSHBUTTONS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE PUSHBUTTONS ⇨ USER PUSHBUTTON 1(16)

■ USER PUSHBUTTON 1 ■	PUSHBUTTON 1 FUNCTION: Disabled	Range: Self-Reset, Latched, Disabled
MESSAGE	PUSHBTN 1 ID TEXT:	Range: Up to 20 alphanumeric characters
MESSAGE	PUSHBTN 1 ON TEXT:	Range: Up to 20 alphanumeric characters
MESSAGE	PUSHBTN 1 OFF TEXT:	Range: Up to 20 alphanumeric characters
MESSAGE	PUSHBTN 1 HOLD: 0.0 s	Range: 0.0 to 10.0 s in steps of 0.1

MESSAGE	PUSHBTN 1 RESET: Off	Range: FlexLogic operand
MESSAGE	PUSHBTN 1 AUTORST: Disabled	Range: Disabled, Enabled
MESSAGE	PUSHBTN 1 AUTORST DELAY: 1.0 s	Range: 0.2 to 600.0 s in steps of 0.1
MESSAGE	PUSHBTN 1 REMOTE: Off	Range: FlexLogic operand
MESSAGE	PUSHBTN 1 LOCAL: Off	Range: FlexLogic operand
MESSAGE	PUSHBTN 1 DROP-OUT TIME: 0.00 s	Range: 0 to 60.00 s in steps of 0.05
MESSAGE	PUSHBTN 1 LED CTL: Off	Range: FlexLogic operand
MESSAGE	PUSHBTN 1 MESSAGE: Disabled	Range: Disabled, Normal, High Priority
MESSAGE	PUSHBUTTON 1 EVENTS: Disabled	Range: Disabled, Enabled

The optional user-programmable pushbuttons (specified in the order code) provide an easy and error-free method of entering digital state (on, off) information. The number of available pushbuttons is dependent on the faceplate module ordered with the relay.

- Type P faceplate: standard horizontal faceplate with 12 user-programmable pushbuttons.
- Type Q faceplate: enhanced horizontal faceplate with 16 user-programmable pushbuttons.

The digital state can be entered locally (by directly pressing the front panel pushbutton) or remotely (via FlexLogic operands) into FlexLogic equations, protection elements, and control elements. Typical applications include breaker control, autorecloser blocking, and setting groups changes. The user-programmable pushbuttons are under the control level of password protection.

The user-configurable pushbuttons for the enhanced faceplate are shown below.

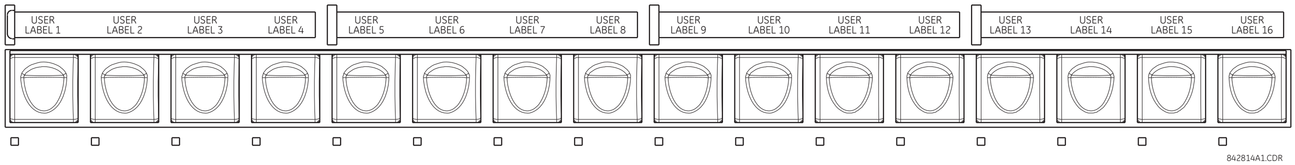

Figure 5–15: USER-PROGRAMMABLE PUSHBUTTONS (ENHANCED FACEPLATE)

The user-configurable pushbuttons for the standard faceplate are shown below.

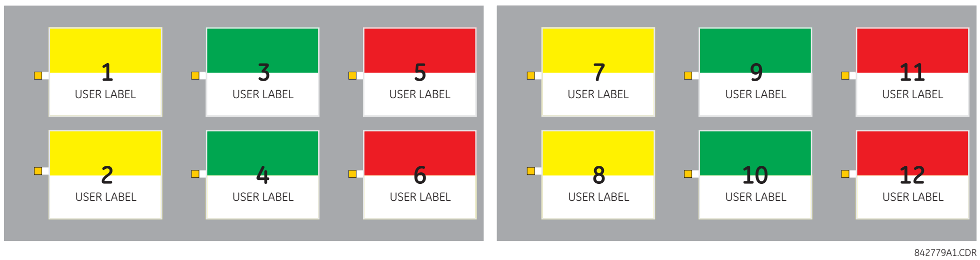

Figure 5–16: USER-PROGRAMMABLE PUSHBUTTONS (STANDARD FACEPLATE)

Both the standard and enhanced faceplate pushbuttons can be custom labeled with a factory-provided template, available online at http://www.gedigitalenergy.com/multilin. The EnerVista UR Setup software can also be used to create labels for the enhanced faceplate.

5

Each pushbutton asserts its own "On" and "Off" FlexLogic operands (for example, PUSHBUTTON 1 ON and PUSHBUTTON 1 OFF). These operands are available for each pushbutton and are used to program specific actions. If any pushbutton is active, the ANY PB ON operand will be asserted.

Each pushbutton has an associated LED indicator. By default, this indicator displays the present status of the corresponding pushbutton (on or off). However, each LED indicator can be assigned to any FlexLogic operand through the **PUSHBTN 1 LED CTL** setting.

The pushbuttons can be automatically controlled by activating the operands assigned to the **PUSHBTN 1 SET** (for latched and self-reset mode) and **PUSHBTN 1 RESET** (for latched mode only) settings. The pushbutton reset status is declared when the PUSHBUTTON 1 OFF operand is asserted. The activation and deactivation of user-programmable pushbuttons is dependent on whether latched or self-reset mode is programmed.

- *Latched mode*: In latched mode, a pushbutton can be set (activated) by asserting the operand assigned to the **PUSHBTN 1 SET** setting or by directly pressing the associated front panel pushbutton. The pushbutton maintains the set state until deactivated by the reset command or after a user-specified time delay. The state of each pushbutton is stored in non-volatile memory and maintained through a loss of control power.

  The pushbutton is reset (deactivated) in latched mode by asserting the operand assigned to the **PUSHBTN 1 RESET** setting or by directly pressing the associated active front panel pushbutton.

  It can also be programmed to reset automatically through the **PUSHBTN 1 AUTORST** and **PUSHBTN 1 AUTORST DELAY** settings. These settings enable the autoreset timer and specify the associated time delay. The autoreset timer can be used in select-before-operate (SBO) breaker control applications, where the command type (close/open) or breaker location (feeder number) must be selected prior to command execution. The selection must reset automatically if control is not executed within a specified time period.

- *Self-reset mode*: In self-reset mode, a pushbutton will remain active for the time it is pressed (the *pulse duration*) plus the dropout time specified in the **PUSHBTN 1 DROP-OUT TIME** setting. If the pushbutton is activated via FlexLogic, the pulse duration is specified by the **PUSHBTN 1 DROP-OUT TIME** only. The time the operand remains assigned to the **PUSHBTN 1 SET** setting has no effect on the pulse duration.

  The pushbutton is reset (deactivated) in self-reset mode when the dropout delay specified in the **PUSHBTN 1 DROP-OUT TIME** setting expires.

NOTE

The pulse duration of the remote set, remote reset, or local pushbutton must be at least 50 ms to operate the pushbutton. This allows the user-programmable pushbuttons to properly operate during power cycling events and various system disturbances that may cause transient assertion of the operating signals.

The local and remote operation of each user-programmable pushbutton can be inhibited through the **PUSHBTN 1 LOCAL** and **PUSHBTN 1 REMOTE** settings, respectively. If local locking is applied, the pushbutton will ignore set and reset commands executed through the front panel pushbuttons. If remote locking is applied, the pushbutton will ignore set and reset commands executed through FlexLogic operands.

The locking functions are not applied to the autorestart feature. In this case, the inhibit function can be used in SBO control operations to prevent the pushbutton function from being activated and ensuring "one-at-a-time" select operation.

The locking functions can also be used to prevent the accidental pressing of the front panel pushbuttons. The separate inhibit of the local and remote operation simplifies the implementation of local/remote control supervision.

Pushbutton states can be logged by the event recorder and displayed as target messages. In latched mode, user-defined messages can also be associated with each pushbutton and displayed when the pushbutton is on or changing to off.

- **PUSHBUTTON 1 FUNCTION**: This setting selects the characteristic of the pushbutton. If set to "Disabled", the pushbutton is not active and the corresponding FlexLogic operands (both "On" and "Off") are de-asserted. If set to "Self-Reset", the control logic is activated by the pulse (longer than 100 ms) issued when the pushbutton is being physically pressed or virtually pressed via a FlexLogic operand assigned to the **PUSHBTN 1 SET** setting.

  When in "Self-Reset" mode and activated locally, the pushbutton control logic asserts the "On" corresponding FlexLogic operand as long as the pushbutton is being physically pressed, and after being released the deactivation of the operand is delayed by the drop out timer. The "Off" operand is asserted when the pushbutton element is deactivated. If the pushbutton is activated remotely, the control logic of the pushbutton asserts the corresponding "On" FlexLogic operand only for the time period specified by the **PUSHBTN 1 DROP-OUT TIME** setting.

  If set to "Latched", the control logic alternates the state of the corresponding FlexLogic operand between "On" and "Off" on each button press or by virtually activating the pushbutton (assigning set and reset operands). When in the "Latched" mode, the states of the FlexLogic operands are stored in a non-volatile memory. Should the power supply be lost, the correct state of the pushbutton is retained upon subsequent power up of the relay.

- **PUSHBTN 1 ID TEXT:** This setting specifies the top 20-character line of the user-programmable message and is intended to provide ID information of the pushbutton. See the *User-definable Displays* section for instructions on how to enter alphanumeric characters from the keypad.

- **PUSHBTN 1 ON TEXT:** This setting specifies the bottom 20-character line of the user-programmable message and is displayed when the pushbutton is in the "on" position. See the *User-definable Displays* section for instructions on entering alphanumeric characters from the keypad.

- **PUSHBTN 1 OFF TEXT:** This setting specifies the bottom 20-character line of the user-programmable message and is displayed when the pushbutton is activated from the on to the off position and the **PUSHBUTTON 1 FUNCTION** is "Latched". This message is not displayed when the **PUSHBUTTON 1 FUNCTION** is "Self-reset" as the pushbutton operand status is implied to be "Off" upon its release. The length of the "Off" message is configured with the **PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨ FLASH MESSAGE TIME** setting.

- **PUSHBTN 1 HOLD**: This setting specifies the time required for a pushbutton to be pressed before it is deemed active. This timer is reset upon release of the pushbutton. Note that any pushbutton operation will require the pushbutton to be pressed a minimum of 50 ms. This minimum time is required prior to activating the pushbutton hold timer.

- **PUSHBTN 1 SET**: This setting assigns the FlexLogic operand serving to operate the pushbutton element and to assert PUSHBUTTON 1 ON operand. The duration of the incoming set signal must be at least 100 ms.

- **PUSHBTN 1 RESET**: This setting assigns the FlexLogic operand serving to reset pushbutton element and to assert PUSHBUTTON 1 OFF operand. This setting is applicable only if pushbutton is in latched mode. The duration of the incoming reset signal must be at least 50 ms.

- **PUSHBTN 1 AUTORST**: This setting enables the user-programmable pushbutton autoreset feature. This setting is applicable only if the pushbutton is in the "Latched" mode.

- **PUSHBTN 1 AUTORST DELAY**: This setting specifies the time delay for automatic reset of the pushbutton when in the latched mode.

- **PUSHBTN 1 REMOTE**: This setting assigns the FlexLogic operand serving to inhibit pushbutton operation from the operand assigned to the **PUSHBTN 1 SET** or **PUSHBTN 1 RESET** settings.

- **PUSHBTN 1 LOCAL**: This setting assigns the FlexLogic operand serving to inhibit pushbutton operation from the front panel pushbuttons. This locking functionality is not applicable to pushbutton autoreset.

- **PUSHBTN 1 DROP-OUT TIME**: This setting applies only to “Self-Reset” mode and specifies the duration of the push-button active status after the pushbutton has been released. When activated remotely, this setting specifies the entire activation time of the pushbutton status; the length of time the operand remains on has no effect on the pulse duration. This setting is required to set the duration of the pushbutton operating pulse.
- **PUSHBTN 1 LED CTL**: This setting assigns the FlexLogic operand serving to drive pushbutton LED. If this setting is “Off”, then LED operation is directly linked to PUSHBUTTON 1 ON operand.
- **PUSHBTN 1 MESSAGE**: If pushbutton message is set to “High Priority”, the message programmed in the **PUSHBTN 1 ID** and **PUSHBTN 1 ON TEXT** settings will be displayed undisturbed as long as PUSHBUTTON 1 ON operand is asserted. The high priority option is not applicable to the **PUSHBTN 1 OFF TEXT** setting.

  This message can be temporary removed if any front panel keypad button is pressed. However, ten seconds of keypad inactivity will restore the message if the PUSHBUTTON 1 ON operand is still active.

  If the **PUSHBTN 1 MESSAGE** is set to “Normal”, the message programmed in the **PUSHBTN 1 ID** and **PUSHBTN 1 ON TEXT** settings will be displayed as long as PUSHBUTTON 1 ON operand is asserted, but not longer than time period specified by **FLASH MESSAGE TIME** setting. After the flash time is expired, the default message or other active target message is displayed. The instantaneous reset of the flash message will be executed if any relay front panel button is pressed or any new target or message becomes active.

  The **PUSHBTN 1 OFF TEXT** setting is linked to PUSHBUTTON 1 OFF operand and will be displayed in conjunction with **PUSHBTN 1 ID** only if pushbutton element is in the “Latched” mode. The **PUSHBTN 1 OFF TEXT** message will be displayed as “Normal” if the **PUSHBTN 1 MESSAGE** setting is “High Priority” or “Normal”.
- **PUSHBUTTON 1 EVENTS**: If this setting is enabled, each pushbutton state change will be logged as an event into event recorder.

The user-programmable pushbutton logic is shown below.

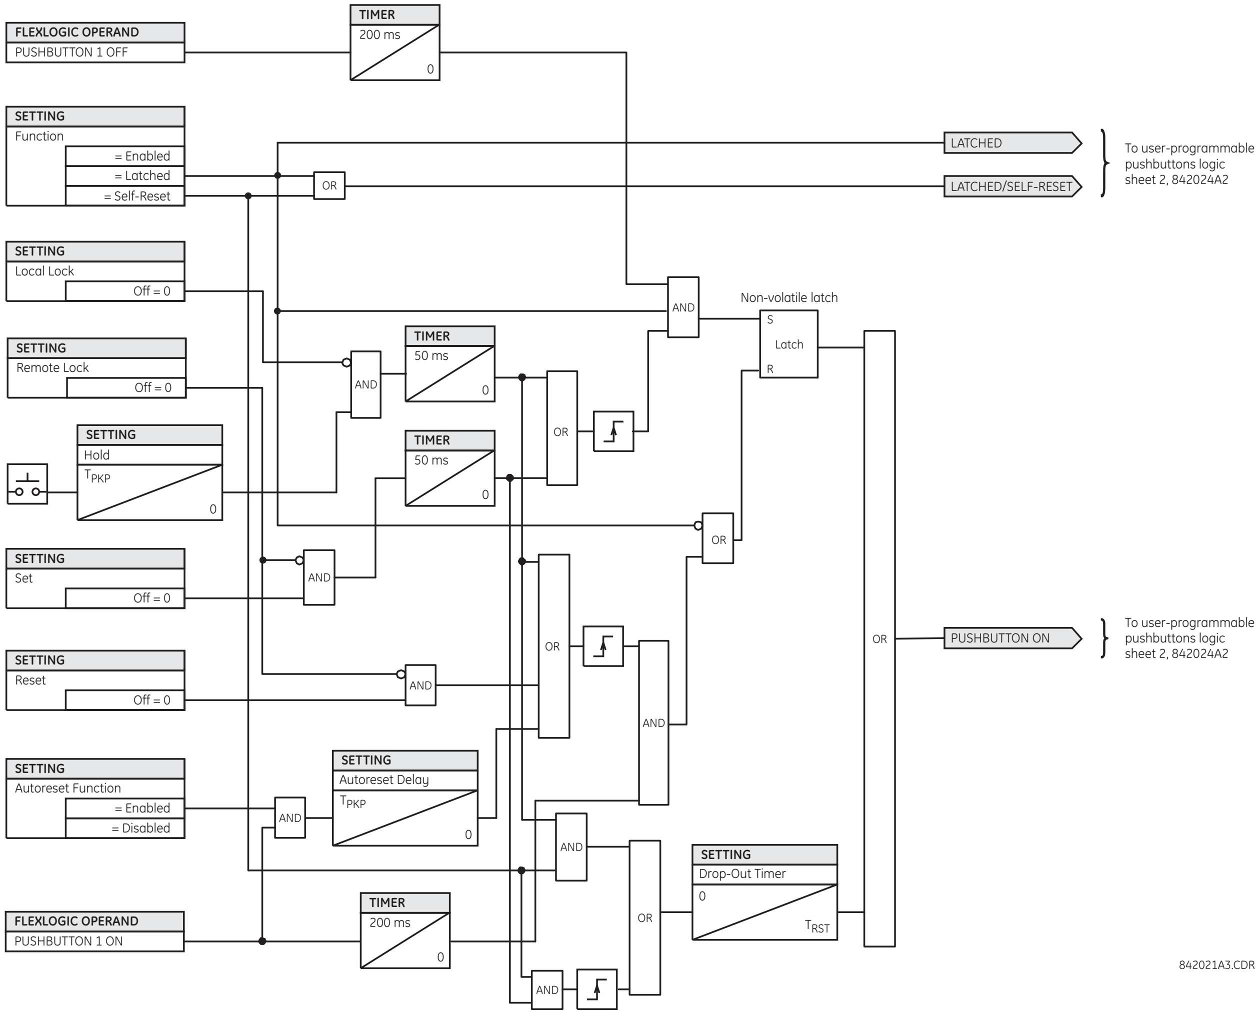

Figure 5–17: USER-PROGRAMMABLE PUSHBUTTON LOGIC (Sheet 1 of 2)

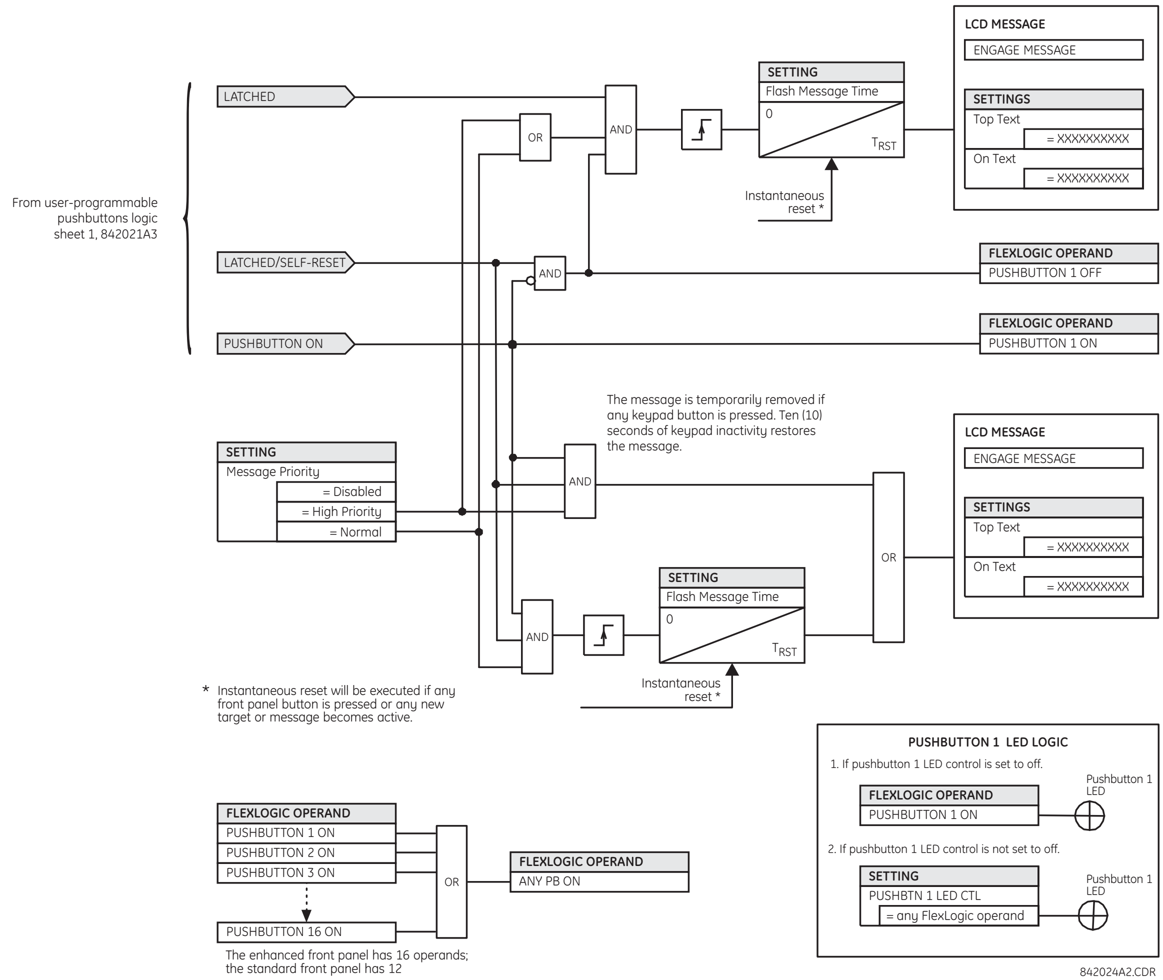

Figure 5–18: USER-PROGRAMMABLE PUSHBUTTON LOGIC (Sheet 2 of 2)

NOTE

User-programmable pushbuttons require a type HP or HQ faceplate. If an HP or HQ type faceplate was ordered separately, the relay order code must be changed to indicate the correct faceplate option. This can be done via EnerVista UR Setup with the **Maintenance > Enable Pushbutton** command.

5.2.15 FLEX STATE PARAMETERS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ FLEX STATE PARAMETERS

■ FLEX STATE ■ PARAMETERS		PARAMETER 1: Off	*Range: FlexLogic operand*
	MESSAGE	PARAMETER 2: Off	*Range: FlexLogic operand*
	MESSAGE	PARAMETER 3: Off	*Range: FlexLogic operand*
		↓	
	MESSAGE	PARAMETER 256: Off	*Range: FlexLogic operand*

This feature provides a mechanism where any of 256 selected FlexLogic operand states can be used for efficient monitoring. The feature allows user-customized access to the FlexLogic operand states in the relay. The state bits are packed so that 16 states may be read out in a single Modbus register. The state bits can be configured so that all of the states which are of interest to the user are available in a minimum number of Modbus registers.

The state bits may be read out in the "Flex States" register array beginning at Modbus address 0900h. Sixteen states are packed into each register, with the lowest-numbered state in the lowest-order bit. There are sixteen registers to accommodate the 256 state bits.

5.2.16 USER-DEFINABLE DISPLAYS

a) MAIN MENU

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-DEFINABLE DISPLAYS

Menu		Setting	Range
■ USER-DEFINABLE ■ DISPLAYS		INVOKE AND SCROLL: Off	*Range: FlexLogic operand*
	MESSAGE	■ USER DISPLAY 1 ■	*Range: up to 20 alphanumeric characters*
	MESSAGE	■ USER DISPLAY 3 ■	*Range: up to 20 alphanumeric characters*
	MESSAGE	■ USER DISPLAY 2 ■	*Range: up to 20 alphanumeric characters*
		↓	
	MESSAGE	■ USER DISPLAY 16 ■	*Range: up to 20 alphanumeric characters*

This menu provides a mechanism for manually creating up to 16 user-defined information displays in a convenient viewing sequence in the **USER DISPLAYS** menu (between the **TARGETS** and **ACTUAL VALUES** top-level menus). The sub-menus facilitate text entry and Modbus register data pointer options for defining the user display content.

Once programmed, the user-definable displays can be viewed in two ways.

- **KEYPAD**: Use the MENU key to select the **USER DISPLAYS** menu item to access the first user-definable display (note that only the programmed screens are displayed). The screens can be scrolled using the UP and DOWN keys. The display disappears after the default message time-out period specified by the **PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨⇩ DEFAULT MESSAGE TIMEOUT** setting.
- **USER-PROGRAMMABLE CONTROL INPUT**: The user-definable displays also respond to the **INVOKE AND SCROLL** setting. Any FlexLogic operand (in particular, the user-programmable pushbutton operands), can be used to navigate the programmed displays.

  On the rising edge of the configured operand (such as when the pushbutton is pressed), the displays are invoked by showing the last user-definable display shown during the previous activity. From this moment onward, the operand acts exactly as the down key and allows scrolling through the configured displays. The last display wraps up to the first one. The **INVOKE AND SCROLL** input and the DOWN key operate concurrently.

  When the default timer expires (set by the **DEFAULT MESSAGE TIMEOUT** setting), the relay will start to cycle through the user displays. The next activity of the **INVOKE AND SCROLL** input stops the cycling at the currently displayed user display, not at the first user-defined display. The **INVOKE AND SCROLL** pulses must last for at least 250 ms to take effect.

b) USER DISPLAY 1(16)

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-DEFINABLE DISPLAYS ⇨ USER DISPLAY 1(16)

Menu		Setting	Range
■ USER DISPLAY 1 ■	◄►	DISP 1 TOP LINE:	Range: up to 20 alphanumeric characters
MESSAGE	▲▼	DISP 1 BOTTOM LINE:	Range: up to 20 alphanumeric characters
MESSAGE	▲▼	DISP 1 ITEM 1 0	Range: 0 to 65535 in steps of 1
MESSAGE	▲▼	DISP 1 ITEM 2 0	Range: 0 to 65535 in steps of 1
MESSAGE	▲▼	DISP 1 ITEM 3 0	Range: 0 to 65535 in steps of 1
MESSAGE	▲▼	DISP 1 ITEM 4 0	Range: 0 to 65535 in steps of 1
MESSAGE	▲	DISP 1 ITEM 5: 0	Range: 0 to 65535 in steps of 1

Any existing system display can be automatically copied into an available user display by selecting the existing display and pressing the ENTER key. The display will then prompt **ADD TO USER DISPLAY LIST?**. After selecting "Yes", a message indicates that the selected display has been added to the user display list. When this type of entry occurs, the sub-menus are automatically configured with the proper content – this content may subsequently be edited.

5

This menu is used to enter user-defined text and user-selected Modbus-registered data fields into the particular user display. Each user display consists of two 20-character lines (top and bottom). The tilde (~) character is used to mark the start of a data field – the length of the data field needs to be accounted for. Up to five separate data fields can be entered in a user display – the *n*th tilde (~) refers to the *n*th item.

A user display may be entered from the faceplate keypad or the EnerVista UR Setup interface (preferred for convenience). The following procedure shows how to enter text characters in the top and bottom lines from the faceplate keypad:

1. Select the line to be edited.
2. Press the decimal key to enter text edit mode.
3. Use either VALUE key to scroll through the characters. A space is selected like a character.
4. Press the decimal key to advance the cursor to the next position.
5. Repeat step 3 and continue entering characters until the desired text is displayed.
6. The HELP key may be pressed at any time for context sensitive help information.
7. Press the ENTER key to store the new settings.

To enter a numerical value for any of the five items (the *decimal form* of the selected Modbus address) from the faceplate keypad, use the number keypad. Use the value of "0" for any items not being used. Use the HELP key at any selected system display (setting, actual value, or command) which has a Modbus address, to view the *hexadecimal form* of the Modbus address, then manually convert it to decimal form before entering it (EnerVista UR Setup usage conveniently facilitates this conversion).

Use the MENU key to go to the user displays menu to view the user-defined content. The current user displays will show in sequence, changing every four seconds. While viewing a user display, press the ENTER key and then select the 'Yes" option to remove the display from the user display list. Use the MENU key again to exit the user displays menu.

An example user display setup and result is shown below:

■ USER DISPLAY 1 ■		DISP 1 TOP LINE: Current X ~ A	Shows user-defined text with first tilde marker.
MESSAGE		DISP 1 BOTTOM LINE: Current Y ~ A	Shows user-defined text with second tilde marker.
MESSAGE		DISP 1 ITEM 1: 6016	Shows decimal form of user-selected Modbus register address, corresponding to first tilde marker.
MESSAGE		DISP 1 ITEM 2: 6357	Shows decimal form of user-selected Modbus register address, corresponding to second tilde marker.
MESSAGE		DISP 1 ITEM 3: 0	This item is not being used. There is no corresponding tilde marker in top or bottom lines.
MESSAGE		DISP 1 ITEM 4: 0	This item is not being used. There is no corresponding tilde marker in top or bottom lines.
MESSAGE		DISP 1 ITEM 5: 0	This item is not being used. There is no corresponding tilde marker in top or bottom lines.
USER DISPLAYS	→	Current X 0.850 Current Y 0.327 A	Shows the resultant display content.

NOTE

If the parameters for the top line and the bottom line items have the same units, then the unit is displayed on the bottom line only. The units are only displayed on both lines if the units specified both the top and bottom line items are different.

5

5.2.17 DIRECT INPUTS/OUTPUTS

a) MAIN MENU

MESSAGE	■ UNRETURNED ■ MESSAGES ALARM CH1	See page 5-96.
MESSAGE	■ UNRETURNED ■ MESSAGES ALARM CH2	See page 5-96.

Direct inputs and outputs are intended for exchange of status information (inputs and outputs) between UR-series relays connected directly via type 7 digital communications cards. The mechanism is very similar to IEC 61850 GSSE, except that communications takes place over a non-switchable isolated network and is optimized for speed. On type 7 cards that support two channels, direct output messages are sent from both channels simultaneously. This effectively sends direct output messages both ways around a ring configuration. On type 7 cards that support one channel, direct output messages are sent only in one direction. Messages will be resent (forwarded) when it is determined that the message did not originate at the receiver.

Direct output message timing is similar to GSSE message timing. Integrity messages (with no state changes) are sent at least every 1000 ms. Messages with state changes are sent within the main pass scanning the inputs and asserting the outputs unless the communication channel bandwidth has been exceeded. Two self-tests are performed and signaled by the following FlexLogic operands:

1. DIRECT RING BREAK (direct input/output ring break). This FlexLogic operand indicates that direct output messages sent from a UR-series relay are not being received back by the relay.
2. DIRECT DEVICE 1 OFF to DIRECT DEVICE 16 OFF (direct device offline). These FlexLogic operands indicate that direct output messages from at least one direct device are not being received.

Direct input and output settings are similar to remote input and output settings. The equivalent of the remote device name strings for direct inputs and outputs is the **DIRECT OUTPUT DEVICE ID**. The **DIRECT OUTPUT DEVICE ID** setting identifies the relay in all direct output messages. All UR-series IEDs in a ring should have unique numbers assigned. The IED ID is used to identify the sender of the direct input and output message.

If the direct input and output scheme is configured to operate in a ring (**DIRECT I/O CH1 RING CONFIGURATION** or **DIRECT I/O CH2 RING CONFIGURATION** is “Yes”), all direct output messages should be received back. If not, the direct input/output ring break self-test is triggered. The self-test error is signaled by the DIRECT RING BREAK FlexLogic operand.

5

Select the **DIRECT I/O DATA RATE** to match the data capabilities of the communications channel. All IEDs communicating over direct inputs and outputs must be set to the same data rate. UR-series IEDs equipped with dual-channel communications cards apply the same data rate to both channels. Delivery time for direct input and output messages is approximately 0.2 of a power system cycle at 128 kbps and 0.4 of a power system cycle at 64 kbps, per each ‘bridge’.

Table 5–10: DIRECT INPUT AND OUTPUT DATA RATES

	Channel 2	64 kbps
7R	Channel 1	64 kbps
7S	Channel 1	64 kbps
	Channel 2	64 kbps

NOTE

The G.703 modules are fixed at 64 kbps. The **DIRECT I/O DATA RATE** setting is not applicable to these modules.

The **DIRECT I/O CHANNEL CROSSOVER** setting applies to F60s with dual-channel communication cards and allows crossing over messages from channel 1 to channel 2. This places all UR-series IEDs into one direct input and output network regardless of the physical media of the two communication channels.

The following application examples illustrate the basic concepts for direct input and output configuration. See the *Inputs and Outputs* section in this chapter for information on configuring FlexLogic operands (flags, bits) to be exchanged.

EXAMPLE 1: EXTENDING THE INPUT/OUTPUT CAPABILITIES OF A UR-SERIES RELAY

Consider an application that requires additional quantities of digital inputs or output contacts or lines of programmable logic that exceed the capabilities of a single UR-series chassis. The problem is solved by adding an extra UR-series IED, such as the C30, to satisfy the additional input and output and programmable logic requirements. The two IEDs are connected via single-channel digital communication cards as shown in the figure below.

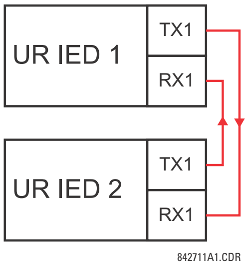

Figure 5–19: INPUT AND OUTPUT EXTENSION VIA DIRECT INPUTS AND OUTPUTS

In the above application, the following settings should be applied. For UR-series IED 1:

DIRECT OUTPUT DEVICE ID: “1”
DIRECT I/O CH1 RING CONFIGURATION: “Yes”
DIRECT I/O DATA RATE: “128 kbps”

For UR-series IED 2:

DIRECT OUTPUT DEVICE ID: “2”
DIRECT I/O CH1 RING CONFIGURATION: “Yes”
DIRECT I/O DATA RATE: “128 kbps”

The message delivery time is about 0.2 of power cycle in both ways (at 128 kbps); that is, from device 1 to device 2, and from device 2 to device 1. Different communications cards can be selected by the user for this back-to-back connection (for example: fiber, G.703, or RS422).

EXAMPLE 2: INTERLOCKING BUSBAR PROTECTION

A simple interlocking busbar protection scheme could be accomplished by sending a blocking signal from downstream devices, say 2, 3, and 4, to the upstream device that monitors a single incomer of the busbar, as shown below.

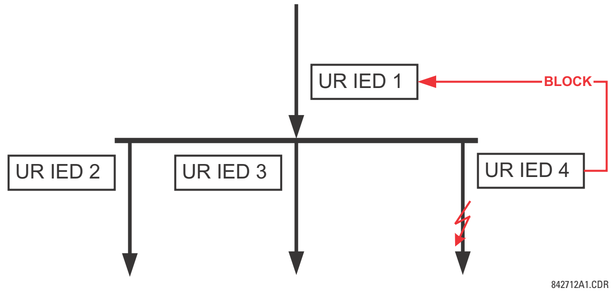

Figure 5–20: SAMPLE INTERLOCKING BUSBAR PROTECTION SCHEME

For increased reliability, a dual-ring configuration (shown below) is recommended for this application.

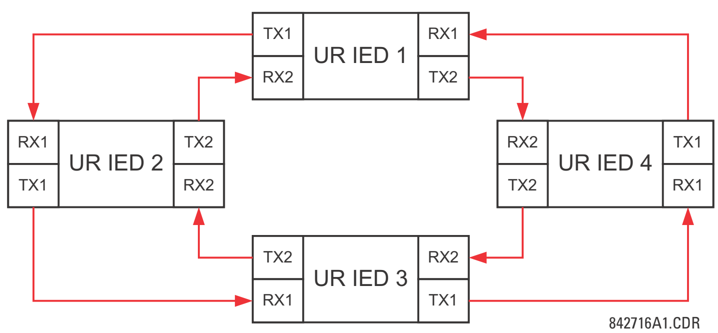

Figure 5–21: INTERLOCKING BUS PROTECTION SCHEME VIA DIRECT INPUTS/OUTPUTS

In the above application, the following settings should be applied. For UR-series IED 1:

DIRECT OUTPUT DEVICE ID: "1"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

For UR-series IED 2:

DIRECT OUTPUT DEVICE ID: "2"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

For UR-series IED 3:

DIRECT OUTPUT DEVICE ID: "3"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

For UR-series IED 4:

DIRECT OUTPUT DEVICE ID: "4"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

Message delivery time is approximately 0.2 of power system cycle (at 128 kbps) times number of 'bridges' between the origin and destination. Dual-ring configuration effectively reduces the maximum 'communications distance' by a factor of two.

In this configuration the following delivery times are expected (at 128 kbps) if both rings are healthy:

IED 1 to IED 2: 0.2 of power system cycle;
IED 1 to IED 3: 0.4 of power system cycle;
IED 1 to IED 4: 0.2 of power system cycle;
IED 2 to IED 3: 0.2 of power system cycle;
IED 2 to IED 4: 0.4 of power system cycle;
IED 3 to IED 4: 0.2 of power system cycle.

If one ring is broken (say TX2-RX2) the delivery times are as follows:

IED 1 to IED 2: 0.2 of power system cycle;
IED 1 to IED 3: 0.4 of power system cycle;
IED 1 to IED 4: 0.6 of power system cycle;
IED 2 to IED 3: 0.2 of power system cycle;
IED 2 to IED 4: 0.4 of power system cycle;
IED 3 to IED 4: 0.2 of power system cycle.

A coordinating timer for this bus protection scheme could be selected to cover the worst case scenario (0.4 of a power system cycle). Upon detecting a broken ring, the coordination time should be adaptively increased to 0.6 of a power system cycle. The complete application requires addressing a number of issues such as failure of both the communications rings, failure or out-of-service conditions of one of the relays, etc. Self-monitoring flags of the direct inputs and outputs feature would be primarily used to address these concerns.

EXAMPLE 3: PILOT-AIDED SCHEMES

Consider the three-terminal line protection application shown below:

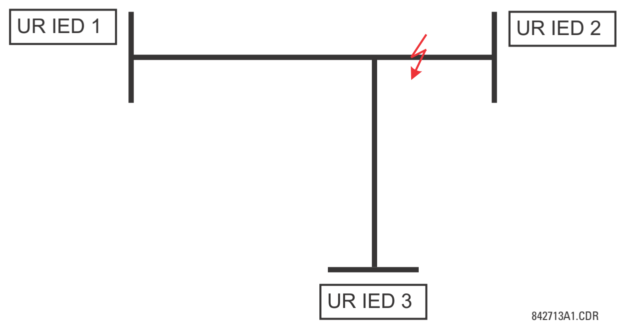

Figure 5–22: THREE-TERMINAL LINE APPLICATION

A permissive pilot-aided scheme could be implemented in a two-ring configuration as shown below (IEDs 1 and 2 constitute a first ring, while IEDs 2 and 3 constitute a second ring):

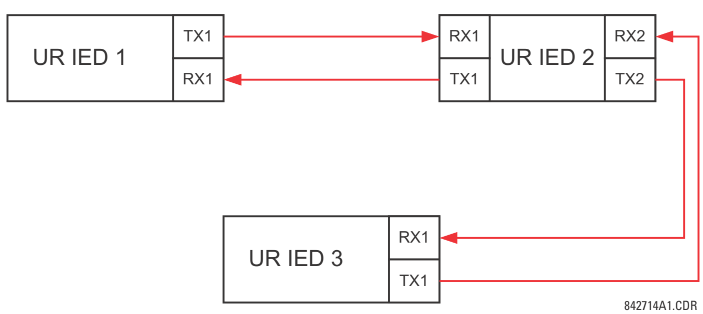

Figure 5–23: SINGLE-CHANNEL OPEN LOOP CONFIGURATION

In the above application, the following settings should be applied. For UR-series IED 1:

DIRECT OUTPUT DEVICE ID: "1"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

For UR-series IED 2:

DIRECT OUTPUT DEVICE ID: “2”
DIRECT I/O CH1 RING CONFIGURATION: “Yes”
DIRECT I/O CH2 RING CONFIGURATION: “Yes”

For UR-series IED 3:

DIRECT OUTPUT DEVICE ID: “3”
DIRECT I/O CH1 RING CONFIGURATION: “Yes”
DIRECT I/O CH2 RING CONFIGURATION: “Yes”

In this configuration the following delivery times are expected (at 128 kbps):

IED 1 to IED 2: 0.2 of power system cycle;
IED 1 to IED 3: 0.5 of power system cycle;
IED 2 to IED 3: 0.2 of power system cycle.

In the above scheme, IEDs 1 and 3 do not communicate directly. IED 2 must be configured to forward the messages as explained in the *Inputs and Outputs* section. A blocking pilot-aided scheme should be implemented with more security and, ideally, faster message delivery time. This is accomplished using a dual-ring configuration as shown here.

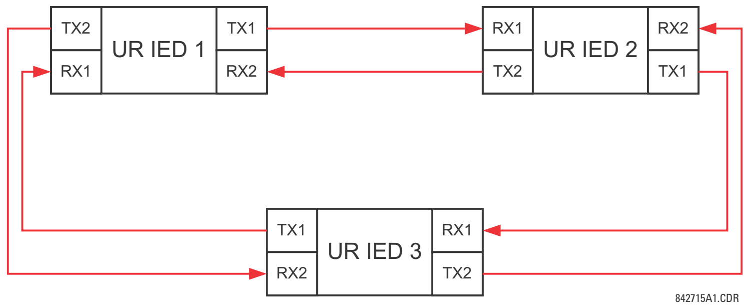

Figure 5–24: DUAL-CHANNEL CLOSED LOOP (DUAL-RING) CONFIGURATION

In the above application, the following settings should be applied. For UR-series IED 1:

DIRECT OUTPUT DEVICE ID: “1”
DIRECT I/O CH1 RING CONFIGURATION: “Yes”
DIRECT I/O CH2 RING CONFIGURATION: “Yes”

For UR-series IED 2:

DIRECT OUTPUT DEVICE ID: “2”
DIRECT I/O CH1 RING CONFIGURATION: “Yes”
DIRECT I/O CH2 RING CONFIGURATION: “Yes”

For UR-series IED 3:

DIRECT OUTPUT DEVICE ID: “3”
DIRECT I/O CH1 RING CONFIGURATION: “Yes”
DIRECT I/O CH2 RING CONFIGURATION: “Yes”

In this configuration the following delivery times are expected (at 128 kbps) if both the rings are healthy:

IED 1 to IED 2: 0.2 of power system cycle;
IED 1 to IED 3: 0.2 of power system cycle;
IED 2 to IED 3: 0.2 of power system cycle.

The two communications configurations could be applied to both permissive and blocking schemes. Speed, reliability and cost should be taken into account when selecting the required architecture.

b) CRC ALARM CH1(2)

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ DIRECT I/O ⇨⇩ CRC ALARM CH1(2)

■ CRC ALARM CH1 ■	◀▶	CRC ALARM CH1 FUNCTION: Disabled	*Range: Enabled, Disabled*
MESSAGE	▲▼	CRC ALARM CH1 MESSAGE COUNT: 600	*Range: 100 to 10000 in steps of 1*
MESSAGE	▲▼	CRC ALARM CH1 THRESHOLD: 10	*Range: 1 to 1000 in steps of 1*
MESSAGE	▲	CRC ALARM CH1 EVENTS: Disabled	*Range: Enabled, Disabled*

The F60 checks integrity of the incoming direct input and output messages using a 32-bit CRC. The CRC alarm function is available for monitoring the communication medium noise by tracking the rate of messages failing the CRC check. The monitoring function counts all incoming messages, including messages that failed the CRC check. A separate counter adds up messages that failed the CRC check. When the failed CRC counter reaches the user-defined level specified by the **CRC ALARM CH1 THRESHOLD** setting within the user-defined message count **CRC ALARM 1 CH1 COUNT**, the DIR IO CH1 CRC ALARM FlexLogic operand is set.

When the total message counter reaches the user-defined maximum specified by the **CRC ALARM CH1 MESSAGE COUNT** setting, both the counters reset and the monitoring process is restarted.

The operand shall be configured to drive an output contact, user-programmable LED, or selected communication-based output. Latching and acknowledging conditions - if required - should be programmed accordingly.

The CRC alarm function is available on a per-channel basis. The total number of direct input and output messages that failed the CRC check is available as the **ACTUAL VALUES ⇨ STATUS ⇨⇩ DIRECT INPUTS ⇨⇩ CRC FAIL COUNT CH1** actual value.

- *Message count and length of the monitoring window*: To monitor communications integrity, the relay sends 1 message per second (at 64 kbps) or 2 messages per second (128 kbps) even if there is no change in the direct outputs. For example, setting the **CRC ALARM CH1 MESSAGE COUNT** to “10000”, corresponds a time window of about 160 minutes at 64 kbps and 80 minutes at 128 kbps. If the messages are sent faster as a result of direct outputs activity, the monitoring time interval will shorten. This should be taken into account when determining the **CRC ALARM CH1 MESSAGE COUNT** setting. For example, if the requirement is a maximum monitoring time interval of 10 minutes at 64 kbps, then the **CRC ALARM CH1 MESSAGE COUNT** should be set to $10 \times 60 \times 1 = 600$.
- *Correlation of failed CRC and bit error rate (BER)*: The CRC check may fail if one or more bits in a packet are corrupted. Therefore, an exact correlation between the CRC fail rate and the BER is not possible. Under certain assumptions an approximation can be made as follows. A direct input and output packet containing 20 bytes results in 160 bits of data being sent and therefore, a transmission of 63 packets is equivalent to 10,000 bits. A BER of 10^{-4} implies 1 bit error for every 10000 bits sent or received. Assuming the best case of only 1 bit error in a failed packet, having 1 failed packet for every 63 received is about equal to a BER of 10^{-4}.

c) UNRETURNED MESSAGES ALARM CH1(2)

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ DIRECT I/O ⇨⇩ UNRETURNED MESSAGES ALARM CH1(2)

■ UNRETURNED ■ MESSAGES ALARM CH1	◁▷	UNRET MSGS ALARM CH1 FUNCTION: Disabled	Range: Enabled, Disabled
MESSAGE	△▽	UNRET MSGS ALARM CH1 MESSAGE COUNT: 600	Range: 100 to 10000 in steps of 1
MESSAGE	△▽	UNRET MSGS ALARM CH1 THRESHOLD: 10	Range: 1 to 1000 in steps of 1
MESSAGE	△	UNRET MSGS ALARM CH1 EVENTS: Disabled	Range: Enabled, Disabled

The F60 checks integrity of the direct input and output communication ring by counting unreturned messages. In the ring configuration, all messages originating at a given device should return within a pre-defined period of time. The unreturned messages alarm function is available for monitoring the integrity of the communication ring by tracking the rate of unreturned messages. This function counts all the outgoing messages and a separate counter adds the messages have failed to return. When the unreturned messages counter reaches the user-definable level specified by the **UNRET MSGS ALARM CH1 THRESHOLD** setting and within the user-defined message count **UNRET MSGS ALARM CH1 COUNT**, the DIR IO CH1 UNRET ALM FlexLogic operand is set.

When the total message counter reaches the user-defined maximum specified by the **UNRET MSGS ALARM CH1 MESSAGE COUNT** setting, both the counters reset and the monitoring process is restarted.

The operand shall be configured to drive an output contact, user-programmable LED, or selected communication-based output. Latching and acknowledging conditions, if required, should be programmed accordingly.

5

The unreturned messages alarm function is available on a per-channel basis and is active only in the ring configuration. The total number of unreturned input and output messages is available as the **ACTUAL VALUES ⇨ STATUS ⇨⇩ DIRECT INPUTS ⇨⇩ UNRETURNED MSG COUNT CH1** actual value.

5.2.18 TELEPROTECTION

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ TELEPROTECTION

■ TELEPROTECTION ■	◁▷	TELEPROTECTION FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE	△▽	NUMBER OF TERMINALS: 2	Range: 2, 3
MESSAGE	△▽	NUMBER OF COMM CHANNELS: 1	Range: 1, 2
MESSAGE	△▽	LOCAL RELAY ID NUMBER: 0	Range: 0 to 255 in steps of 1
MESSAGE	△▽	TERMINAL 1 RELAY ID NUMBER: 0	Range: 0 to 255 in steps of 1
MESSAGE	△	TERMINAL 2 RELAY ID NUMBER: 0	Range: 0 to 255 in steps of 1

Digital teleprotection functionality is designed to transfer protection commands between two or three relays in a secure, fast, dependable, and deterministic fashion. Possible applications are permissive or blocking pilot schemes and direct transfer trip (DTT). Teleprotection can be applied over any analog or digital channels and any communications media, such as direct fiber, copper wires, optical networks, or microwave radio links. A mixture of communication media is possible.

Once teleprotection is enabled and the teleprotection input/outputs are configured, data packets are transmitted continuously every 1/4 cycle (3/8 cycle if using C37.94 modules) from peer-to-peer. Security of communication channel data is achieved by using CRC-32 on the data packet.

NOTE: Teleprotection inputs/outputs and direct inputs/outputs are mutually exclusive – as such, they cannot be used simultaneously. Once teleprotection inputs and outputs are enabled, direct inputs and outputs are blocked, and *vice versa*.

- **NUMBER OF TERMINALS**: Specifies whether the teleprotection system operates between two peers or three peers.
- **NUMBER OF CHANNELS**: Specifies how many channels are used. If the **NUMBER OF TERMINALS** is “3” (three-terminal system), set the **NUMBER OF CHANNELS** to “2”. For a two-terminal system, the **NUMBER OF CHANNELS** can set to “1” or “2” (redundant channels).
- **LOCAL RELAY ID NUMBER**, **TERMINAL 1 RELAY ID NUMBER**, and **TERMINAL 2 RELAY ID NUMBER**: In installations that use multiplexers or modems, it is desirable to ensure that the data used by the relays protecting a given line is from the correct relays. The teleprotection function performs this check by reading the message ID sent by transmitting relays and comparing it to the programmed ID in the receiving relay. This check is also used to block inputs if inadvertently set to loopback mode or data is being received from a wrong relay by checking the ID on a received channel. If an incorrect ID is found on a channel during normal operation, the TELEPROT CH1 ID FAIL or TELEPROT CH2 ID FAIL FlexLogic operand is set, driving the event with the same name and blocking the teleprotection inputs. For commissioning purposes, the result of channel identification is also shown in the **STATUS ⇨⇩ CHANNEL TESTS ⇨⇩ VALIDITY OF CHANNEL CONFIGURATION** actual value. The default value of “0” for the **LOCAL RELAY ID NUMBER** indicates that relay ID is not to be checked. On two- terminals two-channel systems, the same **LOCAL RELAY ID NUMBER** is transmitted over both channels; as such, only the **TERMINAL 1 ID NUMBER** has to be programmed on the receiving end.

5.2.19 INSTALLATION

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ INSTALLATION

			Range
■ INSTALLATION ■	◁▷	RELAY SETTINGS: Not Programmed	Range: Not Programmed, Programmed
MESSAGE	△	RELAY NAME: Relay-1	Range: up to 20 alphanumeric characters

To safeguard against the installation of a relay without any entered settings, the unit will not allow signaling of any output relay until **RELAY SETTINGS** is set to "Programmed". This setting is defaulted to "Not Programmed" when at the factory. The **UNIT NOT PROGRAMMED** self-test error message is displayed until the relay is put into the "Programmed" state.

The **RELAY NAME** setting allows the user to uniquely identify a relay. This name will appear on generated reports.

5.3.1 REMOTE RESOURCES CONFIGURATION

When F60 is ordered with a process card module as a part of HardFiber system, then an additional **Remote Resources** menu tree is available in EnerVista UR Setup software to allow configuration of the HardFiber system.

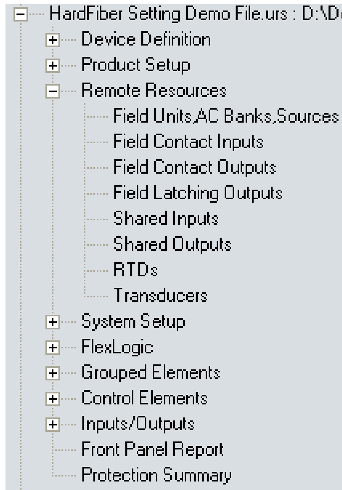

Figure 5–25: REMOTE RESOURCES CONFIGURATION MENU

The remote resources settings configure a F60 with a process bus module to work with HardFiber *Bricks*. Remote resources configuration is only available through the EnerVista UR Setup software, and is not available through the F60 front panel. A Brick provides eight AC measurements, along with contact inputs, DC analog inputs, and contact outputs, to be the remote interface to field equipment such as circuit breakers and transformers. The F60 with a process bus module has access to all of the capabilities of up to eight Bricks. Remote resources settings configure the point-to-point connection between specific fiber optic ports on the F60 process card and specific Brick. The relay is then configured to measure specific currents, voltages and contact inputs from those Bricks, and to control specific outputs.

The configuration process for remote resources is straightforward and consists of the following steps.

- *Configure the field units*. This establishes the point-to-point connection between a specific port on the relay process bus module, and a specific digital core on a specific Brick. This is a necessary first step in configuring a process bus relay.
- *Configure the AC banks*. This sets the primary and secondary quantities and connections for currents and voltages. AC bank configuration also provides a provision for redundant measurements for currents and voltages, a powerful reliability improvement possible with process bus.
- *Configure signal sources*. This functionality of the F60 has not changed other than the requirement to use currents and voltages established by AC bank configuration under the remote resources menu.
- *Configure field contact inputs, field contact outputs, RTDs, and transducers as required for the application's functionality.* These inputs and outputs are the physical interface to circuit breakers, transformers, and other equipment. They replace the traditional contact inputs and outputs located at the relay to virtually eliminate copper wiring.
- *Configure shared inputs and outputs as required for the application's functionality.* Shared inputs and outputs are distinct binary channels that provide high-speed protection quality signaling between relays through a Brick.

For additional information on how to configure a relay with a process bus module, see GE publication number GEK-113658: HardFiber Process Bus System Instruction Manual.

5.4.1 AC INPUTS

a) CURRENT BANKS

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨ AC INPUTS ⇨ CURRENT BANK F1(F5)

■ CURRENT BANK F1 ■	PHASE CT F1 PRIMARY: 1 A	*Range: 1 to 65000 A in steps of 1*
MESSAGE	PHASE CT F1 SECONDARY: 1 A	*Range: 1 A, 5 A*
MESSAGE	GROUND CT F1 PRIMARY: 1 A	*Range: 1 to 65000 A in steps of 1*
MESSAGE	GROUND CT F1 SECONDARY: 1 A	*Range: 1 A, 5 A*

NOTE

Because energy parameters are accumulated, these values should be recorded and then reset immediately prior to changing CT characteristics.

Two banks of phase and ground CTs can be set, where the current banks are denoted in the following format (*X* represents the module slot position letter):

Xa, where ***X*** = {**F**} and ***a*** = {**1**, **5**}.

See the *Introduction to AC Sources* section at the beginning of this chapter for additional details.

These settings are critical for all features that have settings dependent on current measurements. When the relay is ordered, the CT module must be specified to include a standard or sensitive ground input. As the phase CTs are connected in wye (star), the calculated phasor sum of the three phase currents (IA + IB + IC = neutral current = 3Io) is used as the input for the neutral overcurrent elements. In addition, a zero-sequence (core balance) CT which senses current in all of the circuit primary conductors, or a CT in a neutral grounding conductor may also be used. For this configuration, the ground CT primary rating must be entered. To detect low level ground fault currents, the sensitive ground input may be used. In this case, the sensitive ground CT primary rating must be entered. Refer to chapter 3 for more details on CT connections.

Enter the rated CT primary current values. For both 1000:5 and 1000:1 CTs, the entry would be 1000. For correct operation, the CT secondary rating must match the setting (which must also correspond to the specific CT connections used).

The following example illustrates how multiple CT inputs (current banks) are summed as one source current. Given the following current banks:

- F1: CT bank with 500:1 ratio.
- F5: CT bank with 1000:1 ratio.

The following rule applies:

$$\text{SRC 1} = \text{F1} + \text{F5} \qquad \textbf{(EQ 5.7)}$$

1 pu is the highest primary current. In this case, 1000 is entered and the secondary current from the 500:1 and 800:1 ratio CTs will be adjusted to that created by a 1000:1 CT before summation. If a protection element is set up to act on SRC 1 currents, then a pickup level of 1 pu will operate on 1000 A primary.

The same rule applies for current sums from CTs with different secondary taps (5 A and 1 A).

b) VOLTAGE BANKS

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨ AC INPUTS ⇨⇩ VOLTAGE BANK F5

■ VOLTAGE BANK F5 ■		PHASE VT F5 CONNECTION: Wye	Range: Wye, Delta
MESSAGE		PHASE VT F5 SECONDARY: 66.4 V	Range: 25.0 to 240.0 V in steps of 0.1
MESSAGE		PHASE VT F5 RATIO: 1.00 :1	Range: 1.00 to 24000.00 in steps of 0.01
MESSAGE		AUXILIARY VT F5 CONNECTION: Vag	Range: Vn, Vag, Vbg, Vcg, Vab, Vbc, Vca
MESSAGE		AUXILIARY VT F5 SECONDARY: 66.4 V	Range: 25.0 to 240.0 V in steps of 0.1
MESSAGE		AUXILIARY VT F5 RATIO: 1.00 :1	Range: 1.00 to 24000.00 in steps of 0.01

NOTICE Because energy parameters are accumulated, these values should be recorded and then reset immediately prior to changing VT characteristics.

One bank of phase/auxiliary VTs can be set, where voltage banks are denoted in the following format (*X* represents the module slot position letter):

Xa, where ***X*** = {**F**} and ***a*** = {**5**}.

See the *Introduction to AC Sources* section at the beginning of this chapter for additional details.

With VTs installed, the relay can perform voltage measurements as well as power calculations. Enter the **PHASE VT F5 CONNECTION** made to the system as “Wye” or “Delta”. An open-delta source VT connection would be entered as “Delta”.

NOTE

The nominal **PHASE VT F5 SECONDARY** voltage setting is the voltage across the relay input terminals when nominal voltage is applied to the VT primary.

For example, on a system with a 13.8 kV nominal primary voltage and with a 14400:120 volt VT in a delta connection, the secondary voltage would be 115; that is, (13800 / 14400) × 120. For a wye connection, the voltage value entered must be the phase to neutral voltage which would be 115 / $\sqrt{3}$ = 66.4.

On a 14.4 kV system with a delta connection and a VT primary to secondary turns ratio of 14400:120, the voltage value entered would be 120; that is, 14400 / 120.

NOTE

If the **PHASE VT F5 CONNECTION** is set to “Delta”, the relay will not calculate voltage harmonics.

5.4.2 POWER SYSTEM

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ POWER SYSTEM

■ POWER SYSTEM ■		NOMINAL FREQUENCY: 60 Hz	Range: 25 to 60 Hz in steps of 1
MESSAGE		PHASE ROTATION: ABC	Range: ABC, ACB
MESSAGE		FREQUENCY AND PHASE REFERENCE: SRC 1	Range: SRC 1, SRC 2
MESSAGE		FREQUENCY TRACKING: Enabled	Range: Disabled, Enabled

The power system **NOMINAL FREQUENCY** value is used as a default to set the digital sampling rate if the system frequency cannot be measured from available signals. This may happen if the signals are not present or are heavily distorted. Before reverting to the nominal frequency, the frequency tracking algorithm holds the last valid frequency measurement for a safe period of time while waiting for the signals to reappear or for the distortions to decay.

The phase sequence of the power system is required to properly calculate sequence components and power parameters. The **PHASE ROTATION** setting matches the power system phase sequence. Note that this setting informs the relay of the actual system phase sequence, either ABC or ACB. CT and VT inputs on the relay, labeled as A, B, and C, must be connected to system phases A, B, and C for correct operation.

The **FREQUENCY AND PHASE REFERENCE** setting determines which signal source is used (and hence which AC signal) for phase angle reference. The AC signal used is prioritized based on the AC inputs that are configured for the signal source: phase voltages takes precedence, followed by auxiliary voltage, then phase currents, and finally ground current.

For three phase selection, phase A is used for angle referencing ($V_{\text{ANGLE REF}} = V_A$), while Clarke transformation of the phase signals is used for frequency metering and tracking ($V_{\text{FREQUENCY}} = (2V_A - V_B - V_C)/3$) for better performance during fault, open pole, and VT and CT fail conditions.

The phase reference and frequency tracking AC signals are selected based upon the Source configuration, regardless of whether or not a particular signal is actually applied to the relay.

Phase angle of the reference signal always displays zero degrees and all other phase angles are relative to this signal. If the pre-selected reference signal is not measurable at a given time, the phase angles are not referenced.

The phase angle referencing is done via a phase locked loop, which can synchronize independent UR-series relays if they have the same AC signal reference. This results in very precise correlation of phase angle indications between different UR-series relays.

NOTE

FREQUENCY TRACKING is set to **"**Disabled**"** only in unusual circumstances; consult the factory for special variable-frequency applications.

NOTE

The frequency tracking feature functions only when the F60 is in the "Programmed" mode. If the F60 is "Not Programmed", then metering values are available but can exhibit significant errors.

5.4.3 SIGNAL SOURCES

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ SIGNAL SOURCES ⇨ SOURCE 1(2)

■ SOURCE 1 ■		SOURCE 1 NAME: SRC 1	Range: up to six alphanumeric characters
MESSAGE		SOURCE 1 PHASE CT: None	Range: None, F1, F5, F1+F5,... up to a combination of any 6 CTs. Only Phase CT inputs are displayed.
MESSAGE		SOURCE 1 GROUND CT: None	Range: None, F1, F5, F1+F5,... up to a combination of any 6 CTs. Only Ground CT inputs are displayed.
MESSAGE		SOURCE 1 PHASE VT: None	Range: None, F5 Only phase voltage inputs will be displayed.
MESSAGE		SOURCE 1 AUX VT: None	Range: None, F5 Only auxiliary voltage inputs will be displayed.

Identical menus are available for each source. The "SRC 1" text can be replaced by with a user-defined name appropriate for the associated source.

The first letter in the source identifier represents the module slot position. The number directly following this letter represents either the first bank of four channels (1, 2, 3, 4) called "1" or the second bank of four channels (5, 6, 7, 8) called "5" in a particular CT/VT module. See the *Introduction to AC Sources* section at the beginning of this chapter for details on this concept.

It is possible to select the sum of all CT combinations. The first channel displayed is the CT to which all others will be referred. For example, the selection "F1+F5" indicates the sum of each phase from channels "F1" and "F5", scaled to whichever CT has the higher ratio. Selecting "None" hides the associated actual values.

The approach used to configure the AC sources consists of several steps; first step is to specify the information about each CT and VT input. For CT inputs, this is the nominal primary and secondary current. For VTs, this is the connection type, ratio and nominal secondary voltage. Once the inputs have been specified, the configuration for each source is entered, including specifying which CTs are summed together.

NOTE: When the F60 is equipped with a type 8Z CT/VT module for high impedance fault detection, the CT bank of this module should not be assigned to a source which will be used by any conventional protection element. The type 8Z module CT bank is used solely by the high impedance fault detection algorithm.

User selection of AC parameters for comparator elements:

CT/VT modules automatically calculate all current and voltage parameters from the available inputs. Users must select the specific input parameters to be measured by every element in the relevant settings menu. The internal design of the element specifies which type of parameter to use and provides a setting for source selection. In elements where the parameter may be either fundamental or RMS magnitude, such as phase time overcurrent, two settings are provided. One setting specifies the source, the second setting selects between fundamental phasor and RMS.

AC input actual values:

The calculated parameters associated with the configured voltage and current inputs are displayed in the current and voltage sections of actual values. Only the phasor quantities associated with the actual AC physical input channels will be displayed here. All parameters contained within a configured source are displayed in the sources section of the actual values.

DISTURBANCE DETECTORS (INTERNAL):

The disturbance detector (ANSI 50DD) element is a sensitive current disturbance detector that detects any disturbance on the protected system. The 50DD function is used directly in some elements in the relay, for example VT Fuse Failure detector or Fault Report. It can also be used to supervise current-based elements to prevent maloperation as a result of the wrong settings or external CT wiring problem. A disturbance detector is provided for each source.

The 50DD function responds to the changes in magnitude of the sequence currents. The disturbance detector scheme logic is as follows:

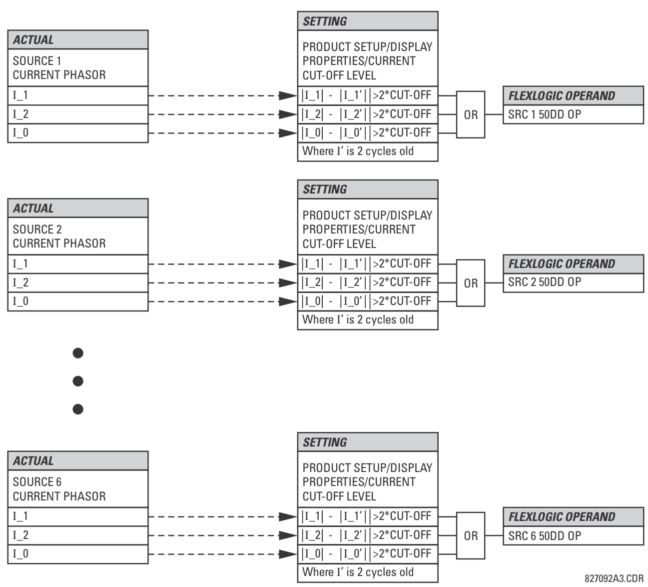

Figure 5–26: DISTURBANCE DETECTOR LOGIC DIAGRAM

The disturbance detector responds to the change in currents of twice the current cut-off level. The default cut-off threshold is 0.02 pu; thus by default the disturbance detector responds to a change of 0.04 pu. The metering sensitivity setting (**PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨⇩ CURRENT CUT-OFF LEVEL**) controls the sensitivity of the disturbance detector accordingly.

EXAMPLE USE OF SOURCES:

An example of the use of sources is shown in the diagram below. A relay could have the following hardware configuration:

This configuration could be used on a two-winding transformer, with one winding connected into a breaker-and-a-half system. The following figure shows the arrangement of sources used to provide the functions required in this application, and the CT/VT inputs that are used to provide the data.

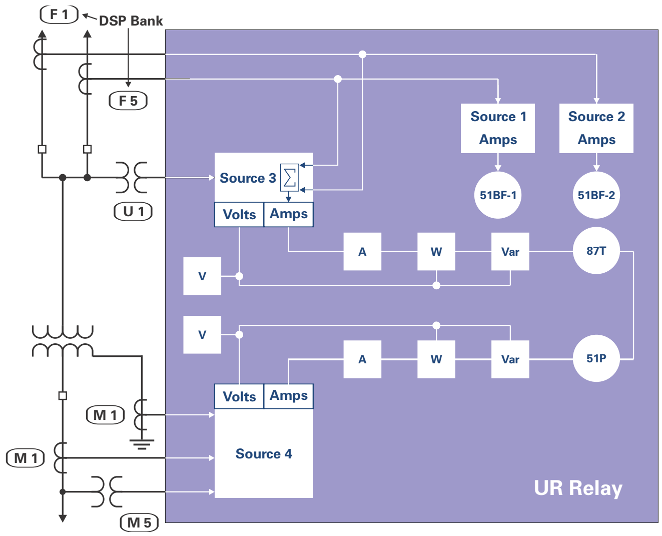

Figure 5–27: EXAMPLE USE OF SOURCES

	Y LV	D HV	AUX

5

A description of the operation of the breaker control and status monitoring features is provided in chapter 4. Only information concerning programming of the associated settings is covered here. These features are provided for two or more breakers; a user may use only those portions of the design relevant to a single breaker, which must be breaker 1.

The number of breaker control elements is dependent on the number of CT/VT modules specified with the F60. The following settings are available for each breaker control element.

- **BREAKER 1 FUNCTION:** This setting enables and disables the operation of the breaker control feature.
- **BREAKER1 PUSH BUTTON CONTROL:** Set to “Enable” to allow faceplate push button operations.
- **BREAKER 1 NAME:** Assign a user-defined name (up to six characters) to the breaker. This name will be used in flash messages related to breaker 1.
- **BREAKER 1 MODE:** This setting selects “3-Pole” mode, where all breaker poles are operated simultaneously, or “1-Pole” mode where all breaker poles are operated either independently or simultaneously.
- **BREAKER 1 OPEN:** This setting selects an operand that creates a programmable signal to operate an output relay to open breaker 1.
- **BREAKER 1 BLK OPEN**: This setting selects an operand that prevents opening of the breaker. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.
- **BREAKER 1 CLOSE:** This setting selects an operand that creates a programmable signal to operate an output relay to close breaker 1.
- **BREAKER 1 BLK CLOSE**: This setting selects an operand that prevents closing of the breaker. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.
- **BREAKER 1 ΦA/3P CLOSED:** This setting selects an operand, usually a contact input connected to a breaker auxiliary position tracking mechanism. This input should be a normally-open 52/a status input to create a logic 1 when the breaker is closed. If the **BREAKER 1 MODE** setting is selected as “3-Pole”, this setting selects a single input as the operand used to track the breaker open or closed position. If the mode is selected as “1-Pole”, the input mentioned above is used to track phase A and the **BREAKER 1 ΦB** and **BREAKER 1 ΦC** settings select operands to track phases B and C, respectively.
- **BREAKER 1 ΦA/3P OPND:** This setting selects an operand, usually a contact input, that should be a normally-closed 52/b status input to create a logic 1 when the breaker is open. If a separate 52/b contact input is not available, then the inverted BREAKER 1 CLOSED status signal can be used.
- **BREAKER 1 ΦB CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase B closed position as above for phase A.
- **BREAKER 1 ΦB OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase B opened position as above for phase A.
- **BREAKER 1 ΦC CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase C closed position as above for phase A.
- **BREAKER 1 ΦC OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase C opened position as above for phase A.
- **BREAKER 1 Toperate**: This setting specifies the required interval to overcome transient disagreement between the 52/a and 52/b auxiliary contacts during breaker operation. If transient disagreement still exists after this time has expired, the BREAKER 1 BAD STATUS FlexLogic operand is asserted from alarm or blocking purposes.
- **BREAKER 1 EXT ALARM:** This setting selects an operand, usually an external contact input, connected to a breaker alarm reporting contact.
- **BREAKER 1 ALARM DELAY:** This setting specifies the delay interval during which a disagreement of status among the three-pole position tracking operands will not declare a pole disagreement. This allows for non-simultaneous operation of the poles.
- **MANUAL CLOSE RECAL1 TIME:** This setting specifies the interval required to maintain setting changes in effect after an operator has initiated a manual close command to operate a circuit breaker.
- **BREAKER 1 OUT OF SV:** Selects an operand indicating that breaker 1 is out-of-service.

5

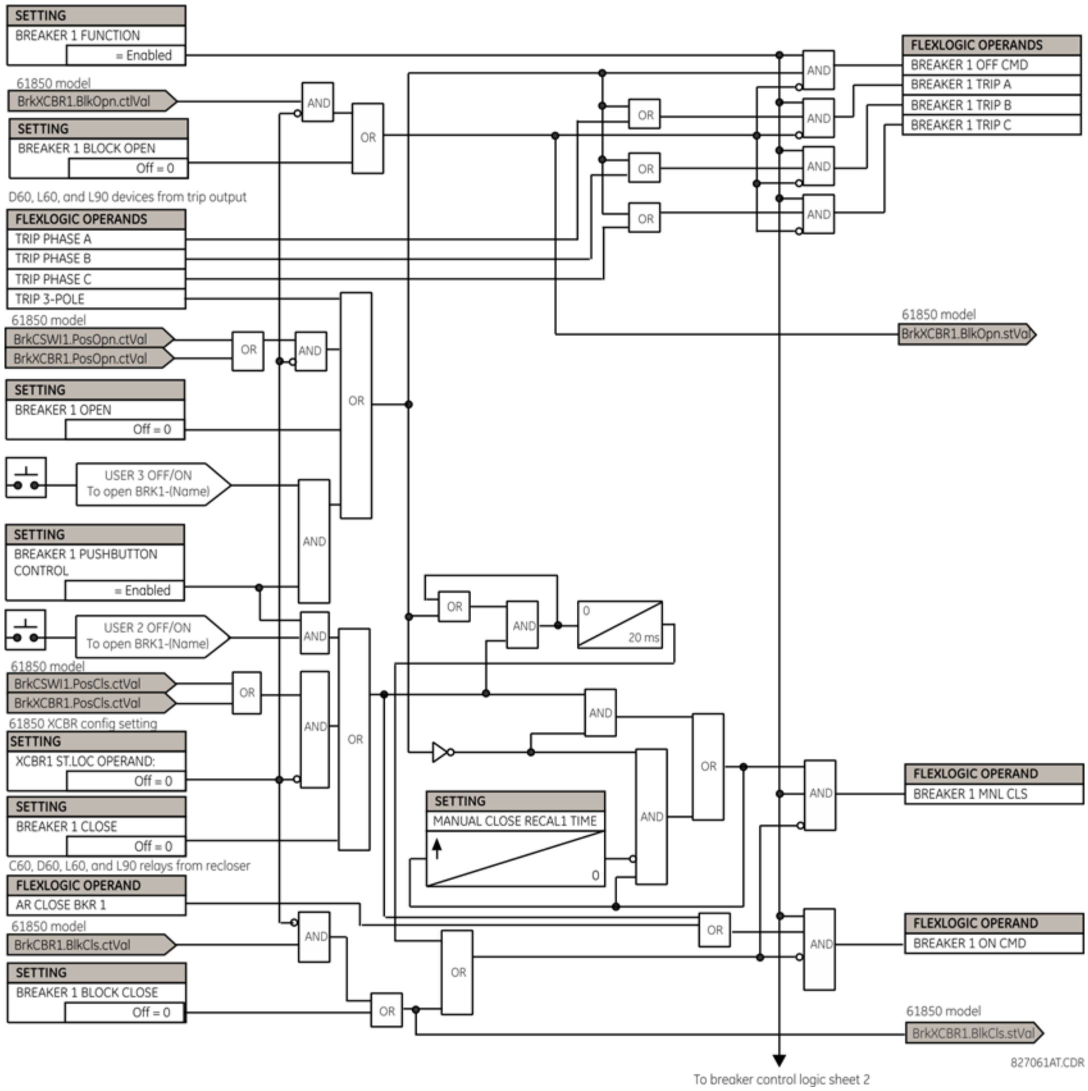

Figure 5–28: DUAL BREAKER CONTROL SCHEME LOGIC (Sheet 1 of 2)

NOTE

IEC 61850 functionality is permitted when the F60 is in “Programmed” mode and not in the local control mode.

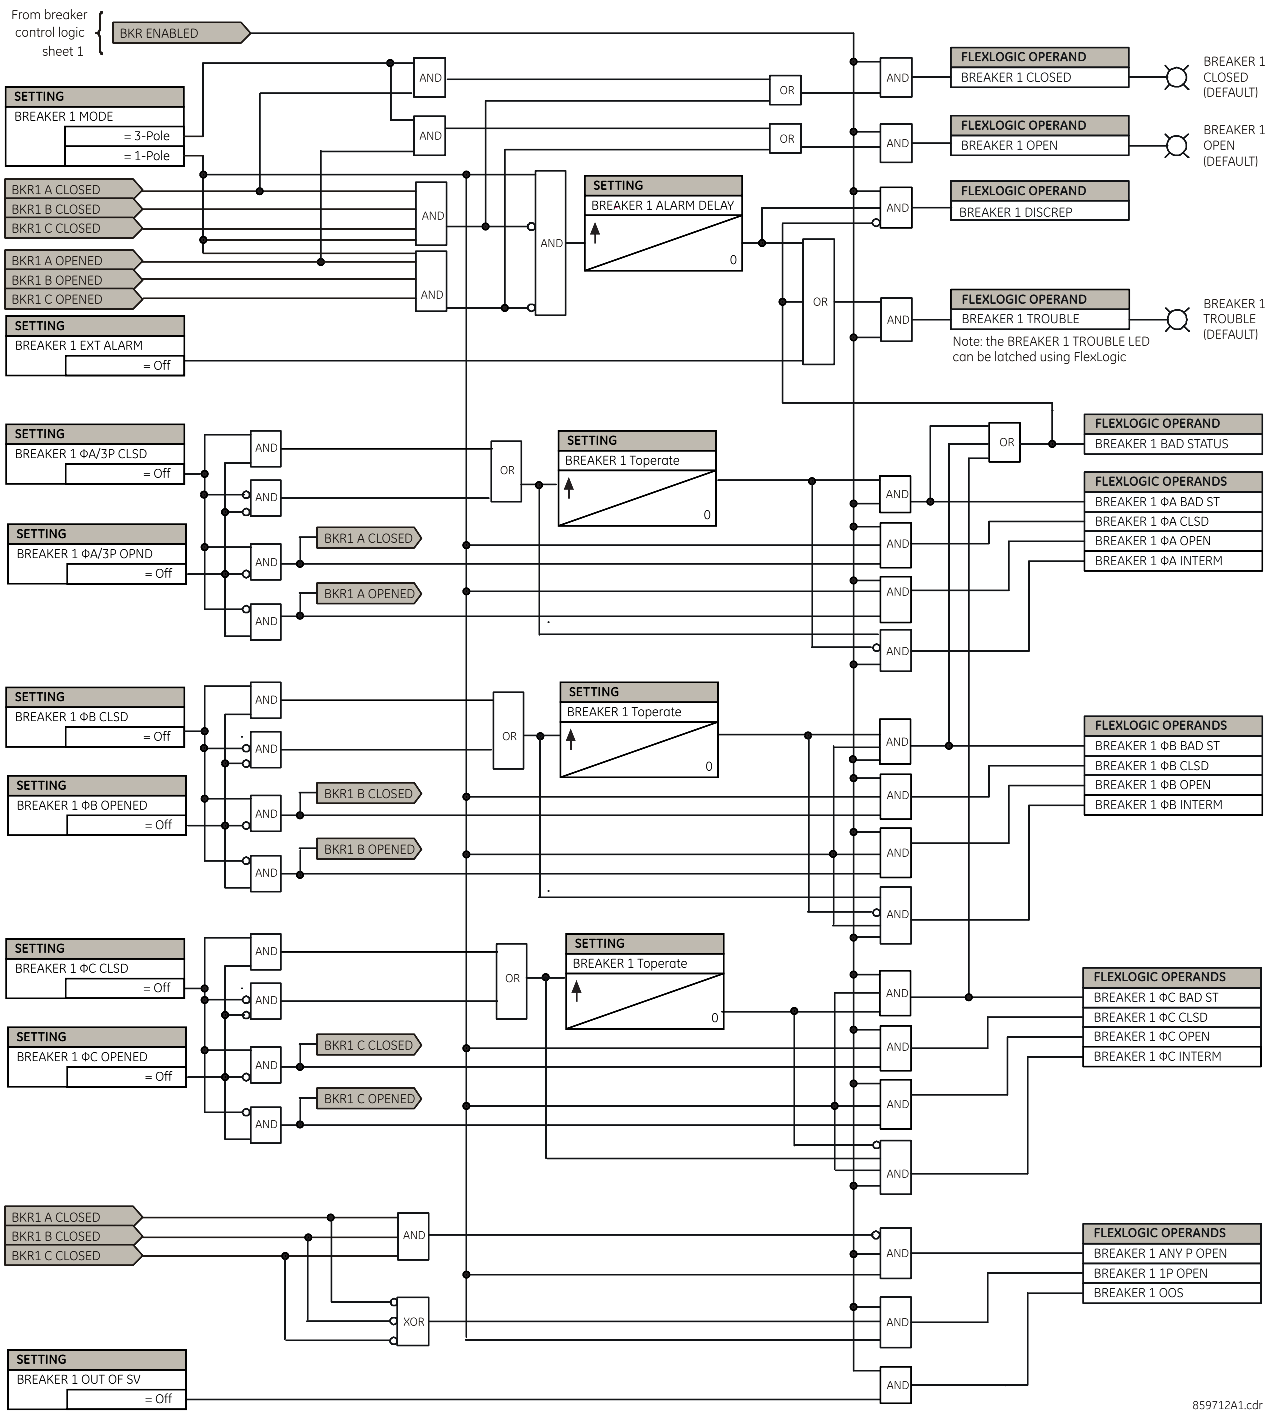

Figure 5–29: DUAL BREAKER CONTROL SCHEME LOGIC (Sheet 2 of 2)

The breaker element has direct hard-coded connections to IEC 61850 model as shown in the logic diagram. This allows remote open/close operation of each breaker, using either CSWI or XCBR IEC 61850 logical nodes. IEC 61850 select-before-operate functionality, local/remote switch functionality along with a blocking of open/close commands are provided. Note that IEC 61850 commands are event-driven and dwell time for these is one protection pass only. If you want to maintain the close/open command for a certain time, do so either on the contact outputs using the "Seal-in" setting or in FlexLogic.

5.4.5 DISCONNECT SWITCHES

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ SWITCHES ⇨ SWITCH 1(8)

■ SWITCH 1 ■	SWITCH 1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE	SWITCH 1 NAME: SW 1	Range: up to 6 alphanumeric characters
MESSAGE	SWITCH 1 MODE: 3-Pole	Range: 3-Pole, 1-Pole
MESSAGE	SWITCH 1 OPEN: Off	Range: FlexLogic operand
MESSAGE	SWITCH 1 BLK OPEN: Off	Range: FlexLogic operand
MESSAGE	SWITCH 1 CLOSE: Off	Range: FlexLogic operand
MESSAGE	SWITCH 1 BLK CLOSE: Off	Range: FlexLogic operand

MESSAGE	SWITCH 1 ΦC CLOSED: Off	Range: FlexLogic operand
MESSAGE	SWITCH 1 ΦC OPENED: Off	Range: FlexLogic operand
MESSAGE	SWITCH 1 Toperate: 0.070 s	Range: 0.000 to 65.535 s in steps of 0.001
MESSAGE	SWITCH 1 ALARM DELAY: 0.000 s	Range: 0.000 to 65.535 s in steps of 0.001
MESSAGE	SWITCH 1 EVENTS: Disabled	Range: Disabled, Enabled

The disconnect switch element contains the auxiliary logic for status and serves as the interface for opening and closing of disconnect switches from SCADA or through the front panel interface. The disconnect switch element can be used to create an interlocking functionality. For greater security in determination of the switch pole position, both the 89/a and 89/b auxiliary contacts are used with reporting of the discrepancy between them. The number of available disconnect switches depends on the number of the CT/VT modules ordered with the F60.

- **SWITCH 1 FUNCTION:** This setting enables and disables the operation of the disconnect switch element.
- **SWITCH 1 NAME:** Assign a user-defined name (up to six characters) to the disconnect switch. This name will be used in flash messages related to disconnect switch 1.
- **SWITCH 1 MODE:** This setting selects "3-Pole" mode, where disconnect switch poles have a single common auxiliary switch, or "1-Pole" mode where each disconnect switch pole has its own auxiliary switch.

- **SWITCH 1 OPEN:** This setting selects an operand that creates a programmable signal to operate a contact output to open disconnect switch 1.
- **SWITCH 1 BLK OPEN**: This setting selects an operand that prevents opening of the disconnect switch. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.
- **SWITCH 1 CLOSE:** This setting selects an operand that creates a programmable signal to operate a contact output to close disconnect switch 1.
- **SWITCH 1 BLK CLOSE**: This setting selects an operand that prevents closing of the disconnect switch. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.
- **SWTCH 1 ΦA/3P CLSD:** This setting selects an operand, usually a contact input connected to a disconnect switch auxiliary position tracking mechanism. This input should be a normally-open 89/a status input to create a logic 1 when the disconnect switch is closed. If the **SWITCH 1 MODE** setting is selected as “3-Pole”, this setting selects a single input as the operand used to track the disconnect switch open or closed position. If the mode is selected as “1-Pole”, the input mentioned above is used to track phase A and the **SWITCH 1 ΦB** and **SWITCH 1 ΦC** settings select operands to track phases B and C, respectively.
- **SWTCH 1 ΦA/3P OPND:** This setting selects an operand, usually a contact input, that should be a normally-closed 89/b status input to create a logic 1 when the disconnect switch is open. If a separate 89/b contact input is not available, then an inverted 89/a status signal can be used.
- **SWITCH 1 ΦB CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase B closed position as above for phase A.
- **SWITCH 1 ΦB OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase B opened position as above for phase A.
- **SWITCH 1 ΦC CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase C closed position as above for phase A.
- **SWITCH 1 ΦC OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase C opened position as above for phase A.
- **SWITCH 1 Toperate**: This setting specifies the required interval to overcome transient disagreement between the 89/a and 89/b auxiliary contacts during disconnect switch operation. If transient disagreement still exists after this time has expired, the SWITCH 1 BAD STATUS FlexLogic operand is asserted from alarm or blocking purposes.
- **SWITCH 1 ALARM DELAY:** This setting specifies the delay interval during which a disagreement of status among the three-pole position tracking operands will not declare a pole disagreement. This allows for non-simultaneous operation of the poles.

NOTE

IEC 61850 functionality is permitted when the F60 is in “Programmed” mode and not in the local control mode.

5

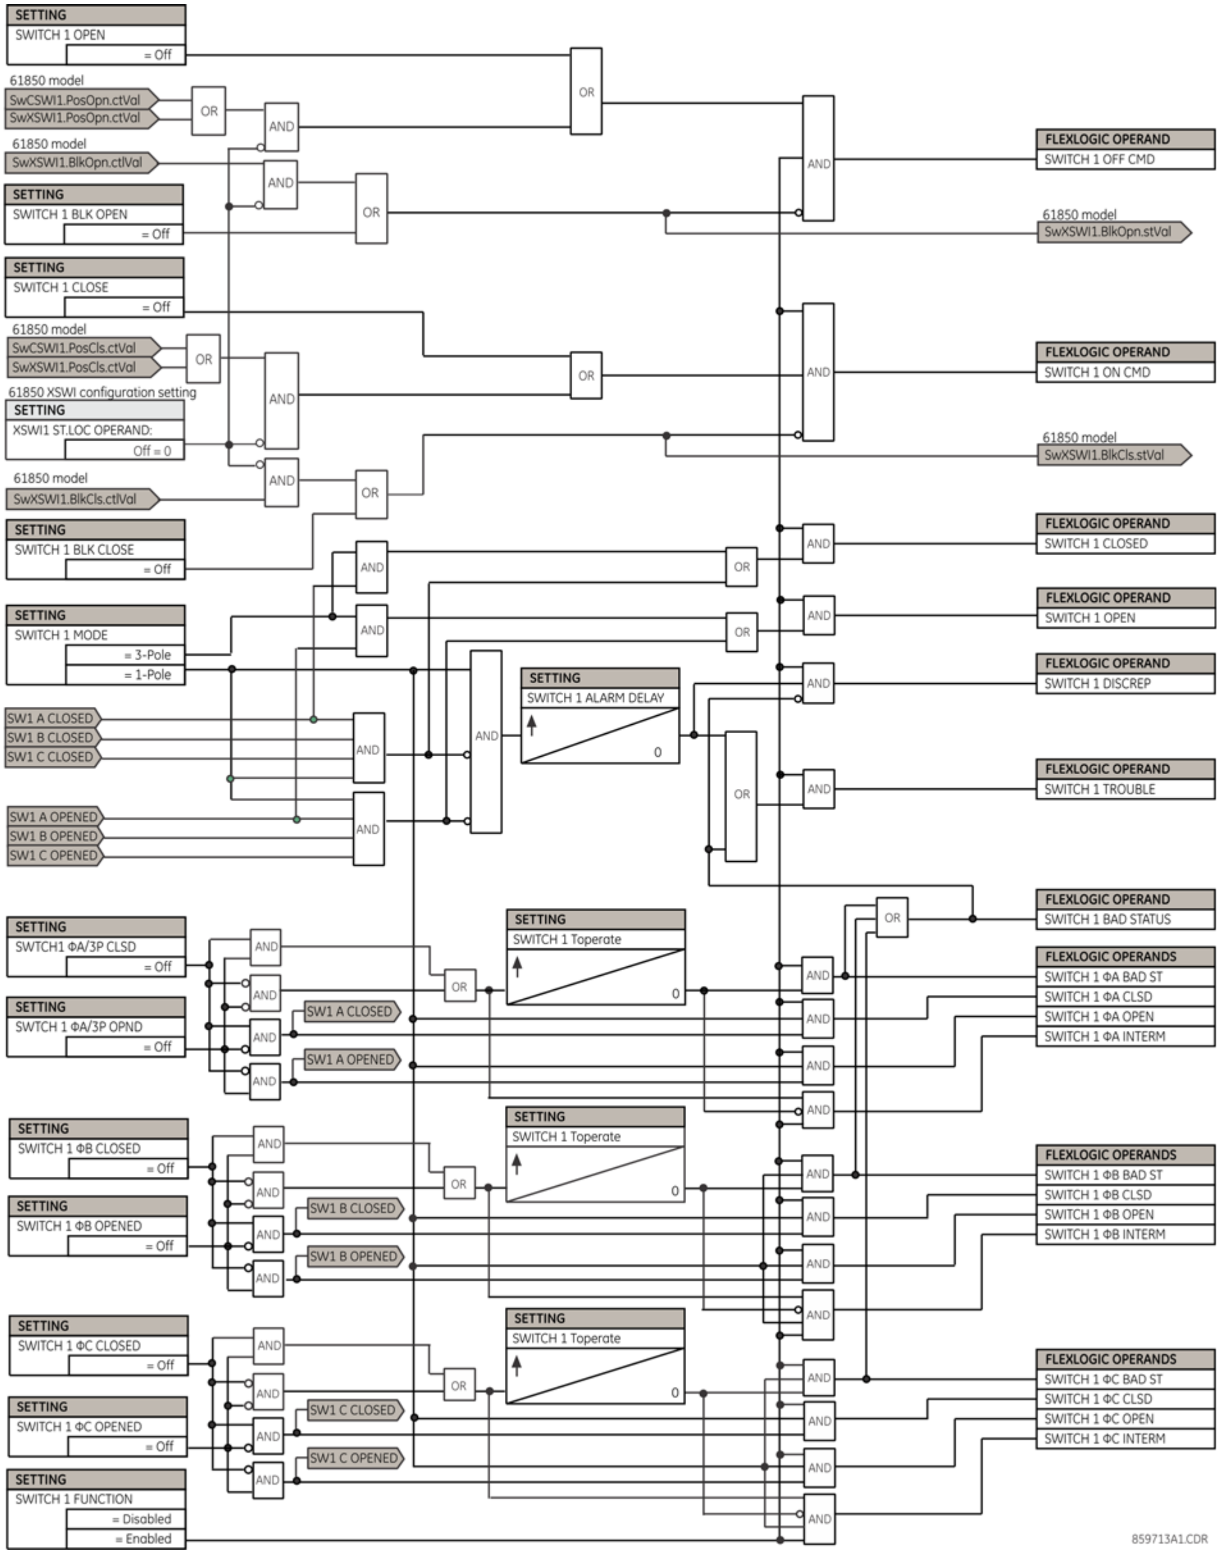

Figure 5–30: DISCONNECT SWITCH SCHEME LOGIC

5

The switch element has direct hard-coded connections to IEC 61850 model as shown in the logic diagram. This allows remote open/close operation of each switch, using either CSWI or XSWI IEC 61850 logical nodes. IEC 61850 select-before-operate functionality, local/remote switch functionality along with a blocking open/close commands are provided. Note that IEC 61850 commands are event-driven and dwell time for these is one protection pass only. If you want to maintain close/open command for a certain time, do so either on the contact outputs using the "Seal-in" setting or in FlexLogic.

5.4.6 FLEXCURVES

a) SETTINGS

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ FLEXCURVES ⇨ FLEXCURVE A(D)

```
■ FLEXCURVE A
■
```

```
FLEXCURVE A TIME AT
0.00 xPKP:       0 ms
```

Range: 0 to 65535 ms in steps of 1

FlexCurves A through D have settings for entering times to reset and operate at the following pickup levels: 0.00 to 0.98 and 1.03 to 20.00. This data is converted into two continuous curves by linear interpolation between data points. To enter a custom FlexCurve, enter the reset and operate times (using the VALUE keys) for each selected pickup point (using the MESSAGE UP/DOWN keys) for the desired protection curve (A, B, C, or D).

Table 5–11: FLEXCURVE TABLE

RESET	TIME MS	RESET	TIME MS	OPERATE	TIME MS	OPERATE	TIME MS	OPERATE	TIME MS	OPERATE	TIME MS
0.00		0.68		1.03		2.9		4.9		10.5	
0.05		0.70		1.05		3.0		5.0		11.0	
0.10		0.72		1.1		3.1		5.1		11.5	
0.15		0.74		1.2		3.2		5.2		12.0	
0.20		0.76		1.3		3.3		5.3		12.5	
0.25		0.78		1.4		3.4		5.4		13.0	
0.30		0.80		1.5		3.5		5.5		13.5	
0.35		0.82		1.6		3.6		5.6		14.0	
0.40		0.84		1.7		3.7		5.7		14.5	
0.45		0.86		1.8		3.8		5.8		15.0	
0.48		0.88		1.9		3.9		5.9		15.5	
0.50		0.90		2.0		4.0		6.0		16.0	
0.52		0.91		2.1		4.1		6.5		16.5	
0.54		0.92		2.2		4.2		7.0		17.0	
0.56		0.93		2.3		4.3		7.5		17.5	
0.58		0.94		2.4		4.4		8.0		18.0	
0.60		0.95		2.5		4.5		8.5		18.5	
0.62		0.96		2.6		4.6		9.0		19.0	
0.64		0.97		2.7		4.7		9.5		19.5	
0.66		0.98		2.8		4.8		10.0		20.0	

NOTE: The relay using a given FlexCurve applies linear approximation for times between the user-entered points. Special care must be applied when setting the two points that are close to the multiple of pickup of 1; that is, 0.98 pu and 1.03 pu. It is recommended to set the two times to a similar value; otherwise, the linear approximation may result in undesired behavior for the operating quantity that is close to 1.00 pu.

b) FLEXCURVE CONFIGURATION WITH ENERVISTA UR SETUP

The EnerVista UR Setup software allows for easy configuration and management of FlexCurves and their associated data points. Prospective FlexCurves can be configured from a selection of standard curves to provide the best approximate fit, then specific data points can be edited afterwards. Alternately, curve data can be imported from a specified file (.csv format) by selecting the **Import Data From** EnerVista UR Setup setting.

Curves and data can be exported, viewed, and cleared by clicking the appropriate buttons. FlexCurves are customized by editing the operating time (ms) values at pre-defined per-unit current multiples. Note that the pickup multiples start at zero (implying the "reset time"), operating time below pickup, and operating time above pickup.

c) RECLOSER CURVE EDITING

Recloser curve selection is special in that recloser curves can be shaped into a composite curve with a minimum response time and a fixed time above a specified pickup multiples. There are 41 recloser curve types supported. These definite operating times are useful to coordinate operating times, typically at higher currents and where upstream and downstream protective devices have different operating characteristics. The recloser curve configuration window shown below appears when the Initialize From EnerVista UR Setup setting is set to “Recloser Curve” and the **Initialize FlexCurve** button is clicked.

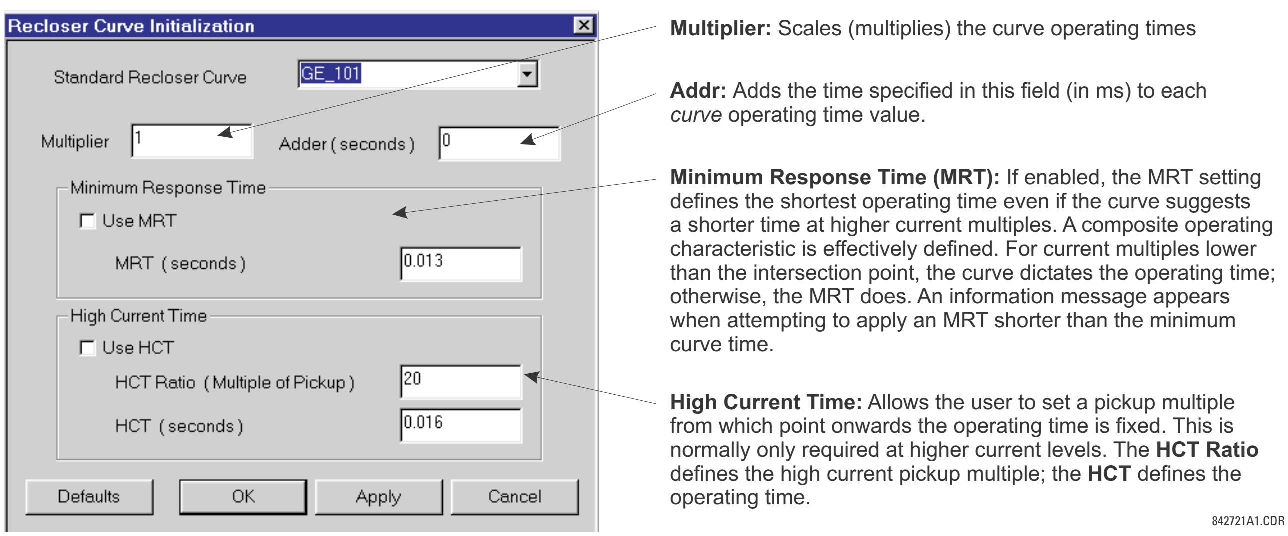

Figure 5–31: RECLOSER CURVE INITIALIZATION

NOTE: The multiplier and adder settings only affect the curve portion of the characteristic and not the MRT and HCT settings. The HCT settings override the MRT settings for multiples of pickup greater than the HCT ratio.

d) EXAMPLE

A composite curve can be created from the GE_111 standard with MRT = 200 ms and HCT initially disabled and then enabled at eight (8) times pickup with an operating time of 30 ms. At approximately four (4) times pickup, the curve operating time is equal to the MRT and from then onwards the operating time remains at 200 ms (see below).

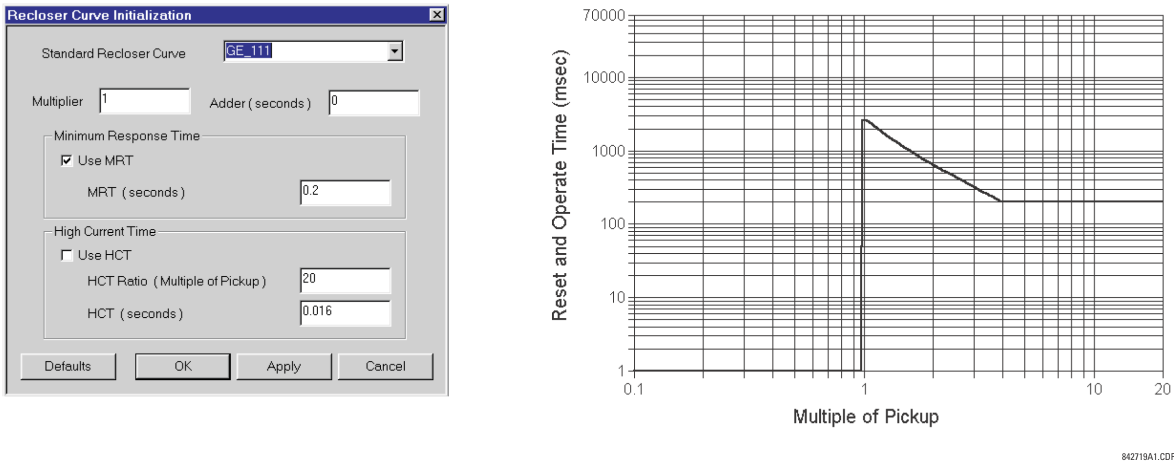

Figure 5–32: COMPOSITE RECLOSER CURVE WITH HCT DISABLED

With the HCT feature enabled, the operating time reduces to 30 ms for pickup multiples exceeding 8 times pickup.

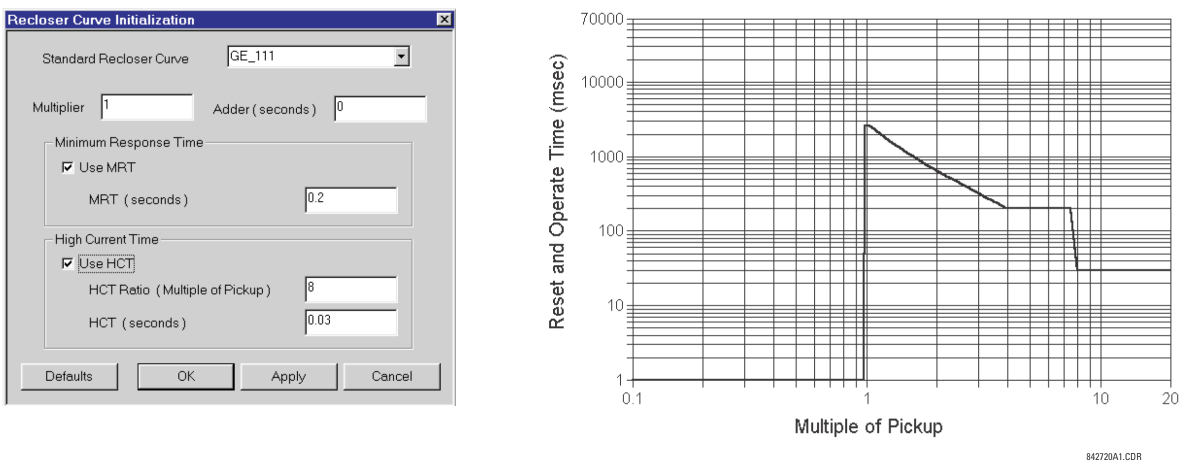

Figure 5–33: COMPOSITE RECLOSER CURVE WITH HCT ENABLED

NOTE

Configuring a composite curve with an increase in operating time at increased pickup multiples is not allowed. If this is attempted, the EnerVista UR Setup software generates an error message and discards the proposed changes.

e) STANDARD RECLOSER CURVES

The standard recloser curves available for the F60 are displayed in the following graphs.

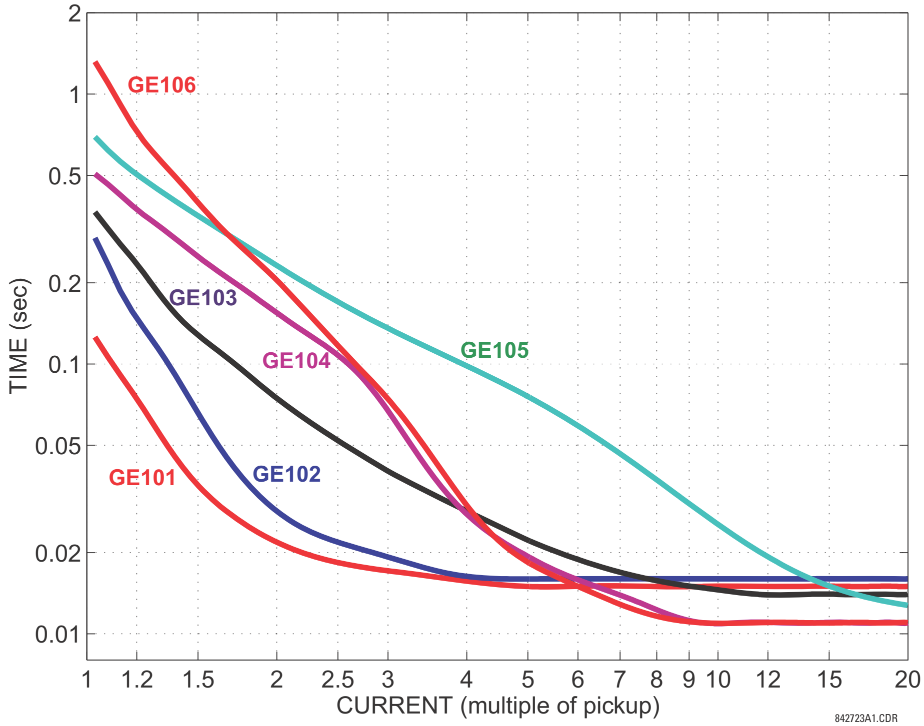

Figure 5–34: RECLOSER CURVES GE101 TO GE106

5.4.7 PHASOR MEASUREMENT UNIT

a) MAIN MENU

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ PHASOR MEASUREMENT UNIT

■ PHASOR MEASUREMENT ■ UNIT	◀▶	■ PHASOR MEASUREMENT ■ UNIT 1	See below.
MESSAGE	▲▼	■ AGGREGATOR ■ UNIT 1	See page 5-135.
MESSAGE	▲	■ IEC 90-5 MSVCB ■ CONFIGURATION	See page 5-137.

The F60 Feeder Protection System is provided with an optional phasor measurement unit feature. This feature is specified as a software option at the time of ordering. The number of phasor measurement units available can also depend on this option. Using the order code for your device, see the order codes in chapter 2 for details.

UR Synchrophasor Implementation

PHASORS are used within protection relays. If these phasors are referenced to a common time base they are referred to as a **SYNCHROPHASOR**. A vastly improved method for tracking power system dynamic phenomena for improved power system monitoring, protection, operation, and control can be realized if Synchrophasors from different locations within the power system are networked to a central location.

5

The F60 offers PMU features over two communication standards, IEC 61850-9-5 and IEEE C37.118. The figure shows complete Synchrophasor implementation.

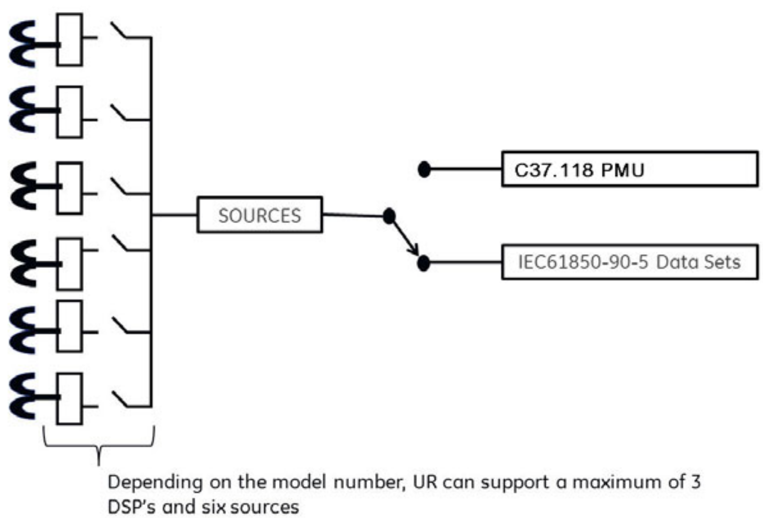

Figure 5–42: COMPLETE SYNCHROPHASOR IMPLEMENTATION

UR Implementation of IEC 61850-90-5

Synchrophasor data as measured and calculated by phasor measurement units (PMUs) is used to assess the condition of the electrical power network. The IEEE C37.118 standards define synchrophasors and related message formats to transmit synchrophasor data. Synchrophasor streaming via IEEE C37.118 has proven to work but the desire to have a communication mechanism that is compliant with the concept of IEC 61850 has led to the development of IEC 61850-90-5. The IEC 61850-90-5 standard defines the packet structure for multicast routing of streamed Sampled Value (SV) known as R-SV.

Firmware versions 7.0 and above have a 90-5 based R-SV implementation equivalent in structure and configuration to that of the existing IEEE C37.118 implementation of firmware version 6.0, that is, synchrophasor data at rates up to 60 Hz for metering and 120 Hz for protection class synchrophasors. The following two figures depict the general data flow for the generation of synchrophasor data for IEC 61850-90-5. In the first figure, when IEC 61850-90-5 is selected all real and virtual sources are available for the IEC 61850-90-5 PMUs.

The number of PMUs and aggregators vary by product, as outlined in the table.

Table 5–12: IMPLEMENTATION BY MODEL NUMBER

MODEL	NUMBER OF PMUS	NUMBER OF AGGREGATORS	NUMBER OF ANALOG INPUTS
N60	6	4	16
C60	2	2	16
D60, F60, G60, L30, L90, T60	1	1	16

The figure shows an example of an N60 using four Logical Device PMUs (Logical Device 2 through 5) and four aggregators. The control blocks for the aggregators are located in LD1. A 64 char LDName setting is provided..

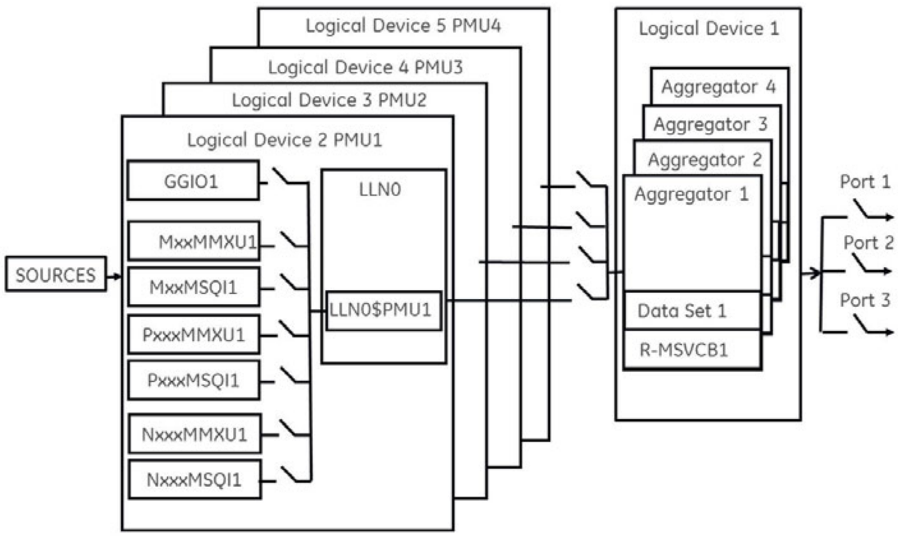

Figure 5–43: N60 EXAMPLE FOR FOUR LOGICAL DEVICE PMUS

NOTE

Precise time input to the relay from the international time standard, via either IRIG-B or PTP, is vital for correct synchrophasor measurement and reporting. For IRIG-B, a DC level shift IRIG-B receiver must be used for the phasor measurement unit to output proper synchrophasor values.

Depending on the applied filter, the Synchrophasors that are produced by PMUs are classified as either P (protection) or M (Measurement) class Synchrophasors. Synchrophasors available within the UR that have no filtering applied are classified as NONE, which within the standard is classified as PRES OR UNKNOWN under the Calculation Method - ClcMth. Each Logical Device PMU supports one MxxMMXU, MxxMSQI, PxxxMMXU , PxxxMSQI, NxxMMXU, and one NxxMSQI logical node.

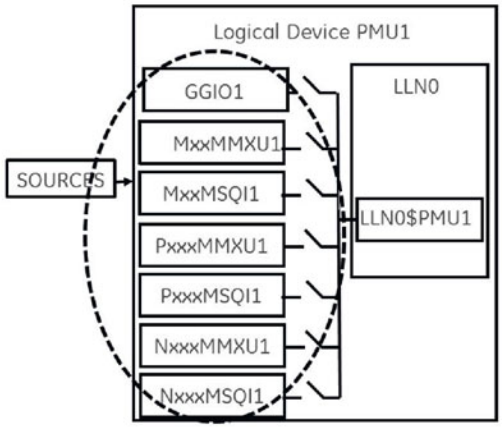

Figure 5–44: LOGICAL NODES SUPPORTED IN EACH LOGICAL DEVICE

The following is a summary of LNs that are in each Logical Device (LD2 through LD7):

- PxxxMMXU1 ClcMth = P-Class (Note Vaux is mapped to Vneut of MMXU)

- PxxxMSQI1 ClcMth = P-CLASS

- MxxMMXU1 ClcMth = M-Class (Note Vaux is mapped to Vneut of MMXU)

- MxxMSQI1 ClcMth = M-CLASS

- NxxMMXU1 ClcMth = M-Class (Note Vaux is mapped to Vneut of MMXU)

- NxxMSQI1 ClcMth = M-CLASS

- GGIO1 which contains 16 digital status indication points and 16 analog points. The Analog GGIO values are selectable from any FlexAnalog value in the UR.

NOTE

The Synchro Logical Nodes in an LD report at the same rate as set in the PMUn Basic Configuration setting. This is reflected in the instantiation of the Data Object – SmpRate in the msvcb## of LLN0 in the LD1. SmpRate is a Read Only Integer Status (INS).

When the first PMU from any LD is mapped into an aggregator, the aggregator inherits the Sample Rate (SmpRate) and IEEE C37.118 Class (P or M) of that PMU. The value of the SmpRate DO in the Report Control Block is set based on the value of the Sample Rate in the PMU. The Class of the Dataset are mapped into the MSVID of the Dataset (see text below for the overall name of the MSVID). If other PMUs are mapped into the same aggregator with different Sample Rates or from different classes, then a Self-Test error (DatSetErr) is set and dataset transmission is blocked.

A setting value – MSVID – is created with a maximum input range of 56 characters (=64 less 6 for the IDCode less 2 for the Class).

The value of MSVID in the dataset is a concatenation of the aggregator IDCode and the MSVID setting value in the format: MSVID-AggregatorIDCode-CLASS where CLASS is P, M, or N (for None) – depending on the Class of the first PMU included in the Aggregator.

NOTE

Synchrophasor Rectangular Format and Integer data types are NOT supported in IEC 61850-90-5 (only supported with IEEE C37.118) and not to set — GGIO1 which contains 16 digital status indication points — aggregated as a 16 bit bitstring and 16 analog points. The Analog GGIO values are selectable from any FlexAnalog value in the UR. For version 7.0 and later the description fields for the phasors, analog and digital channels are populated with the 16 character name field provided within the Basic Configuration menu. Additionally, the names of the 16 binary points are implemented as numbered descriptions — d1, d2, d3, and so on. The number of descriptions are equal to the number of bits configured in the 16 bit digital status word.

NOTE

All bitstrings less than or equal to 32 bits in length map into a 32 bit bitstring in an IEC 61850-90-5 dataset.

The Value of the Nominal Frequency of the chassis is instantiated as a DO in LPHD of LD1. The value is named HzNom and is an Integer Status (INS).

The UR also supports the option to apply no filtering to the synchrophasors. If no filtering is applied (PMU Class = None), according to the standard, the ClcMth attribute is PRES. The semantic of the ClcMth used is not carried in the individual DO and so it is recommended that one of letters of the prefix on the instantiated LNs be set to "P" or "M" accordingly in order to differentiate. For version 7.0 and later, only FCDA data is supported. The *Implementation by Model Number* table earlier describes the maximum size of each PMU data set for version 7.2 and later using FCDA data (non-structured data).

EXAMPLE: PROTECTION SYNCHROPHASORS DATA SET WITH REPORTING RATE 60 FRAMES/SECOND

This example gives the protection synchrophasors data set with a reporting rate of 60 frames per second (P60MMXU1). See the figure earlier, Logical Nodes Supported in Each Logical Device. This data or list of items, as shown in the following figure, is not available to the UR setup program but is available to be mapped by the user into a selected aggregator or aggregators dataset. The logical device name (LDName) of each PMU LD is a 64 character user setting. The IEEE C37.118 STN and IDCode is to be mapped as a concatenated value in the (d)escription field of LPL CDC of the NamPlt DO in LLN0. The mapping is implemented as STN-IDCode (text string).

From each PMU, the user selects the phasor information of interest that is mapped into the selected aggregator datset(s). For version 7.0 and later only FCDA data is supported.

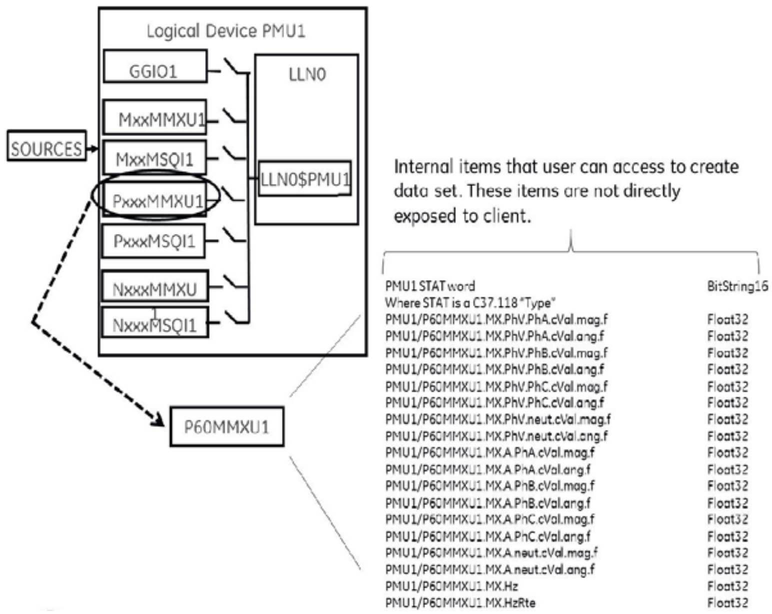

Figure 5–45: DATA SET CREATED FROM USER SELECTED INTERNAL ITEMS

5

EXAMPLE: THE CREATION OF DIFFERENT DATA SETS

The aggregators allow the aggregation of phasors from multiple PMUs (with the same reporting rate) into a single custom data set to optimize bandwidth when streaming.

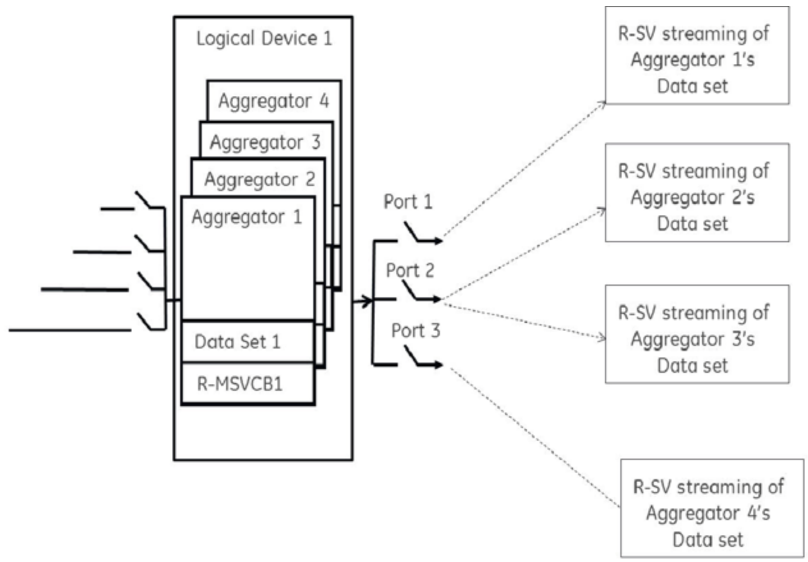

Figure 5–46: EXAMPLE OF AGGREGATOR DATA SETS

5

CONFIGURATION EXAMPLE: CFG-2 BASED CONFIGURATION (USING IEC 61850-90-5)

The F60 is expected to send the CFG-2 file (IEEE C37.118 config. file) upon request from the upstream synchrophasor devices (for example, P30) without stopping R-SV multicasting, as shown in the figure below. The primary domain controller (PDC) does not need to use a stop/start data stream command if the UR protocol is set to IEC 61850-90-5 prior to requesting the configuration via CFG-2 (IEEE C37.118 config. file). The CFG-2 request from the P30 can be on TCP/IP or UDP/IP, however, R-SV data streaming is only UDP multicasts (not TCP).

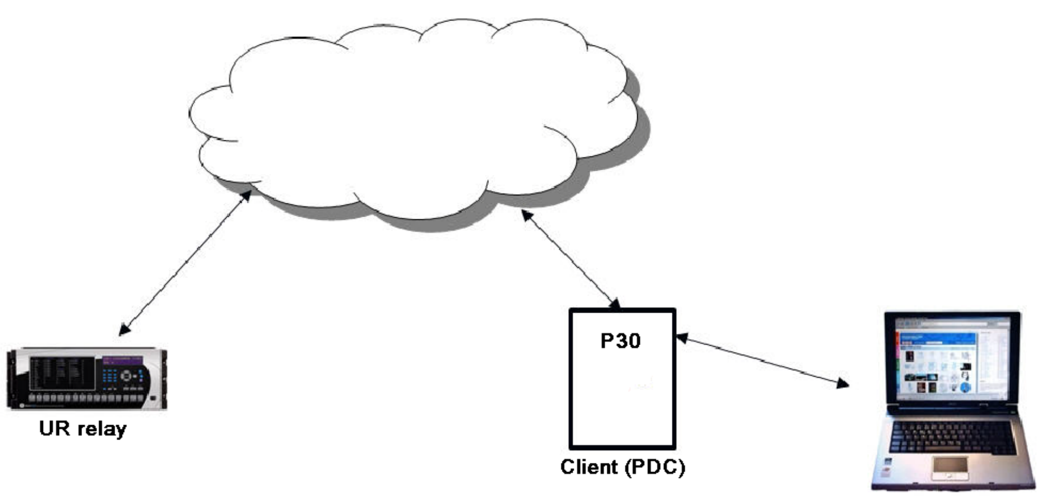

Figure 5–47: CFG-2 BASED CONFIGURATION SOLUTION

MODIFICATION OF SYNC WORD IN CFG-2 FOR TR 90-5 DATA SETS

In the CFG-2 file, all relevant information about the data being streamed is included. However, this file does not include the fact that it describes a 90-5 dataset or the number of Application Service Data Units (datasets). In order to communicate this information via the CFG-2 file for a given aggregator, when the aggregator is set to 90-5, the version number of the CFG-2 file (found in bits 0-3 of the frame SYNC word, which should presently be set to 2) is set as follows:

VALUE (DECIMAL)	# OF ASDUS
11	1
12	2
13	3
14	4

The PMU settings are organized in logical groups as follows.

MESSAGE	▲▼	■ 37.118 PMU 1 ■ CONFIGURATION	See below
MESSAGE	▲▼	■ 90-5 PMU 1 ■ CONFIGURATION	See below.

This section contains basic phasor measurement unit (PMU) data, such as functions, source settings, and names.

- **PMU 1 FUNCTION**: This setting enables the LOGICAL Device PMU 1 functionality. Use this setting to permanently enable or disable the feature.
- **PMU 1 IDCODE**: This setting assigns a numerical ID to the PMU. It corresponds to the IDCODE field of the data, configuration, header, and command frames of the IEEE C37.118 protocol. The PMU uses this value when sending data, configuration, and header frames; and it responds to this value when receiving the command frame. This is used when only data from one PMU is present.
- **PMU 1 STN**: This setting assigns an alphanumeric ID to the PMU station. It corresponds to the STN field of the configuration frame of the IEEE C37.118 protocol. This value is a 16-character ASCII string as per the IEEE C37.118 standard.
- **PMU 1 SIGNAL SOURCE**: This setting specifies one of the available F60 signal sources for processing in the PMU. Note that any combination of voltages and currents can be configured as a source. The current channels can be configured as sums of physically connected currents. This facilitates PMU applications in breaker-and-a-half, ring-bus, and similar arrangements. The PMU feature calculates voltage phasors for actual voltage (A, B, C, and auxiliary) and current (A, B, C, and ground) channels of the source, as well as symmetrical components (0, 1, and 2) of both voltages and currents. When configuring communication and recording features of the PMU, the user can select, from the above superset, the content to be sent out or recorded. When one source is selected by one PMU, it cannot be selected by another PMU.
- **PMU 1 CLASS (Range P, M, None)**: This setting selects the synchrophasor class. Note that a reporting rate of 100 or 120 can only be selected for class P synchrophasors and if the system frequency is 50 or 60 Hz, respectively.
- **PMU 1 RATE**: This setting specifies the reporting rate for the network (Ethernet) port. This value applies to all PMU streams of the device that are assigned to transmit over this aggregator. For a system frequency of 60 Hz (50 Hz), the F60 generates a reporting mismatch message if the selected rate is not set as 10 Hz, 12 Hz, 15 Hz, 20 Hz, 30 Hz, 60 Hz, or 120 Hz (or 10 Hz, 25 Hz, 50 Hz or 100 Hz when the system frequency is 50 Hz) when entered via the keypad or software; and the F60 stops the transmission of reports. Note that 4 Hz is not allowed for an M-class 50 Hz system).
- **PMU1 PHS-1** to **PMU1 PHS-14**: These settings specify synchrophasors to be transmitted from the superset of all synchronized measurements. The table outlines available synchrophasor values.

SELECTION	MEANING
Va	First voltage channel, either Va or Vab
Vb	Second voltage channel, either Vb or Vbc
Vc	Third voltage channel, either Vc or Vca
Vx	Fourth voltage channel
Ia	Phase A current, physical channel or summation as per the source settings
Ib	Phase B current, physical channel or summation as per the source settings
Ic	Phase C current, physical channel or summation as per the source settings
Ig	Fourth current channel, physical or summation as per the source settings
V1	Positive-sequence voltage, referenced to Va
V2	Negative-sequence voltage, referenced to Va
V0	Zero-sequence voltage
I1	Positive-sequence current, referenced to Ia
I2	Negative-sequence current, referenced to Ia
I0	Zero-sequence current

These settings allow for optimizing the frame size and maximizing transmission channel usage, depending on a given application. Select “Off” to suppress transmission of a given value.

- **PMU1 PHS-1 NM** to **PMU1 PHS-14 NM**: These settings allow for custom naming of the synchrophasor channels. Sixteen-character ASCII strings are allowed as in the CHNAM field of the configuration frame. These names are typically based on station, bus, or breaker names.
- **PMU1 A-CH-1** to **PMU1 A-CH-16**: These settings specify any analog data measured by the relay to be included as a user-selectable analog channel of the data frame. Up to 16 analog channels can be configured to send any FlexAnalog value from the relay. Examples include frequency, rate of frequency change, active and reactive power, per phase or three-phase power, power factor, temperature via RTD inputs, and THD. The configured analog values are sampled concurrently with the synchrophasor instant and sent as 32-bit floating-point values scaled to Engineering units.
- **PMU1 A-CH-1 NM** to **PMU1 A-CH-16 NM**: These settings allow for custom naming of the analog channels. Sixteen-character ASCII strings are allowed as in the CHNAM field of the configuration frame.
- **PMU1 D-CH-1** to **PMU1 D-CH-16**: These settings specify any digital flag measured by the relay to be included as a user-selectable digital channel of the data frame. Up to 16 digital channels can be configured to send any FlexLogic operand from the relay. The configured digital flags are sampled concurrently with the synchrophasor instant. These values are mapped into a two-byte integer number, with byte 1 LSB corresponding to the digital channel 1 and byte 2 MSB corresponding to digital channel 16.
- **PMU1 D-CH-1 NM** to **PMU1 D-CH-16 NM**: These settings allow for custom naming of the digital channels. Sixteen-character ASCII strings are allowed as in the CHNAM field of the configuration frame.
- **PMU1 D-CH-1 NORMAL STATE** to **PMU1 D-CH-16 NORMAL STATE**: These settings allow for specifying a *normal state* for each digital channel. These states are transmitted in configuration frames to the data concentrator.

C37.118 PMU 1 CONFIGURATION

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨PHASOR MEASUREMENT ⇨⇩BASIC CONFIGURATION ⇨PMU 1 ⇨PMU 1 BASIC CONFIGURATION ⇨⇩37.118 PMU 1 CONFIGURATION

■ 37.118 PMU 1 ■ CONFIGURATION	◀▶	PMU 1 FORMAT: Integer	*Range: Integer, Floating-point* *Default: Integer*
	MESSAGE ▲	PMU 1 STYLE: Polar	*Range: Polar, Rectangular* *Default: Polar*

PMU 1 FORMAT: This setting selects whether synchrophasors are reported as 16-bit integers or 32-bit IEEE floating point numbers. This setting complies with bit-1 of the FORMAT field of the IEEE C37.118 configuration frame. This setting applies to synchrophasors only; the user-selectable FlexAnalog channels are always transmitted as 16-bit integer values.

PMU 1 STYLE: This setting selects whether synchrophasors are reported in rectangular (real and imaginary) coordinates or in polar (magnitude and angle) coordinates. This setting complies with bit-0 of the FORMAT field of the IEEE C37.118 configuration frame.

NOTE: With 90-5 PMU, the FORMAT and STYLE are Floating-point and Polar respectively, as specified in the IEC 61850 standard.

IEC 61850–90–5 PMU 1 CONFIGURATION

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨PHASOR MEASUREMENT ⇨⇩BASIC CONFIGURATION ⇨PMU1⇨PMU 1 BASIC CONFIGURATION ⇨⇩90 – 5 PMU 1 CONFIGURATION

■ 90–5 PMU 1 ■ CONFIGURATION	◀▶	PMU 1 LDINST: PMU1	*Range: 64 char ASCII text* *Default: PMU1*

PMU1 LDINST: A user-defined visible string (maximum 64 char ASCII test) to assign Logical Device (LD) Inst for a PMU LD.

NOTE: As per IEC 61850-6 standard specification, the PMU LD Name is the concatenated combination (to total 64 characters) of IED Name (specified in IEC 61850 Server Settings) appended with PMU X LDINST string.

c) CALIBRATION

MESSAGE		PMU 1 IC CALIBRATION ANGLE: 0.00°	Range: –5.00 to 5.00° in steps of 0.05
MESSAGE		PMU 1 IC CALIBRATION MAG: 100.0%	Range: 95.0 to 105.0 in steps of 0.1%
MESSAGE		PMU 1 IG CALIBRATION ANGLE: 0.00°	Range: –5.00 to 5.00° in steps of 0.05
MESSAGE		PMU 1 IG CALIBRATION MAG: 100.0%	Range: 95.0 to 105.0 in steps of 0.1%
MESSAGE		PMU 1 SEQ VOLT SHIFT ANGLE: 0°	Range: –180 to 180° in steps of 30
MESSAGE		PMU 1 SEQ CURR SHIFT ANGLE: 0°	Range: –180 to 180° in steps of 30

This menu contains user angle and magnitude calibration data for the phasor measurement unit (PMU). This data is combined with the factory adjustments to shift the phasors for better accuracy.

- **PMU 1 VA... IG CALIBRATION ANGLE**: These settings recognize applications with protection class voltage and current sources, and allow the user to calibrate each channel (four voltages and four currents) individually to offset errors introduced by VTs, CTs, and cabling. The setting values are effectively added to the measured angles. Therefore, enter a positive correction of the secondary signal lags the true signal; and negative value if the secondary signal leads the true signal.

- **PMU 1 VA... IG CALIBRATION MAGNITUDE**: These settings recognize applications with protection class voltage and current sources, and allow the user to calibrate each channel (four voltages and four currents) individually to offset errors introduced by VTs, CTs. The setting values are effectively a multiplier of the measured magnitudes. Therefore, enter a multiplier greater than 100% of the secondary signal increases the true signal; and a multiplier less than 100% value of the secondary signal reduces the true signal.
- **PMU 1 SEQ VOLT SHIFT ANGLE**: This setting allows correcting positive- and negative-sequence voltages for vector groups of power transformers located between the PMU voltage point, and the reference node. This angle is effectively added to the positive-sequence voltage angle, and subtracted from the negative-sequence voltage angle. Note that:
  1. When this setting is not “0°”, the phase and sequence voltages do not agree. Unlike sequence voltages, the phase voltages cannot be corrected in a general case, and therefore are reported as measured.
  2. When receiving synchrophasor data at multiple locations, with possibly different reference nodes, it can be more beneficial to allow the central locations to perform the compensation of sequence voltages.
  3. This setting applies to PMU data only. The F60 calculates symmetrical voltages independently for protection and control purposes without applying this correction.
  4. When connected to line-to-line voltages, the PMU calculates symmetrical voltages with the reference to the AG voltage, and not to the physically connected AB voltage (see the *Metering Conventions* section in Chapter 6).
- **PMU 1 SEQ CURR SHIFT ANGLE**: This setting allows correcting positive and negative-sequence currents for vector groups of power transformers located between the PMU current point and the reference node. The setting has the same meaning for currents as the **PMU 1 SEQ VOLT SHIFT ANGLE** setting has for voltages. Normally, the two correcting angles are set identically, except rare applications when the voltage and current measuring points are located at different windings of a power transformer.

d) PMU TRIGGERING OVERVIEW

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ PHASOR... ⇨⇩ PHASOR MEASUREMENT UNIT 1 ⇨⇩ PMU 1 TRIGGERING

■ PMU 1 ■ TRIGGERING	◀▶	■ PMU 1 USER ■ TRIGGER	See page 5-129.
MESSAGE	▲▼	■ PMU 1 FREQUENCY ■ TRIGGER	See page 5-129.
MESSAGE	▲▼	■ PMU 1 VOLTAGE ■ TRIGGER	See page 5-130.
MESSAGE	▲▼	■ PMU 1 CURRENT ■ TRIGGER	See page 5-131.
MESSAGE	▲▼	■ PMU 1 POWER ■ TRIGGER	See page 5-132.
MESSAGE	▲	■ PMU 1 df/dt ■ TRIGGER	See page 5-134.

Each logical phasor measurement unit (PMU) contains five triggering mechanisms to facilitate triggering of the associated PMU recorder, or cross-triggering of other PMUs of the system. They are:

- Overfrequency and underfrequency
- Overvoltage and undervoltage
- Overcurrent
- Overpower
- High rate of change of frequency

The pre-configured triggers can be augmented with a user-specified condition built freely using programmable logic of the relay. The entire triggering logic is refreshed once every two power system cycles.

All five triggering functions and the user-definable condition are consolidated (ORed) and connected to the PMU recorder. Each trigger can be programmed to log its operation into the event recorder, and to signal its operation via targets. The five triggers drive the STAT bits of the data frame to inform the destination of the synchrophasor data regarding the cause of trigger. The following convention is adopted to drive bits 11, 3, 2, 1, and 0 of the STAT word.

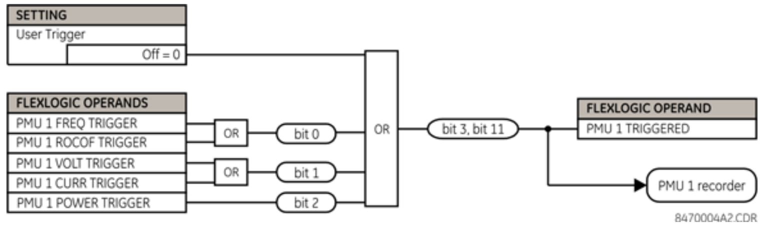

Figure 5–48: STAT BITS LOGIC

The trigger reset (drop-off) timer is available for all five triggering functions (FREQ, ROCOF, VOLT, CURR, POWER) in individual trigger settings under the TRIGGER DPO TIME setting. This asserts individual trigger operand and overall PMU x TRIGGERED operand with stat bits 3 and 11 for a fixed interval defined by this setting. If it is required that PMU x TRIGGERED operand with stat bits 3 and 11 stay longer than the individual reset timer, then use the PMU x USER TRIGGER setting assigned with appropriate elements and FlexLogic. In short, in case of USER TRIGGER, the drop-off time needs to be implemented using FlexLogic.

e) USER TRIGGERING

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ PHASOR MEASUREMENT... ⇨⇩ PMU 1 TRIGGERING ⇨⇩ PMU 1 USER TRIGGER

■ PMU 1 USER ■ TRIGGER	◄►	PMU1 USER TRIGGER: Off	*Range: FlexLogic operands*

The user trigger allows customized triggering logic to be constructed from FlexLogic. The entire triggering logic is refreshed once every two power system cycles.

f) FREQUENCY TRIGGERING

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ PHASOR MEASUREMENT... ⇨⇩ PMU 1 TRIGGERING ⇨⇩ PMU 1 FREQUENCY TRIGGER

■ PMU 1 FREQUENCY ■ TRIGGER	◄►	PMU 1 FREQ TRIGGER FUNCTION: Disabled	*Range: Enabled, Disabled*
MESSAGE	▲▼	PMU 1 FREQ TRIGGER LOW-FREQ: 49.00 Hz	*Range: 20.00 to 70.00 Hz in steps of 0.01*
MESSAGE	▲▼	PMU 1 FREQ TRIGGER HIGH-FREQ: 61.00 Hz	*Range: 20.00 to 70.00 Hz in steps of 0.01*
MESSAGE	▲▼	PMU 1 FREQ TRIGGER PKP TIME: 0.10 s	*Range: 0.00 to 600.00 s in steps of 0.01*
MESSAGE	▲▼	PMU 1 FREQ TRIGGER DPO TIME: 1.00 s	*Range: 0.00 to 600.00 s in steps of 0.01*
MESSAGE	▲▼	PMU 1 FREQ TRIG BLK: Off	*Range: FlexLogic operand*
MESSAGE	▲▼	PMU 1 FREQ TRIGGER TARGET: Self-Reset	*Range: Self-Reset, Latched, Disabled*
MESSAGE	▲	PMU 1 FREQ TRIGGER EVENTS: Disabled	*Range: Enabled, Disabled*

The trigger responds to the frequency signal of the phasor measurement unit (PMU) source. The frequency is calculated from among phase voltages, auxiliary voltage, phase currents and ground current, in this hierarchy, depending on the source configuration as per F60 standards. This element requires that the frequency be above the minimum measurable value. If the frequency is below this value, such as when the circuit is de-energized, the trigger drops out.

- **PMU 1 FREQ TRIGGER LOW-FREQ**: This setting specifies the low threshold for the abnormal frequency trigger. The comparator applies a 0.02 Hz hysteresis.
- **PMU 1 FREQ TRIGGER HIGH-FREQ**: This setting specifies the high threshold for the abnormal frequency trigger. The comparator applies a 0.02 Hz hysteresis.
- **PMU 1 FREQ TRIGGER PKP TIME**: This setting can be used to filter out spurious conditions and avoid unnecessary triggering of the recorder.
- **PMU 1 FREQ TRIGGER DPO TIME**: This setting can be used to extend the trigger after the situation returned to normal. This setting is of particular importance when using the recorder in the forced mode (recording as long as the triggering condition is asserted).

This element responds to abnormal voltage. Separate thresholds are provided for low and high voltage. In terms of signaling its operation, the element does not differentiate between the undervoltage and overvoltage events. The trigger responds to the phase voltage signal of the phasor measurement unit (PMU) source. All voltage channels (A, B, and C or AB, BC, and CA) are processed independently and can trigger the recorder. A minimum voltage supervision of 0.1 pu is implemented to prevent pickup on a de-energized circuit, similarly to the undervoltage protection element.

- **PMU 1 VOLT TRIGGER LOW-VOLT**: This setting specifies the low threshold for the abnormal voltage trigger, in per-unit of the PMU source. 1 pu is a nominal voltage value defined as the nominal secondary voltage times VT ratio. The comparator applies a 1% hysteresis.
- **PMU 1 VOLT TRIGGER HIGH-VOLT**: This setting specifies the high threshold for the abnormal voltage trigger, in per-unit of the PMU source. 1 pu is a nominal voltage value defined as the nominal secondary voltage times VT ratio. The comparator applies a 1% hysteresis.
- **PMU 1 VOLT TRIGGER PKP TIME**: This setting can bused to filter out spurious conditions and avoid unnecessary triggering of the recorder.
- **PMU 1 VOLT TRIGGER DPO TIME**: This setting can be used to extend the trigger after the situation returned to normal. This setting is of particular importance when using the recorder in the forced mode (recording as long as the triggering condition is asserted).

This element responds to abnormal power. Separate thresholds are provided for active, reactive, and apparent powers. In terms of signaling its operation the element does not differentiate between the three types of power. The trigger responds to the single-phase and three-phase power signals of the phasor measurement unit (PMU) source.

- **PMU 1 POWER TRIGGER ACTIVE**: This setting specifies the pickup threshold for the active power of the source. For single-phase power, 1 pu is a product of 1 pu voltage and 1 pu current, or the product of nominal secondary voltage, the VT ratio and the nominal primary current. For the three-phase power, 1 pu is three times that for a single-phase power in case of wye-connected VTs and $\sqrt{3}$ times in case of delta-connected VTs. The comparator applies a 3% hysteresis.

- **PMU 1 POWER TRIGGER REACTIVE**: This setting specifies the pickup threshold for the reactive power of the source. For single-phase power, 1 pu is a product of 1 pu voltage and 1 pu current, or the product of nominal secondary voltage, the VT ratio and the nominal primary current. For the three-phase power, 1 pu is three times that for a single-phase power in case of wye-connected VTs and $\sqrt{3}$ times in case of delta-connected VTs. The comparator applies a 3% hysteresis.
- **PMU 1 POWER TRIGGER APPARENT**: This setting specifies the pickup threshold for the apparent power of the source. For single-phase power, 1 pu is a product of 1 pu voltage and 1 pu current, or the product of nominal secondary voltage, the VT ratio and the nominal primary current. For the three-phase power, 1 pu is three times that for a single-phase power in case of wye-connected VTs and $\sqrt{3}$ times in case of delta-connected VTs. The comparator applies a 3% hysteresis.
- **PMU 1 POWER TRIGGER PKP TIME**: This setting can be used to filter out spurious conditions and avoid unnecessary triggering of the recorder.
- **PMU 1 POWER TRIGGER DPO TIME**: This setting can be used to extend the trigger after the situation returned to normal. This setting is of particular importance when using the recorder in the forced mode (recording as long as the triggering condition is asserted).

This element responds to frequency rate of change. Separate thresholds are provided for rising and dropping frequency. The trigger responds to the rate of change of frequency (df/dt) of the phasor measurement unit (PMU) source.

- **PMU 1 df/dt TRIGGER RAISE**: This setting specifies the pickup threshold for the rate of change of frequency in the raising direction (positive df/dt). The comparator applies a 4% hysteresis.
- **PMU 1 df/dt TRIGGER FALL**: This setting specifies the pickup threshold for the rate of change of frequency in the falling direction (negative df/dt). The comparator applies a 4% hysteresis.
- **PMU 1 df/dt TRIGGER PKP TIME**: This setting can be used to filter out spurious conditions and avoid unnecessary triggering of the recorder.
- **PMU 1 df/dt TRIGGER DPO TIME**: This setting can be used to extend the trigger after the situation returned to normal. This setting is of particular importance when using the recorder in the forced mode (recording as long as the triggering condition is asserted).

PMU 1 TIMED TRIGGER
POSITION: 10%
```
Range: 1 to 50% in steps of 1

- **PMU 1 FUNCTION**: This setting enables or disables the recorder for PMU 1. The rate is fixed at the reporting rate set within the aggregator (that is, Aggregator 1).
- **PMU 1 NO OF TIMED RECORDS**: This setting specifies the number of timed records that are available for a given logical PMU 1. The length of each record is equal to the available memory divided by the content size and number of records. As the number of records is increased the available storage for each record is reduced. The relay supports a maximum of 128 records in either timed or forced mode.
- **PMU 1 TRIGGER MODE**: This setting specifies what happens when the recorder uses its entire available memory storage. Under the "Automatic Overwrite", the last record is erased to facilitate new recording, when triggered. Under the "Protected" selection, the recorder stops creating new records when the entire memory is used up by the old uncleared records.
- **PMU 1 TIMED TRIGGER POSITION**: This setting specifies the amount of pre-trigger data as a percent of the entire record. This setting applies only to the timed mode of recording.

- **PMU AGGREGATOR1 PROTOCOL**: This setting selects if the IEEE C37.118 or IEC 61850-90-5 standard is used. Because one protocol is supported at a time in a device, this setting applies to all PMU aggregators.
- **PMU AGGREGATOR1 IDCODE**: Numeric identifier of the Aggregator / PDC function. In an IEEE C37.118 output stream, this identifies the ID of the aggregator, which is only used if there is more than 1 PMU mapped into an aggregator.
- **PMU AGGREGATOR1 PMU1**: If set to “Yes” aggregator 1 includes the PMU1 data set in the reporting data stream. AGGREGATOR1 does not include PMU1 data set in the report if set to “No”.

NOTE

Only PMUs with same reporting rate can be assigned to the same PMU AGGREGATOR.

5

C37.118 AGGREGATOR 1 CONFIGURATION

- **PMU AGGREGATOR1: TCP PORT**: This setting selects the TCP port number to be used by this aggregator for network reporting. All ports, even those of unused aggregators, must be valid and unique to avoid port number collisions.
- **PMU AGGREGATOR1 UDP PORT**: This setting selects the UDP port number to be used by this aggregator for network reporting. All ports, even those of unused aggregators, must be valid and unique to avoid port number collisions.
- **PMU AGGREGATOR1 PDC CONTROL**: The synchrophasor standard allows for user-defined controls originating at the PDC, to be executed on the PMU. The control is accomplished via an extended command frame. The relay decodes the first word of the extended field, EXTFRAME, to drive 16 dedicated FlexLogic operands. Each aggregator supports 16 FlexLogic operands as shown in the table. The operands are asserted for 5 seconds following reception of the command frame. If the new command frame arrives within the 5 second period, the FlexLogic operands are updated, and the 5 second timer is restarted. This setting enables or disables the control. When enabled, all 16 operands for each aggregator are active; when disabled all 16 operands for each aggregator remain reset.

Table 5–13: FLEXLOGIC OPERANDS SUPPORTED BY AGGREGATOR

- **MSVCB 1 SVENA:** The SV Stream Control is set by either toggling an assigned FlexLogic operand or a remote client write, to start and stop the streaming of R-SV frames. If remote client control is disabled, a negative response is provided to the client in response to a write attempt. A FlexLogic operand (SvEna) is provided for each Aggregator that reflects the state of the SvEna control where “1”= Enabled and “0”=Disabled. The logic for setting the SvEna control bit is shown in the following figure.

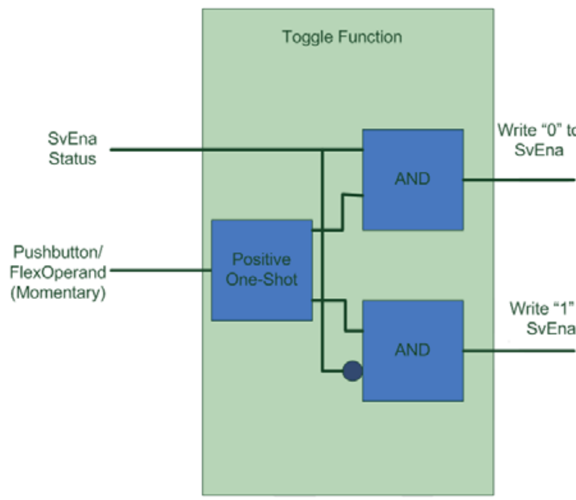

Figure 5–54: LOGIC FOR SETTING SVENA CONTROL BIT

- **MSVCB 1 Client CONTRL:** This setting determines if a client can write to the reserve bit. When the assigned FlexLogic operand is a logic 1 state, remote clients can write to both the reserve bit and the SvEna bit. When the FlexLogic operand is a logic 0 state, the remote client writes to the reserve bit, the SvEna is rejected by the UR, and a negative response with the appropriate Service Error is returned to the client.
- **MSVCB 1 SVENA Default:** This setting sets the default state of the stream (On or Off) on power-up or restart.
- **MSVCB 1 CONFREV:** The relay increments the Configuration revision every time the configuration is changed. This setting allows the user to reset the configuration back to 1 or a value from 1 to 4294967295.
- **MSVCB 1 PRIORITY:** A value from 0 through 7: The default value is 4.
- **MSVCB 1 IP Class:** The value represents the IPv4 Differentiated Services (formerly called TypeOfService) value. The default value is set for Expedited Forwarding (101110B (46 or 2EH). This value provides priority routing, when supported in the routers.
- **MSVCB 1 VID:** A range of values limited from 0 to 4095.
- **MSVCB 1 APPID:** This setting allows the selection of a specific application ID for each sending device.
- **MSVCB 1 DEST IP Address:** This is the destination multicast address IP address that is entered in Standard IPV4 address format. The valid range for IPv4 is from 224.0.0.0 to 239.255.255.255, but the UR does not test the address entered.
- **MSVCB 1 Security:** This setting selects the level of security and authentication used, as outlined in the following table, and is in the form of an enumeration as per standard. The range is 0 to 2.

NOTE

Shaded settings in the table are not supported in firmware 7.0.

ENUMERATION	AUTHENTICATION	ENCRYPTION
0	no	no
1	yes	no
2	yes	yes

5.5.1 INTRODUCTION TO FLEXLOGIC

To provide maximum flexibility to the user, the arrangement of internal digital logic combines fixed and user-programmed parameters. Logic upon which individual features are designed is fixed, and all other logic, from digital input signals through elements or combinations of elements to digital outputs, is variable. The user has complete control of all variable logic through FlexLogic. In general, the system receives analog and digital inputs which it uses to produce analog and digital outputs. The major sub-systems of a generic UR-series relay involved in this process are shown below.

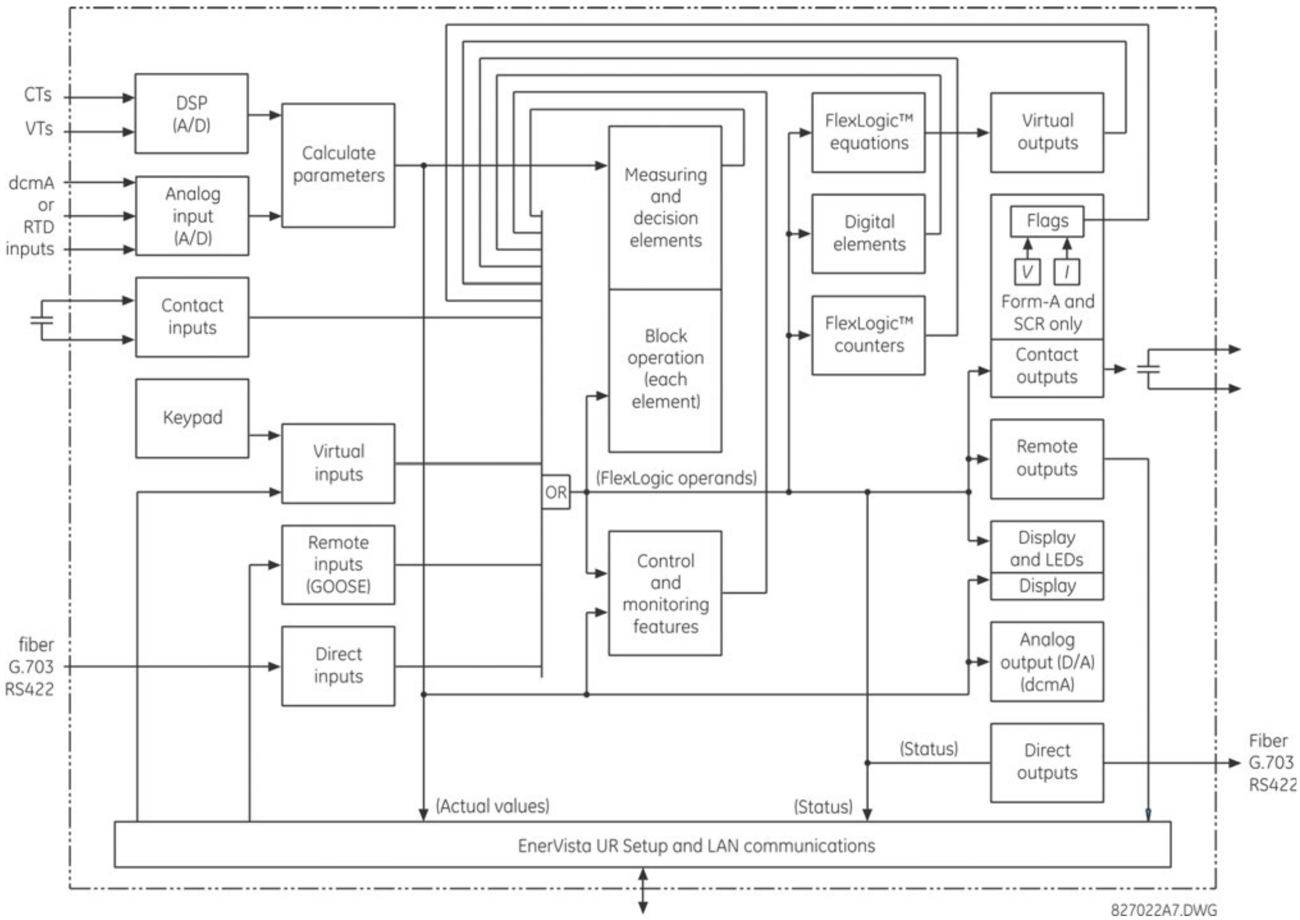

Figure 5–55: UR ARCHITECTURE OVERVIEW

The states of all digital signals used in the F60 are represented by flags (or FlexLogic operands, which are described later in this section). A digital "1" is represented by a 'set' flag. Any external contact change-of-state can be used to block an element from operating, as an input to a control feature in a FlexLogic equation, or to operate a contact output. The state of the contact input can be displayed locally or viewed remotely via the communications facilities provided. If a simple scheme where a contact input is used to block an element is desired, this selection is made when programming the element. This capability also applies to the other features that set flags: elements, virtual inputs, remote inputs, schemes, and human operators.

If more complex logic than presented above is required, it is implemented via FlexLogic. For example, if it is desired to have the closed state of contact input H7a and the operated state of the phase undervoltage element block the operation of the phase time overcurrent element, the two control input states are programmed in a FlexLogic equation. This equation ANDs the two control inputs to produce a virtual output which is then selected when programming the phase time overcurrent to be used as a blocking input. Virtual outputs can only be created by FlexLogic equations.

Traditionally, protective relay logic has been relatively limited. Any unusual applications involving interlocks, blocking, or supervisory functions had to be hard-wired using contact inputs and outputs. FlexLogic minimizes the requirement for auxiliary components and wiring while making more complex schemes possible.

The logic that determines the interaction of inputs, elements, schemes and outputs is field programmable through the use of logic equations that are sequentially processed. The use of virtual inputs and outputs in addition to hardware is available internally and on the communication ports for other relays to use (distributed FlexLogic).

FlexLogic allows users to customize the relay through a series of equations that consist of *operators* and *operands*. The operands are the states of inputs, elements, schemes and outputs. The operators are logic gates, timers and latches (with set and reset inputs). A system of sequential operations allows any combination of specified operands to be assigned as inputs to specified operators to create an output. The final output of an equation is a numbered register called a *virtual output*. Virtual outputs can be used as an input operand in any equation, including the equation that generates the output, as a seal-in or other type of feedback.

A FlexLogic equation consists of parameters that are either operands or operators. Operands have a logic state of 1 or 0. Operators provide a defined function, such as an AND gate or a Timer. Each equation defines the combinations of parameters to be used to set a Virtual Output flag. Evaluation of an equation results in either a 1 (=ON, i.e. flag set) or 0 (=OFF, i.e. flag not set). Each equation is evaluated at least 4 times every power system cycle.

Some types of operands are present in the relay in multiple instances; e.g. contact and remote inputs. These types of operands are grouped together (for presentation purposes only) on the faceplate display. The characteristics of the different types of operands are listed in the table below.

5

Table 5–15: F60 FLEXLOGIC OPERAND TYPES

OPERAND TYPE	STATE	EXAMPLE FORMAT	CHARACTERISTICS [INPUT IS ‘1’ (= ON) IF...]
Contact Input	On	Cont Ip On	Voltage is presently applied to the input (external contact closed).
	Off	Cont Ip Off	Voltage is presently not applied to the input (external contact open).
Contact Output (type Form-A contact only)	Current On	Cont Op 1 Ion	Current is flowing through the contact.
	Voltage On	Cont Op 1 VOn	Voltage exists across the contact.
	Voltage Off	Cont Op 1 VOff	Voltage does not exists across the contact.
Direct Input	On	DIRECT INPUT 1 On	The direct input is presently in the ON state.
Element (Analog)	Pickup	PHASE TOC1 PKP	The tested parameter is presently above the pickup setting of an element which responds to rising values or below the pickup setting of an element which responds to falling values.
	Dropout	PHASE TOC1 DPO	This operand is the logical inverse of the above PKP operand.
	Operate	PHASE TOC1 OP	The tested parameter has been above/below the pickup setting of the element for the programmed delay time, or has been at logic 1 and is now at logic 0 but the reset timer has not finished timing.
	Block	PHASE TOC1 BLK	The output of the comparator is set to the block function.
Element (Digital)	Pickup	Dig Element 1 PKP	The input operand is at logic 1.
	Dropout	Dig Element 1 DPO	This operand is the logical inverse of the above PKP operand.
	Operate	Dig Element 1 OP	The input operand has been at logic 1 for the programmed pickup delay time, or has been at logic 1 for this period and is now at logic 0 but the reset timer has not finished timing.
Element (Digital Counter)	Higher than	Counter 1 HI	The number of pulses counted is above the set number.
	Equal to	Counter 1 EQL	The number of pulses counted is equal to the set number.
	Lower than	Counter 1 LO	The number of pulses counted is below the set number.
Fixed	On	On	Logic 1
	Off	Off	Logic 0
Remote Input	On	REMOTE INPUT 1 On	The remote input is presently in the ON state.
Virtual Input	On	Virt Ip 1 On	The virtual input is presently in the ON state.
Virtual Output	On	Virt Op 1 On	The virtual output is presently in the set state (i.e. evaluation of the equation which produces this virtual output results in a "1").

The operands available for this relay are listed alphabetically by types in the following table.

	PHASE UV2	Same set of operands as shown for PHASE UV1
ELEMENT: Synchrophasor phasor measurement unit (PMU)	PMU Agg 1 SvEng On PMU 1 CURR TRIGGER PMU 1 FREQ TRIGGER PMU 1 POWER TRIGGER PMU 1 ROCOF TRIGGER PMU 1 VOLT TRIGGER PMU 1 TRIGGERED	SvEng data item in associated control block is on Overcurrent trigger of phasor measurement unit 1 has operated Abnormal frequency trigger of phasor measurement unit 1 has operated Overpower trigger of phasor measurement unit 1 has operated Rate of change of frequency trigger of phasor measurement unit 1 has operated Abnormal voltage trigger of phasor measurement unit 1 has operated Phasor measurement unit 1 triggered; no events or targets are generated by this operand
ELEMENT: Synchrophasor one-shot	PMU ONE-SHOT EXPIRED PMU ONE-SHOT OP PMU ONE-SHOT PENDING	Indicates the one-shot operation has been executed, and the present time is at least 30 seconds past the scheduled one-shot time Indicates the one-shot operation and remains asserted for 30 seconds afterwards Indicates the one-shot operation is pending; that is, the present time is before the scheduled one-shot time
ELEMENT: Selector switch	SELECTOR 1 POS Y SELECTOR 1 BIT 0 SELECTOR 1 BIT 1 SELECTOR 1 BIT 2 SELECTOR 1 STP ALARM SELECTOR 1 BIT ALARM SELECTOR 1 ALARM SELECTOR 1 PWR ALARM	Selector switch 1 is in Position Y (mutually exclusive operands) First bit of the 3-bit word encoding position of selector 1 Second bit of the 3-bit word encoding position of selector 1 Third bit of the 3-bit word encoding position of selector 1 Position of selector 1 has been pre-selected with the stepping up control input but not acknowledged Position of selector 1 has been pre-selected with the 3-bit control input but not acknowledged Position of selector 1 has been pre-selected but not acknowledged Position of selector switch 1 is undetermined or restored from memory when the relay powers up and synchronizes to the three-bit input
	SELECTOR 2	Same set of operands as shown above for SELECTOR 1
ELEMENT: Setting group	SETTING GROUP ACT 1 SETTING GROUP ACT 2 SETTING GROUP ACT 3 SETTING GROUP ACT 4 SETTING GROUP ACT 5 SETTING GROUP ACT 6	Setting group 1 is active Setting group 2 is active Setting group 3 is active Setting group 4 is active Setting group 5 is active Setting group 6 is active

Table 5–16: F60 FLEXLOGIC OPERANDS (Sheet 6 of 9)

OPERAND TYPE	OPERAND SYNTAX	OPERAND DESCRIPTION
ELEMENT: Sub-harmonic stator ground fault detector	SH STAT GND STG1 PKP	Stage 1 of the sub-harmonic stator ground protection has picked up
	SH STAT GND STG1 DPO	Stage 1 of the sub-harmonic stator ground protection has dropped out
	SH STAT GND STG1 OP	Stage 1 of the sub-harmonic stator ground protection has operated
	SH STAT GND STG2 PKP	Stage 2 of the sub-harmonic stator ground protection has picked up
	SH STAT GND STG2 DPO	Stage 2 of the sub-harmonic stator ground protection has dropped out
	SH STAT GND STG2 OP	Stage 2 of the sub-harmonic stator ground protection has operated
	SH STAT GND OC PKP	Ground over current element of the sub-harmonic stator ground protection has picked up
	SH STAT GND OC DPO	Ground over current element of the sub-harmonic stator ground protection has dropped out
	SH STAT GND OC OP	Ground over current element of the sub-harmonic stator ground protection has operated
	SH STAT GND TRB PKP	Sub-harmonic stator ground module trouble has picked up
	SH STAT GND TRB DPO	Sub-harmonic stator ground module trouble has dropped out
	SH STAT GND TRB OP	Sub-harmonic stator ground module trouble has operated
ELEMENT: Disturbance detector	SRC1 50DD OP	Source 1 disturbance detector has operated
	SRC2 50DD OP	Source 2 disturbance detector has operated
ELEMENT: VTFF (Voltage transformer fuse failure)	SRC1 VT FF OP	Source 1 VT fuse failure detector has operated
	SRC1 VT FF DPO	Source 1 VT fuse failure detector has dropped out
	SRC1 VT FF VOL LOSS	Source 1 has lost voltage signals (V2 below 10% and V1 below 5% of nominal)
	SRC1 VT NEU WIRE OPEN	Source 1 VT neutral wire open detected.When the VT is connected in Delta, this function should not be enabled because there is no neutral wire for Delta connected VT.
	SRC2 VT FF to SRC VT FF	Same set of operands as shown for SRC1 VT FF
ELEMENT: Disconnect switch	SWITCH 1 OFF CMD	Disconnect switch 1 open command initiated
	SWITCH 1 ON CMD	Disconnect switch 1 close command initiated
	SWITCH 1 CLOSED	Disconnect switch 1 is closed
	SWITCH 1 OPEN	Disconnect switch 1 is open
	SWITCH 1 DISCREP	Disconnect switch 1 has discrepancy
	SWITCH 1 TROUBLE	Disconnect switch 1 trouble alarm
	SWITCH 1 ΦA CLSD	Disconnect switch 1 phase A is closed
	SWITCH 1 ΦA OPEN	Disconnect switch 1 phase A is open
	SWITCH 1 ΦA BAD ST	Disconnect switch 1 phase A bad status is detected (discrepancy between the 52/a and 52/b contacts)
	SWITCH 1 ΦA INTERM	Disconnect switch 1 phase A intermediate status is detected (transition from one position to another)
	SWITCH 1 ΦB CLSD	Disconnect switch 1 phase B is closed
	SWITCH 1 ΦB OPEN	Disconnect switch 1 phase B is open
	SWITCH 1 ΦB BAD ST	Disconnect switch 1 phase B bad status is detected (discrepancy between the 52/a and 52/b contacts)
	SWITCH 1 ΦB INTERM	Disconnect switch 1 phase B intermediate status is detected (transition from one position to another)
	SWITCH 1 ΦC CLSD	Disconnect switch 1 phase C is closed
	SWITCH 1 ΦC OPEN	Disconnect switch 1 phase C is open
	SWITCH 1 ΦC BAD ST	Disconnect switch 1 phase C bad status is detected (discrepancy between the 52/a and 52/b contacts)
	SWITCH 1 ΦC INTERM	Disconnect switch 1 phase C intermediate status is detected (transition from one position to another)
	SWITCH 1 BAD STATUS	Disconnect switch 1 bad status is detected on any pole
	SWITCH 2...	Same set of operands as shown for SWITCH 1
ELEMENT: Synchrocheck	SYNC 1 DEAD S OP	Synchrocheck 1 dead source has operated
	SYNC 1 DEAD S DPO	Synchrocheck 1 dead source has dropped out
	SYNC 1 SYNC OP	Synchrocheck 1 in synchronization has operated
	SYNC 1 SYNC DPO	Synchrocheck 1 in synchronization has dropped out
	SYNC 1 CLS OP	Synchrocheck 1 close has operated
	SYNC 1 CLS DPO	Synchrocheck 1 close has dropped out
	SYNC 1 V1 ABOVE MIN	Synchrocheck 1 V1 is above the minimum live voltage
	SYNC 1 V1 BELOW MAX	Synchrocheck 1 V1 is below the maximum dead voltage
	SYNC 1 V2 ABOVE MIN	Synchrocheck 1 V2 is above the minimum live voltage
	SYNC 1 V2 BELOW MAX	Synchrocheck 1 V2 is below the maximum dead voltage
	SYNC 2	Same set of operands as shown for SYNC 1

Table 5–16: F60 FLEXLOGIC OPERANDS (Sheet 7 of 9)

OPERAND TYPE	OPERAND SYNTAX	OPERAND DESCRIPTION
ELEMENT: Teleprotection channel tests	TELEPRO CH1 FAIL TELEPRO CH2 FAIL TELEPRO CH1 ID FAIL TELEPRO CH2 ID FAIL TELEPRO CH1 CRC FAIL TELEPRO CH2 CRC FAIL TELEPRO CH1 PKT LOST TELEPRO CH2 PKT LOST	Channel 1 failed Channel 2 failed The ID check for a peer relay on channel 1 has failed The ID check for a peer relay on channel 2 has failed CRC detected packet corruption on channel 1 CRC detected packet corruption on channel 2 CRC detected lost packet on channel 1 CRC detected lost packet on channel 2
ELEMENT: Teleprotection inputs/outputs	TELEPRO INPUT 1-1 On ↓ TELEPRO INPUT 1-16 On TELEPRO INPUT 2-1 On ↓ TELEPRO INPUT 2-16 On	Flag is set, Logic =1 ↓ Flag is set, Logic =1 Flag is set, Logic =1 ↓ Flag is set, Logic =1
ELEMENT: Thermal overload protection	THERMAL PROT 1 PKP THERMAL PROT 1 OP	Thermal overload protection 1 picked up Thermal overload protection 1 operated
ELEMENT Trip bus	TRIP BUS 1 PKP TRIP BUS 1 OP	Asserted when the trip bus 1 element picks up. Asserted when the trip bus 1 element operates.
	TRIP BUS 2...	Same set of operands as shown for TRIP BUS 1
ELEMENT: Underfrequency	UNDERFREQ 1 PKP UNDERFREQ 1 OP UNDERFREQ 1 DPO	Underfrequency 1 has picked up Underfrequency 1 has operated Underfrequency 1 has dropped out
	UNDERFREQ 2 to 6	Same set of operands as shown for UNDERFREQ 1 above
ELEMENT: Wattmetric zero- sequence directional	WATTMETRIC 1 PKP WATTMETRIC 1 OP	Wattmetric directional element 1 has picked up Wattmetric directional element 1 has operated
	WATTMETRIC 2...	Same set of operands as per WATTMETRIC 1 above
FIXED OPERANDS	Off	Logic = 0. Does nothing and may be used as a delimiter in an equation list; used as ‘Disable’ by other features.
	On	Logic = 1. Can be used as a test setting.
INPUTS/OUTPUTS: Contact inputs	Cont Ip 1 On Cont Ip 2 On ↓ Cont Ip 1 Off Cont Ip 2 Off ↓	(will not appear unless ordered) (will not appear unless ordered) ↓ (will not appear unless ordered) (will not appear unless ordered) ↓
INPUTS/OUTPUTS: Contact outputs, current (from detector on form-A output only)	Cont Op 1 IOn Cont Op 2 IOn ↓	(will not appear unless ordered) (will not appear unless ordered) ↓
INPUTS/OUTPUTS: Contact outputs, voltage (from detector on form-A output only)	Cont Op 1 VOn Cont Op 2 VOn ↓	(will not appear unless ordered) (will not appear unless ordered) ↓
	Cont Op 1 VOff Cont Op 2 VOff ↓	(will not appear unless ordered) (will not appear unless ordered) ↓
INPUTS/OUTPUTS Direct inputs	DIRECT INPUT 1 On ↓ DIRECT INPUT 32 On	Flag is set, logic=1 ↓ Flag is set, logic=1
INPUTS/OUTPUTS: Remote double- point status inputs	RemDPS Ip 1 BAD RemDPS Ip 1 INTERM RemDPS Ip 1 OFF RemDPS Ip 1 ON	Asserted while the remote double-point status input is in the bad state. Asserted while the remote double-point status input is in the intermediate state. Asserted while the remote double-point status input is off. Asserted while the remote double-point status input is on.
	REMDPS Ip 2...	Same set of operands as per REMDPS 1 above
INPUTS/OUTPUTS: Remote inputs	REMOTE INPUT 1 On REMOTE INPUT 2 On REMOTE INPUT 2 On ↓ REMOTE INPUT 32 On	Flag is set, logic=1 Flag is set, logic=1 Flag is set, logic=1 ↓ Flag is set, logic=1

5

Table 5–16: F60 FLEXLOGIC OPERANDS (Sheet 8 of 9)

OPERAND TYPE	OPERAND SYNTAX	OPERAND DESCRIPTION
INPUTS/OUTPUTS: Virtual inputs	Virt Ip 1 On Virt Ip 2 On Virt Ip 3 On ↓ Virt Ip 64 On	Flag is set, logic=1 Flag is set, logic=1 Flag is set, logic=1 ↓ Flag is set, logic=1
INPUTS/OUTPUTS: Virtual outputs	Virt Op 1 On Virt Op 2 On Virt Op 3 On ↓ Virt Op 96 On	Flag is set, logic=1 Flag is set, logic=1 Flag is set, logic=1 ↓ Flag is set, logic=1
LED INDICATORS: Fixed front panel LEDs	LED IN SERVICE LED TROUBLE LED TEST MODE LED TRIP LED ALARM LED PICKUP LED VOLTAGE LED CURRENT LED FREQUENCY LED OTHER LED PHASE A LED PHASE B LED PHASE C LED NEUTRAL/GROUND	Asserted when the front panel IN SERVICE LED is on. Asserted when the front panel TROUBLE LED is on. Asserted when the front panel TEST MODE LED is on. Asserted when the front panel TRIP LED is on. Asserted when the front panel ALARM LED is on. Asserted when the front panel PICKUP LED is on. Asserted when the front panel VOLTAGE LED is on. Asserted when the front panel CURRENT LED is on. Asserted when the front panel FREQUENCY LED is on. Asserted when the front panel OTHER LED is on. Asserted when the front panel PHASE A LED is on. Asserted when the front panel PHASE B LED is on. Asserted when the front panel PHASE C LED is on. Asserted when the front panel NEUTRAL/GROUND LED is on.
LED INDICATORS: LED test	LED TEST IN PROGRESS	An LED test has been initiated and has not finished.
LED INDICATORS: User-programmable LEDs	LED USER 1	Asserted when user-programmable LED 1 is on.
	LED USER 2 to 48	The operand above is available for user-programmable LEDs 2 through 48.

Table 5–16: F60 FLEXLOGIC OPERANDS (Sheet 9 of 9)

OPERAND TYPE	OPERAND SYNTAX	OPERAND DESCRIPTION
SELF-DIAGNOSTICS (See *Relay Self-tests* descriptions in *Chapter 7: Commands and Targets*)	ANY MAJOR ERROR ANY MINOR ERROR ANY SELF-TESTS BATTERY FAIL CLOCK UNSYNCHRONIZED DIRECT DEVICE OFF DIRECT RING BREAK EQUIPMENT MISMATCH FLEXLOGIC ERR TOKEN LATCHING OUT ERROR MAINTENANCE ALERT FIRST ETHERNET FAIL PROCESS BUS FAILURE PTP FAILURE REMOTE DEVICE OFF RRTD COMM FAIL SECOND ETHERNET FAIL THIRD ETHERNET FAIL SNTP FAILURE SYSTEM EXCEPTION TEMP MONITOR UNIT NOT PROGRAMMED	Any of the major self-test errors generated (major error) Any of the minor self-test errors generated (minor error) Any self-test errors generated (generic, any error) The battery is not functioning. Return power supply module to manufacturer. Relay is not synchronized to the international time standard A direct device is configured but not connected The Direct I/O settings is for a connection that is not in a ring The configuration of modules does not match the stored order code A FlexLogic equation is incorrect A difference is detected between the desired and actual latch contact state A subset of the minor self-test errors generated, see Chapter 7 Link failure detected. See description in *Chapter 7: Commands and targets.* See description in *Chapter 7: Commands and targets* "Bad PTP Signal" self-test as described in Chapter 7 One or more GOOSE devices are not responding See description in *Chapter 7: Commands and targets* See description in *Chapter 7: Commands and targets* See description in *Chapter 7: Commands and targets* SNTP server is not responding See description in *Chapter 7: Commands and targets* Monitors ambient temperature and maximum operating temperature The product setup>installation>relay settings setting is not programmed
TEMPERATURE MONITOR	TEMP MONITOR	Asserted while the ambient temperature is greater than the maximum operating temperature (80°C)
USER-PROGRAMMABLE PUSHBUTTONS	PUSHBUTTON 1 ON PUSHBUTTON 1 OFF ANY PB ON	Pushbutton number 1 is in the “On” position Pushbutton number 1 is in the “Off” position Any of twelve pushbuttons is in the “On” position
	PUSHBUTTON 2 to 12	Same set of operands as PUSHBUTTON 1

Some operands can be re-named by the user. These are the names of the breakers in the breaker control feature, the ID (identification) of contact inputs, the ID of virtual inputs, and the ID of virtual outputs. If the user changes the default name or ID of any of these operands, the assigned name will appear in the relay list of operands. The default names are shown in the FlexLogic operands table above.

The characteristics of the logic gates are tabulated below, and the operators available in FlexLogic are listed in the Flex-Logic operators table.

Table 5–17: FLEXLOGIC GATE CHARACTERISTICS

GATES	NUMBER OF INPUTS	OUTPUT IS ‘1’ (= ON) IF...
NOT	1	input is ‘0’
OR	2 to 16	any input is ‘1’
AND	2 to 16	all inputs are ‘1’
NOR	2 to 16	all inputs are ‘0’
NAND	2 to 16	any input is ‘0’
XOR	2	only one input is ‘1’

Table 5–18: FLEXLOGIC OPERATORS

TYPE	SYNTAX	DESCRIPTION	NOTES
Editor	INSERT	Insert a parameter in an equation list.	
	DELETE	Delete a parameter from an equation list.	
End	END	The first END encountered signifies the last entry in the list of processed FlexLogic parameters.	
One-shot	POSITIVE ONE SHOT	One shot that responds to a positive going edge.	A 'one shot' refers to a single input gate that generates a pulse in response to an edge on the input. The output from a 'one shot' is True (positive) for only one pass through the FlexLogic equation. There is a maximum of 64 'one shots'.
	NEGATIVE ONE SHOT	One shot that responds to a negative going edge.	
	DUAL ONE SHOT	One shot that responds to both the positive and negative going edges.	
Logic gate	NOT	Logical NOT	Operates on the previous parameter.
	OR(2) ↓ OR(16)	2 input OR gate ↓ 16 input OR gate	Operates on the 2 previous parameters. ↓ Operates on the 16 previous parameters.
	AND(2) ↓ AND(16)	2 input AND gate ↓ 16 input AND gate	Operates on the 2 previous parameters. ↓ Operates on the 16 previous parameters.
	NOR(2) ↓ NOR(16)	2 input NOR gate ↓ 16 input NOR gate	Operates on the 2 previous parameters. ↓ Operates on the 16 previous parameters.
	NAND(2) ↓ NAND(16)	2 input NAND gate ↓ 16 input NAND gate	Operates on the 2 previous parameters. ↓ Operates on the 16 previous parameters.
	XOR(2)	2 input Exclusive OR gate	Operates on the 2 previous parameters.
	LATCH (S,R)	Latch (set, reset): reset-dominant	The parameter preceding LATCH(S,R) is the reset input. The parameter preceding the reset input is the set input.
Timer	TIMER 1 ↓ TIMER 32	Timer set with FlexLogic timer 1 settings. ↓ Timer set with FlexLogic timer 32 settings.	The timer is started by the preceding parameter. The output of the timer is TIMER #.
Assign virtual output	= Virt Op 1 ↓ = Virt Op 96	Assigns previous FlexLogic operand to virtual output 1. ↓ Assigns previous FlexLogic operand to virtual output 96.	The virtual output is set by the preceding parameter

5.5.2 FLEXLOGIC RULES

When forming a FlexLogic equation, the sequence in the linear array of parameters must follow these general rules:

1. Operands must precede the operator which uses the operands as inputs.
2. Operators have only one output. The output of an operator must be used to create a virtual output if it is to be used as an input to two or more operators.
3. Assigning the output of an operator to a virtual output terminates the equation.
4. A timer operator (for example, "TIMER 1") or virtual output assignment (for example, " = Virt Op 1") may only be used once. If this rule is broken, a syntax error will be declared.

5.5.3 FLEXLOGIC EVALUATION

Each equation is evaluated in the order in which the parameters have been entered.

NOTE

FlexLogic provides latches which by definition have a memory action, remaining in the set state after the set input has been asserted. However, they are volatile; that is, they reset on the re-application of control power.

When making changes to settings, all FlexLogic equations are re-compiled whenever any new setting value is entered, so all latches are automatically reset. If it is necessary to re-initialize FlexLogic during testing, for example, it is suggested to power the unit down and then back up.

5.5.4 FLEXLOGIC EXAMPLE

This section provides an example of implementing logic for a typical application. The sequence of the steps is quite important as it should minimize the work necessary to develop the relay settings. Note that the example presented in the figure below is intended to demonstrate the procedure, not to solve a specific application situation.

In the example below, it is assumed that logic has already been programmed to produce virtual outputs 1 and 2, and is only a part of the full set of equations used. When using FlexLogic, it is important to make a note of each virtual output used – a virtual output designation (1 to 96) can only be properly assigned once.

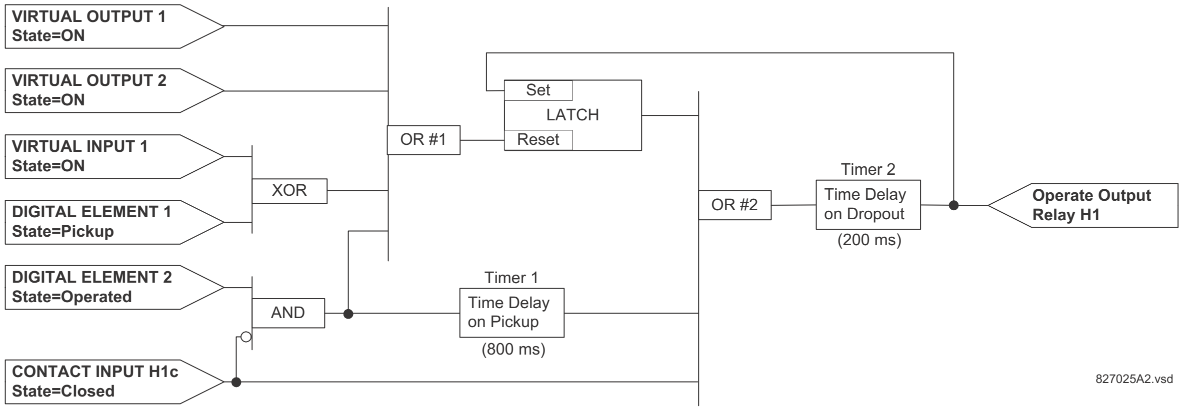

Figure 5–56: EXAMPLE LOGIC SCHEME

1. Inspect the example logic diagram to determine if the required logic can be implemented with the FlexLogic operators. If this is not possible, the logic must be altered until this condition is satisfied. Once this is done, count the inputs to each gate to verify that the number of inputs does not exceed the FlexLogic limits, which is unlikely but possible. If the number of inputs is too high, subdivide the inputs into multiple gates to produce an equivalent. For example, if 25 inputs to an AND gate are required, connect Inputs 1 through 16 to AND(16), 17 through 25 to AND(9), and the outputs from these two gates to AND(2).

   Inspect each operator between the initial operands and final virtual outputs to determine if the output from the operator is used as an input to more than one following operator. If so, the operator output must be assigned as a virtual output.

   For the example shown above, the output of the AND gate is used as an input to both OR#1 and Timer 1, and must therefore be made a virtual output and assigned the next available number (i.e. Virtual Output 3). The final output must also be assigned to a virtual output as virtual output 4, which will be programmed in the contact output section to operate relay H1 (that is, contact output H1).

   Therefore, the required logic can be implemented with two FlexLogic equations with outputs of virtual output 3 and virtual output 4 as shown below.

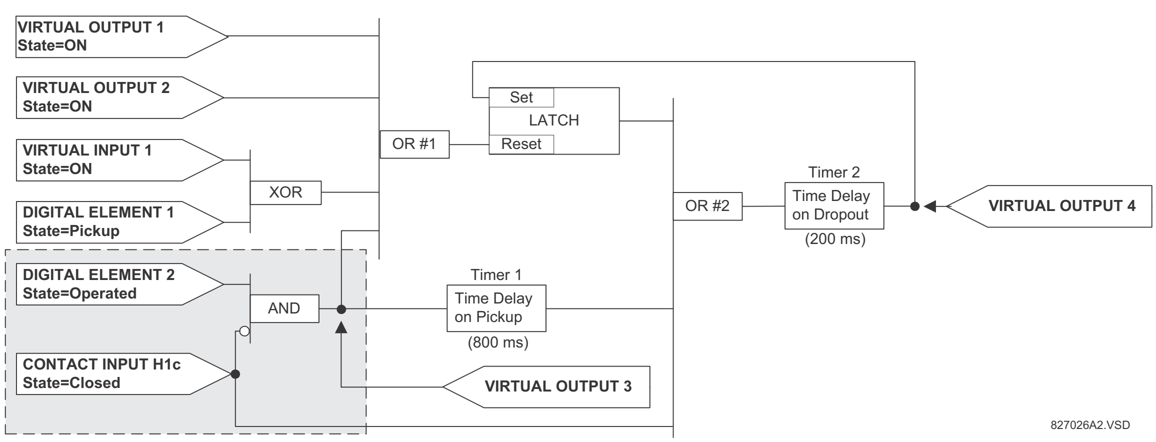

Figure 5–57: LOGIC EXAMPLE WITH VIRTUAL OUTPUTS

2. Prepare a logic diagram for the equation to produce virtual output 3, as this output will be used as an operand in the virtual output 4 equation (create the equation for every output that will be used as an operand first, so that when these operands are required they will already have been evaluated and assigned to a specific virtual output). The logic for virtual output 3 is shown below with the final output assigned.

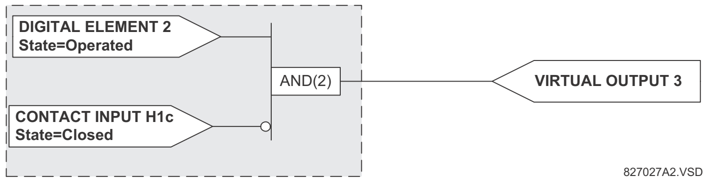

Figure 5–58: LOGIC FOR VIRTUAL OUTPUT 3

3. Prepare a logic diagram for virtual output 4, replacing the logic ahead of virtual output 3 with a symbol identified as virtual output 3, as shown below.

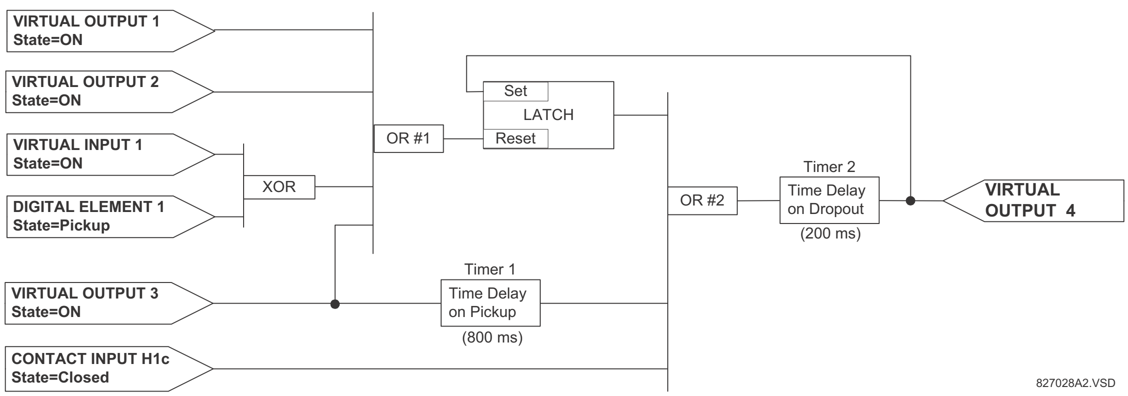

Figure 5–59: LOGIC FOR VIRTUAL OUTPUT 4

4. Program the FlexLogic equation for virtual output 3 by translating the logic into available FlexLogic parameters. The equation is formed one parameter at a time until the required logic is complete. It is generally easier to start at the output end of the equation and work back towards the input, as shown in the following steps. It is also recommended to list operator inputs from bottom to top. For demonstration, the final output will be arbitrarily identified as parameter 99, and each preceding parameter decremented by one in turn. Until accustomed to using FlexLogic, it is suggested that a worksheet with a series of cells marked with the arbitrary parameter numbers be prepared, as shown below.

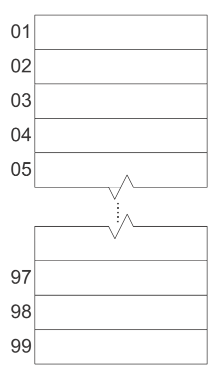

Figure 5–60: FLEXLOGIC WORKSHEET

5. Following the procedure outlined, start with parameter 99, as follows:

   99: The final output of the equation is virtual output 3, which is created by the operator "= Virt Op n". This parameter is therefore "= Virt Op 3."

98: The gate preceding the output is an AND, which in this case requires two inputs. The operator for this gate is a 2-input AND so the parameter is "AND(2)". Note that FlexLogic rules require that the number of inputs to most types of operators must be specified to identify the operands for the gate. As the 2-input AND will operate on the two operands preceding it, these inputs must be specified, starting with the lower.

97: This lower input to the AND gate must be passed through an inverter (the NOT operator) so the next parameter is "NOT". The NOT operator acts upon the operand immediately preceding it, so specify the inverter input next.

96: The input to the NOT gate is to be contact input H1c. The ON state of a contact input can be programmed to be set when the contact is either open or closed. Assume for this example the state is to be ON for a closed contact. The operand is therefore "Cont Ip H1c On".

95: The last step in the procedure is to specify the upper input to the AND gate, the operated state of digital element 2. This operand is "DIG ELEM 2 OP".

Writing the parameters in numerical order can now form the equation for virtual output 3:

```
[95] DIG ELEM 2 OP
[96] Cont Ip H1c On
[97] NOT
[98] AND(2)
[99] = Virt Op 3
```

It is now possible to check that this selection of parameters will produce the required logic by converting the set of parameters into a logic diagram. The result of this process is shown below, which is compared to the logic for virtual output 3 diagram as a check.

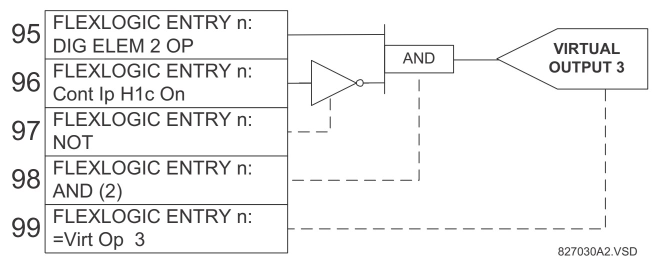

Figure 5–61: FLEXLOGIC EQUATION FOR VIRTUAL OUTPUT 3

6. Repeating the process described for virtual output 3, select the FlexLogic parameters for Virtual Output 4.

99: The final output of the equation is virtual output 4 which is parameter "= Virt Op 4".

98: The operator preceding the output is timer 2, which is operand "TIMER 2". Note that the settings required for the timer are established in the timer programming section.

97: The operator preceding timer 2 is OR #2, a 3-input OR, which is parameter "OR(3)".

96: The lowest input to OR #2 is operand "Cont Ip H1c On".

95: The center input to OR #2 is operand "TIMER 1".

94: The input to timer 1 is operand "Virt Op 3 On".

93: The upper input to OR #2 is operand "LATCH (S,R)".

92: There are two inputs to a latch, and the input immediately preceding the latch reset is OR #1, a 4-input OR, which is parameter "OR(4)".

91: The lowest input to OR #1 is operand "Virt Op 3 On".

90: The input just above the lowest input to OR #1 is operand "XOR(2)".

89: The lower input to the XOR is operand "DIG ELEM 1 PKP".

88: The upper input to the XOR is operand "Virt Ip 1 On".

87: The input just below the upper input to OR #1 is operand "Virt Op 2 On".

86: The upper input to OR #1 is operand "Virt Op 1 On".

85: The last parameter is used to set the latch, and is operand "Virt Op 4 On".

The equation for virtual output 4 is:

```
[85] Virt Op 4 On
[86] Virt Op 1 On
[87] Virt Op 2 On
[88] Virt Ip 1 On
[89] DIG ELEM 1 PKP
[90] XOR(2)
[91] Virt Op 3 On
[92] OR(4)
[93] LATCH (S,R)
[94] Virt Op 3 On
[95] TIMER 1
[96] Cont Ip H1c On
[97] OR(3)
[98] TIMER 2
[99] = Virt Op 4
```

It is now possible to check that the selection of parameters will produce the required logic by converting the set of parameters into a logic diagram. The result of this process is shown below, which is compared to the logic for virtual output 4 diagram as a check.

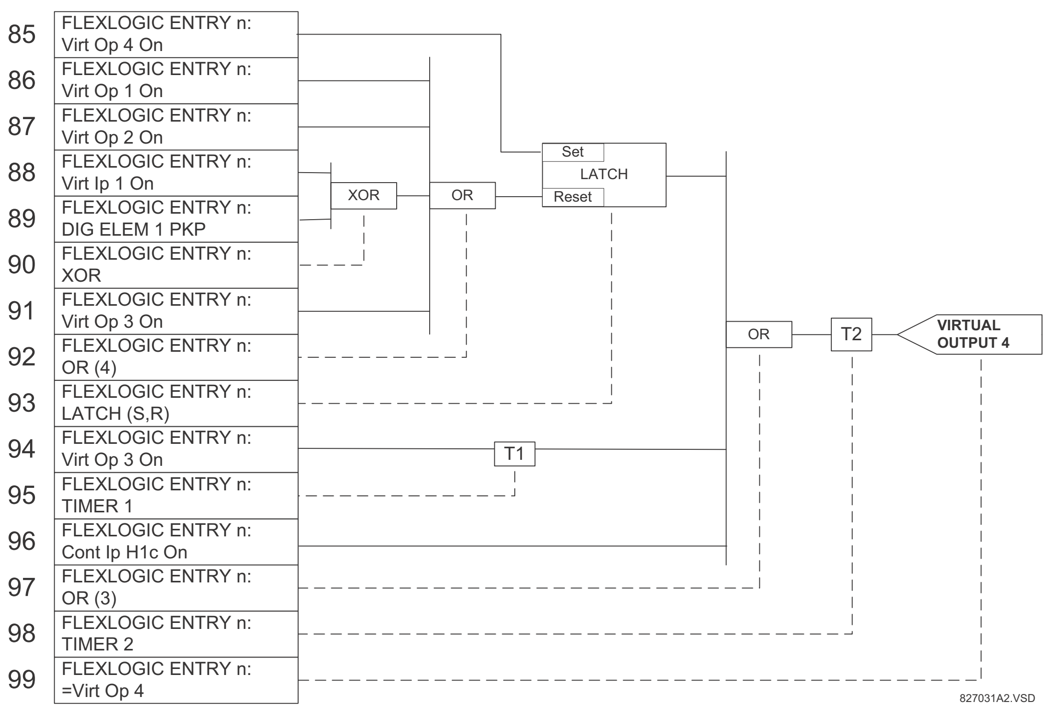

Figure 5–62: FLEXLOGIC EQUATION FOR VIRTUAL OUTPUT 4

7. Now write the complete FlexLogic expression required to implement the logic, making an effort to assemble the equation in an order where Virtual Outputs that will be used as inputs to operators are created before needed. In cases where a lot of processing is required to perform logic, this may be difficult to achieve, but in most cases will not cause problems as all logic is calculated at least four times per power frequency cycle. The possibility of a problem caused by sequential processing emphasizes the necessity to test the performance of FlexLogic before it is placed in service.

   In the following equation, virtual output 3 is used as an input to both latch 1 and timer 1 as arranged in the order shown below:

```
DIG ELEM 2 OP
Cont Ip H1c On
NOT
AND(2)
```

```
= Virt Op 3
Virt Op 4 On
Virt Op 1 On
Virt Op 2 On
Virt Ip 1 On
DIG ELEM 1 PKP
XOR(2)
Virt Op 3 On
OR(4)
LATCH (S,R)
Virt Op 3 On
TIMER 1
Cont Ip H1c On
OR(3)
TIMER 2
= Virt Op 4
END
```

In the expression above, the virtual output 4 input to the four-input OR is listed before it is created. This is typical of a form of feedback, in this case, used to create a seal-in effect with the latch, and is correct.

8. The logic should always be tested after it is loaded into the relay, in the same fashion as has been used in the past. Testing can be simplified by placing an "END" operator within the overall set of FlexLogic equations. The equations will then only be evaluated up to the first "END" operator.

   The "On" and "Off" operands can be placed in an equation to establish a known set of conditions for test purposes, and the "INSERT" and "DELETE" commands can be used to modify equations.

5.5.5 FLEXLOGIC EQUATION EDITOR

PATH: SETTINGS ⇨⇩ FLEXLOGIC ⇨ FLEXLOGIC EQUATION EDITOR

■ FLEXLOGIC ■ EQUATION EDITOR		FLEXLOGIC ENTRY 1: END	*Range: FlexLogic operands*
	MESSAGE	FLEXLOGIC ENTRY 2: END	*Range: FlexLogic operands*
		↓	
	MESSAGE	FLEXLOGIC ENTRY 512: END	*Range: FlexLogic operands*

There are 512 FlexLogic entries available, numbered from 1 to 512, with default END entry settings. If a "Disabled" Element is selected as a FlexLogic entry, the associated state flag will never be set to ‘1’. The ‘+/–‘ key may be used when editing FlexLogic equations from the keypad to quickly scan through the major parameter types.

5.5.6 FLEXLOGIC TIMERS

PATH: SETTINGS ⇨⇩ FLEXLOGIC ⇨⇩ FLEXLOGIC TIMERS ⇨ FLEXLOGIC TIMER 1(32)

■ FLEXLOGIC ■ TIMER 1		TIMER 1 TYPE: millisecond	*Range: millisecond, second, minute*

A FlexElement is a universal comparator that can be used to monitor any analog actual value calculated by the relay or a net difference of any two analog actual values of the same type. The effective operating signal could be treated as a signed number or its absolute value could be used as per user's choice.

The element can be programmed to respond either to a signal level or to a rate-of-change (delta) over a pre-defined period of time. The output operand is asserted when the operating signal is higher than a threshold or lower than a threshold as per user's choice.

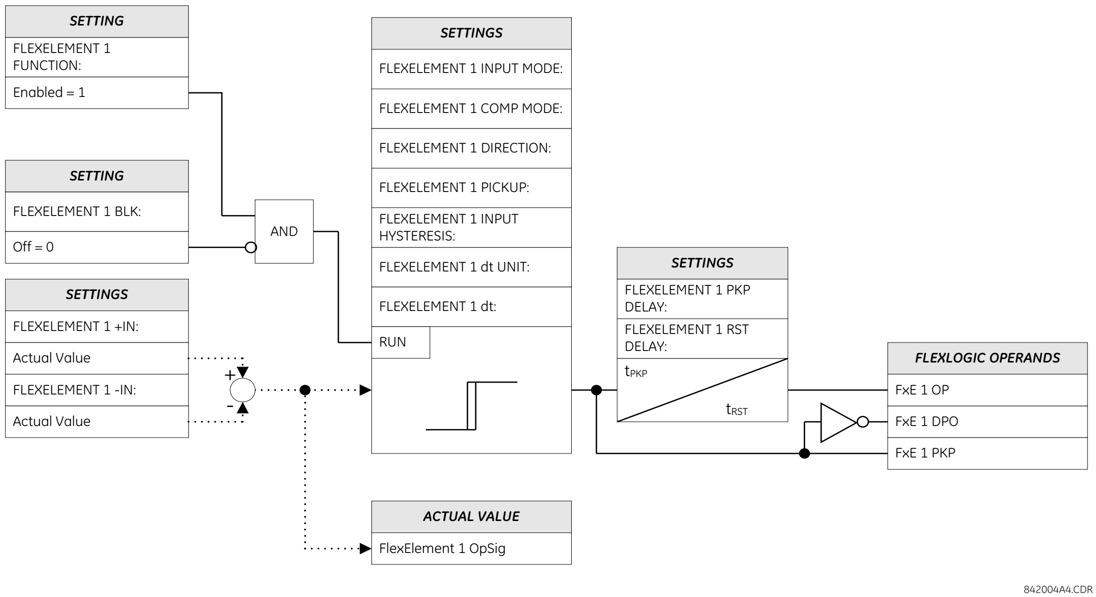

Figure 5–63: FLEXELEMENT SCHEME LOGIC

The **FLEXELEMENT 1 +IN** setting specifies the first (non-inverted) input to the FlexElement. Zero is assumed as the input if this setting is set to “Off”. For proper operation of the element at least one input must be selected. Otherwise, the element will not assert its output operands.

This **FLEXELEMENT 1 –IN** setting specifies the second (inverted) input to the FlexElement. Zero is assumed as the input if this setting is set to “Off”. For proper operation of the element at least one input must be selected. Otherwise, the element will not assert its output operands. This input should be used to invert the signal if needed for convenience, or to make the element respond to a differential signal such as for a top-bottom oil temperature differential alarm. The element will not operate if the two input signals are of different types, for example if one tries to use active power and phase angle to build the effective operating signal.

The element responds directly to the differential signal if the **FLEXELEMENT 1 INPUT MODE** setting is set to “Signed”. The element responds to the absolute value of the differential signal if this setting is set to “Absolute”. Sample applications for the “Absolute” setting include monitoring the angular difference between two phasors with a symmetrical limit angle in both directions; monitoring power regardless of its direction, or monitoring a trend regardless of whether the signal increases of decreases.

The element responds directly to its operating signal – as defined by the **FLEXELEMENT 1 +IN**, **FLEXELEMENT 1 –IN** and **FLEXELEMENT 1 INPUT MODE** settings – if the **FLEXELEMENT 1 COMP MODE** setting is set to “Level”. The element responds to the rate of change of its operating signal if the **FLEXELEMENT 1 COMP MODE** setting is set to “Delta”. In this case the **FLEXELEMENT 1 dt UNIT** and **FLEXELEMENT 1 dt** settings specify how the rate of change is derived.

The **FLEXELEMENT 1 DIRECTION** setting enables the relay to respond to either high or low values of the operating signal. The following figure explains the application of the **FLEXELEMENT 1 DIRECTION**, **FLEXELEMENT 1 PICKUP** and **FLEXELEMENT 1 HYSTERESIS** settings.

5

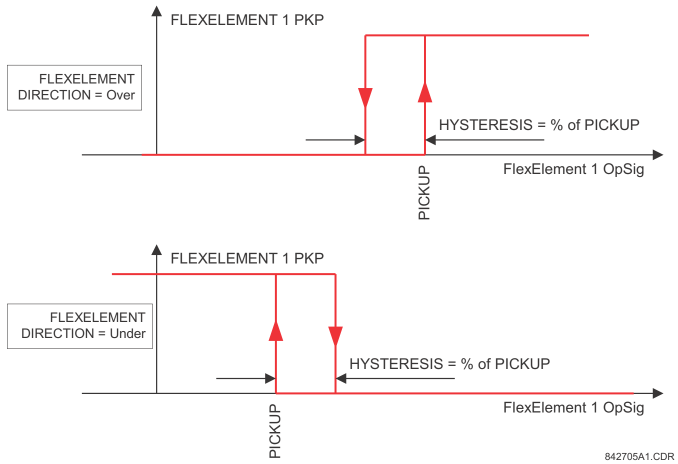

Figure 5–64: FLEXELEMENT DIRECTION, PICKUP, AND HYSTERESIS

In conjunction with the **FLEXELEMENT 1 INPUT MODE** setting the element could be programmed to provide two extra characteristics as shown in the figure below.

5

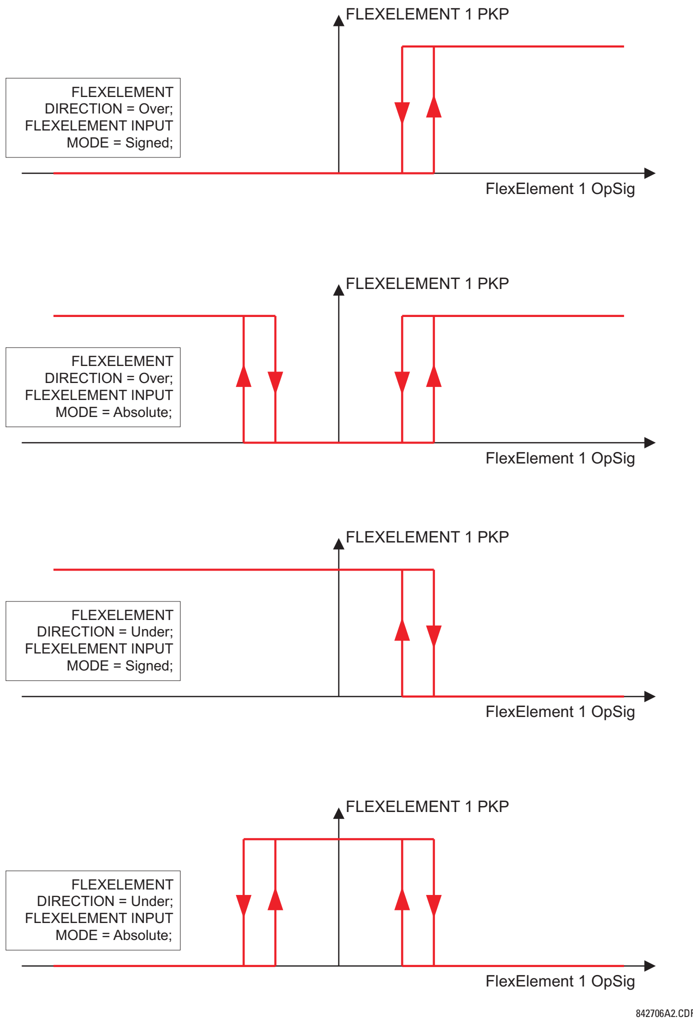

Figure 5–65: FLEXELEMENT INPUT MODE SETTING

The **FLEXELEMENT 1 PICKUP** setting specifies the operating threshold for the effective operating signal of the element. If set to “Over”, the element picks up when the operating signal exceeds the **FLEXELEMENT 1 PICKUP** value. If set to “Under”, the element picks up when the operating signal falls below the **FLEXELEMENT 1 PICKUP** value.

The **FLEXELEMENT 1 HYSTERESIS** setting controls the element dropout. It should be noticed that both the operating signal and the pickup threshold can be negative facilitating applications such as reverse power alarm protection. The FlexElement can be programmed to work with all analog actual values measured by the relay. The **FLEXELEMENT 1 PICKUP** setting is entered in per-unit values using the following definitions of the base units:

Table 5–19: FLEXELEMENT BASE UNITS

BREAKER ARCING AMPS (Brk X Arc Amp A, B, and C)	BASE = 2000 $kA^2 \times$ cycle
dcmA	BASE = maximum value of the **DCMA INPUT MAX** setting for the two transducers configured under the +IN and –IN inputs.
DELTA TIME	BASE = 1 μs
FREQUENCY	f_{BASE} = 1 Hz
FREQUENCY RATE OF CHANGE	df/dt_{BASE} = 1 Hz/s
PHASE ANGLE	φ_{BASE} = 360 degrees (see the UR angle referencing convention)
POWER FACTOR	PF_{BASE} = 1.00

Table 5–19: FLEXELEMENT BASE UNITS

RTDs	BASE = 100°C
SENSITIVE DIR POWER (Sns Dir Power)	P_{BASE} = maximum value of 3 × V_{BASE} × I_{BASE} for the +IN and –IN inputs of the sources configured for the sensitive power directional element(s).
SOURCE CURRENT	I_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SOURCE ENERGY (Positive and Negative Watthours, Positive and Negative Varhours)	E_{BASE} = 10000 MWh or MVAh, respectively
SOURCE POWER	P_{BASE} = maximum value of V_{BASE} × I_{BASE} for the +IN and –IN inputs
SOURCE THD & HARMONICS	BASE = 1%
SOURCE VOLTAGE	V_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SYNCHROCHECK (Max Delta Volts)	V_{BASE} = maximum primary RMS value of all the sources related to the +IN and –IN inputs

The **FLEXELEMENT 1 HYSTERESIS** setting defines the pickup–dropout relation of the element by specifying the width of the hysteresis loop as a percentage of the pickup value as shown in the *FlexElement direction, pickup, and hysteresis* diagram.

The **FLEXELEMENT 1 DT UNIT** setting specifies the time unit for the setting **FLEXELEMENT 1 dt**. This setting is applicable only if **FLEXELEMENT 1 COMP MODE** is set to “Delta”. The **FLEXELEMENT 1 DT** setting specifies duration of the time interval for the rate of change mode of operation. This setting is applicable only if **FLEXELEMENT 1 COMP MODE** is set to “Delta”.

This **FLEXELEMENT 1 PKP DELAY** setting specifies the pickup delay of the element. The **FLEXELEMENT 1 RST DELAY** setting specifies the reset delay of the element.

5.5.8 NON-VOLATILE LATCHES

PATH: SETTINGS ⇨⇩ FLEXLOGIC ⇨⇩ NON-VOLATILE LATCHES ⇨ LATCH 1(16)

■ LATCH 1 ■		LATCH 1 FUNCTION: Disabled	Range: *Disabled, Enabled*
	MESSAGE	LATCH 1 TYPE: Reset Dominant	Range: *Reset Dominant, Set Dominant*
	MESSAGE	LATCH 1 SET: Off	Range: *FlexLogic operand*
	MESSAGE	LATCH 1 RESET: Off	Range: *FlexLogic operand*
	MESSAGE	LATCH 1 TARGET: Self-reset	Range: *Self-reset, Latched, Disabled*
	MESSAGE	LATCH 1 EVENTS: Disabled	Range: *Disabled, Enabled*

The non-volatile latches provide a permanent logical flag that is stored safely and will not reset upon reboot after the relay is powered down. Typical applications include sustaining operator commands or permanently block relay functions, such as Autorecloser, until a deliberate interface action resets the latch. The settings element operation is described below:

- **LATCH 1 TYPE**: This setting characterizes Latch 1 to be Set- or Reset-dominant.
- **LATCH 1 SET**: If asserted, the specified FlexLogic operands 'sets' Latch 1.
- **LATCH 1 RESET**: If asserted, the specified FlexLogic operand 'resets' Latch 1.

5

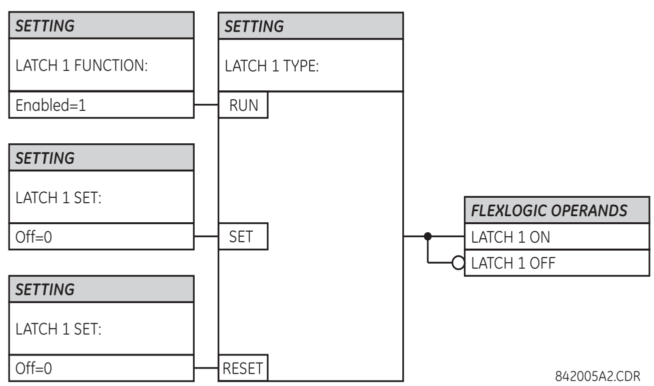

Figure 5–66: NON-VOLATILE LATCH OPERATION TABLE (N = 1 to 16) AND LOGIC

5.6.1 OVERVIEW

Each protection element can be assigned up to six different sets of settings according to setting group designations 1 to 6. The performance of these elements is defined by the active setting group at a given time. Multiple setting groups allow the user to conveniently change protection settings for different operating situations (for example, altered power system configuration, season of the year, etc.). The active setting group can be preset or selected via the **SETTING GROUPS** menu (see the *Control Elements* section later in this chapter). See also the *Introduction to Elements* section at the beginning of this chapter.

5.6.2 SETTING GROUP

PATH: SETTINGS ⇨⇩ GROUPED ELEMENTS ⇨ SETTING GROUP 1(6)

■ SETTING GROUP 1 ■		■ LOAD ENCROACHMENT ■	See page 5-163.
	MESSAGE	■ PHASE CURRENT ■	See page 5-165.
	MESSAGE	■ NEUTRAL CURRENT ■	See page 5-175.
	MESSAGE	■ WATTMETRIC ■ GROUND FAULT	See page 5-183.
	MESSAGE	■ GROUND CURRENT ■	See page 5-186.
	MESSAGE	■ NEGATIVE SEQUENCE ■ CURRENT	See page 5-188.
	MESSAGE	■ BREAKER FAILURE ■	See page 5-195.
	MESSAGE	■ VOLTAGE ELEMENTS ■	See page 5-204.
	MESSAGE	■ POWER ■	See page 5-212.

Each of the six setting group menus is identical. Setting group 1 (the default active group) automatically becomes active if no other group is active (see the *Control elements* section for additional details).

5.6.3 LOAD ENCROACHMENT

PATH: SETTINGS ⇨⇩ GROUPED ELEMENTS ⇨ SETTING GROUP 1(6) ⇨⇩ LOAD ENCROACHMENT

The load encroachment element responds to the positive-sequence voltage and current and applies a characteristic shown in the figure below.

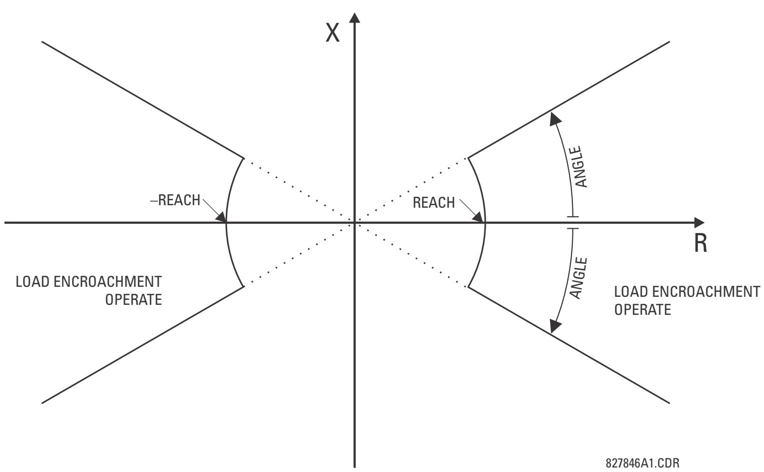

Figure 5–67: LOAD ENCROACHMENT CHARACTERISTIC

The element operates if the positive-sequence voltage is above a settable level and asserts its output signal that can be used to block selected protection elements such as distance or phase overcurrent. The following figure shows an effect of the load encroachment characteristics used to block the quadrilateral distance element.

5

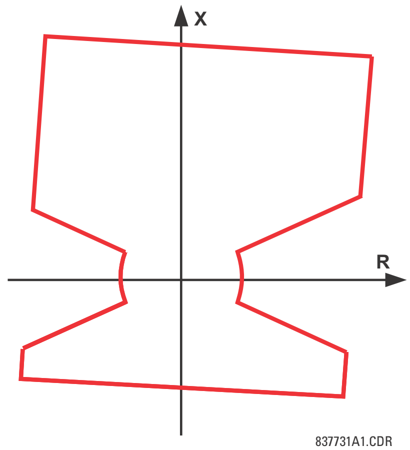

Figure 5–68: LOAD ENCROACHMENT APPLIED TO DISTANCE ELEMENT

- **LOAD ENCROACHMENT MIN VOLT:** This setting specifies the minimum positive-sequence voltage required for operation of the element. If the voltage is below this threshold a blocking signal will not be asserted by the element. When selecting this setting one must remember that the F60 measures the phase-to-ground sequence voltages regardless of the VT connection.

  The nominal VT secondary voltage as specified with the **SYSTEM SETUP ⇨⇩ AC INPUTS ⇨ VOLTAGE BANK X5 ⇨⇩ PHASE VT SECONDARY** setting is the per-unit base for this setting.

- **LOAD ENCROACHMENT REACH:** This setting specifies the resistive reach of the element as shown in the *Load encroachment characteristic* diagram. This setting should be entered in secondary ohms and be calculated as the positive-sequence resistance seen by the relay under maximum load conditions and unity power factor.

- **LOAD ENCROACHMENT ANGLE:** This setting specifies the size of the blocking region as shown on the *Load encroachment characteristic* diagram and applies to the positive-sequence impedance.

The F60 Feeder Protection System has two (2) phase time overcurrent, two (2) phase instantaneous overcurrent, and two (2) phase directional overcurrent elements.

b) INVERSE TIME OVERCURRENT CHARACTERISTICS

The inverse time overcurrent curves used by the time overcurrent elements are the IEEE, IEC, GE Type IAC, and I^2t standard curve shapes. This allows for simplified coordination with downstream devices.

If none of these curve shapes is adequate, FlexCurves may be used to customize the inverse time curve characteristics. The definite time curve is also an option that may be appropriate if only simple protection is required.

Table 5–20: OVERCURRENT CURVE TYPES

IEEE	IEC	GE TYPE IAC	OTHER
IEEE Extremely Inverse	IEC Curve A (BS142)	IAC Extremely Inverse	I^2t
IEEE Very Inverse	IEC Curve B (BS142)	IAC Very Inverse	FlexCurves A, B, C, and D
IEEE Moderately Inverse	IEC Curve C (BS142)	IAC Inverse	Recloser Curves
	IEC Short Inverse	IAC Short Inverse	Definite Time

A time dial multiplier setting allows selection of a multiple of the base curve shape (where the time dial multiplier = 1) with the curve shape (**CURVE**) setting. Unlike the electromechanical time dial equivalent, operate times are directly proportional to the time multiplier (**TD MULTIPLIER**) setting value. For example, all times for a multiplier of 10 are 10 times the multiplier 1 or base curve values. Setting the multiplier to zero results in an instantaneous response to all current levels above pickup.

Time overcurrent time calculations are made with an internal *energy capacity* memory variable. When this variable indicates that the energy capacity has reached 100%, a time overcurrent element will operate. If less than 100% energy capacity is accumulated in this variable and the current falls below the dropout threshold of 97 to 98% of the pickup value, the variable must be reduced. Two methods of this resetting operation are available: “Instantaneous” and “Timed”. The “Instantaneous” selection is intended for applications with other relays, such as most static relays, which set the energy capacity directly to zero when the current falls below the reset threshold. The “Timed” selection can be used where the relay must coordinate with electromechanical relays.

IEEE CURVES:

The IEEE time overcurrent curve shapes conform to industry standards and the IEEE C37.112-1996 curve classifications for extremely, very, and moderately inverse. The IEEE curves are derived from the formulae:

$$T = TDM \times \left[\frac{A}{\left(\frac{I}{I_{pickup}} \right)^p - 1} + B \right], T_{RESET} = TDM \times \left[\frac{t_r}{1 - \left(\frac{I}{I_{pickup}} \right)^2} \right] \quad \textbf{(EQ 5.8)}$$

where: T = operate time (in seconds), TDM = Multiplier setting, I = input current, I_{pickup} = Pickup Current setting
A, B, p = constants, T_{RESET} = reset time in seconds (assuming energy capacity is 100% and **RESET** is "Timed"),
t_r = characteristic constant

IEC CURVES

For European applications, the relay offers three standard curves defined in IEC 255-4 and British standard BS142. These are defined as IEC Curve A, IEC Curve B, and IEC Curve C. The formulae for these curves are:

$$T = TDM \times \left[\frac{K}{(I/I_{pickup})^E - 1}\right],\ T_{RESET} = TDM \times \left[\frac{t_r}{1 - (I/I_{pickup})^2}\right] \quad \textbf{(EQ 5.9)}$$

where: T = operate time (in seconds), TDM = Multiplier setting, I = input current, I_{pickup} = Pickup Current setting, K, E = constants, t_r = characteristic constant, and T_{RESET} = reset time in seconds (assuming energy capacity is 100% and **RESET** is "Timed")

FLEXCURVES:

The custom FlexCurves are described in detail in the FlexCurves section of this chapter. The curve shapes for the FlexCurves are derived from the formulae:

$$T = \text{TDM} \times \left[\text{FlexCurve Time at } \left(\frac{I}{I_{pickup}}\right)\right] \quad \text{when } \left(\frac{I}{I_{pickup}}\right) \geq 1.00 \quad \textbf{(EQ 5.12)}$$

$$T_{RESET} = \text{TDM} \times \left[\text{FlexCurve Time at } \left(\frac{I}{I_{pickup}}\right)\right] \quad \text{when } \left(\frac{I}{I_{pickup}}\right) \leq 0.98 \quad \textbf{(EQ 5.13)}$$

where: T = Operate Time (sec.), TDM = Multiplier setting
I = Input Current, I_{pickup} = Pickup Current setting
T_{RESET} = Reset Time in seconds (assuming energy capacity is 100% and RESET: Timed)

DEFINITE TIME CURVE:

The Definite Time curve shape operates as soon as the pickup level is exceeded for a specified period of time. The base definite time curve delay is in seconds. The curve multiplier of 0.00 to 600.00 makes this delay adjustable from instantaneous to 600.00 seconds in steps of 10 ms.

$$T = \text{TDM} \text{ in seconds, when } I > I_{pickup} \quad \textbf{(EQ 5.14)}$$

$$T_{RESET} = \text{TDM} \text{ in seconds} \quad \textbf{(EQ 5.15)}$$

where: T = Operate Time (sec.), TDM = Multiplier setting
I = Input Current, I_{pickup} = Pickup Current setting
T_{RESET} = Reset Time in seconds (assuming energy capacity is 100% and RESET: Timed)

RECLOSER CURVES:

The F60 uses the FlexCurve feature to facilitate programming of 41 recloser curves. See the FlexCurve section in this chapter for details.

The phase time overcurrent element can provide a desired time-delay operating characteristic versus the applied current or be used as a simple definite time element. The phase current input quantities may be programmed as fundamental phasor magnitude or total waveform RMS magnitude as required by the application.

Two methods of resetting operation are available: “Timed” and “Instantaneous” (see the *Inverse TOC Curve Characteristics* section earlier for details on curve setup, trip times, and reset operation). When the element is blocked, the time accumulator will reset according to the reset characteristic. For example, if the element reset characteristic is set to “Instantaneous” and the element is blocked, the time accumulator will be cleared immediately.

The **PHASE TOC1 PICKUP** setting can be dynamically reduced by a voltage restraint feature (when enabled). This is accomplished via the multipliers (Mvr) corresponding to the phase-phase voltages of the voltage restraint characteristic curve (see the figure below); the pickup level is calculated as ‘Mvr’ times the **PHASE TOC1 PICKUP** setting. If the voltage restraint feature is disabled, the pickup level always remains at the setting value.

The phase directional elements (one for each of phases A, B, and C) determine the phase current flow direction for steady state and fault conditions and can be used to control the operation of the phase overcurrent elements via the **BLOCK** inputs of these elements.

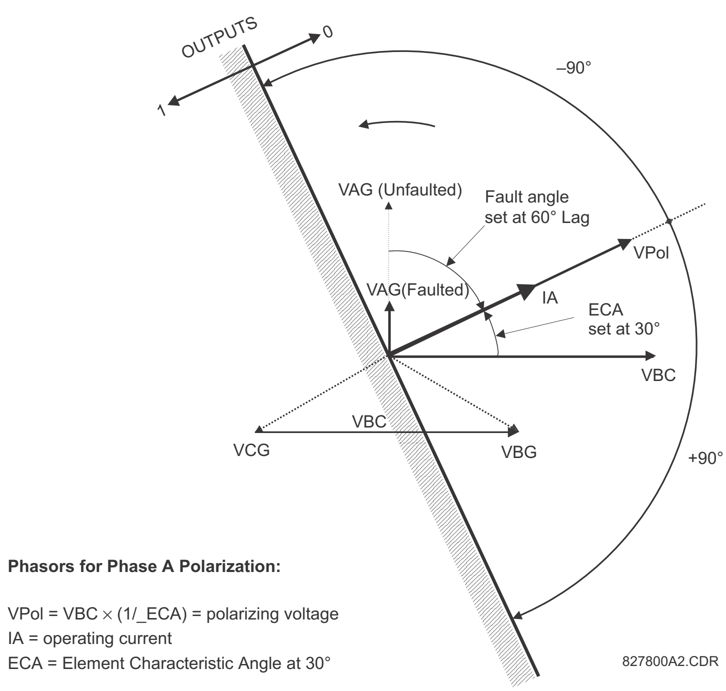

Figure 5–73: PHASE A DIRECTIONAL POLARIZATION

This element is intended to apply a block signal to an overcurrent element to prevent an operation when current is flowing in a particular direction. The direction of current flow is determined by measuring the phase angle between the current from the phase CTs and the line-line voltage from the VTs, based on the 90° or quadrature connection. If there is a requirement to supervise overcurrent elements for flows in opposite directions, such as can happen through a bus-tie breaker, two phase directional elements should be programmed with opposite element characteristic angle (ECA) settings.

To increase security for three phase faults very close to the VTs used to measure the polarizing voltage, a voltage memory feature is incorporated. This feature stores the polarizing voltage the moment before the voltage collapses, and uses it to determine direction. The voltage memory remains valid for one second after the voltage has collapsed.

The main component of the phase directional element is the phase angle comparator with two inputs: the operating signal (phase current) and the polarizing signal (the line voltage, shifted in the leading direction by the characteristic angle, ECA).

The following table shows the operating and polarizing signals used for phase directional control:

PHASE	OPERATING SIGNAL	POLARIZING SIGNAL V_{pol}	
		ABC PHASE SEQUENCE	ACB PHASE SEQUENCE
A	angle of IA	angle of VBC × (1∠ECA)	angle of VCB × (1∠ECA)
B	angle of IB	angle of VCA × (1∠ECA)	angle of VAC × 1∠ECA)
C	angle of IC	angle of VAB × (1∠ECA)	angle of VBA × (1∠ECA)

MODE OF OPERATION:

- When the function is “Disabled”, or the operating current is below 5% × CT nominal, the element output is “0”.
- When the function is “Enabled”, the operating current is above 5% × CT nominal, and the polarizing voltage is above the **PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨⇩ VOLTAGE CUT-OFF LEVEL** value, the element output is dependent on the phase angle between the operating and polarizing signals:

  – The element output is logic “0” when the operating current is within polarizing voltage ±90°.
  – For all other angles, the element output is logic “1”.
- Once the voltage memory has expired, the phase overcurrent elements under directional control can be set to block or trip on overcurrent as follows:

  – When **BLOCK WHEN V MEM EXP** is set to “Yes”, the directional element will block the operation of any phase overcurrent element under directional control when voltage memory expires.
  – When **BLOCK WHEN V MEM EXP** is set to “No”, the directional element allows tripping of phase overcurrent elements under directional control when voltage memory expires.

In all cases, directional blocking will be permitted to resume when the polarizing voltage becomes greater than the ‘polarizing voltage threshold’.

SETTINGS:

- **PHASE DIR 1 SIGNAL SOURCE:** This setting is used to select the source for the operating and polarizing signals. The operating current for the phase directional element is the phase current for the selected current source. The polarizing voltage is the line voltage from the phase VTs, based on the 90° or ‘quadrature’ connection and shifted in the leading direction by the element characteristic angle (ECA).
- **PHASE DIR 1 ECA:** This setting is used to select the element characteristic angle, i.e. the angle by which the polarizing voltage is shifted in the leading direction to achieve dependable operation. In the design of the UR-series elements, a block is applied to an element by asserting logic 1 at the blocking input. This element should be programmed via the ECA setting so that the output is **logic 1 for current in the non-tripping direction**.
- **PHASE DIR 1 POL V THRESHOLD:** This setting is used to establish the minimum level of voltage for which the phase angle measurement is reliable. The setting is based on VT accuracy. The default value is “0.700 pu”.
- **PHASE DIR 1 BLOCK WHEN V MEM EXP:** This setting is used to select the required operation upon expiration of voltage memory. When set to "Yes", the directional element blocks the operation of any phase overcurrent element under directional control, when voltage memory expires; when set to "No", the directional element allows tripping of phase overcurrent elements under directional control.

NOTE

The phase directional element responds to the forward load current. In the case of a following reverse fault, the element needs some time – in the order of 8 ms – to establish a blocking signal. Some protection elements such as instantaneous overcurrent may respond to reverse faults before the blocking signal is established. Therefore, a coordination time of at least 10 ms must be added to all the instantaneous protection elements under the supervision of the phase directional element. If current reversal is of a concern, a longer delay – in the order of 20 ms – may be needed.

The neutral time overcurrent element can provide a desired time-delay operating characteristic versus the applied current or be used as a simple definite time element. The neutral current input value is a quantity calculated as 3Io from the phase currents and may be programmed as fundamental phasor magnitude or total waveform RMS magnitude as required by the application.

Two methods of resetting operation are available: “Timed” and “Instantaneous” (see the *Inverse TOC Curve Characteristics* section for details on curve setup, trip times and reset operation). When the element is blocked, the time accumulator will reset according to the reset characteristic. For example, if the element reset characteristic is set to “Instantaneous” and the element is blocked, the time accumulator will be cleared immediately.

The neutral instantaneous overcurrent element may be used as an instantaneous function with no intentional delay or as a definite time function. The element essentially responds to the magnitude of a neutral current fundamental frequency phasor calculated from the phase currents. A positive-sequence restraint is applied for better performance. A small portion (6.25%) of the positive-sequence current magnitude is subtracted from the zero-sequence current magnitude when forming the operating quantity of the element as follows:

$$I_{op} = 3 \times (|I\_0| - K \cdot |I\_1|) \quad \text{where } K = 1/16 \qquad \textbf{(EQ 5.16)}$$

The positive-sequence restraint allows for more sensitive settings by counterbalancing spurious zero-sequence currents resulting from:

- System unbalances under heavy load conditions
- Transformation errors of current transformers (CTs) during double-line and three-phase faults.
- Switch-off transients during double-line and three-phase faults.

The positive-sequence restraint must be considered when testing for pickup accuracy and response time (multiple of pickup). The operating quantity depends on how test currents are injected into the relay (single-phase injection: $I_{op} = 0.9375 \cdot I_{injected}$; three-phase pure zero-sequence injection: $I_{op} = 3 \times I_{injected}$).

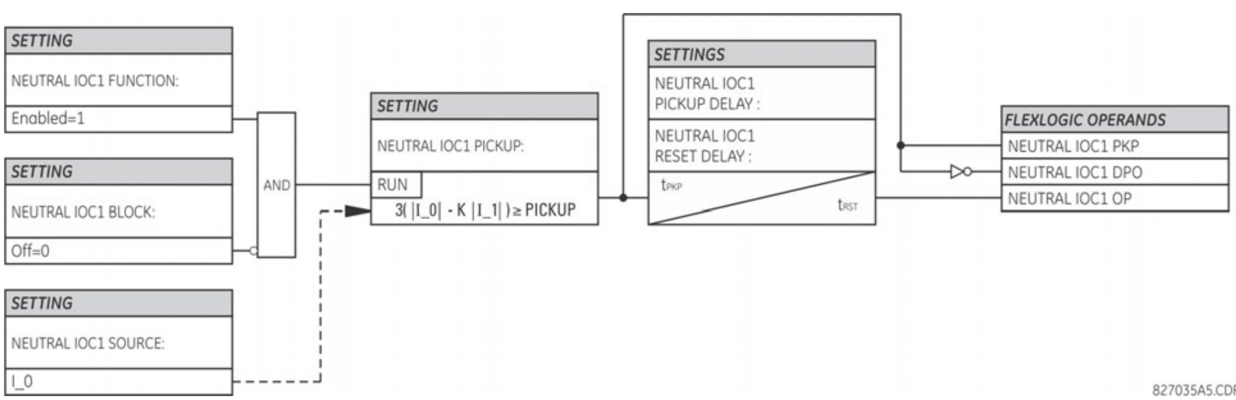

Figure 5–76: NEUTRAL IOC1 SCHEME LOGIC

MESSAGE	NEUTRAL DIR OC1 EVENTS: Disabled	Range: Disabled, Enabled

The neutral directional overcurrent element provides both forward and reverse fault direction indications the NEUTRAL DIR OC1 FWD and NEUTRAL DIR OC1 REV operands, respectively. The output operand is asserted if the magnitude of the operating current is above a pickup level (overcurrent unit) and the fault direction is seen as *forward* or *reverse*, respectively (directional unit).

The **overcurrent unit** responds to the magnitude of a fundamental frequency phasor of the either the neutral current calculated from the phase currents or the ground current. There are separate pickup settings for the forward-looking and reverse-looking functions. If set to use the calculated 3I_0, the element applies a *positive-sequence restraint* for better performance: a small user-programmable portion of the positive-sequence current magnitude is subtracted from the zero-sequence current magnitude when forming the operating quantity.

$$I_{op} = 3 \times (|I\_0| - K \times |I\_1|) \quad \textbf{(EQ 5.17)}$$

The positive-sequence restraint allows for more sensitive settings by counterbalancing spurious zero-sequence currents resulting from:

- System unbalances under heavy load conditions.

- Transformation errors of current transformers (CTs) during double-line and three-phase faults.
- Switch-off transients during double-line and three-phase faults.

The positive-sequence restraint must be considered when testing for pickup accuracy and response time (multiple of pickup). The operating quantity depends on the way the test currents are injected into the relay (single-phase injection: $I_{op} = (1 - K) \times I_{injected}$; three-phase pure zero-sequence injection: $I_{op} = 3 \times I_{injected}$).

The positive-sequence restraint is removed for low currents. If the positive-sequence current is below 0.8 pu, the restraint is removed by changing the constant *K* to zero. This facilitates better response to high-resistance faults when the unbalance is very small and there is no danger of excessive CT errors as the current is low.

The **directional unit** uses the zero-sequence current (I_0) or ground current (IG) for fault direction discrimination and may be programmed to use either zero-sequence voltage ("Calculated V0" or "Measured VX"), ground current (IG), or both for polarizing. The zero-sequence current (I_0) must be greater than the **PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨⇩ CURRENT CUT-OFF LEVEL** setting value and IG must be greater than 0.05 pu to be validated as the operating quantity for directional current. The following tables define the neutral directional overcurrent element.

Table 5–28: QUANTITIES FOR "CALCULATED 3I0" CONFIGURATION

DIRECTIONAL UNIT				OVERCURRENT UNIT
POLARIZING MODE	DIRECTION	COMPARED PHASORS		
Voltage	Forward	–V_0 + Z_offset × I_0	I_0 × 1∠ECA	$I_{op} = 3 \times (\lvert I\_0\rvert - K \times \lvert I\_1\rvert)$ if $\lvert I_1\rvert > 0.8$ pu $I_{op} = 3 \times (\lvert I\_0\rvert)$ if $\lvert I_1\rvert \le 0.8$ pu
	Reverse	–V_0 + Z_offset × I_0	–I_0 × 1∠ECA

		or		
		IG	I_0	
	Reverse	–V_0 + Z_offset × I_0	–I_0 × 1∠ECA	
		or		
		IG	–I_0	

Table 5–29: QUANTITIES FOR "MEASURED IG" CONFIGURATION

DIRECTIONAL UNIT				OVERCURRENT UNIT
POLARIZING MODE	DIRECTION	COMPARED PHASORS		
Voltage	Forward	–V_0 + Z_offset × IG/3	IG × 1∠ECA	$I_{op} = \lvert IG\rvert$
	Reverse	–V_0 + Z_offset × IG/3	–IG × 1∠ECA	

where: $V\_0 = \frac{1}{3}(VAG + VBG + VCG) = \text{zero sequence voltage}$,

$I\_0 = \frac{1}{3}IN = \frac{1}{3}(IA + IB + IC) = \text{zero sequence current}$,

ECA = element characteristic angle and IG = ground current

When **NEUTRAL DIR OC1 POL VOLT** is set to "Measured VX", one-third of this voltage is used in place of V_0. The following figure explains the usage of the voltage polarized directional unit of the element.

The figure below shows the voltage-polarized phase angle comparator characteristics for a phase A to ground fault, with:

- ECA = 90° (element characteristic angle = centerline of operating characteristic)
- FWD LA = 80° (forward limit angle = the ± angular limit with the ECA for operation)
- REV LA = 80° (reverse limit angle = the ± angular limit with the ECA for operation)

The element incorporates a current reversal logic: if the reverse direction is indicated for at least 1.25 of a power system cycle, the prospective forward indication is delayed by 1.5 of a power system cycle. The element is designed to emulate an electromechanical directional device. Larger operating and polarizing signals results in faster directional discrimination bringing more security to the element operation.

The forward-looking function is designed to be more secure as compared to the reverse-looking function, and therefore, should be used for the tripping direction. The reverse-looking function is designed to be faster as compared to the forward-looking function and should be used for the blocking direction. This allows for better protection coordination.

The above bias should be taken into account when using the neutral directional overcurrent element to directionalize other protection elements.

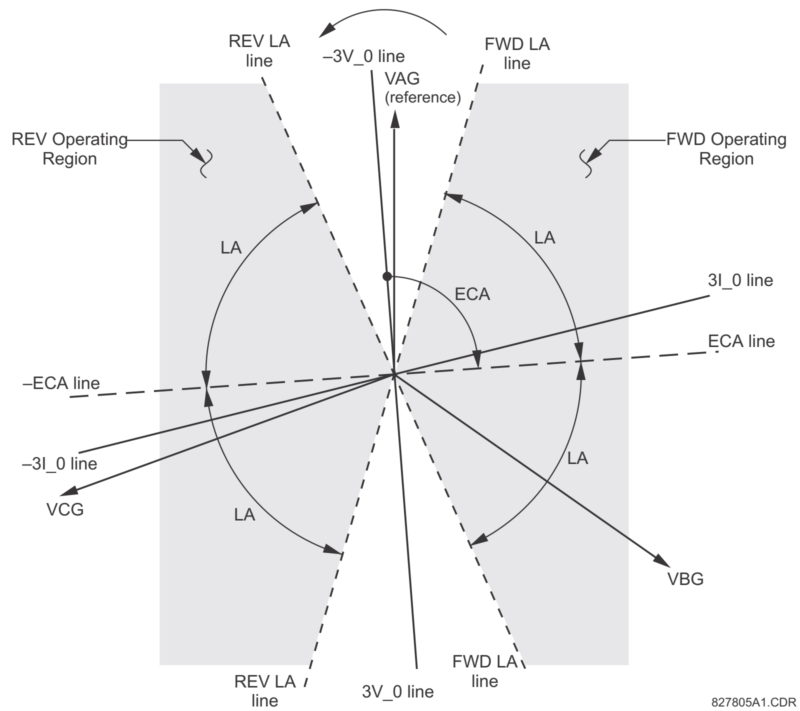

Figure 5–77: NEUTRAL DIRECTIONAL VOLTAGE-POLARIZED CHARACTERISTICS

- **NEUTRAL DIR OC1 POLARIZING:** This setting selects the polarizing mode for the directional unit.
  - If "Voltage" polarizing is selected, the element uses the zero-sequence voltage angle for polarization. The user can use either the zero-sequence voltage V_0 calculated from the phase voltages, or the zero-sequence voltage supplied externally as the auxiliary voltage V_X, both from the **NEUTRAL DIR OC1 SOURCE**.

    The calculated V_0 can be used as polarizing voltage only if the voltage transformers are connected in Wye. The auxiliary voltage can be used as the polarizing voltage provided **SYSTEM SETUP ⇨ AC INPUTS ⇨⇩ VOLTAGE BANK ⇨⇩ AUXILIARY VT CONNECTION** is set to "Vn" and the auxiliary voltage is connected to a zero-sequence voltage source (such as broken delta connected secondary of VTs).

    The zero-sequence (V_0) or auxiliary voltage (V_X), accordingly, must be greater than the **VOLTAGE CUTOFF LEVEL** setting specified in the **PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES** menu to be validated for use as a polarizing signal. If the polarizing signal is invalid, neither forward nor reverse indication is given.
  - If "Current" polarizing is selected, the element uses the ground current angle connected externally and configured under **NEUTRAL OC1 SOURCE** for polarization. The ground CT must be connected between the ground and neutral point of an adequate local source of ground current. The ground current must be greater than 0.05 pu to be validated as a polarizing signal. If the polarizing signal is not valid, neither forward nor reverse indication is given. In addition, the zero-sequence current (I_0) must be greater than the **PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨⇩ CURRENT CUT-OFF LEVEL** setting value.

    For a choice of current polarizing, it is recommended that the polarizing signal be analyzed to ensure that a known direction is maintained irrespective of the fault location. For example, if using an autotransformer neutral current as a polarizing source, it should be ensured that a reversal of the ground current does not occur for a high-side fault. The low-side system impedance should be assumed minimal when checking for this condition. A similar situation arises for a wye/delta/wye transformer, where current in one transformer winding neutral may reverse when faults on both sides of the transformer are considered.

– If “Dual” polarizing is selected, the element performs both directional comparisons as described. A given direction is confirmed if either voltage or current comparators indicate so. If a conflicting (simultaneous forward and reverse) indication occurs, the forward direction overrides the reverse direction.

– If "Dual-V" polarizing is selected, "Voltage" polarizing is performed and "Current" polarizing is ignored if the voltage polarizing signal is valid; otherwise "Current" polarizing is performed if the current polarizing signal is valid. If neither of them is valid, neither forward nor reverse indication is given.

– If "Dual-I" polarizing is selected, "Current" polarizing is performed and "Voltage" polarizing is ignored if the current polarizing signal is valid; otherwise "Voltage" polarizing is performed if the voltage polarizing signal is valid. If neither of them is valid, neither forward nor reverse indication is given.

- **NEUTRAL DIR OC1 POL VOLT:** Selects the polarizing voltage used by the directional unit when "Voltage," "Dual," "Dual-V," or "Dual-I" polarizing mode is set. The polarizing voltage can be programmed to be either the zero-sequence voltage calculated from the phase voltages ("Calculated V0") or supplied externally as an auxiliary voltage ("Measured VX").
- **NEUTRAL DIR OC1 OP CURR:** This setting indicates whether the 3I_0 current calculated from the phase currents, or the ground current shall be used by this protection. This setting acts as a switch between the neutral and ground modes of operation (67N and 67G). If set to “Calculated 3I0” the element uses the phase currents and applies the positive-sequence restraint; if set to “Measured IG” the element uses ground current supplied to the ground CT of the CT bank configured as **NEUTRAL DIR OC1 SOURCE**. If this setting is “Measured IG”, then the **NEUTRAL DIR OC1 POLARIZING** setting must be “Voltage”, as it is not possible to use the ground current as an operating and polarizing signal simultaneously. IG current has to be above 0.05 ps to be used as operate quantity.
- **NEUTRAL DIR OC1 POS-SEQ RESTRAINT**: This setting controls the amount of the positive-sequence restraint. Set to 0.063 for backward compatibility with firmware revision 3.40 and older. Set to zero to remove the restraint. Set higher if large system unbalances or poor CT performance are expected.
- **NEUTRAL DIR OC1 OFFSET:** This setting specifies the offset impedance used by this protection. The primary application for the offset impedance is to guarantee correct identification of fault direction on series compensated lines. In regular applications, the offset impedance ensures proper operation even if the zero-sequence voltage at the relaying point is very small. If this is the intent, the offset impedance shall not be larger than the zero-sequence impedance of the protected circuit. Practically, it shall be several times smaller. The offset impedance shall be entered in secondary ohms.
- **NEUTRAL DIR OC1 FWD ECA:** This setting defines the characteristic angle (ECA) for the forward direction in the "Voltage" polarizing mode. The "Current" polarizing mode uses a fixed ECA of 0°. The ECA in the reverse direction is the angle set for the forward direction shifted by 180°.
- **NEUTRAL DIR OC1 FWD LIMIT ANGLE:** This setting defines a symmetrical (in both directions from the ECA) limit angle for the forward direction.
- **NEUTRAL DIR OC1 FWD PICKUP:** This setting defines the pickup level for the overcurrent unit of the element in the forward direction. When selecting this setting it must be kept in mind that the design uses a ‘positive-sequence restraint’ technique for the “Calculated 3I0” mode of operation.
- **NEUTRAL DIR OC1 REV LIMIT ANGLE:** This setting defines a symmetrical (in both directions from the ECA) limit angle for the reverse direction.
- **NEUTRAL DIR OC1 REV PICKUP:** This setting defines the pickup level for the overcurrent unit of the element in the reverse direction. When selecting this setting it must be kept in mind that the design uses a *positive-sequence restraint* technique for the “Calculated 3I0” mode of operation.

The wattmetric zero-sequence directional element responds to power derived from zero-sequence voltage and current in a direction specified by the element characteristic angle. The angle can be set within all four quadrants and the power can be active or reactive. Therefore, the element may be used to sense either forward or reverse ground faults in either inductive, capacitive or resistive networks. The inverse time characteristic allows time coordination of elements across the network.

Typical applications include ground fault protection in solidly grounded transmission networks, grounded/ungrounded/resistor-grounded/resonant-grounded distribution networks, or for directionalizing other non-directional ground elements.

- **WATTMETRIC GND FLT 1 VOLT**: The element uses neutral voltage (that is, three times the zero-sequence voltage). This setting allows selecting between the internally calculated neutral voltage, or externally supplied voltage (broken delta VT connected to the auxiliary channel bank of the relay). When the latter selection is made, the auxiliary channel must be identified by the user as a neutral voltage under the VT bank settings. This element operates when the auxiliary voltage is configured as neutral.

- **WATTMETRIC GND FLT 1 OV PKP**: This setting specifies the minimum zero sequence voltage supervising the directional power measurement. This threshold should be higher than possible unbalance during normal operation of the system. Typically, this setting would be selected at 0.1 to 0.2 pu for the ungrounded or resonant grounded systems, and at 0.05 to 0.1 pu for solidly or resistor-grounded systems. When using externally supplied voltage via the auxiliary voltage channel, 1 pu is the nominal voltage of this channel as per VT bank settings. When using internally calculated neutral voltage, 1 pu is the nominal phase to ground voltage as per the VT bank settings.
- **WATTMETRIC GND FLT 1 CURR**: The element responds to the neutral current (that is, three times zero-sequence current), either calculated internally from the phase currents or supplied externally via the ground CT input from more accurate sources such as the core balanced CT. This setting allows selecting the source of the operating current.
- **WATTMETRIC GND FLT 1 OC PKP**: This setting specifies the current supervision level for the measurement of the zero-sequence power.
- **WATTMETRIC GND FLT 1 OC PKP DEL**: This setting specifies delay for the overcurrent portion of this element. The delay applies to the WATTMETRIC 1 PKP operand driven from the overcurrent condition.
- **WATTMETRIC GND FLT 1 PWR PKP**: This setting specifies the operating point of the element. A value of 1 pu is a product of the 1 pu voltage as specified for the overvoltage condition of this element, and 1 pu current as specified for the overcurrent condition of this element.
- **WATTMETRIC GND FLT 1 REF PWR**: This setting is used to calculate the inverse time characteristic delay (defined by S_{ref} in the following equations). A value of 1 pu represents the product of a 1 pu voltage (as specified in the overvoltage condition for this element) and a 1 pu current (as specified in the overcurrent condition for this element.
- **WATTMETRIC GND FLT 1 ECA**: This setting adjusts the maximum torque angle of the element. The operating power is calculated as:

$$S\_op = \mathrm{Re}(V_n(I_n \times 1\angle \mathrm{ECA})^*) \quad \textbf{(EQ 5.18)}$$

5

where * indicates complex conjugate. By varying the element characteristic angle (ECA), the element can be made to respond to forward or reverse direction in inductive, resistive, or capacitive networks as shown in the *Wattmetric characteristic angle response* diagram.

- **WATTMETRIC GND FLT 1 PWR PKP DEL**: This setting defines a definite time delay before the inverse time characteristic is activated. If the curve selection is set as “Definite Time”, the element would operate after this security time delay. If the curve selection is “Inverse” or one of the FlexCurves, the element uses both the definite and inverse time timers simultaneously. The definite time timer, specified by this setting, is used and when expires it releases the inverse time timer for operation (torque control).
- **WATTMETRIC GND FLT 1 CURVE**: This setting allows choosing one of three methods to delay operate signal once all conditions are met to discriminate fault direction.

The “Definite Time” selection allows for a fixed time delay defined by the **WATTMETRIC GND FLT 1 PWR PKP DEL** setting.

The “Inverse” selection allows for inverse time characteristics delay defined by the following formula:

$$t = m \times \frac{S_{ref}}{S_{op}} \quad \textbf{(EQ 5.19)}$$

where m is a multiplier defined by the multiplier setting, S_{ref} is the multiplier setting, and S_{op} is the operating power at the time. This timer starts after the definite time timer expires.

The four FlexCurves allow for custom user-programmable time characteristics. When working with FlexCurves, the element uses the operate to pickup ratio, and the multiplier setting is not applied:

$$t = \mathrm{FlexCurve}\left(\frac{S_{op}}{S_{ref}}\right) \quad \textbf{(EQ 5.20)}$$

Again, the FlexCurve timer starts after the definite time timer expires.

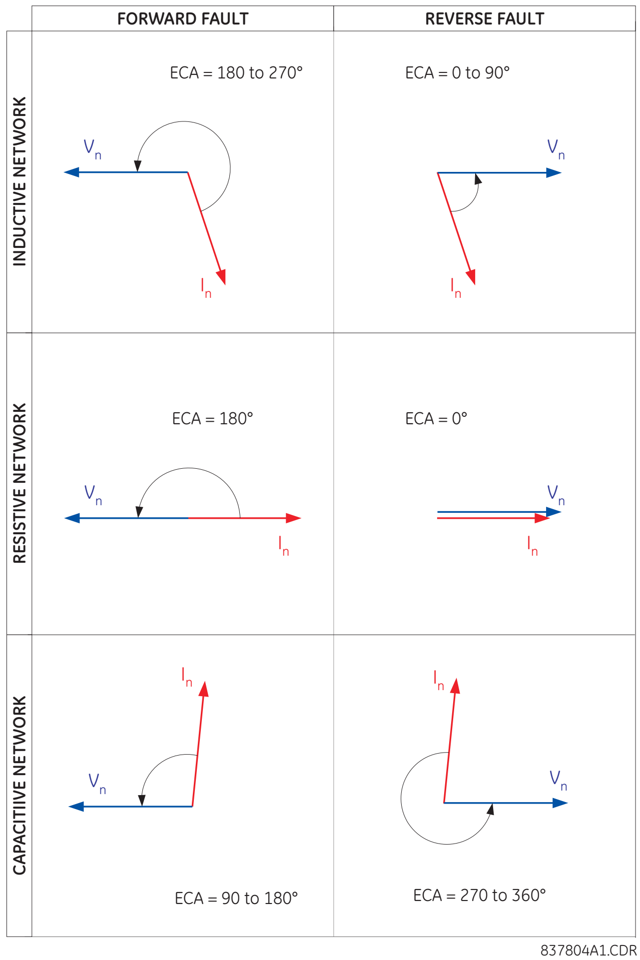

Figure 5–79: WATTMETRIC CHARACTERISTIC ANGLE RESPONSE

- **WATTMETRIC GND FLT 1 MULTIPLIER**: This setting is applicable if **WATTMETRIC GND FLT 1 CURVE** above is selected to Inverse and defines the multiplier factor for the inverse time delay.

This element can provide a desired time-delay operating characteristic versus the applied current or be used as a simple definite time element. The ground current input value is the quantity measured by the ground input CT and is the fundamental phasor or RMS magnitude. Two methods of resetting operation are available: "Timed" and "Instantaneous" (see the *Inverse TOC Curve Characteristics* section for details). When the element is blocked, the time accumulator will reset according to the reset characteristic. For example, if the element reset characteristic is set to "Instantaneous" and the element is blocked, the time accumulator will be cleared immediately.

NOTE: These elements measure the current that is connected to the ground channel of a CT/VT module. The conversion range of a standard channel is from 0.02 to 46 times the CT rating.

NOTE: This channel may be also equipped with a sensitive input. The conversion range of a sensitive channel is from 0.002 to 4.6 times the CT rating.

The negative-sequence time overcurrent element may be used to determine and clear unbalance in the system. The input for calculating negative-sequence current is the fundamental phasor value.

Two methods of resetting operation are available; "Timed" and "Instantaneous" (refer to the *Inverse Time Overcurrent Characteristics* sub-section for details on curve setup, trip times and reset operation). When the element is blocked, the time accumulator resets according to the reset characteristic. For example, if the element reset characteristic is set to "Instantaneous" and the element is blocked, the time accumulator is cleared immediately.

5

The negative-sequence instantaneous overcurrent element may be used as an instantaneous function with no intentional delay or as a definite time function. The element responds to the negative-sequence current fundamental frequency phasor magnitude (calculated from the phase currents) and applies a positive-sequence restraint for better performance: a small portion (12.5%) of the positive-sequence current magnitude is subtracted from the negative-sequence current magnitude when forming the operating quantity:

$$I_{op} = |I\_2| - K \cdot |I\_1| \quad \text{where } K = 1/8 \qquad \textbf{(EQ 5.21)}$$

The positive-sequence restraint allows for more sensitive settings by counterbalancing spurious negative-sequence currents resulting from:

- system unbalances under heavy load conditions
- transformation errors of current transformers (CTs) during three-phase faults
- fault inception and switch-off transients during three-phase faults

The positive-sequence restraint must be considered when testing for pickup accuracy and response time (multiple of pickup). The operating quantity depends on the way the test currents are injected into the relay (single-phase injection: $I_{op} = 0.2917 \cdot I_{injected}$; three-phase injection, opposite rotation: $I_{op} = I_{injected}$).

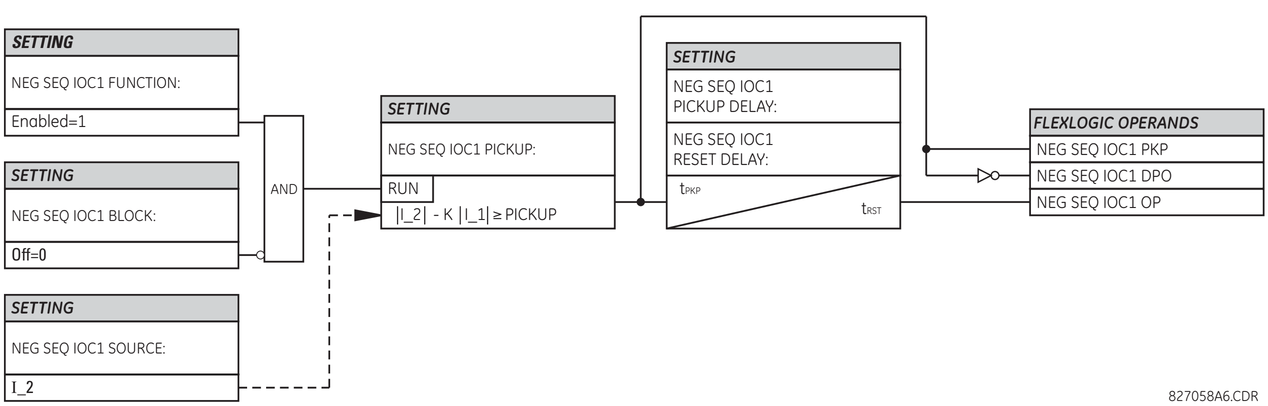

Figure 5–84: NEGATIVE SEQUENCE IOC1 SCHEME LOGIC

MESSAGE	▲▼	NEG SEQ DIR OC1 REV LIMIT ANGLE: 90°	*Range: 40 to 90° in steps of 1*
MESSAGE	▲▼	NEG SEQ DIR OC1 REV PICKUP: 0.050 pu	*Range: 0.015 to 30.000 pu in steps of 0.001*
MESSAGE	▲▼	NEG SEQ DIR OC1 BLK: Off	*Range: FlexLogic operand*
MESSAGE	▲▼	NEG SEQ DIR OC1 TARGET: Self-reset	*Range: Self-reset, Latched, Disabled*
MESSAGE	▲	NEG SEQ DIR OC1 EVENTS: Disabled	*Range: Disabled, Enabled*

There are two negative-sequence directional overcurrent protection elements available. The element provides both forward and reverse fault direction indications through its output operands NEG SEQ DIR OC1 FWD and NEG SEQ DIR OC1 REV, respectively. The output operand is asserted if the magnitude of the operating current is above a pickup level (overcurrent unit) and the fault direction is seen as *forward* or *reverse*, respectively (directional unit).

The overcurrent unit of the element essentially responds to the magnitude of a fundamental frequency phasor of either the negative-sequence or neutral current as per user selection.

A positive-sequence restraint is applied for better performance: a small user-programmable portion of the positive-sequence current magnitude is subtracted from the negative or zero-sequence current magnitude, respectively, when forming the element operating quantity.

$$I_{op} = |I\_2| - K \times |I\_1| \quad \text{or} \quad I_{op} = 3 \times (|I\_0| - K \times |I\_1|) \qquad \textbf{(EQ 5.22)}$$

The positive-sequence restraint allows for more sensitive settings by counterbalancing spurious negative-sequence and zero-sequence currents resulting from:

- System unbalances under heavy load conditions.
- Transformation errors of current transformers (CTs).
- Fault inception and switch-off transients.

The positive-sequence restraint must be considered when testing for pick-up accuracy and response time (multiple of pickup). The positive-sequence restraint is removed for low currents. If the positive-sequence current is less than 0.8 pu, then the restraint is removed by changing the constant *K* to zero. This results in better response to high-resistance faults when the unbalance is very small and there is no danger of excessive CT errors, since the current is low.

The *operating quantity* depends on the way the test currents are injected into the F60. For single phase injection:

- $I_{op} = ⅓ \times (1 - K) \times I_{injected}$ for I_2 mode.
- $I_{op} = (1 - K) \times I_{injected}$ for I_0 mode if I_1 > 0.8 pu.

The *directional unit* uses the negative-sequence current (I_2) and negative-sequence voltage (V_2).

The following tables define the negative-sequence directional overcurrent element.

Table 5–30: NEGATIVE-SEQUENCE DIRECTIONAL OVERCURRENT UNIT

MODE	OPERATING CURRENT
Negative-sequence	I_{op} = |I_2| – *K* × I_1|
Zero-sequence	I_{op} = 3 × (|I_0| – *K* × |I_1|) if |I_1| > 0.8 pu I_{op} = 3 × |I_0| if |I_1| ≤ 0.8 pu

Table 5–31: NEGATIVE-SEQUENCE DIRECTIONAL UNIT

DIRECTION	COMPARED PHASORS	
Forward	–V_2 + Z_offset × I_2	I_2 × 1∠ECA
Reverse	–V_2 + Z_offset × I_2	–(I_2 × 1∠ECA)
Forward	–V_2 + Z_offset × I_2	I_2 × 1∠ECA
Reverse	–V_2 + Z_offset × I_2	–(I_2 × 1∠ECA)

5

The negative-sequence voltage must be greater than the **VOLTAGE CUTOFF LEVEL** setting specified in the **PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES** menu to be validated for use as a polarizing signal. If the polarizing signal is not validated neither forward nor reverse indication is given. The following figure explains the usage of the voltage polarized directional unit of the element.

The following figure shows the phase angle comparator characteristics for a phase A to ground fault, with settings of:

ECA = 75° (element characteristic angle = centerline of operating characteristic)
FWD LA = 80° (forward limit angle = ± the angular limit with the ECA for operation)
REV LA = 80° (reverse limit angle = ± the angular limit with the ECA for operation)

The element incorporates a current reversal logic: if the reverse direction is indicated for at least 1.25 of a power system cycle, the prospective forward indication will be delayed by 1.5 of a power system cycle. The element is designed to emulate an electromechanical directional device. Larger operating and polarizing signals will result in faster directional discrimination bringing more security to the element operation.

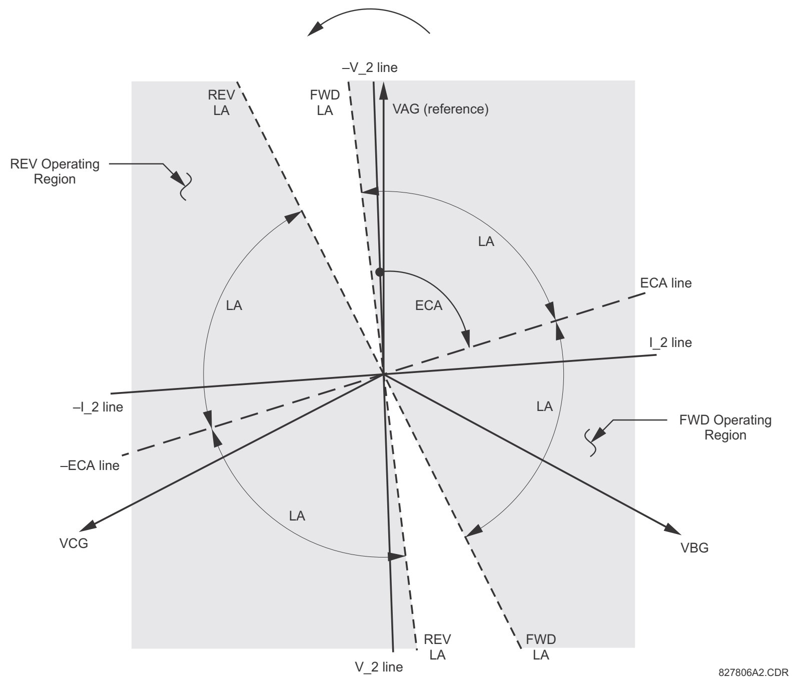

Figure 5–85: NEGATIVE-SEQUENCE DIRECTIONAL CHARACTERISTIC

The forward-looking function is designed to be more secure as compared to the reverse-looking function, and therefore should be used for the tripping direction. The reverse-looking function is designed to be faster as compared to the forward-looking function and should be used for the blocking direction. This allows for better protection coordination. Take this bias into account when using the negative-sequence directional overcurrent element to directionalize other protection elements. The negative-sequence directional pickup must be greater than the PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨⇩ CURRENT CUT-OFF LEVEL setting value.

- **NEG SEQ DIR OC1 OFFSET:** This setting specifies the offset impedance used by this protection. The primary application for the offset impedance is to guarantee correct identification of fault direction on series compensated lines (see the *Application of settings* chapter for information on how to calculate this setting). In regular applications, the offset impedance ensures proper operation even if the negative-sequence voltage at the relaying point is very small. If this is the intent, the offset impedance shall not be larger than the negative-sequence impedance of the protected circuit. Practically, it is several times smaller. The offset impedance is entered in secondary ohms. See the *Theory of operation* chapter for additional details.
- **NEG SEQ DIR OC1 TYPE:** This setting selects the operating mode for the overcurrent unit of the element. The choices are “Neg Sequence” and “Zero Sequence”. In some applications it is advantageous to use a directional negative-sequence overcurrent function instead of a directional zero-sequence overcurrent function as inter-circuit mutual effects are minimized.
- **NEG SEQ DIR OC1 POS-SEQ RESTRAINT**: This setting controls the positive-sequence restraint. Set to 0.063 (in “Zero Sequence” mode) or 0.125 (in “Neg Sequence” mode) for backward compatibility with revisions 3.40 and earlier. Set to zero to remove the restraint. Set higher if large system unbalances or poor CT performance are expected.
- **NEG SEQ DIR OC1 FWD ECA:** This setting select the element characteristic angle (ECA) for the forward direction. The element characteristic angle in the reverse direction is the angle set for the forward direction shifted by 180°.
- **NEG SEQ DIR OC1 FWD LIMIT ANGLE:** This setting defines a symmetrical (in both directions from the ECA) limit angle for the forward direction.

- **NEG SEQ DIR OC1 FWD PICKUP:** This setting defines the pickup level for the overcurrent unit in the forward direction. Upon **NEG SEQ DIR OC1 TYPE** selection, this pickup threshold applies to zero- or negative-sequence current. When selecting this setting it must be kept in mind that the design uses a *positive-sequence restraint* technique.
- **NEG SEQ DIR OC1 REV LIMIT ANGLE:** This setting defines a symmetrical (in both directions from the ECA) limit angle for the reverse direction.
- **NEG SEQ DIR OC1 REV PICKUP:** This setting defines the pickup level for the overcurrent unit in the reverse direction. Upon **NEG SEQ DIR OC1 TYPE** selection, this pickup threshold applies to zero- or negative-sequence current. When selecting this setting it must be kept in mind that the design uses a *positive-sequence restraint* technique.

In general, a breaker failure scheme determines that a breaker signaled to trip has not cleared a fault within a definite time, so further tripping action must be performed. Tripping from the breaker failure scheme should trip all breakers, both local and remote, that can supply current to the faulted zone. Usually operation of a breaker failure element will cause clearing of a larger section of the power system than the initial trip. Because breaker failure can result in tripping a large number of breakers and this affects system safety and stability, a very high level of security is required.

Two schemes are provided: one for three-pole tripping only (identified by the name “3BF”) and one for three pole plus single-pole operation (identified by the name “1BF”). The philosophy used in these schemes is identical. The operation of a breaker failure element includes three stages: initiation, determination of a breaker failure condition, and output.

INITIATION STAGE:

A FlexLogic operand representing the protection trip signal initially sent to the breaker must be selected to initiate the scheme. The initiating signal should be sealed-in if primary fault detection can reset before the breaker failure timers have finished timing. The seal-in is supervised by current level, so it is reset when the fault is cleared. If desired, an incomplete sequence seal-in reset can be implemented by using the initiating operand to also initiate a FlexLogic timer, set longer than any breaker failure timer, whose output operand is selected to block the breaker failure scheme.

Schemes can be initiated either directly or with current level supervision. It is particularly important in any application to decide if a current-supervised initiate is to be used. The use of a current-supervised initiate results in the breaker failure element not being initiated for a breaker that has very little or no current flowing through it, which may be the case for transformer faults. For those situations where it is required to maintain breaker fail coverage for fault levels below the **BF1 PH AMP SUPV PICKUP** or the **BF1 N AMP SUPV PICKUP** setting, a current supervised initiate should *not* be used. This feature should be utilized for those situations where coordinating margins may be reduced when high speed reclosing is used. Thus, if this choice is made, fault levels must always be above the supervision pickup levels for dependable operation of the breaker fail scheme. This can also occur in breaker-and-a-half or ring bus configurations where the first breaker closes into a fault; the protection trips and attempts to initiate breaker failure for the second breaker, which is in the process of closing, but does not yet have current flowing through it.

When the scheme is initiated, it immediately sends a trip signal to the breaker initially signaled to trip (this feature is usually described as re-trip). This reduces the possibility of widespread tripping that results from a declaration of a failed breaker.

DETERMINATION OF A BREAKER FAILURE CONDITION:

The schemes determine a breaker failure condition via three *paths*. Each of these paths is equipped with a time delay, after which a failed breaker is declared and trip signals are sent to all breakers required to clear the zone. The delayed paths are associated with breaker failure timers 1, 2, and 3, which are intended to have delays increasing with increasing timer numbers. These delayed paths are individually enabled to allow for maximum flexibility.

Timer 1 logic (early path) is supervised by a fast-operating breaker auxiliary contact. If the breaker is still closed (as indicated by the auxiliary contact) and fault current is detected after the delay interval, an output is issued. Operation of the breaker auxiliary switch indicates that the breaker has mechanically operated. The continued presence of current indicates that the breaker has failed to interrupt the circuit.

Timer 2 logic (main path) is not supervised by a breaker auxiliary contact. If fault current is detected after the delay interval, an output is issued. This path is intended to detect a breaker that opens mechanically but fails to interrupt fault current; the logic therefore does not use a breaker auxiliary contact.

The timer 1 and 2 paths provide two levels of current supervision, high-set and low-set, that allow the supervision level to change from a current which flows before a breaker inserts an opening resistor into the faulted circuit to a lower level after resistor insertion. The high-set detector is enabled after timeout of timer 1 or 2, along with a timer that will enable the low-set detector after its delay interval. The delay interval between high-set and low-set is the expected breaker opening time. Both current detectors provide a fast operating time for currents at small multiples of the pickup value. The overcurrent detectors are required to operate after the breaker failure delay interval to eliminate the need for very fast resetting overcurrent detectors.

Timer 3 logic (slow path) is supervised by a breaker auxiliary contact and a control switch contact used to indicate that the breaker is in or out-of-service, disabling this path when the breaker is out-of-service for maintenance. There is no current level check in this logic as it is intended to detect low magnitude faults and it is therefore the slowest to operate.

OUTPUT:

The outputs from the schemes are:

- FlexLogic operands that report on the operation of portions of the scheme
- FlexLogic operand used to re-trip the protected breaker
- FlexLogic operands that initiate tripping required to clear the faulted zone. The trip output can be sealed-in for an adjustable period.
- Target message indicating a failed breaker has been declared
- Illumination of the faceplate Trip LED (and the Phase A, B or C LED, if applicable)

MAIN PATH SEQUENCE:

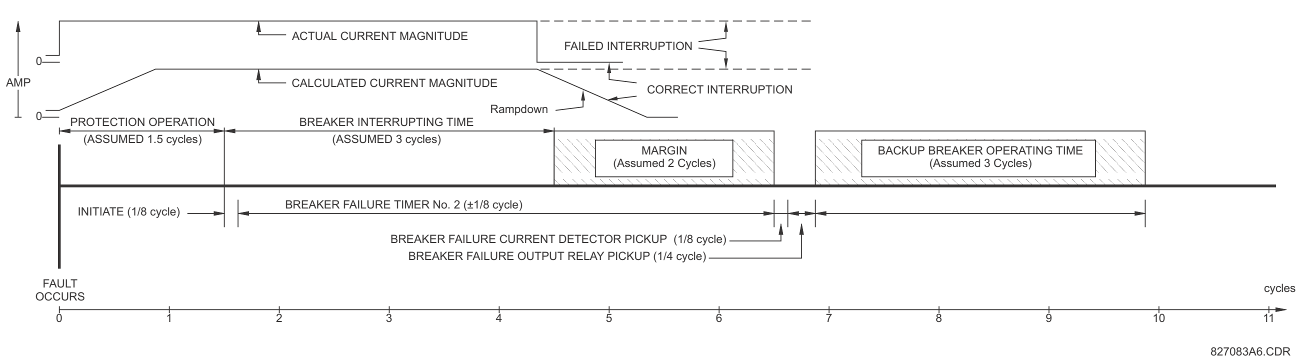

Figure 5–87: BREAKER FAILURE MAIN PATH SEQUENCE

The current supervision elements reset in less than 0.7 of a power cycle for any multiple of pickup current as shown below.

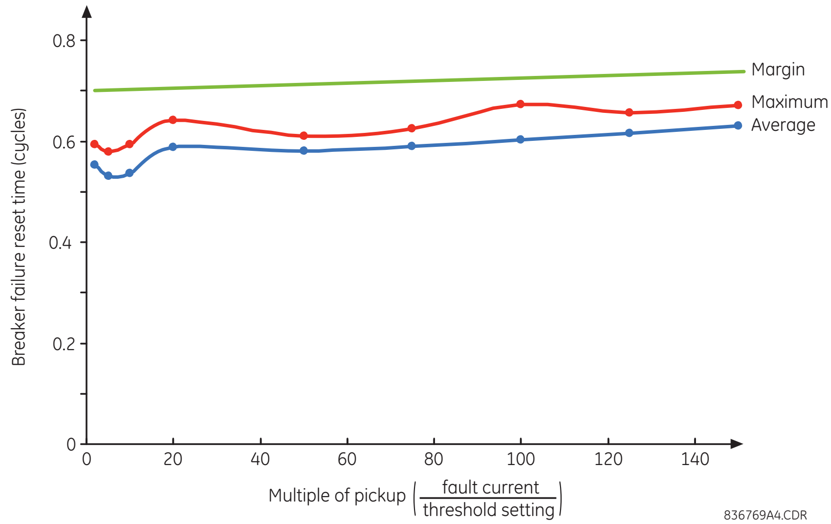

Figure 5–88: BREAKER FAILURE OVERCURRENT SUPERVISION RESET TIME

SETTINGS:

5

- **BF1 MODE:** This setting is used to select the breaker failure operating mode: single or three pole.
- **BF1 USE AMP SUPV:** If set to "Yes", the element will only be initiated if current flowing through the breaker is above the supervision pickup level.
- **BF1 USE SEAL-IN:** If set to "Yes", the element will only be sealed-in if current flowing through the breaker is above the supervision pickup level.
- **BF1 3-POLE INITIATE:** This setting selects the FlexLogic operand that will initiate three-pole tripping of the breaker.
- **BF1 PH AMP SUPV PICKUP:** This setting is used to set the phase current initiation and seal-in supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker. It can be set as low as necessary (lower than breaker resistor current or lower than load current) – high-set and low-set current supervision will guarantee correct operation.
- **BF1 N AMP SUPV PICKUP:** This setting is used to set the neutral current initiate and seal-in supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker. Neutral current supervision is used only in the three phase scheme to provide increased sensitivity. This setting is valid only for three-pole tripping schemes.
- **BF1 USE TIMER 1:** If set to "Yes", the early path is operational.
- **BF1 TIMER 1 PICKUP DELAY:** Timer 1 is set to the shortest time required for breaker auxiliary contact Status-1 to open, from the time the initial trip signal is applied to the breaker trip circuit, plus a safety margin.
- **BF1 USE TIMER 2:** If set to "Yes", the main path is operational.
- **BF1 TIMER 2 PICKUP DELAY:** Timer 2 is set to the expected opening time of the breaker, plus a safety margin. This safety margin was historically intended to allow for measuring and timing errors in the breaker failure scheme equipment. In microprocessor relays this time is not significant. In F60 relays, which use a Fourier transform, the calculated current magnitude will ramp-down to zero one power frequency cycle after the current is interrupted, and this lag should be included in the overall margin duration, as it occurs after current interruption. The *Breaker failure main path sequence* diagram below shows a margin of two cycles; this interval is considered the minimum appropriate for most applications.

  Note that in bulk oil circuit breakers, the interrupting time for currents less than 25% of the interrupting rating can be significantly longer than the normal interrupting time.
- **BF1 USE TIMER 3:** If set to "Yes", the Slow Path is operational.
- **BF1 TIMER 3 PICKUP DELAY:** Timer 3 is set to the same interval as timer 2, plus an increased safety margin. Because this path is intended to operate only for low level faults, the delay can be in the order of 300 to 500 ms.

- **BF1 BKR POS1 ϕA/3P:** This setting selects the FlexLogic operand that represents the protected breaker early-type auxiliary switch contact (52/a). When using the single-pole breaker failure scheme, this operand represents the protected breaker early-type auxiliary switch contact on pole A. This is normally a non-multiplied form-A contact. The contact may even be adjusted to have the shortest possible operating time.
- **BF1 BKR POS2 ϕA/3P:** This setting selects the FlexLogic operand that represents the breaker normal-type auxiliary switch contact (52/a). When using the single-pole breaker failure scheme, this operand represents the protected breaker auxiliary switch contact on pole A. This may be a multiplied contact.
- **BF1 BREAKER TEST ON:** This setting is used to select the FlexLogic operand that represents the breaker in-service/out-of-service switch set to the out-of-service position.
- **BF1 PH AMP HISET PICKUP:** This setting sets the phase current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, before a breaker opening resistor is inserted.
- **BF1 N AMP HISET PICKUP:** This setting sets the neutral current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, before a breaker opening resistor is inserted. Neutral current supervision is used only in the three pole scheme to provide increased sensitivity. *This setting is valid only for three-pole breaker failure schemes*.
- **BF1 PH AMP LOSET PICKUP:** This setting sets the phase current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, after a breaker opening resistor is inserted (approximately 90% of the resistor current).
- **BF1 N AMP LOSET PICKUP:** This setting sets the neutral current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, after a breaker opening resistor is inserted (approximately 90% of the resistor current). *This setting is valid only for three-pole breaker failure schemes*.
- **BF1 LOSET TIME DELAY:** Sets the pickup delay for current detection after opening resistor insertion.
- **BF1 TRIP DROPOUT DELAY:** This setting is used to set the period of time for which the trip output is sealed-in. This timer must be coordinated with the automatic reclosing scheme of the failed breaker, to which the breaker failure element sends a cancel reclosure signal. Reclosure of a remote breaker can also be prevented by holding a transfer trip signal on longer than the reclaim time.
- **BF1 PH A INITIATE / BF1 PH B INITIATE / BF 1 PH C INITIATE:** These settings select the FlexLogic operand to initiate phase A, B, or C single-pole tripping of the breaker and the phase A, B, or C portion of the scheme, accordingly. *This setting is only valid for single-pole breaker failure schemes*.
- **BF1 BKR POS1 ϕB / BF1 BKR POS 1 ϕC:** These settings select the FlexLogic operand to represents the protected breaker early-type auxiliary switch contact on poles B or C, accordingly. This contact is normally a non-multiplied Form-A contact. The contact may even be adjusted to have the shortest possible operating time. *This setting is valid only for single-pole breaker failure schemes*.
- **BF1 BKR POS2 ϕB:** Selects the FlexLogic operand that represents the protected breaker normal-type auxiliary switch contact on pole B (52/a). This may be a multiplied contact. *This setting is valid only for single-pole breaker failure schemes*.
- **BF1 BKR POS2 ϕC:** This setting selects the FlexLogic operand that represents the protected breaker normal-type auxiliary switch contact on pole C (52/a). This may be a multiplied contact. For single-pole operation, the scheme has the same overall general concept except that it provides re-tripping of each single pole of the protected breaker. The approach shown in the following single pole tripping diagram uses the initiating information to determine which pole is supposed to trip. The logic is segregated on a per-pole basis. The overcurrent detectors have ganged settings. *This setting is valid only for single-pole breaker failure schemes*.

  Upon operation of the breaker failure element for a single pole trip command, a three-pole trip command should be given via output operand BKR FAIL 1 TRIP OP.

These protection elements can be used for a variety of applications such as:

- ***Undervoltage Protection:*** For voltage sensitive loads, such as induction motors, a drop in voltage increases the drawn current which may cause dangerous overheating in the motor. The undervoltage protection feature can be used to either cause a trip or generate an alarm when the voltage drops below a specified voltage setting for a specified time delay.
- ***Permissive Functions:*** The undervoltage feature may be used to block the functioning of external devices by operating an output relay when the voltage falls below the specified voltage setting. The undervoltage feature may also be used to block the functioning of other elements through the block feature of those elements.
- ***Source Transfer Schemes:*** In the event of an undervoltage, a transfer signal may be generated to transfer a load from its normal source to a standby or emergency power source.

The undervoltage elements can be programmed to have a definite time delay characteristic. The definite time curve operates when the voltage drops below the pickup level for a specified period of time. The time delay is adjustable from 0 to 600.00 seconds in steps of 0.01. The undervoltage elements can also be programmed to have an inverse time delay characteristic.

The undervoltage delay setting defines the family of curves shown below.

$$T = \frac{D}{\left(1 - \frac{V}{V_{pickup}}\right)} \qquad \textbf{(EQ 5.23)}$$

where: T = operating time
D = undervoltage delay setting (D = 0.00 operates instantaneously)
V = secondary voltage applied to the relay
V_{pickup} = pickup level

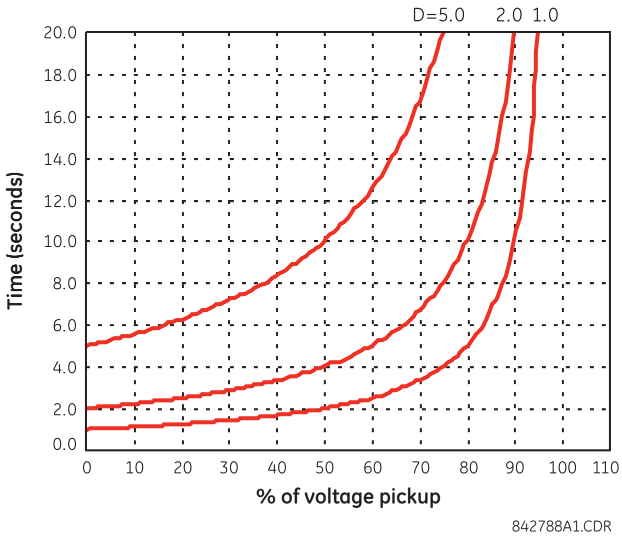

Figure 5–93: INVERSE TIME UNDERVOLTAGE CURVES

NOTE

At 0% of pickup, the operating time equals the UNDERVOLTAGE DELAY setting.

b) PHASE UNDERVOLTAGE (ANSI 27P, IEC PTUV)

MESSAGE	PHASE UV1 EVENTS: Disabled	Range: Disabled, Enabled

This element may be used to give a desired time-delay operating characteristic versus the applied fundamental voltage (phase-to-ground or phase-to-phase for wye VT connection, or phase-to-phase for delta VT connection) or as a definite time element. The element resets instantaneously if the applied voltage exceeds the dropout voltage. The delay setting selects the minimum operating time of the phase undervoltage. The minimum voltage setting selects the operating voltage below which the element is blocked (a setting of "0" will allow a dead source to be considered a fault condition).

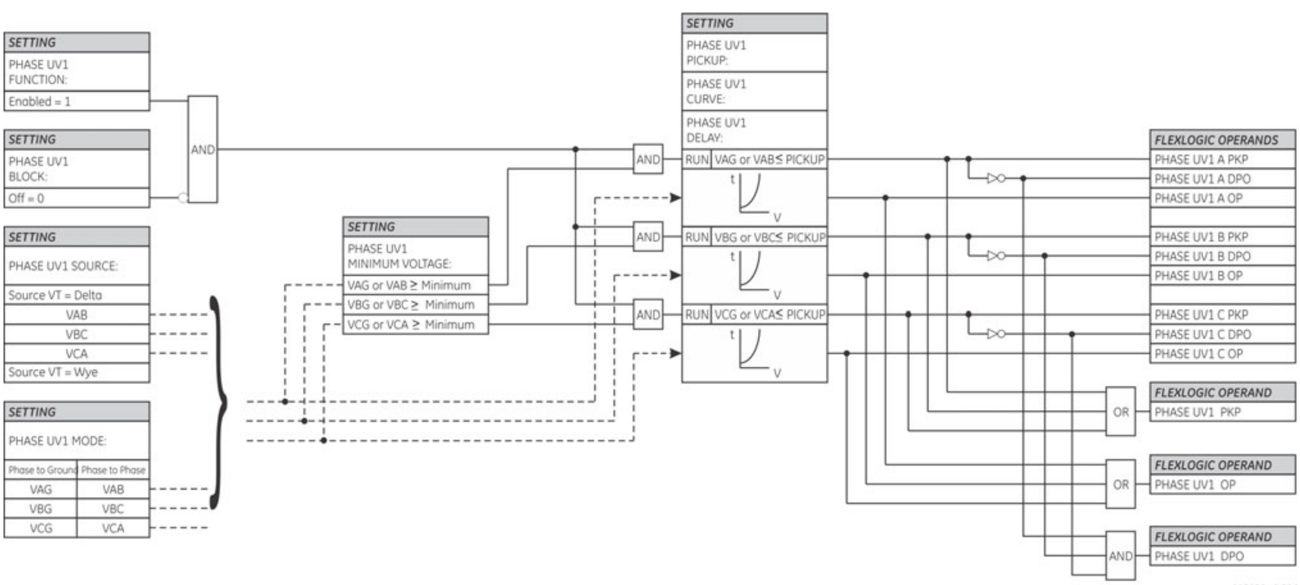

Figure 5–94: PHASE UNDERVOLTAGE1 SCHEME LOGIC

c) PHASE OVERVOLTAGE (ANSI 59P, IEC PTOV)

PATH: SETTINGS ⇨⇩ GROUPED ELEMENTS ⇨ SETTING GROUP 1(6) ⇨⇩ VOLTAGE ELEMENTS ⇨⇩ PHASE OVERVOLTAGE1(3)

Menu		Setting	Range
■ PHASE ■ OVERVOLTAGE1		PHASE OV1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE		PHASE OV1 SIGNAL SOURCE: SRC 1	Range: SRC 1, SRC 2

MESSAGE		PHASE OV1 EVENTS: Disabled	Range: Disabled, Enabled

There are three phase overvoltage elements available. A phase overvoltage element is used as an instantaneous element with no intentional time delay or as a definite time element. The input voltage is the phase-to-phase voltage, either measured directly from delta-connected VTs or as calculated from phase-to-ground (wye) connected VTs. The specific voltages to be used for each phase are shown below.

5

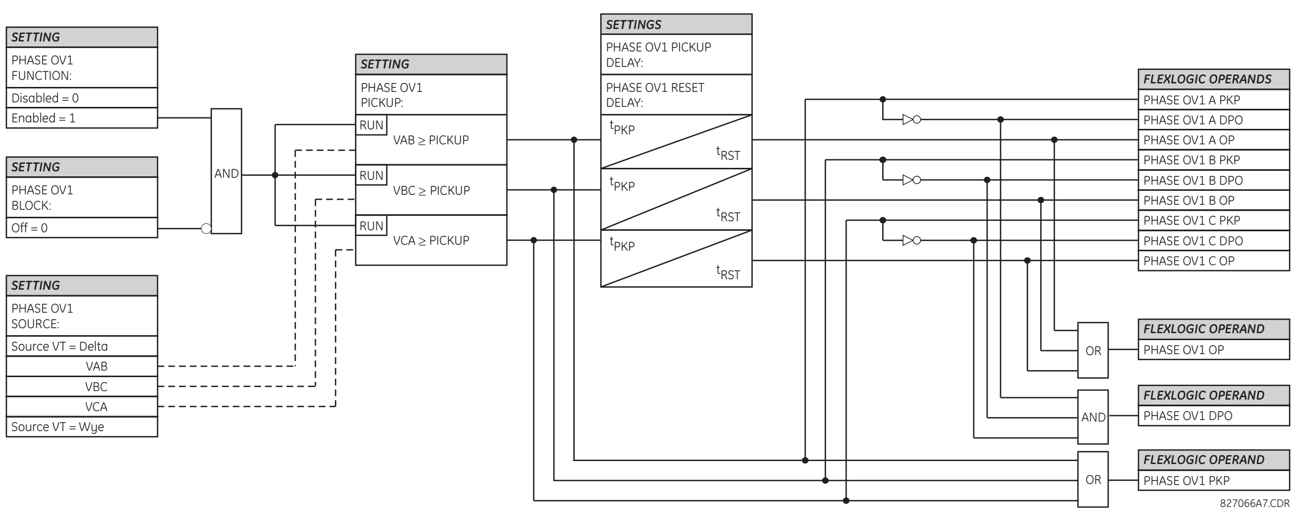

Figure 5–95: PHASE OVERVOLTAGE SCHEME LOGIC

NOTE

If the source VT is wye-connected, then the phase overvoltage pickup condition is $V > \sqrt{3} \times \text{Pickup}$ for V_{AB}, V_{BC}, and V_{CA}.

d) NEUTRAL OVERVOLTAGE (ANSI 59N, IEC PTOV)

5

There are three neutral overvoltage elements available. The neutral overvoltage element can be used to detect asymmetrical system voltage condition due to a ground fault or to the loss of one or two phases of the source. The element responds to the system neutral voltage (3V_0), calculated from the phase voltages. The nominal secondary voltage of the phase voltage channels entered under **SETTINGS ⇨⇩ SYSTEM SETUP ⇨ AC INPUTS ⇨⇩ VOLTAGE BANK ⇨ PHASE VT SECONDARY** is the p.u. base used when setting the pickup level.

The neutral overvoltage element can provide a time-delayed operating characteristic versus the applied voltage (initialized from FlexCurves A, B, or C) or be used as a definite time element. The **NEUTRAL OV1 PICKUP DELAY** setting applies only if the **NEUTRAL OV1 CURVE** setting is "Definite time". The source assigned to this element must be configured for a phase VT.

VT errors and normal voltage unbalance must be considered when setting this element. This function requires the VTs to be wye-connected.

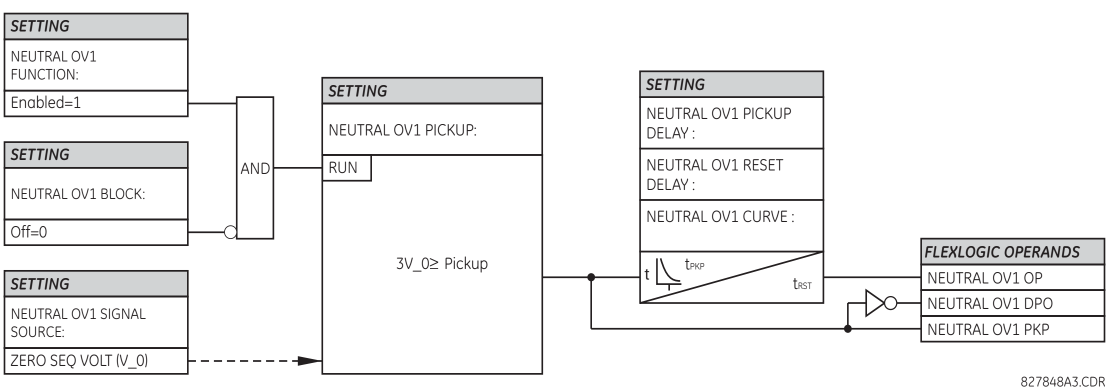

Figure 5–96: NEUTRAL OVERVOLTAGE1 SCHEME LOGIC

e) NEGATIVE SEQUENCE OVERVOLTAGE (ANSI 59Q, IEC PTOV)

PATH: SETTINGS ⇨⇩ GROUPED ELEMENTS ⇨ SETTING GROUP 1(6) ⇨⇩ VOLTAGE ELEMENTS ⇨⇩ NEG SEQ OV1(3)

	■ NEG SEQ OV1 ■

MESSAGE	AUX UV1 TARGET: Self-reset	Range: Self-reset, Latched, Disabled
MESSAGE	AUX UV1 EVENTS: Disabled	Range: Disabled, Enabled

The F60 contains one auxiliary undervoltage element for each VT bank. This element is intended for monitoring undervoltage conditions of the auxiliary voltage. The **AUX UV1 PICKUP** selects the voltage level at which the time undervoltage element starts timing. The nominal secondary voltage of the auxiliary voltage channel entered under **SETTINGS ⇨⇩ SYSTEM SETUP ⇨ AC INPUTS ⇨⇩ VOLTAGE BANK X5 ⇨⇩ AUXILIARY VT X5 SECONDARY** is the per-unit base used when setting the pickup level.

The **AUX UV1 DELAY** setting selects the minimum operating time of the auxiliary undervoltage element. Both **AUX UV1 PICKUP** and **AUX UV1 DELAY** settings establish the operating curve of the undervoltage element. The auxiliary undervoltage element can be programmed to use either definite time delay or inverse time delay characteristics. The operating characteristics and equations for both definite and inverse time delay are as for the phase undervoltage element.

The element resets instantaneously. The minimum voltage setting selects the operating voltage below which the element is blocked.

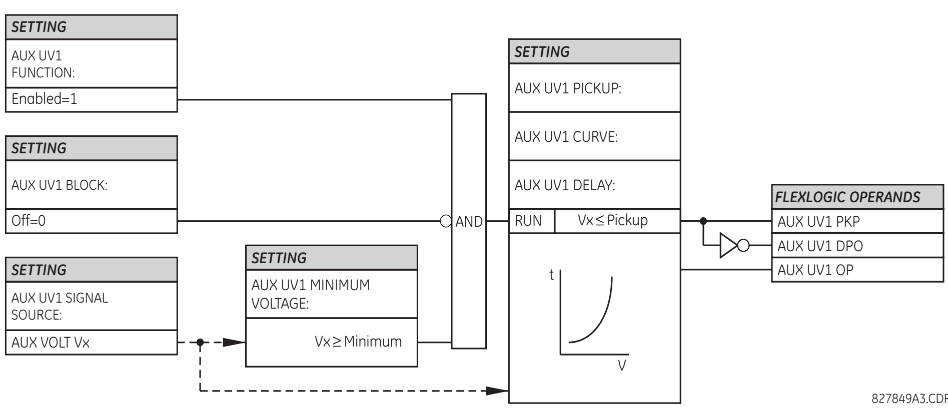

Figure 5–98: AUXILIARY UNDERVOLTAGE SCHEME LOGIC

The sensitive directional power element responds to three-phase directional power and is designed for reverse power and low forward power applications for synchronous machines or interconnections involving co-generation. The relay measures the three-phase power from either full set of wye-connected VTs or full-set of delta-connected VTs. In the latter case, the two-wattmeter method is used. Refer to the *UR-series metering conventions* section in chapter 6 for details regarding the active and reactive powers used by the sensitive directional power element.

The element has an adjustable characteristic angle and minimum operating power as shown in the *Directional power characteristic* diagram. The element responds to the following condition:

$$P\cos\theta + Q\sin\theta > SMIN \quad \textbf{(EQ 5.24)}$$

where: *P* and *Q* are active and reactive powers as measured per the UR-series metering convention,
θ is a sum of the element characteristic (**DIR POWER 1 RCA**) and calibration (**DIR POWER 1 CALIBRATION**) angles, and
SMIN is the minimum operating power

The operating quantity is displayed in the **ACTUAL VALUES ⇨ METERING ⇨⇩ SENSITIVE DIRECTIONAL POWER 1(2)** actual value. The element has two independent (as to the pickup and delay settings) stages for alarm and trip, respectively.

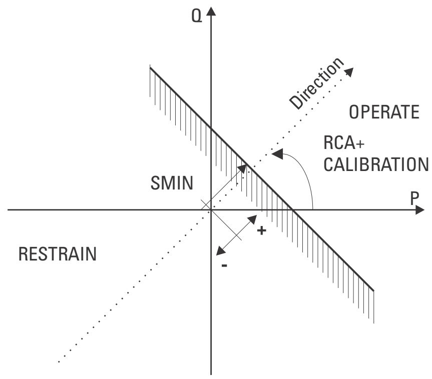

Figure 5–100: DIRECTIONAL POWER CHARACTERISTIC

By making the characteristic angle adjustable and providing for both negative and positive values of the minimum operating power a variety of operating characteristics can be achieved as presented in the figure below. For example, section (a) in the figure below shows settings for reverse power, while section (b) shows settings for low forward power applications.

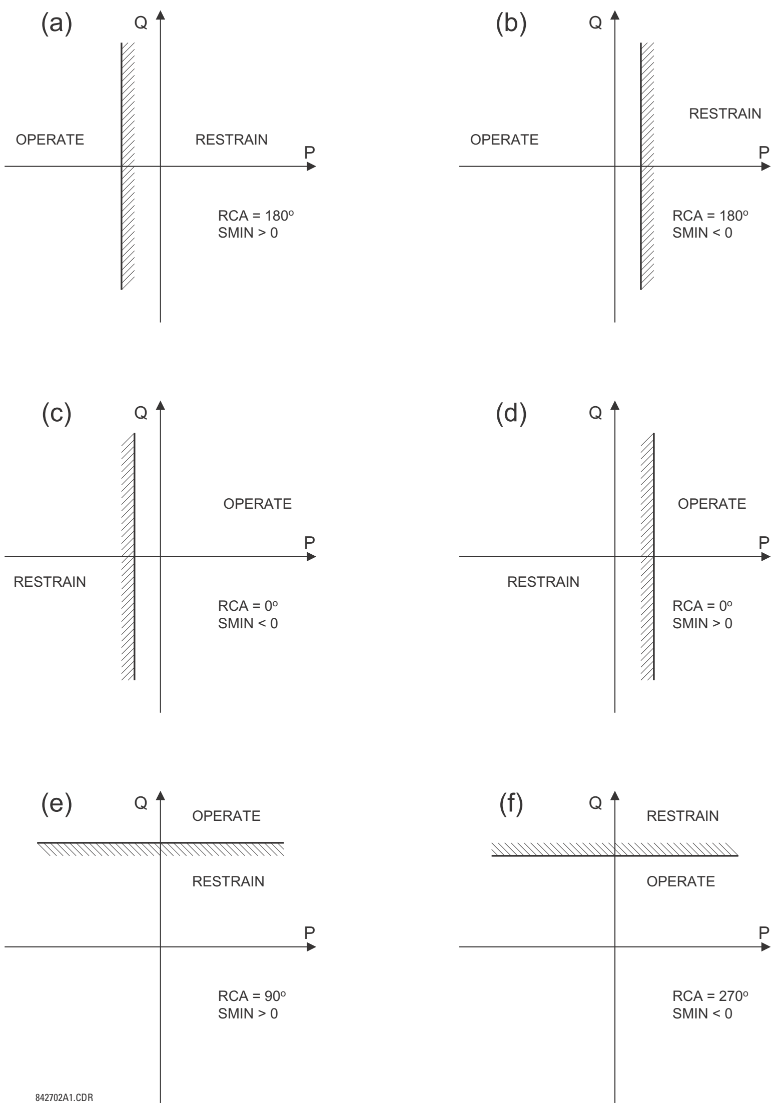

Figure 5–101: DIRECTIONAL POWER ELEMENT SAMPLE APPLICATIONS

- **DIR POWER 1 RCA:** Specifies the relay characteristic angle (RCA) for the sensitive directional power function. Application of this setting is threefold:
  1. It allows the element to respond to active or reactive power in any direction (active overpower/underpower, etc.).
  2. Together with a precise calibration angle, it allows compensation for any CT and VT angular errors to permit more sensitive settings.
  3. It allows for required direction in situations when the voltage signal is taken from behind a delta-wye connected power transformer and the phase angle compensation is required.

  For example, the active overpower characteristic is achieved by setting **DIR POWER 1 RCA** to "0°", reactive overpower by setting **DIR POWER 1 RCA** to "90°", active underpower by setting **DIR POWER 1 RCA** to "180°", and reactive underpower by setting **DIR POWER 1 RCA** to "270°".
- **DIR POWER 1 CALIBRATION:** This setting allows the relay characteristic angle to change in steps of 0.05°. This may be useful when a small difference in VT and CT angular errors is to be compensated to permit more sensitive settings. This setting virtually enables calibration of the directional power function in terms of the angular error of applied VTs and CTs. The element responds to the sum of the **DIR POWER 1 RCA** and **DIR POWER 1 CALIBRATION** settings.
- **DIR POWER 1 STG1 SMIN:** This setting specifies the minimum power as defined along the relay characteristic angle (RCA) for the stage 1 of the element. The positive values imply a shift towards the operate region along the RCA line; the negative values imply a shift towards the restrain region along the RCA line. Refer to the *Directional power sample applications* figure for details. Together with the RCA, this setting enables a wide range of operating characteristics. This setting applies to three-phase power and is entered in per-unit (pu) values. The base quantity is 3-phase power on primary side, which is calculated as $\sqrt{3}$ x Phase CT Primary x Phase VT Ratio x Phase VT Secondary in case of delta connected VTs; and 3 x Phase CT Primary x Phase VT Ratio x Phase VT Secondary in case of wye connected VTs.

  5

  For example, a setting of 2% for a 200 MW machine is 0.02 $\times$ 200 MW = 4 MW. If 13.8kV is line voltage and 10 kA is a primary CT current, the source pu quantity is 239 MVA, and thus, SMIN should be set at 4 MW / 239 MVA = 0.0167 pu $\approx$ 0.017 pu. If the reverse power application is considered, RCA = 180° and SMIN = 0.017 pu.

  The element drops out if the magnitude of the positive-sequence current becomes virtually zero, that is, it drops below the cutoff level.
- **DIR POWER 1 STG1 DELAY:** This setting specifies a time delay for stage 1. For reverse power or low forward power applications for a synchronous machine, stage 1 is typically applied for alarming and stage 2 for tripping.

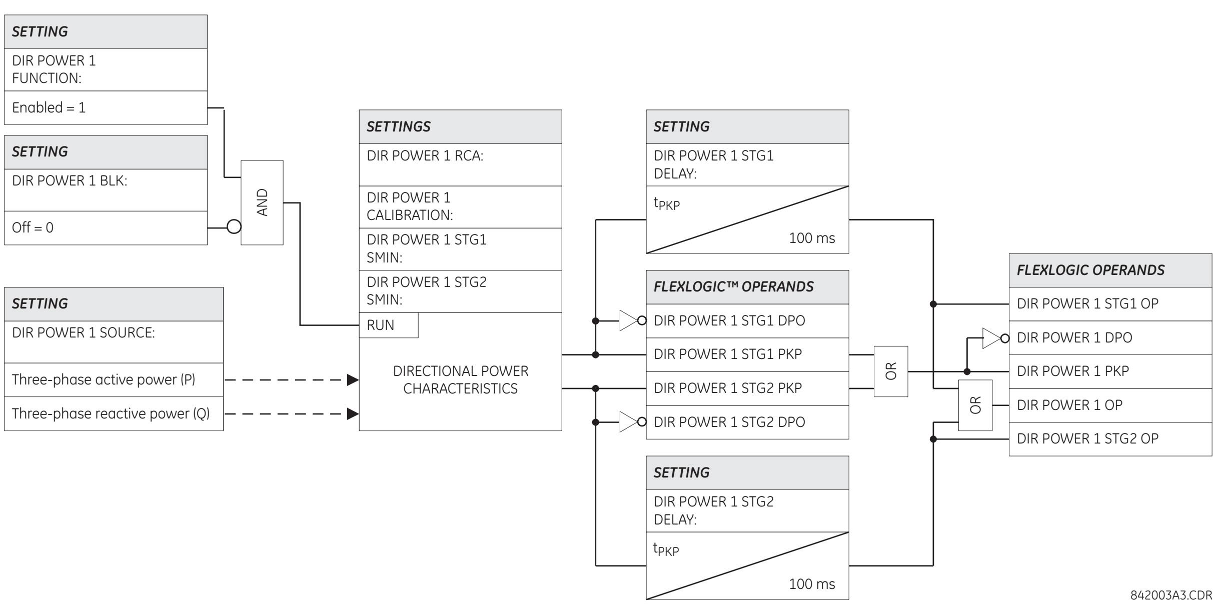

Figure 5–102: SENSITIVE DIRECTIONAL POWER SCHEME LOGIC

5.7.1 OVERVIEW

Control elements are generally used for control rather than protection. See the *Introduction to Elements* section at the beginning of this chapter for further information.

5.7.2 TRIP BUS

The trip bus element allows aggregating outputs of protection and control elements without using FlexLogic and assigning them a simple and effective manner. Each trip bus can be assigned for either trip or alarm actions. Simple trip conditioning such as latch, delay, and seal-in delay are available.

The easiest way to assign element outputs to a trip bus is through the EnerVista UR Setup software A protection summary is displayed by navigating to a specific protection or control protection element and checking the desired bus box. Once the desired element is selected for a specific bus, a list of element operate-type operands are displayed and can be assigned to a trip bus. If more than one operate-type operand is required, it may be assigned directly from the trip bus menu.

Figure 5–103: TRIP BUS FIELDS IN THE PROTECTION SUMMARY

The following settings are available.

- **TRIP BUS 1 BLOCK**: The trip bus output is blocked when the operand assigned to this setting is asserted.
- **TRIP BUS 1 PICKUP DELAY**: This setting specifies a time delay to produce an output depending on how output is used.
- **TRIP BUS 1 RESET DELAY**: This setting specifies a time delay to reset an output command. The time delay should be set long enough to allow the breaker or contactor to perform a required action.
- **TRIP BUS 1 INPUT 1** to **TRIP BUS 1 INPUT 16**: These settings select a FlexLogic operand to be assigned as an input to the trip bus.
- **TRIP BUS 1 LATCHING**: This setting enables or disables latching of the trip bus output. This is typically used when lockout is required or user acknowledgement of the relay response is required.
- **TRIP BUS 1 RESET**: The trip bus output is reset when the operand assigned to this setting is asserted. Note that the RESET OP operand is pre-wired to the reset gate of the latch, As such, a reset command the front panel interface or via communications will reset the trip bus output.

MESSAGE	GROUP 6 NAME:	Range: up to 16 alphanumeric characters
MESSAGE	SETTING GROUP EVENTS: Disabled	Range: Disabled, Enabled

The 61850 standard provides for the ability to monitor, edit, and change setting groups in a relay through a series of services operating on Setting Group Control Block values. There is one SGCB in LLN0 in LD1 in the UR as, at present, the other LDs do not support multiple setting groups The default value of **SETTING GROUPS** is Disabled. In order for 61850 and/or UR setting group control to function, the **SETTING GROUPS FUNCTION** must be set to Enabled.

The active setting group in the UR is settable from either the value set via a FlexLogic operand in the UR (present practice) or a SelectActiveSG command from a 61850 Client. For both the UR and IEC 61850, the default active setting group is "1".

A 61850 SelectActiveSG command sets one of the internal Non-Volatile flags (61850 SG Level x) that represents the requested Active Setting Group shown as follows:

Table 5–32: ACTIVE SETTING GROUP

SELECTACTIVESG VALUE	FLAG SET
1 (default)	SG Level 1
2	SG Level 2
3	SG Level 3
4	SG Level 4
5	SG Level 4
6	SG Level 6

On power-up or restart, the previously selected 61850 SG Level x is re-instated. Similarly, the input to the setting group control in the UR can be designed with Non-Volatile latches to achieve the same effect.

The setting groups menu controls the activation and deactivation of up to six possible groups of settings in the **GROUPED ELEMENTS** settings menu. The faceplate Settings In Use LEDs indicate which active group (with a non-flashing energized LED) is in service.

The **SETTING GROUPS BLK** setting prevents the active setting group from changing when the FlexLogic parameter is set to "On". This can be useful in applications where it is undesirable to change the settings under certain conditions, such as the breaker being open.

The **GROUP 2 ACTIVATE ON** to **GROUP 6 ACTIVATE ON** settings select a FlexLogic operand which, when set, makes the particular setting group active for use by any grouped element. A priority scheme ensures that only one group is active at a given time – the highest-numbered group that is activated by its **ACTIVATE ON** parameter takes priority over the lower-numbered groups. There is no activate on setting for group 1 (the default active group), because group 1 automatically becomes active if no other group is active.

The **SETTING GROUP 1 NAME** to **SETTING GROUP 6 NAME** settings allows the user to assign a name to each of the six settings groups. Once programmed, this name appears on the second line of the **GROUPED ELEMENTS ⇨ SETTING GROUP 1(6)** menu display.

The relay can be set up via a FlexLogic equation to receive requests to activate or de-activate a particular non-default settings group. The following FlexLogic equation (see the following figure) illustrates requests via remote communications (for example, VIRTUAL INPUT 1 ON) or from a local contact input (for example, CONTACT IP 1 ON) to initiate the use of a particular settings group, and requests from several overcurrent pickup measuring elements to inhibit the use of the particular settings group. The assigned VIRTUAL OUTPUT 1 operand is used to control the “On” state of a particular settings group.

MESSAGE	SELECTOR 1 EVENTS: Disabled	Range: Disabled, Enabled

The selector switch element is intended to replace a mechanical selector switch. Typical applications include setting group control or control of multiple logic sub-circuits in user-programmable logic.

The element provides for two control inputs. The step-up control allows stepping through selector position one step at a time with each pulse of the control input, such as a user-programmable pushbutton. The three-bit control input allows setting the selector to the position defined by a three-bit word.

The element allows pre-selecting a new position without applying it. The pre-selected position gets applied either after time-out or upon acknowledgement via separate inputs (user setting). The selector position is stored in non-volatile memory. Upon power-up, either the previous position is restored or the relay synchronizes to the current three-bit word (user setting). Basic alarm functionality alerts the user under abnormal conditions; for example, the three-bit control input being out of range.

- **SELECTOR 1 FULL RANGE**: This setting defines the upper position of the selector. When stepping up through available positions of the selector, the upper position wraps up to the lower position (position 1). When using a direct three-bit control word for programming the selector to a desired position, the change would take place only if the control word is within the range of 1 to the **SELECTOR FULL RANGE**. If the control word is outside the range, an alarm is established by setting the SELECTOR ALARM FlexLogic operand for 3 seconds.

5

- **SELECTOR 1 TIME-OUT:** This setting defines the time-out period for the selector. This value is used by the relay in the following two ways. When the **SELECTOR STEP-UP MODE** is "Time-out", the setting specifies the required period of inactivity of the control input after which the pre-selected position is automatically applied. When the **SELECTOR STEP-UP MODE** is "Acknowledge", the setting specifies the period of time for the acknowledging input to appear. The timer is re-started by any activity of the control input. The acknowledging input must come before the **SELECTOR 1 TIME-OUT** timer expires; otherwise, the change will not take place and an alarm will be set.
- **SELECTOR 1 STEP-UP**: This setting specifies a control input for the selector switch. The switch is shifted to a new position at each rising edge of this signal. The position changes incrementally, wrapping up from the last (**SELECTOR 1 FULL RANGE**) to the first (position 1). Consecutive pulses of this control operand must not occur faster than every 50 ms. After each rising edge of the assigned operand, the time-out timer is restarted and the **SELECTOR SWITCH 1: POS Z CHNG INITIATED** target message is displayed, where ***Z*** the pre-selected position. The message is displayed for the time specified by the **FLASH MESSAGE TIME** setting. The pre-selected position is applied after the selector times out ("Time-out" mode), or when the acknowledging signal appears before the element times out ("Acknowledge" mode). When the new position is applied, the relay displays the **SELECTOR SWITCH 1: POSITION Z IN USE** message. Typically, a user-programmable pushbutton is configured as the stepping up control input.
- **SELECTOR 1 STEP-UP MODE**: This setting defines the selector mode of operation. When set to "Time-out", the selector will change its position after a pre-defined period of inactivity at the control input. The change is automatic and does not require any explicit confirmation of the intent to change the selector's position. When set to "Acknowledge", the selector will change its position only after the intent is confirmed through a separate acknowledging signal. If the acknowledging signal does not appear within a pre-defined period of time, the selector does not accept the change and an alarm is established by setting the SELECTOR STP ALARM output FlexLogic operand for 3 seconds.
- **SELECTOR 1 ACK**: This setting specifies an acknowledging input for the stepping up control input. The pre-selected position is applied on the rising edge of the assigned operand. This setting is active only under "Acknowledge" mode of operation. The acknowledging signal must appear within the time defined by the **SELECTOR 1 TIME-OUT** setting after the last activity of the control input. A user-programmable pushbutton is typically configured as the acknowledging input.

5

- **SELECTOR 1 3BIT A0, A1, and A2**: These settings specify a three-bit control input of the selector. The three-bit control word pre-selects the position using the following encoding convention:

A2	A1	A0	POSITION
0	0	0	rest
0	0	1	1
0	1	0	2
0	1	1	3
1	0	0	4
1	0	1	5
1	1	0	6
1	1	1	7

The "rest" position (0, 0, 0) does not generate an action and is intended for situations when the device generating the three-bit control word is having a problem. When **SELECTOR 1 3BIT MODE** is "Time-out", the pre-selected position is applied in **SELECTOR 1 TIME-OUT** seconds after the last activity of the three-bit input. When **SELECTOR 1 3BIT MODE** is "Acknowledge", the pre-selected position is applied on the rising edge of the **SELECTOR 1 3BIT ACK** acknowledging input.

The stepping up control input (**SELECTOR 1 STEP-UP**) and the three-bit control inputs (**SELECTOR 1 3BIT A0** through **A2**) lock-out mutually: once the stepping up sequence is initiated, the three-bit control input is inactive; once the three-bit control sequence is initiated, the stepping up input is inactive.

- **SELECTOR 1 3BIT MODE**: This setting defines the selector mode of operation. When set to "Time-out", the selector changes its position after a pre-defined period of inactivity at the control input. The change is automatic and does not require explicit confirmation to change the selector position. When set to "Acknowledge", the selector changes its position only after confirmation via a separate acknowledging signal. If the acknowledging signal does not appear within a pre-defined period of time, the selector rejects the change and an alarm established by invoking the SELECTOR BIT ALARM FlexLogic operand for 3 seconds.
- **SELECTOR 1 3BIT ACK**: This setting specifies an acknowledging input for the three-bit control input. The pre-selected position is applied on the rising edge of the assigned FlexLogic operand. This setting is active only under the

"Acknowledge" mode of operation. The acknowledging signal must appear within the time defined by the **SELECTOR TIME-OUT** setting after the last activity of the three-bit control inputs. Note that the stepping up control input and three-bit control input have independent acknowledging signals (**SELECTOR 1 ACK** and **SELECTOR 1 3BIT ACK**, accordingly).

- **SELECTOR 1 POWER-UP MODE**: This setting specifies the element behavior on power up of the relay.

  When set to "Restore", the last position of the selector (stored in the non-volatile memory) is restored after powering up the relay. If the position restored from memory is out of range, position 0 (no output operand selected) is applied and an alarm is set (SELECTOR 1 PWR ALARM).

  When set to "Synchronize" selector switch acts as follows. For two power cycles, the selector applies position 0 to the switch and activates SELECTOR 1 PWR ALARM. After two power cycles expire, the selector synchronizes to the position dictated by the three-bit control input. This operation does not wait for time-out or the acknowledging input. When the synchronization attempt is unsuccessful (that is, the three-bit input is not available (0,0,0) or out of range) then the selector switch output is set to position 0 (no output operand selected) and an alarm is established (SELECTOR 1 PWR ALARM).

  The operation of "Synch/Restore" mode is similar to the "Synchronize" mode. The only difference is that after an unsuccessful synchronization attempt, the switch will attempt to restore the position stored in the relay memory. The "Synch/Restore" mode is useful for applications where the selector switch is employed to change the setting group in redundant (two relay) protection schemes.

- **SELECTOR 1 EVENTS**: If enabled, the following events are logged:

EVENT NAME	DESCRIPTION
SELECTOR 1 POS *Z*	Selector 1 changed its position to *Z*.
SELECTOR 1 STP ALARM	The selector position pre-selected via the stepping up control input has not been confirmed before the time out.
SELECTOR 1 BIT ALARM	The selector position pre-selected via the three-bit control input has not been confirmed before the time out.

The following figures illustrate the operation of the selector switch. In these diagrams, “T” represents a time-out setting.

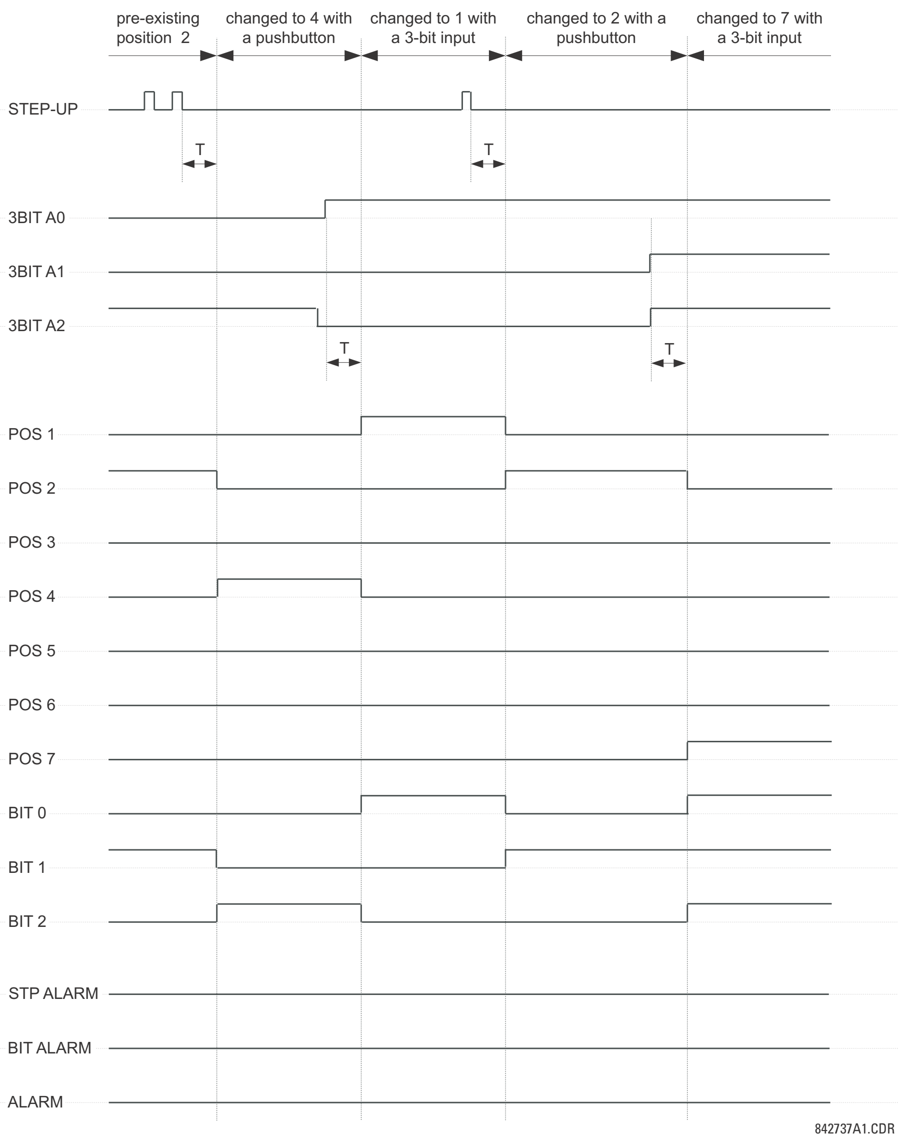

Figure 5–106: TIME-OUT MODE

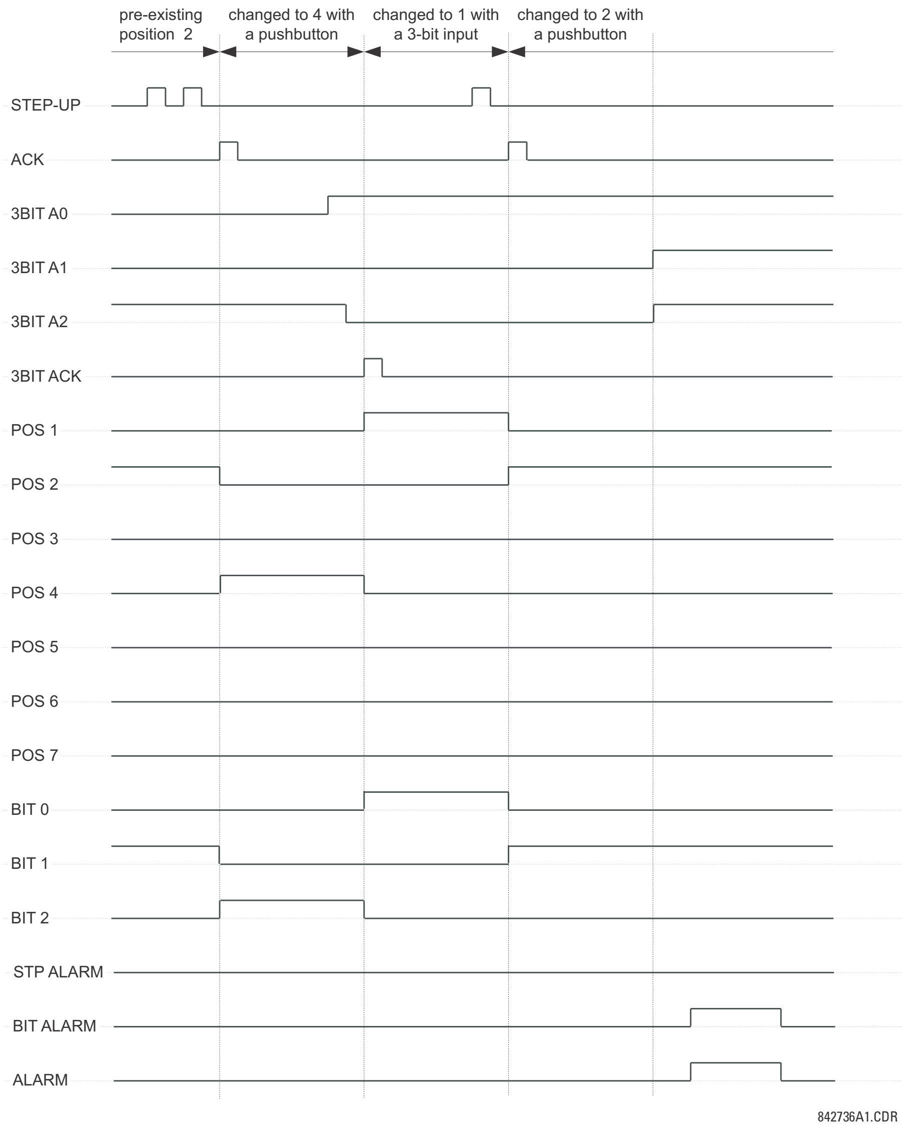

Figure 5–107: ACKNOWLEDGE MODE

APPLICATION EXAMPLE

Consider an application where the selector switch is used to control setting groups 1 through 4 in the relay. The setting groups are to be controlled from both user-programmable pushbutton 1 and from an external device via contact inputs 1 through 3. The active setting group shall be available as an encoded three-bit word to the external device and SCADA via output contacts 1 through 3. The pre-selected setting group shall be applied automatically after 5 seconds of inactivity of the control inputs. When the relay powers up, it should synchronize the setting group to the three-bit control input.

Make the following changes to setting group control in the **SETTINGS** ⇨⇩ **CONTROL ELEMENTS** ⇨ **SETTING GROUPS** menu:

SETTING GROUPS FUNCTION: "Enabled"
SETTING GROUPS BLK: "Off"
GROUP 2 ACTIVATE ON: "SELECTOR 1 POS 2"
GROUP 3 ACTIVATE ON: "SELECTOR 1 POS 3"
GROUP 4 ACTIVATE ON: "SELECTOR 1 POS 4"
GROUP 5 ACTIVATE ON: "Off"
GROUP 6 ACTIVATE ON: "Off"

Make the following changes to selector switch element in the **SETTINGS** ⇨⇩ **CONTROL ELEMENTS** ⇨⇩ **SELECTOR SWITCH** ⇨ **SELECTOR SWITCH 1** menu to assign control to user programmable pushbutton 1 and contact inputs 1 through 3:

SELECTOR 1 FUNCTION: "Enabled"
SELECTOR 1 FULL-RANGE: "4"
SELECTOR 1 STEP-UP MODE: "Time-out"
SELECTOR 1 TIME-OUT: "5.0 s"
SELECTOR 1 STEP-UP: "PUSHBUTTON 1 ON"
SELECTOR 1 ACK: "Off"

SELECTOR 1 3BIT A0: "CONT IP 1 ON"
SELECTOR 1 3BIT A1: "CONT IP 2 ON"
SELECTOR 1 3BIT A2: "CONT IP 3 ON"
SELECTOR 1 3BIT MODE: "Time-out"
SELECTOR 1 3BIT ACK: "Off"
SELECTOR 1 POWER-UP MODE: "Synchronize"

Now, assign the contact output operation (assume the H6E module) to the selector switch element by making the following changes in the **SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS** menu:

OUTPUT H1 OPERATE: "SELECTOR 1 BIT 0"
OUTPUT H2 OPERATE: "SELECTOR 1 BIT 1"
OUTPUT H3 OPERATE: "SELECTOR 1 BIT 2"

Finally, assign configure user-programmable pushbutton 1 by making the following changes in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE PUSHBUTTONS ⇨ USER PUSHBUTTON 1** menu:

PUSHBUTTON 1 FUNCTION: "Self-reset"
PUSHBUTTON 1 DROP-OUT TIME: "0.10 s"

The logic for the selector switch is shown below:

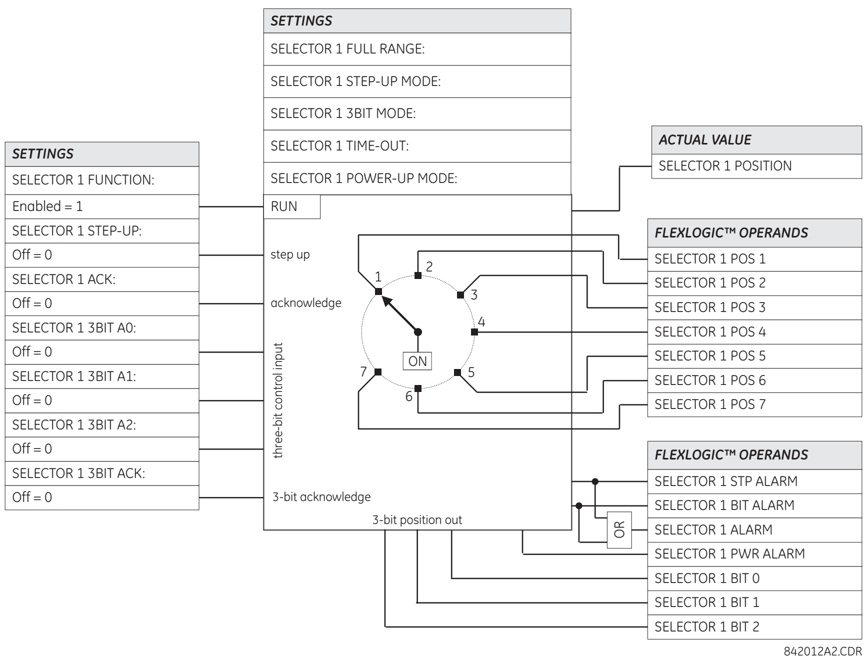

Figure 5–108: SELECTOR SWITCH LOGIC

5

5.7.5 UNDERFREQUENCY

PATH: SETTINGS ⇨⇩ CONTROL ELEMENTS ⇨⇩ UNDERFREQUENCY ⇨ UNDERFREQUENCY 1(6)

■ UNDERFREQUENCY 1 ■	UNDFREQ 1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE	UNDERFREQ 1 BLOCK: Off	Range: FlexLogic operand
MESSAGE	UNDERFREQ 1 SOURCE: SRC 1	Range: SRC 1, SRC 2
MESSAGE	UNDERFREQ 1 MIN VOLT/AMP: 0.10 pu	Range: 0.10 to 1.25 pu in steps of 0.01

MESSAGE	UNDERFREQ 1 TARGET: Self-reset	Range: Self-reset, Latched, Disabled
MESSAGE	UNDERFREQ 1 EVENTS: Disabled	Range: Disabled, Enabled

There are six identical underfrequency elements, numbered from 1 through 6.

The steady-state frequency of a power system is a certain indicator of the existing balance between the generated power and the load. Whenever this balance is disrupted through the loss of an important generating unit or the isolation of part of the system from the rest of the system, the effect will be a reduction in frequency. If the control systems of the system generators do not respond fast enough, the system may collapse. A reliable method to quickly restore the balance between load and generation is to automatically disconnect selected loads, based on the actual system frequency. This technique, called “load-shedding”, maintains system integrity and minimize widespread outages. After the frequency returns to normal, the load may be automatically or manually restored.

The **UNDERFREQ 1 SOURCE** setting is used to select the source for the signal to be measured. The element first checks for a live phase voltage available from the selected source. If voltage is not available, the element attempts to use a phase current. If neither voltage nor current is available, the element will not operate, as it will not measure a parameter below the minimum voltage/current setting.

The **UNDERFREQ 1 MIN VOLT/AMP** setting selects the minimum per unit voltage or current level required to allow the underfrequency element to operate. This threshold is used to prevent an incorrect operation because there is no signal to measure.

This **UNDERFREQ 1 PICKUP** setting is used to select the level at which the underfrequency element is to pickup. For example, if the system frequency is 60 Hz and the load shedding is required at 59.5 Hz, the setting will be 59.50 Hz.

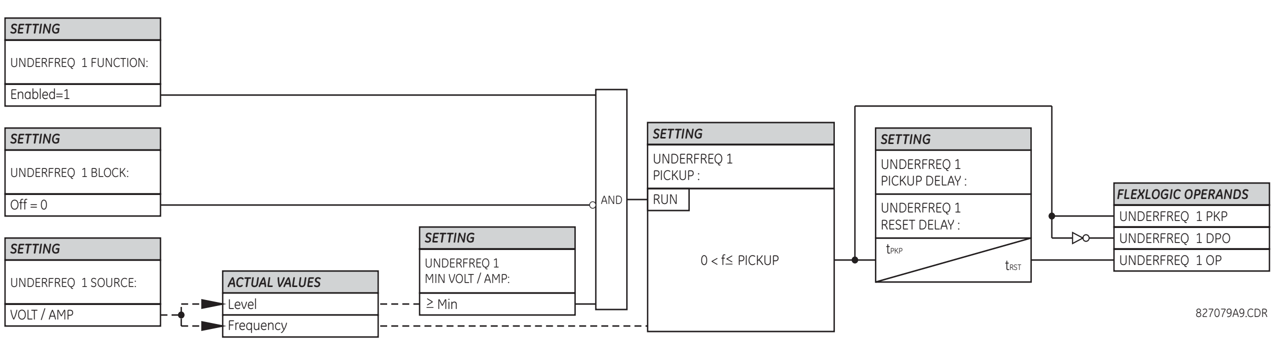

Figure 5–109: UNDERFREQUENCY SCHEME LOGIC

MESSAGE	OVERFREQ 1 TARGET: Self-reset	Range: Self-reset, Latched, Disabled
MESSAGE	OVERFREQ 1 EVENTS: Disabled	Range: Disabled, Enabled

There are four overfrequency elements, numbered 1 through 4.

A frequency calculation for a given source is made on the input of a voltage or current channel, depending on which is available. The channels are searched for the signal input in the following order: voltage channel A, auxiliary voltage channel, current channel A, ground current channel. The first available signal is used for frequency calculation.

The steady-state frequency of a power system is an indicator of the existing balance between the generated power and the load. Whenever this balance is disrupted through the disconnection of significant load or the isolation of a part of the system that has a surplus of generation, the effect will be an increase in frequency. If the control systems of the generators do not respond fast enough, to quickly ramp the turbine speed back to normal, the overspeed can lead to the turbine trip. The overfrequency element can be used to control the turbine frequency ramp down at a generating location. This element can also be used for feeder reclosing as part of the "after load shedding restoration".

The **OVERFREQ 1 SOURCE** setting selects the source for the signal to be measured. The **OVERFREQ 1 PICKUP** setting selects the level at which the overfrequency element is to pickup.

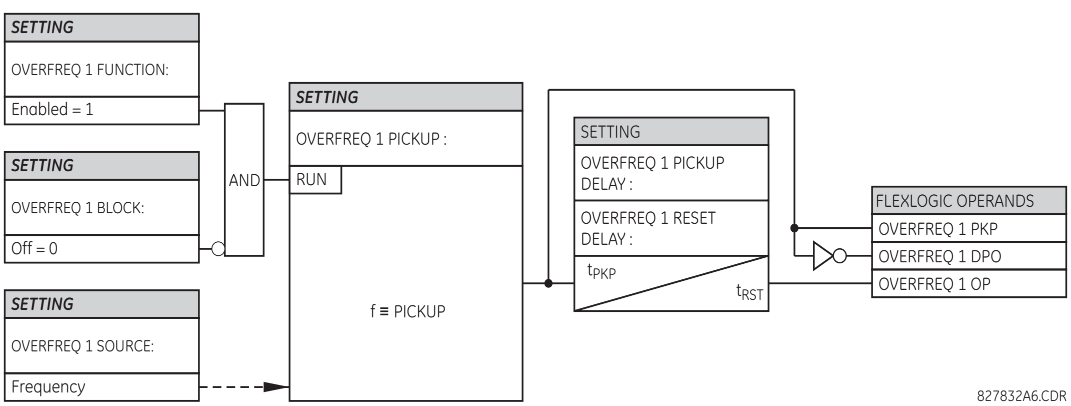

Figure 5–110: OVERFREQUENCY SCHEME LOGIC

5.7.7 FREQUENCY RATE OF CHANGE

PATH: SETTINGS ⇨⇩ CONTROL ELEMENTS ⇨⇩ FREQUENCY RATE OF CHANGE ⇨ FREQUENCY RATE OF CHANGE 1(4)

■ FREQUENCY RATE ■ OF CHANGE 1	FREQ RATE 1 FUNCTION: Disabled	Range: *Disabled, Enabled*
MESSAGE	FREQ RATE 1 SOURCE: SRC 1	Range: *SRC 1, SRC 2*
MESSAGE	FREQ RATE 1 TREND: Increasing	Range: *Increasing, Decreasing, Bi-directional*

MESSAGE	FREQ RATE 1 OC SUPV PICKUP: 0.200 pu	Range: *0.000 to 30.000 pu in steps of 0.001*
MESSAGE	FREQ RATE 1 MIN FREQUENCY: 45.00 Hz	Range: *20.00 to 80.00 Hz in steps of 0.01*
MESSAGE	FREQ RATE 1 MAX FREQUENCY: 65.00 Hz	Range: *20.00 to 80.00 Hz in steps of 0.01*
MESSAGE	FREQ RATE 1 PICKUP DELAY: 0.000 s	Range: *0 to 65.535 s in steps of 0.001*
MESSAGE	FREQ RATE 1 RESET DELAY: 0.000 s	Range: *0 to 65.535 s in steps of 0.001*
MESSAGE	FREQ RATE 1 BLOCK: Off	Range: *FlexLogic operand*
MESSAGE	FREQ RATE 1 TARGET: Self-Reset	Range: *Self-Reset, Latched, Disabled*
MESSAGE	FREQ RATE 1 EVENTS: Disabled	Range: *Disabled, Enabled*

Four independent rate of change of frequency elements are available. The element responds to rate of change of frequency with voltage, current and frequency supervision.

- **FREQ RATE 1 TREND:** This setting allows configuring the element to respond to increasing or decreasing frequency, or to frequency change in either direction.
- **FREQ RATE 1 PICKUP:** This setting specifies an intended df/dt pickup threshold. For applications monitoring a decreasing trend, set **FREQ RATE 1 TREND** to "Decreasing" and specify the pickup threshold accordingly. The operating condition is: $-df/dt > \text{Pickup}$.

  For applications monitoring an increasing trend, set **FREQ RATE 1 TREND** to "Increasing" and specify the pickup threshold accordingly. The operating condition is: $df/dt > \text{Pickup}$.

  For applications monitoring rate of change of frequency in any direction set **FREQ RATE 1 TREND** to "Bi-Directional" and specify the pickup threshold accordingly. The operating condition is: $\text{abs}(df/dt) > \text{Pickup}$
- **FREQ RATE 1 OV SUPV PICKUP:** This setting defines minimum voltage level required for operation of the element. The supervising function responds to the positive-sequence voltage. Overvoltage supervision should be used to prevent operation under specific system conditions such as faults.
- **FREQ RATE 1 OC SUPV PICKUP:** This setting defines minimum current level required for operation of the element. The supervising function responds to the positive-sequence current. Typical application includes load shedding. Set the pickup threshold to zero if no overcurrent supervision is required.

- **FREQ RATE 1 MIN FREQUENCY:** This setting defines minimum frequency level required for operation of the element. The setting may be used to effectively block the feature based on frequency. For example, if the intent is to monitor an increasing trend but only if the frequency is already above certain level, this setting should be set to the required frequency level.
- **FREQ RATE 1 MAX FREQUENCY:** This setting defines maximum frequency level required for operation of the element. The setting may be used to effectively block the feature based on frequency. For example, if the intent is to monitor a decreasing trend but only if the frequency is already below certain level (such as for load shedding), this setting should be set to the required frequency level.

NOTE

If the signal source assigned to the frequency rate of change element is only set to auxiliary VT, then the minimum voltage supervision is 3 V.

MESSAGE		SYNCHK1 TARGET: Self-reset	Range: Self-reset, Latched, Disabled
MESSAGE		SYNCHK1 EVENTS: Disabled	Range: Disabled, Enabled

There are four identical synchrocheck elements available, numbered 1 to 4.

The synchronism check function is intended for supervising the paralleling of two parts of a system which are to be joined by the closure of a circuit breaker. The synchrocheck elements are typically used at locations where the two parts of the system are interconnected through at least one other point in the system.

Synchrocheck verifies that the voltages (V1 and V2) on the two sides of the supervised circuit breaker are within set limits of magnitude, angle and frequency differences. The time that the two voltages remain within the admissible angle difference is determined by the setting of the phase angle difference ΔΦ and the frequency difference ΔF (slip frequency). It can be defined as the time it would take the voltage phasor V1 or V2 to traverse an angle equal to 2 × ΔΦ at a frequency equal to the frequency difference ΔF. This time can be calculated by:

$$T = \frac{1}{\frac{360^\circ}{2 \times \Delta\Phi} \times \Delta F} \quad \textbf{(EQ 5.25)}$$

where: ΔΦ = phase angle difference in degrees; ΔF = frequency difference in Hz.

If one or both sources are de-energized, the synchrocheck programming can allow for closing of the circuit breaker using undervoltage control to by-pass the synchrocheck measurements (dead source function).

- **SYNCHK1 V1 SOURCE**: This setting selects the source for voltage V1 (see NOTES below).
- **SYNCHK1 V2 SOURCE**: This setting selects the source for voltage V2, which must not be the same as used for the V1 (see NOTES below).
- **SYNCHK1 MAX VOLT DIFF**: This setting selects the maximum primary voltage difference in volts between the two sources. A primary voltage magnitude difference between the two input voltages below this value is within the permissible limit for synchronism.
- **SYNCHK1 MAX ANGLE DIFF:** This setting selects the maximum angular difference in degrees between the two sources. An angular difference between the two input voltage phasors below this value is within the permissible limit for synchronism.
- **SYNCHK1 MAX FREQ DIFF:** This setting selects the maximum frequency difference in 'Hz' between the two sources. A frequency difference between the two input voltage systems below this value is within the permissible limit for synchronism.
- **SYNCHK1 MAX FREQ HYSTERESIS**: This setting specifies the required hysteresis for the maximum frequency difference condition. The condition becomes satisfied when the frequency difference becomes lower than **SYNCHK1 MAX FREQ DIFF**. Once the Synchrocheck element has operated, the frequency difference must increase above the **SYNCHK1 MAX FREQ DIFF** + **SYNCHK1 MAX FREQ HYSTERESIS** sum to drop out (assuming the other two conditions, voltage and angle, remain satisfied).
- **SYNCHK1 DEAD SOURCE SELECT:** This setting selects the combination of dead and live sources that will by-pass synchronism check function and permit the breaker to be closed when one or both of the two voltages (V1 or/and V2) are below the maximum voltage threshold. A dead or live source is declared by monitoring the voltage level. Six options are available:

  None: Dead Source function is disabled
  LV1 and DV2: Live V1 and Dead V2
  DV1 and LV2: Dead V1 and Live V2
  DV1 or DV2: Dead V1 or Dead V2
  DV1 Xor DV2: Dead V1 exclusive-or Dead V2 (one source is Dead and the other is Live)
  DV1 and DV2: Dead V1 and Dead V2
- **SYNCHK1 DEAD V1 MAX VOLT:** This setting establishes a maximum voltage magnitude for V1 in 1 'pu'. Below this magnitude, the V1 voltage input used for synchrocheck will be considered "Dead" or de-energized.
- **SYNCHK1 DEAD V2 MAX VOLT**: This setting establishes a maximum voltage magnitude for V2 in 'pu'. Below this magnitude, the V2 voltage input used for synchrocheck will be considered "Dead" or de-energized.
- **SYNCHK1 LIVE V1 MIN VOLT**: This setting establishes a minimum voltage magnitude for V1 in 'pu'. Above this magnitude, the V1 voltage input used for synchrocheck will be considered "Live" or energized.
- **SYNCHK1 LIVE V2 MIN VOLT**: This setting establishes a minimum voltage magnitude for V2 in 'pu'. Above this magnitude, the V2 voltage input used for synchrocheck will be considered "Live" or energized.

NOTES ON THE SYNCHROCHECK FUNCTION:

1. The selected sources for synchrocheck inputs V1 and V2 (which must not be the same source) may include both a three-phase and an auxiliary voltage. The relay will automatically select the specific voltages to be used by the synchrocheck element in accordance with the following table.

NO.	V1 OR V2 (SOURCE Y)	V2 OR V1 (SOURCE Z)	AUTO-SELECTED COMBINATION		AUTO-SELECTED VOLTAGE
			SOURCE Y	SOURCE Z	
1	Phase VTs and Auxiliary VT	Phase VTs and Auxiliary VT	Phase	Phase	VAB
2	Phase VTs and Auxiliary VT	Phase VT	Phase	Phase	VAB
3	Phase VT	Phase VT	Phase	Phase	VAB

NO.	V1 OR V2 (SOURCE Y)	V2 OR V1 (SOURCE Z)	AUTO-SELECTED COMBINATION		AUTO-SELECTED VOLTAGE
			SOURCE Y	SOURCE Z	
4	Phase VT and Auxiliary VT	Auxiliary VT	Phase	Auxiliary	V auxiliary (as set for Source z)
5	Auxiliary VT	Auxiliary VT	Auxiliary	Auxiliary	V auxiliary (as set for selected sources)

The voltages V1 and V2 will be matched automatically so that the corresponding voltages from the two sources will be used to measure conditions. A phase to phase voltage will be used if available in both sources; if one or both of the Sources have only an auxiliary voltage, this voltage will be used. For example, if an auxiliary voltage is programmed to VAG, the synchrocheck element will automatically select VAG from the other source. If the comparison is required on a specific voltage, the user can externally connect that specific voltage to auxiliary voltage terminals and then use this "Auxiliary Voltage" to check the synchronism conditions.

If using a single CT/VT module with both phase voltages and an auxiliary voltage, ensure that only the auxiliary voltage is programmed in one of the sources to be used for synchrocheck.

NOTE

Exception: Synchronism cannot be checked between Delta connected phase VTs and a Wye connected auxiliary voltage.

2. The relay measures frequency and Volts/Hz from an input on a given source with priorities as established by the configuration of input channels to the source. The relay will use the phase channel of a three-phase set of voltages if programmed as part of that source. The relay will use the auxiliary voltage channel only if that channel is programmed as part of the Source and a three-phase set is not.

The maximum number of autoreclosure elements available is equal to the number of installed CT banks.

The autoreclosure feature is intended for use with transmission and distribution lines, in three-pole tripping schemes for single breaker applications. Up to four selectable reclosures 'shots' are possible prior to locking out. Each shot has an independently settable dead time. The protection settings can be changed between shots if so desired, using FlexLogic. Logic inputs are available for disabling or blocking the scheme.

Faceplate panel LEDs indicate the state of the autoreclose scheme as follows:

- Reclose Enabled: The scheme is enabled and may reclose if initiated.
- Reclose Disabled: The scheme is disabled.
- Reclose In Progress: An autoreclosure has been initiated but the breaker has not yet been signaled to close.
- Reclose Locked Out: The scheme has generated the maximum number of breaker closures allowed and, as the fault persists, will not close the breaker again; known as 'Lockout'. The scheme may also be sent in 'Lockout' when the incomplete sequence timer times out or when a block signal occurs while in 'reclose in progress'. The scheme must be reset from Lockout in order to perform reclose for further faults.

5

The reclosure scheme is considered *enabled* when all of the following conditions are true:

- The **AR1 FUNCTION** is set to "Enabled".
- The scheme is not in the 'Lockout' state.
- The 'Block' input is not asserted.
- The **AR1 BLK TIME UPON MNL CLS** timer is not active.

The autoreclose scheme is initiated by a trip signal from any selected protection feature operand. The scheme is initiated provided the circuit breaker is in the closed state before protection operation.

The reclose-in-progress (RIP) is set when a reclosing cycle begins following a reclose initiate signal. Once the cycle is successfully initiated, the RIP signal will seal-in and the scheme will continue through its sequence until one of the following conditions is satisfied:

- The close signal is issued when the dead timer times out, or
- The scheme goes to lockout.

While RIP is active, the scheme checks that the breaker is open and the shot number is below the limit, and then begins measuring the dead time.

Each of the four possible shots has an independently settable dead time. Two additional timers can be used to increase the initial set dead times 1 to 4 by a delay equal to **AR1 DELAY 1** or **AR1 DELAY 2** or the sum of these two delays depending on the selected settings. This offers enhanced setting flexibility using FlexLogic operands to turn the two additional timers "on" and "off". These operands may possibly include AR1 SHOT CNT =n, SETTING GROUP ACT 1, etc. The autoreclose provides up to maximum 4 selectable shots. Maximum number of shots can be dynamically modified through the settings **AR1 REDUCE MAX TO 1 (2, 3)**, using the appropriate FlexLogic operand.

Scheme lockout blocks all phases of the reclosing cycle, preventing automatic reclosure, if any of the following occurs:

- The maximum shot number was reached.
- A 'Block' input is in effect (for instance; Breaker Failure, bus differential protection operated, etc.).

- The 'Incomplete Sequence' timer times out.

The recloser will be latched in the Lockout state until a 'reset from lockout' signal is asserted, either from a manual close of the breaker or from a manual reset command (local or remote). The reset from lockout can be accomplished by operator command, by manually closing the breaker, or whenever the breaker has been closed and stays closed for a preset time.

After the dead time elapses, the scheme issues the close signal. The close signal is latched until the breaker closes or the scheme goes to Lockout.

A reset timer output resets the recloser following a successful reclosure sequence. The reset time is based on the breaker 'reclaim time' which is the minimum time required between successive reclose sequences.

SETTINGS:

- **AR1 INITIATE:** Selects the FlexLogic operand that initiates the scheme, typically the trip signal from protection.
- **AR1 BLOCK:** Selects the FlexLogic operand that blocks the autoreclosure initiate (it could be from the breaker failure, bus differential protection, etc.).
- **AR1 MAX NUMBER OF SHOTS:** Specifies the number of reclosures that can be attempted before reclosure goes to "Lockout" because the fault is permanent.
- **AR1 REDUCE MAX TO 1(3):** Selects the FlexLogic operand that changes the maximum number of shots from the initial setting to 1, 2, or 3, respectively.
- **AR1 MANUAL CLOSE:** Selects the logic input set when the breaker is manually closed.
- **AR1 MNL RST FRM LO:** Selects the FlexLogic operand that resets the autoreclosure from Lockout condition. Typically this is a manual reset from lockout, local or remote.
- **AR1 RESET LOCKOUT IF BREAKER CLOSED:** This setting allows the autoreclose scheme to reset from Lockout if the breaker has been manually closed and stays closed for a preset time. In order for this setting to be effective, the next setting (**AR1 RESET LOCKOUT ON MANUAL CLOSE**) should be disabled.
- **AR1 RESET LOCKOUT ON MANUAL CLOSE:** This setting allows the autoreclose scheme to reset from Lockout when the breaker is manually closed regardless if the breaker remains closed or not. This setting overrides the previous setting (**AR1 RESET LOCKOUT IF BREAKER CLOSED**).
- **AR1 BLK TIME UPON MNL CLS:** The autoreclose scheme can be disabled for a programmable time delay after the associated circuit breaker is manually closed. This prevents reclosing onto a fault after a manual close. This delay must be longer than the slowest expected trip from any protection not blocked after manual closing. If no overcurrent trips occur after a manual close and this time expires, the autoreclose scheme is enabled.
- **AR1 DEAD TIME 1 to AR1 DEAD TIME 4:** These are the intentional delays before first, second, third, and fourth breaker automatic reclosures (1st, 2nd, and 3rd shots), respectively, and should be set longer than the estimated deionizing time following a three pole trip.
- **AR1 ADD DELAY 1:** This setting selects the FlexLogic operand that introduces an additional delay (Delay 1) to the initial set Dead Time (1 to 4). When this setting is "Off", Delay 1 is by-passed.
- **AR1 DELAY 1:** This setting establishes the extent of the additional dead time Delay 1.
- **AR1 ADD DELAY 2:** This setting selects the FlexLogic operand that introduces an additional delay (Delay 2) to the initial set Dead Time (1 to 4). When this setting is "Off", Delay 2 is by-passed.
- **AR1 DELAY 2:** This setting establishes the extent of the additional dead time Delay 2.
- **AR1 RESET LOCKOUT DELAY:** This setting establishes how long the breaker should stay closed after a manual close command, in order for the autorecloser to reset from Lockout.
- **AR1 RESET TIME**: A reset timer output resets the recloser following a successful reclosure sequence. The setting is based on the breaker 'reclaim time' which is the minimum time required between successive reclose sequences.
- **AR1 INCOMPLETE SEQ TIME**: This timer defines the maximum time interval allowed for a single reclose shot. It is started whenever a reclosure is initiated and is active when the scheme is in the 'reclose-in-progress' state. If all conditions allowing a breaker closure are not satisfied when this time expires, the scheme goes to "Lockout".

NOTE

This timer must be set to a delay less than the reset timer.

	MESSAGE	DIGITAL ELEMENT 1 EVENTS: Disabled	Range: *Disabled, Enabled*

There are 48 identical digital elements available, numbered 1 to 48. A digital element can monitor any FlexLogic operand and present a target message and/or enable events recording depending on the output operand state. The digital element settings include a name which will be referenced in any target message, a blocking input from any selected FlexLogic operand, and a timer for pickup and reset delays for the output operand.

- **DIGITAL ELEMENT 1 INPUT:** Selects a FlexLogic operand to be monitored by the digital element.
- **DIGITAL ELEMENT 1 PICKUP DELAY:** Sets the time delay to pickup. If a pickup delay is not required, set to "0".
- **DIGITAL ELEMENT 1 RESET DELAY:** Sets the time delay to reset. If a reset delay is not required, set to "0".
- **DIGITAL ELEMENT 1 PICKUP LED**: This setting enables or disabled the digital element pickup LED. When set to "Disabled", the operation of the pickup LED is blocked.

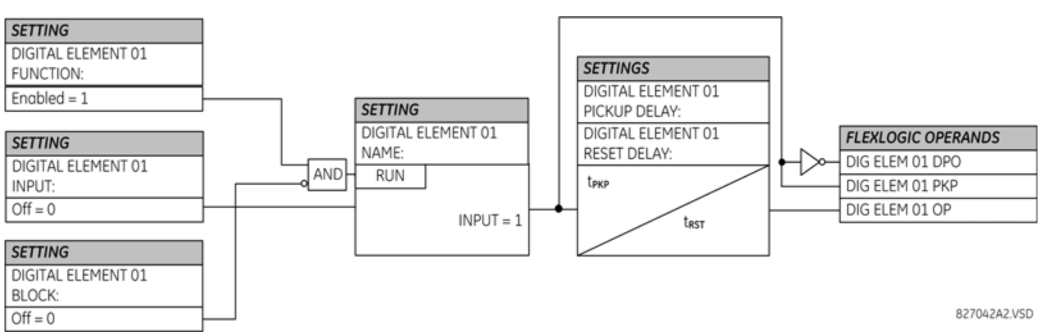

Figure 5–116: DIGITAL ELEMENT SCHEME LOGIC

CIRCUIT MONITORING APPLICATIONS:

Some versions of the digital input modules include an active voltage monitor circuit connected across form-A contacts. The voltage monitor circuit limits the trickle current through the output circuit (see technical specifications for form-A).

As long as the current through the voltage monitor is above a threshold (see technical specifications for form-A), the “Cont Op 1 VOn” FlexLogic operand will be set (for contact input 1 – corresponding operands exist for each contact output). If the output circuit has a high resistance or the DC current is interrupted, the trickle current will drop below the threshold and the “Cont Op 1 VOff” FlexLogic operand will be set. Consequently, the state of these operands can be used as indicators of the integrity of the circuits in which form-A contacts are inserted.

EXAMPLE 1: BREAKER TRIP CIRCUIT INTEGRITY MONITORING

In many applications it is desired to monitor the breaker trip circuit integrity so problems can be detected before a trip operation is required. The circuit is considered to be healthy when the voltage monitor connected across the trip output contact detects a low level of current, well below the operating current of the breaker trip coil. If the circuit presents a high resistance, the trickle current will fall below the monitor threshold and an alarm would be declared.

In most breaker control circuits, the trip coil is connected in series with a breaker auxiliary contact which is open when the breaker is open (see diagram below). To prevent unwanted alarms in this situation, the trip circuit monitoring logic must include the breaker position.

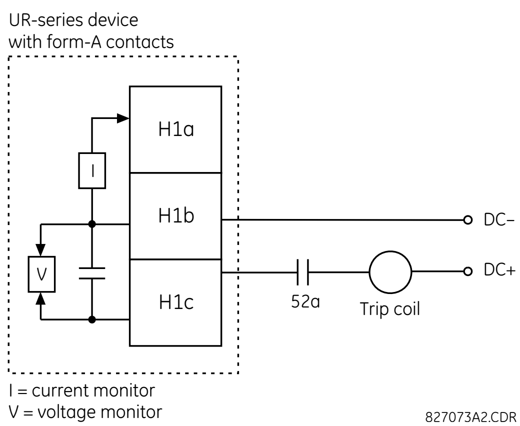

Figure 5–117: TRIP CIRCUIT EXAMPLE 1

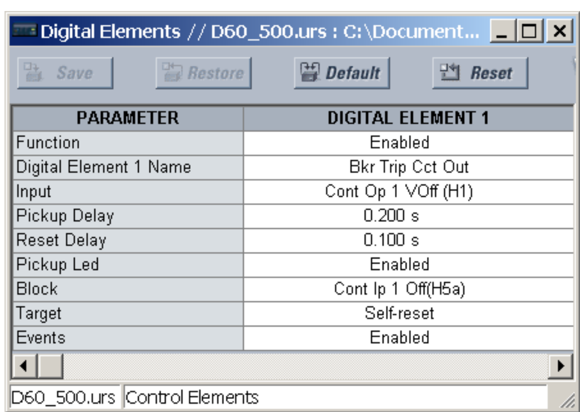
Assume the output contact H1 is a trip contact. Using the contact output settings, this output will be given an ID name; for example, “Cont Op 1". Assume a 52a breaker auxiliary contact is connected to contact input H7a to monitor breaker status. Using the contact input settings, this input will be given an ID name, for example, “Cont Ip 1", and will be set “On” when the breaker is closed. The settings to use digital element 1 to monitor the breaker trip circuit are indicated below (EnerVista UR Setup example shown):



Digital Elements // D60_500.urs : C:\Document...

Save Restore Default Reset

PARAMETER	DIGITAL ELEMENT 1
Function	Enabled
Digital Element 1 Name	Bkr Trip Cct Out
Input	Cont Op 1 VOff (H1)
Pickup Delay	0.200 s
Reset Delay	0.100 s
Pickup Led	Enabled
Block	Cont Ip 1 Off(H5a)
Target	Self-reset
Events	Enabled

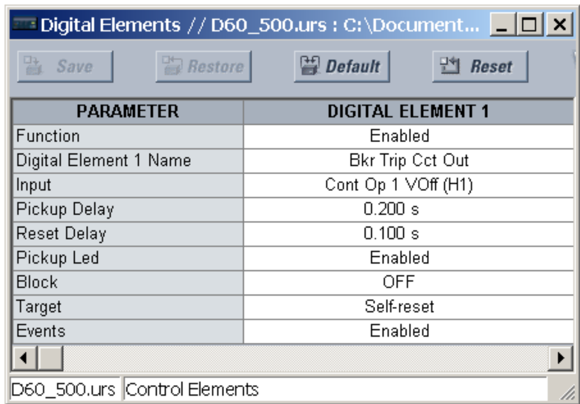
D60_500.urs Control Elements

NOTE

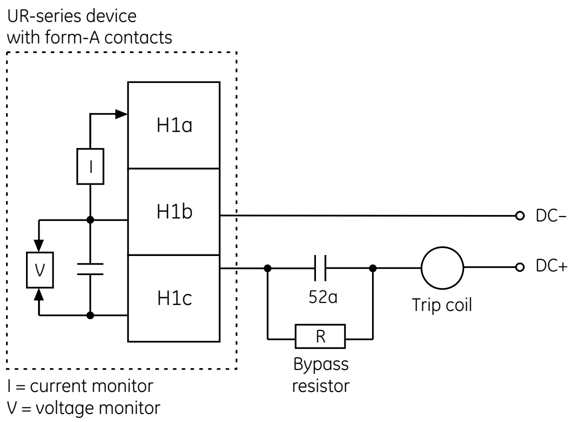
The PICKUP DELAY setting should be greater than the operating time of the breaker to avoid nuisance alarms.

EXAMPLE 2: BREAKER TRIP CIRCUIT INTEGRITY MONITORING

If it is required to monitor the trip circuit continuously, independent of the breaker position (open or closed), a method to maintain the monitoring current flow through the trip circuit when the breaker is open must be provided (as shown in the figure below). This can be achieved by connecting a suitable resistor (see figure below) across the auxiliary contact in the trip circuit. In this case, it is not required to supervise the monitoring circuit with the breaker position – the **BLOCK** setting is selected to "Off". In this case, the settings are as follows (EnerVista UR Setup example shown).



PARAMETER	DIGITAL ELEMENT 1
Function	Enabled
Digital Element 1 Name	Bkr Trip Cct Out
Input	Cont Op 1 VOff (H1)
Pickup Delay	0.200 s
Reset Delay	0.100 s
Pickup Led	Enabled
Block	OFF
Target	Self-reset
Events	Enabled



Values for resistor "R"

Power supply	Resistance	Power

NOTE

The wiring connection for two examples above is applicable to both form-A contacts with voltage monitoring and solid-state contact with voltage monitoring.

5.7.11 DIGITAL COUNTERS

PATH: SETTINGS ⇨⇩ CONTROL ELEMENTS ⇨⇩ DIGITAL COUNTERS ⇨ COUNTER 1(8)

■ COUNTER 1 ■	COUNTER 1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE	COUNTER 1 NAME: Counter 1	Range: 12 alphanumeric characters
MESSAGE	COUNTER 1 UNITS:	Range: 6 alphanumeric characters
MESSAGE	COUNTER 1 PRESET: 0	Range: –2,147,483,648 to +2,147,483,647
MESSAGE	COUNTER 1 COMPARE: 0	Range: –2,147,483,648 to +2,147,483,647
MESSAGE	COUNTER 1 UP: Off	Range: FlexLogic operand
MESSAGE	COUNTER 1 DOWN: Off	Range: FlexLogic operand
MESSAGE	COUNTER 1 BLOCK: Off	Range: FlexLogic operand
MESSAGE	CNT1 SET TO PRESET: Off	Range: FlexLogic operand
MESSAGE	COUNTER 1 RESET: Off	Range: FlexLogic operand
MESSAGE	COUNT1 FREEZE/RESET: Off	Range: FlexLogic operand
MESSAGE	COUNT1 FREEZE/COUNT: Off	Range: FlexLogic operand

There are 8 identical digital counters, numbered from 1 to 8. A digital counter counts the number of state transitions from Logic 0 to Logic 1. The counter is used to count operations such as the pickups of an element, the changes of state of an external contact (e.g. breaker auxiliary switch), or pulses from a watt-hour meter.

- **COUNTER 1 UNITS:** Assigns a label to identify the unit of measure pertaining to the digital transitions to be counted. The units label will appear in the corresponding actual values status.
- **COUNTER 1 PRESET:** Sets the count to a required preset value before counting operations begin, as in the case where a substitute relay is to be installed in place of an in-service relay, or while the counter is running.
- **COUNTER 1 COMPARE:** Sets the value to which the accumulated count value is compared. Three FlexLogic output operands are provided to indicate if the present value is 'more than (HI)', 'equal to (EQL)', or 'less than (LO)' the set value.
- **COUNTER 1 UP:** Selects the FlexLogic operand for incrementing the counter. If an enabled UP input is received when the accumulated value is at the limit of +2,147,483,647 counts, the counter will rollover to –2,147,483,648.
- **COUNTER 1 DOWN:** Selects the FlexLogic operand for decrementing the counter. If an enabled DOWN input is received when the accumulated value is at the limit of –2,147,483,648 counts, the counter will rollover to +2,147,483,647.
- **COUNTER 1 BLOCK:** Selects the FlexLogic operand for blocking the counting operation. All counter operands are blocked.

5

- **CNT1 SET TO PRESET:** Selects the FlexLogic operand used to set the count to the preset value. The counter will be set to the preset value in the following situations:
  1. When the counter is enabled and the **CNT1 SET TO PRESET** operand has the value 1 (when the counter is enabled and **CNT1 SET TO PRESET** operand is 0, the counter will be set to 0).
  2. When the counter is running and the **CNT1 SET TO PRESET** operand changes the state from 0 to 1 (**CNT1 SET TO PRESET** changing from 1 to 0 while the counter is running has no effect on the count).
  3. When a reset or reset/freeze command is sent to the counter and the **CNT1 SET TO PRESET** operand has the value 1 (when a reset or reset/freeze command is sent to the counter and the **CNT1 SET TO PRESET** operand has the value 0, the counter will be set to 0).
- **COUNTER 1 RESET:** Selects the FlexLogic operand for setting the count to either “0” or the preset value depending on the state of the **CNT1 SET TO PRESET** operand.
- **COUNTER 1 FREEZE/RESET:** Selects the FlexLogic operand for capturing (freezing) the accumulated count value into a separate register with the date and time of the operation, and resetting the count to “0”.
- **COUNTER 1 FREEZE/COUNT:** Selects the FlexLogic operand for capturing (freezing) the accumulated count value into a separate register with the date and time of the operation, and continuing counting. The present accumulated value and captured frozen value with the associated date/time stamp are available as actual values. If control power is interrupted, the accumulated and frozen values are saved into non-volatile memory during the power down operation.

MESSAGE	▲	HI-Z EVENTS: Disabled	Range: Disabled, Enabled

Some faults in overhead distribution feeders are characterized by low fault current due to high ground resistance. If the fault current is in the order of expected unbalance load or less, it cannot be reliably detected by overcurrent protection. These faults are classified as high-impedance (Hi-Z) faults. Since a Hi-Z fault is not accompanied by excessive current, it is generally not dangerous to the electrical installation except for some damage to the overhead conductor at the fault location. However, an undetected Hi-Z fault is a risk to people and property as well as having a potential to evolve into a full-blown fault.

The following event types are associated with Hi-Z faults. It is assumed that for all cases that ground is involved.

- High impedance fault: a fault with fault impedance sufficiently high such that it is not detected by overcurrent protection
- High impedance, downed conductor fault: a high impedance fault for which the primary conductor is no longer intact on pole top insulators, but instead is in contact with earth or a grounded object
- Arcing fault: any high impedance fault which exhibits arcing

Combinations of these events are possible: for example, an arcing high impedance, downed conductor fault. The Hi-Z element is intended to detect high impedance faults that arc and to differentiate those that are downed conductors from those that are not. It should be noted that no known technology can detect all Hi-Z faults.

The Hi-Z element was primarily designed for solidly grounded systems. The similar Hi-Z element in the DFM200 relay has been tested with some success on impedance grounded systems as well. However, there are no guarantees of certain operation of the high impedance fault detection element on non-solidly grounded systems.

The Hi-Z data collection consists of RMS Data Capture and Hi-Z Data capture:

- **RMS Data Capture:** The RMS data captures are triggered by two-cycle Hi-Z overcurrent conditions, loss of load conditions, and high arc confidence conditions. Captures triggered by loss of load and high arc confidence conditions are saved to a temporary capture table, and deleted if the event does not result in an Arcing or Downed Conductor condition. The relay maintains a history of four captures and utilizes a combination of age, priority and access for determining which capture to save.

The RMS data capture contains the two-cycle RMS values for the voltage and current for each of the phases and current for the neutral channel. The capture frequency is half the system frequency. Each capture contains 1800 points.

- **High-Z Data Capture**: Hi-Z Data Captures are triggered and maintained in an identical manner as RMS Data Captures. The relay maintains four captures of 300 records each. The capture frequency is 1 Hz and the data collected is defined in the following two tables.

Table 5–33: HI-Z SPECIFIC DATA

#	NAME	DESCRIPTION
0	EadCounts	Total number of EAD counts for the phase
1	ArcConfidence	ArcConfidence for the phase
2	AccumArcConf	Accumulated ArcConfidence for the phase
3	RmsCurrent	The 2-cycle RMS current for the phase
4	HighROC	Flag indicating a high rate of change was detected
5	IOC	Flag indicating an instantaneous 2-cycle overcurrent was detected
6	LossOfLoad	Flag indicating a loss of load was detected
7	EadZeroed	Flag indicating that this phase's EAD table was cleared
8	HighZArmed	Flag indicating that this phase is armed for a high-Z detection
9	VoltageDip	Flag indicating that a voltage dip was detected on this phase
10	HighEad	Flag indicating that a high arc confidence occurred on this phase
11	ArcBurst	Flag indicating that an arc burst was identified on this phase
12	VDisturbanceCc	Cycle-to-cycle voltage disturbance
13	VDisturbanceAbs	Absolute voltage disturbance
14	HarmonicRestraint	Harmonic Restraint

1	StatusMask	Bit-mask of the algorithm state (16 bits) BIT_ARCING BIT_DOWNED_COND BIT_ARC_TREND BIT_PHASE_A BIT_PHASE_B BIT_PHASE_C BIT_PHASE_N BIT_IOC_A BIT_IOC_B BIT_IOC_C BIT_IOC_N BIT_LOL_A BIT_LOL_B BIT_LOL_C BIT_I_DISTURBANCE BIT_V_DISTURBANCE
2	AlgorithmState	Present value of the High-Z output state machine: Normal = 0, Coordination Timeout = 1, Armed = 2, Arcing = 5, Downed Conductor = 9
3	EadZeroedFlag	Flag indicating the EAD table was cleared
4	SpectralFlag	Flag indicating the Spectral algorithm has found a match
5	ThreePhaseFlag	Flag indicating a three phase event was detected
6	PhaseInfo[4]	Phase specific information for the three phase currents and the neutral (see table below)

The algorithm is in “Normal” state when it detects no abnormal activity on the power system. While in the “Normal” state, any one of several power system events (a high output of the Expert Arc Detector, a significant loss of load, or a Hi-Z overcurrent) cause the algorithm to move to the “Coordination Timeout” state, where it remains for the time specified by the **OC PROTECTION COORD TIMEOUT** setting. Following this interval, the algorithm moves into its “Armed” state. The criteria for detecting arcing or a downed conductor are:

1. the Expert Arc Detector Algorithm's output reaches a high level enough times, and
2. its high level was last reached when the algorithm's state was “Armed”.

The “Arcing Sensitivity” setting determines what level constitutes a “high” output from the Expert Arc Detector Algorithm, and the number that constitutes what “enough times” means. If these criteria are met, the algorithm temporarily moves to either the “Arcing” state or the “Downed Conductor” state, the difference being determined by whether or not there was a significant, precipitous loss of load (as determined by the **LOSS OF LOAD THRESHOLD** user setting) or a Hi-Z overcurrent (as determined by the **PHASE OC MIN PICKUP** and **NEUTRAL OC MIN PICKUP** user settings). If either of these caused the algorithm to move from its “Normal” state to its “Coordination Timeout” state, then the algorithm moves to the “Downed Conductor” state temporarily. Otherwise, it temporarily moves to the “Arcing” state. After pulsing either of these outputs, the algorithm's state returns to “Normal”. Also, if two minutes pass without high levels from the Expert Arc Detector Algorithm while the algorithm is in its Armed state, then it moves from the “Armed” state directly back to the “Normal” state.

Two FlexLogic operands, HI-Z ARMED and HI-Z DISARMED, are created to represent the armed state of the Hi-Z element. The HI-Z ARMED operand is on when the algorithm is in the armed state, whereas the HI-Z DISARMED operand is on when the algorithm is not in the armed state. When the algorithm is armed, this also includes the arcing and downed conductor states. When the algorithm is disarmed, this also includes the normal and coordination timeout states (as defined by Modbus format F187 as described in *Appendix B*).

The Hi-Z settings are described below:

- **HI-Z SOURCE**: Selects the source for the RMS currents and voltages used in Hi-Z algorithms. The source should include currents from the 8F/8G CT module and appropriate voltages. If the source does not include voltages, Voltage Supervision is disabled.
- **HI-Z ARCING SENSITIVITY**: This setting establishes the belief-in-arcing confidence level at which the Hi-Z element will recognize arcing and the number of times the algorithm must conform its belief in arcing before it produces an output. The range is 1 to 10, where 10 is the most sensitive and 1 is the least sensitive setting.

  A higher setting would be suitable for a very quiet, well-behaved power system. An initial setting of 5 is suggested if the user has no previous experience with the Hi-Z element.
- **HI-Z ARCING DET SOE RESET TIME**: An ARCING DETECTED event is created upon the detection of arcing by the expert arc detector algorithm. This setting defines the amount of time to hold creation of any new arcing detected events. Any subsequent arcing detection during this time will re-start the hold timer. An ARCING DETECTED DPO event is generated upon the expiration of this reset time. The state of the expert arc detector algorithm is unaffected by this timer. The HI-Z ARC DETECTED DPO operand is set to “On” when the ARCING DETECTED DPO event is created, and remains on until an ARCING DETECTED event is created.
- **HI-Z PHASE EVENT COUNT**: Specifies how many individual belief-in-arcing indications for a phase current must be counted in a specified time period before it is determined that an arcing-suspected event exists. These belief-in-arcing indications are detected by arc detection algorithms (energy and randomness) for a specific set of non-fundamental frequency component energies. This setting affects only the Hi-Z Arcing Suspected outputs.
- **HI-Z GROUND EVENT COUNT**: Specifies how many individual belief-in-arcing indications for a ground/neutral current must be counted in a specified time period before it is determined that an arcing-suspected event exists. These belief-in-arcing indications are detected by arc detection algorithms (energy and randomness) for a specific set of non-fundamental frequency component energies. This setting affects only the Hi-Z Arcing Suspected outputs.
- **HI-Z EVENT COUNT TIME**: Specifies the time (in minutes) over which the relay monitors long-term, sporadic, arcing events for determination of an arcing-suspected event. This setting affects only the Hi-Z Arcing Suspected outputs.
- **HI-Z OC PROTECTION COORD TIMEOUT**: This setting coordinates between the Hi-Z element and conventional feeder overcurrent protection. A downed conductor or an arcing, intact conductor will not be indicated before the expiration of this timeout, which begins when the Hi-Z element detects a trigger condition (i.e. loss of load, high rate of change, overcurrent, breaker open, or high belief-in-arcing confidence). Note that this is a minimum operating time; the actual operating time will depend on the fault characteristics and will likely be significantly longer than this setting.

This value should be such that the conventional feeder overcurrent protection is given an opportunity to operate before the timeout expires. It is recommended that this timeout value not exceed 30 seconds, because arcing fault current often diminishes as the fault progresses, making the fault more difficult to detect with increasing time. After the timeout has expired, at least one additional arc burst must occur in order for the Hi-Z element to proceed with its analysis.

- **HI-Z PHASE OC MIN PICKUP**: Phase overcurrent minimum pickup indicates the level at which the Hi-Z element considers a phase current to be an overcurrent condition. The Hi-Z detection algorithms will ignore all data as long as an overcurrent condition exists on the system, because it is assumed that conventional feeder overcurrent protection will clear an overcurrent fault. It is recommended that this setting is above the maximum load current.
- **HI-Z NEUTRAL OC MIN PICKUP**: Neutral overcurrent minimum pickup indicates the level at which the Hi-Z element considers a neutral current to be an overcurrent condition. The Hi-Z detection algorithms will ignore all data as long as an overcurrent condition exists on the system, because it is assumed that conventional feeder overcurrent protection will clear an overcurrent fault. It is recommended that this setting is above the maximum 3Io (residual) current due to unbalanced loading.
- **HI-Z PHASE RATE OF CHANGE**: Establishes a threshold for determining when a high rate-of-change event occurs on a phase RMS current. An extremely high rate of change is not characteristic of most high impedance faults; it is more indicative of a low impedance fault or of the inrush of breaker closing. The inrush current produces substantial variations in the harmonics used by the high impedance algorithms. Therefore these algorithms ignore all data for several seconds following a high rate-of-change event that exceeds this setting.

  The RMS currents in the Hi-Z algorithms are calculated over a two-cycle time window. The rate-of-change is calculated as the difference between two consecutive two-cycle RMS readings. The recommended setting is 150 A per two-cycle interval. ***The setting is given in primary amperes***.

- **HI-Z NEUTRAL RATE OF CHANGE**: Establishes a threshold for determining when a high rate-of-change event occurs on a neutral RMS current. An extremely high rate of change is not characteristic of most high impedance faults; it is more indicative of a breaker closing, causing associated inrush. The inrush current produces substantial variations in the harmonics used by the high impedance algorithms. Therefore, these algorithms ignore all data for several seconds following a high rate-of-change event exceeding this setting.

  The RMS currents in the Hi-Z algorithms are calculated over a two-cycle time window. The rate-of-change is calculated as the difference between two consecutive two-cycle RMS readings. The recommended setting is 150 A per two-cycle interval. ***The setting is given in primary amperes***.
- **HI-Z LOSS OF LOAD THRESHOLD**: Establishes the loss of load level used as an indication of a downed conductor. A Loss of Load flag is set if the Hi-Z algorithms detect a percentage drop in phase current between two successive two-cycle RMS values that equals or exceeds the Loss of Load Threshold. The amount the phase current must decrease between successive two-cycle RMS values is based on this setting times the recent average phase current level. The range is 5 to 100%; 5% being the most sensitive.
- **HI-Z 3-PHASE EVENT THRESHOLD**: Establishes the level at which the Hi-Z element characterizes a sudden three-phase current increase as a three-phase event. The Hi-Z detection algorithms ignore the data generated by a large three-phase event. The recommended setting is 25 A (*primary*).
- **HI-Z VOLTAGE SUPV THRESHOLD**: In the event that a fault simultaneously occurs on two adjacent feeders (line voltage from the same bus), the drop in line voltage will cause a subsequent drop in load current. This function will block the Loss of Load flag from being set while the voltage is depressed. Thus, if the voltage level drops by a percentage greater than this threshold in successive two-cycle RMS samples, the Loss of Load flag will be blocked. If the setting is "0", the voltage supervision function will be disabled.
- **HI-Z VOLTAGE SUPV DELAY**: This setting adds time delay to the voltage supervision function. Specifically, the Loss of Load flag will continue to be blocked for the number of cycles specified by this setting.
- **HI-Z EVEN HARMONIC RESTRAINT**: This setting determines the level of the even harmonic at which the setting of the overcurrent flags is inhibited. The even harmonic content is evaluated on each phase current as a percentage of that phase's RMS current. The intent is to inhibit the setting of the overcurrent flags if the overcurrent is simply a surge caused by cold-load pickup or other inrush event.

NOTE

IMPORTANT NOTE REGARDING INSTALLATION: The F60 Hi-Z algorithm is adaptive in nature. The algorithm's internal thresholds gradually adapt to background "noise" on circuits with a moderate to high level of transient activity. For the first three to five days after installation (or after being out-of-service for a significant period), the F60 may identify some of this noise as arcing. This should be taken into account when responding to alarms during these type of operating periods.

There is one breaker arcing current element available per CT bank, with a minimum of two elements. This element calculates an estimate of the per-phase wear on the breaker contacts by measuring and integrating the current squared passing through the breaker contacts as an arc. These per-phase values are added to accumulated totals for each phase and compared to a programmed threshold value. When the threshold is exceeded in any phase, the relay can set an output operand to “1”. The accumulated value for each phase can be displayed as an actual value.

The operation of the scheme is shown in the following logic diagram. The same output operand that is selected to operate the output relay used to trip the breaker, indicating a tripping sequence has begun, is used to initiate this feature. A time delay is introduced between initiation and the starting of integration to prevent integration of current flow through the breaker before the contacts have parted. This interval includes the operating time of the output relay, any other auxiliary relays and the breaker mechanism. For maximum measurement accuracy, the interval between change-of-state of the operand (from 0 to 1) and contact separation should be measured for the specific installation. Integration of the measured current continues for 100 ms, which is expected to include the total arcing period.

The feature is programmed to perform fault duration calculations. Fault duration is defined as a time between operation of the disturbance detector occurring before initiation of this feature, and reset of an internal low-set overcurrent function. Correction is implemented to account for a non-zero reset time of the overcurrent function.

Breaker arcing currents and fault duration values are available under the **ACTUAL VALUES ⇨⇩ RECORDS ⇨⇩ MAINTENANCE ⇨ BREAKER 1(2)** menus.

- **BKR 1 ARC AMP INT-A(C):** Select the same output operands that are configured to operate the output relays used to trip the breaker. In three-pole tripping applications, the same operand should be configured to initiate arcing current calculations for poles A, B and C of the breaker. In single-pole tripping applications, per-pole tripping operands should be configured to initiate the calculations for the poles that are actually tripped.
- **BKR 1 ARC AMP DELAY:** This setting is used to program the delay interval between the time the tripping sequence is initiated and the time the breaker contacts are expected to part, starting the integration of the measured current.
- **BKR 1 ARC AMP LIMIT:** Selects the threshold value above which the output operand is set.

The detection of the breaker flashover is based on the following condition:

1. Breaker open,
2. Voltage difference drop, and
3. Measured flashover current through the breaker.

Furthermore, the scheme is applicable for cases where either one or two sets of three-phase voltages are available across the breaker.

THREE VT BREAKER FLASHOVER APPLICATION

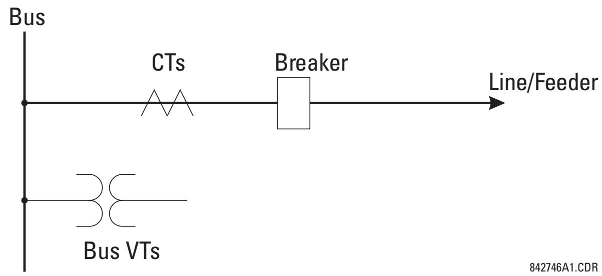
When only one set of VTs is available across the breaker, the **BRK 1 FLSHOVR SIDE 2 SRC** setting should be “None”. To detect an open breaker condition in this application, the scheme checks if the per-phase voltages were recovered (picked up), the status of the breaker is open (contact input indicating the breaker status is off), and no flashover current is flowing. A contact showing the breaker status must be provided to the relay. The voltage difference will not be considered as a condition for open breaker in this part of the logic.

NOTE: Voltages must be present prior to flashover conditions. If the three VTs are placed after the breaker on the line (or feeder), and the downstream breaker is open, the measured voltage would be zero and the flashover element will not be initiated.

The flashover detection will reset if the current drops back to zero, the breaker closes, or the selected FlexLogic operand for supervision changes to high. Using supervision through the **BRK 1 FLSHOVR SPV A**, **BRK 1 FLSHOVR SPV B**, and **BRK 1 FLSHOVR SPV C** settings is recommended by selecting a trip operand that will not allow the flashover element to pickup prior to the trip.

The flashover detection can be used for external alarm, re-tripping the breaker, or energizing the lockout relay.

Consider the following configuration:



The source 1 (SRC1) phase currents are feeder CTs and phase voltages are bus VTs, and Contact Input 1 is set as Breaker 52a contact. The conditions prior to flashover detection are:

1. 52a status = 0.
2. VAg, VBg, or VCg is greater than the pickup setting.
3. IA, IB, IC = 0; no current flows through the breaker.
4. ∆VA is greater than pickup (not applicable in this scheme).

The conditions at flashover detection are:

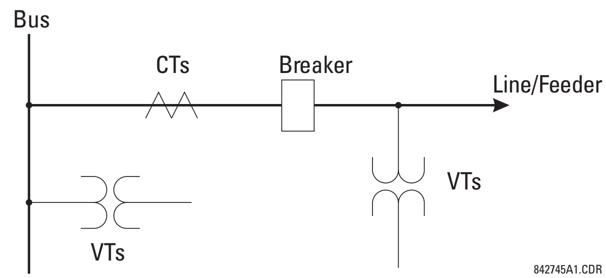
1. 52a status = 0.
2. IA, IB, or IC is greater than the pickup current flowing through the breaker.
3. ∆VA is greater than pickup (not applicable in this scheme).

SIX VT BREAKER FLASHOVER APPLICATION

The per-phase voltage difference approaches zero when the breaker is closed. The is well below any typical minimum pickup voltage. Select the level of the **BRK 1 FLSHOVR DIFF V PKP** setting to be less than the voltage difference measured across the breaker when the close or open breaker resistors are left in service. Prior to flashover, the voltage difference is larger than **BRK 1 FLSHOVR DIFF V PKP**. This applies to either the difference between two live voltages per phase or when the voltage from one side of the breaker has dropped to zero (line de-energized), at least one per-phase voltage is larger than the **BRK 1 FLSHOVR V PKP** setting, and no current flows through the breaker poles. During breaker flashover, the per-phase voltages from both sides of the breaker drops below the pickup value defined by the **BRK 1 FLSHOVR V PKP** setting, the voltage difference drops below the pickup setting, and flashover current is detected. These flashover conditions initiate FlexLogic pickup operands and start the **BRK 1 FLSHOVR PKP DELAY** timer.

This application does not require detection of breaker status via a 52a contact, as it uses a voltage difference larger than the **BRK 1 FLSHOVR DIFF V PKP** setting. However, monitoring the breaker contact will ensure scheme stability.

Consider the following configuration:



The source 1 (SRC1) phase currents are CTs and phase voltages are bus VTs. The source 2 (SRC2) phase voltages are line VTs. Contact input 1 is set as the breaker 52a contact (optional).

The conditions prior to flashover detection are:

1. ∆VA is greater than pickup
2. IA, IB, IC = 0; no current flows through the breaker
3. 52a status = 0 (optional)

The conditions at flashover detection are:

1. ∆VA is less than pickup
2. VAg, VBg, or VCg is lower than the pickup setting
3. IA, IB, or IC is greater than the pickup current flowing through the breaker
4. 52a status = 0 (optional)

5

NOTE: The element is operational only when phase-to-ground voltages are connected to relay terminals. The flashover element will not operate if delta voltages are applied.

The breaker flashover settings are described below.

- **BRK 1 FLSHOVR SIDE 1 SRC**: This setting specifies a signal source used to provide three-phase voltages and three-phase currents from one side of the current breaker. The source selected as a setting and must be configured with breaker phase voltages and currents, even if only three (3) VTs are available across the breaker.
- **BRK 1 FLSHOVR SIDE 2 SRC**: This setting specifies a signal source used to provide another set of three phase voltages whenever six (6) VTs are available across the breaker.
- **BRK 1 STATUS CLSD A** to **BRK 1 STATUS CLSD C**: These settings specify FlexLogic operands to indicate the open status of the breaker. A separate FlexLogic operand can be selected to detect individual breaker pole status and provide flashover detection. The recommended setting is 52a breaker contact or another operand defining the breaker poles open status.
- **BRK 1 FLSHOVR V PKP**: This setting specifies a pickup level for the phase voltages from both sides of the breaker. If six VTs are available, opening the breaker leads to two possible combinations – live voltages from only one side of the breaker, or live voltages from both sides of the breaker. Either case will set the scheme ready for flashover detection upon detection of voltage above the selected value. Set **BRK FLSHOVR V PKP** to 85 to 90% of the nominal voltage.
- **BRK 1 FLSHOVR DIFF V PKP**: This setting specifies a pickup level for the phase voltage difference when two VTs per phase are available across the breaker. The pickup voltage difference should be below the monitored voltage difference when close or open breaker resistors are left in service. The setting is selected as primary volts difference between the sources.
- **BRK 1 FLSHOVR AMP PKP**: This setting specifies the normal load current which can flow through the breaker. Depending on the flashover protection application, the flashover current can vary from levels of the charging current when the line is de-energized (all line breakers open), to well above the maximum line (feeder) load (line/feeder connected to load).
- **BRK 1 FLSHOVR SPV A** to **BRK 1 FLSHOVR SPV C**: These settings specify FlexLogic operands (per breaker pole) that supervise the operation of the element per phase. Supervision can be provided by operation of other protection

elements, breaker failure, and close and trip commands. A six-cycle time delay applies after the selected FlexLogic operand resets.

- **BRK FLSHOVR PKP DELAY**: This setting specifies the time delay to operate after a pickup condition is detected.

One breaker restrike element is provided in the F60.

According to IEEE standard C37.100: *IEEE Standard Definitions for Power Switchgear*, restrike is defined as “a resumption of current between the contacts of a switching device during an opening operation after an interval of zero current of ¼ cycle at normal frequency or longer”.

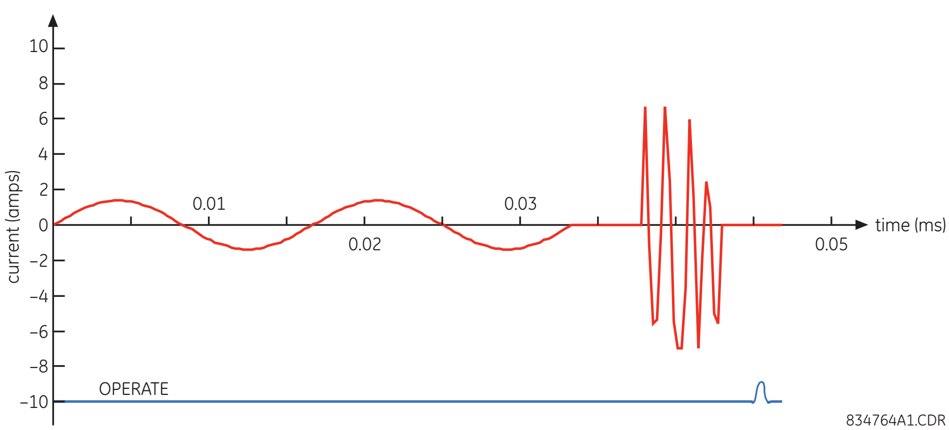

Figure 5–124: TYPICAL RESTRIKE WAVEFORM AND DETECTION FLAG

The breaker restrike algorithm responds to a successful interruption of the phase current following a declaration of capacitor bank offline as per the breaker pole indication. If a high-frequency current with a magnitude greater than the threshold is resumed at least ¼ of a cycle later than the phase current interruption, then a breaker restrike condition is declared in the corresponding phase and the BRK RESTRIKE 1 OP operand is asserted for a short period of time. The user can add counters and other logic to facilitate the decision making process as to the appropriate actions upon detecting a single restrike or a series of consecutive restrikes.

A restrike event (FlexLogic operand) is declared if all of the following hold:

- The current is initially interrupted.
- The breaker status is open.
- An elevated high frequency current condition occurs and the current subsequently drops out again.

The algorithm is illustrated in the state machine diagram shown below.

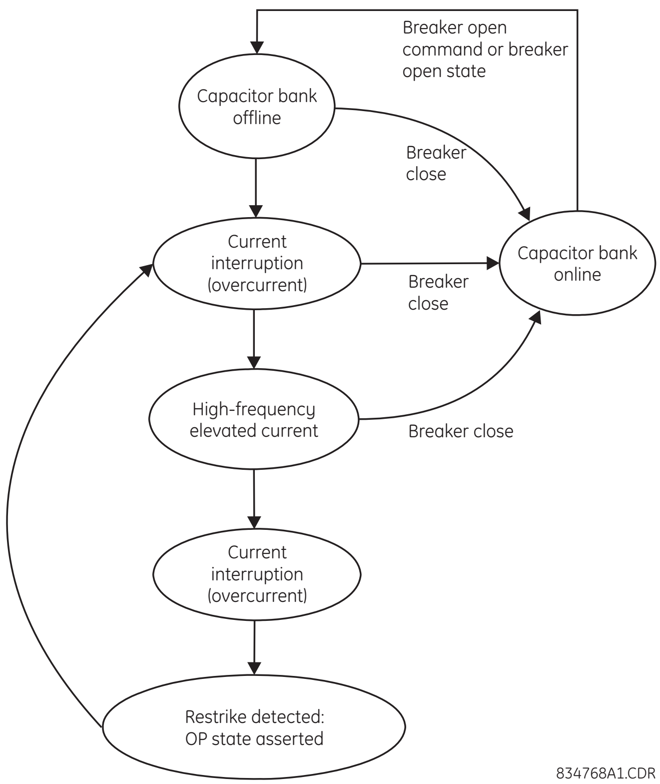

Figure 5–125: ALGORITHM ILLUSTRATION – STATE MACHINE TO DETECT RESTRIKE

In this way, a distinction is made between a self-extinguishing restrike and permanent breaker failure condition. The latter can be detected by the breaker failure function or a regular instantaneous overcurrent element. Also, a fast succession of restrikes will be picked up by breaker failure or instantaneous overcurrent protection.

The following settings are available for each element.

- **BREAKER RESTRIKE 1 FUNCTION**: This setting enable and disables operation of the breaker restrike detection element.
- **BRK RSTR 1 BLOCK**: This setting is used to block operation of the breaker restrike detection element.
- **BREAKER RESTRIKE 1 SOURCE**: This setting selects the source of the current for this element. This source must have a valid CT bank assigned.
- **BREAKER RESTRIKE 1 PICKUP**: This setting specifies the pickup level of the overcurrent detector in per-unit values of CT nominal current.
- **BREAKER RESTRIKE 1 RESET DELAY**: This setting specifies the reset delay for this element. When set to “0 ms”, then FlexLogic operand will be picked up for only 1/8th of the power cycle.
- **BRK RSTR 1 BRK OPEN**: This setting assigns a FlexLogic operand indicating the open position of the breaker. It must be logic “1” when breaker is open.
- **BRK RSTR 1 OPEN CMD**: This setting assigns a FlexLogic operand indicating a breaker open command. It must be logic “1” when breaker is opened, either manually or from protection logic.
- **BRK RSTR 1 CLS CMD**: This setting assigns a FlexLogic operand indicating a breaker close command. It must be logic “1” when breaker is closed.

MESSAGE	▲▼	INCIPIENT FAULT 1 RESET DELAY: 0.100 s	Range: 0.000 to 65.535 s in steps of 0.001
MESSAGE	▲▼	INCIPIENT FAULT 1 TARGET: Self-reset	Range: Self-reset, Latched, Disabled
MESSAGE	▲	INCIPIENT FAULT 1 EVENTS: Disabled	Range: Disabled, Enabled

There are two incipient cable fault detection elements in the relay.

Before a permanent cable fault occurs, there are usually signs of degrading insulation manifesting itself as a short, mostly half-cycle spikes asserting at the phase voltage peak. Due to shortness of such spikes, they are not usually detected by the instantaneous protection of the feeder, which operates on the RMS or fundamental component of the phase current with a relatively high pickup.

The number of detected incipient faults in each phase is counted and available in the **ACTUAL VALUES ⇨ STATUS ⇨⇩ INCIPIENT FAULT** menus. The counters can be reset with the **COMMANDS ⇨⇩ CLEAR RECORDS ⇨⇩ CLEAR INCIPENT FAULT COUNTERS** command.

NOTE: Changes to any of the incipient cable fault detector settings resets of the number of the incipient faults detected to zero.

NOTE: To provide a clear timing indication when the incipient fault occurred, the incipient fault event is time-stamped with the time the fault actually occurred. However, the FlexLogic™ operand is asserted four cycles later, when the incipient fault pattern is confirmed and therefore detected.

The following figure illustrates a recorded field case of an incipient phase B fault. The top portion of the figure shows the raw A, B and C currents. The bottom portion shows the neutral current (blue) and reveals the fault period from under the load and the superimposed phase B current (red). The superimposed current shows two fault current blips as the data slides through the two-cycle memory window. During the actual fault, the neutral current and the superimposed phase B currents closely correspond, confirming the incipient fault hypothesis and identifying the affected phase.

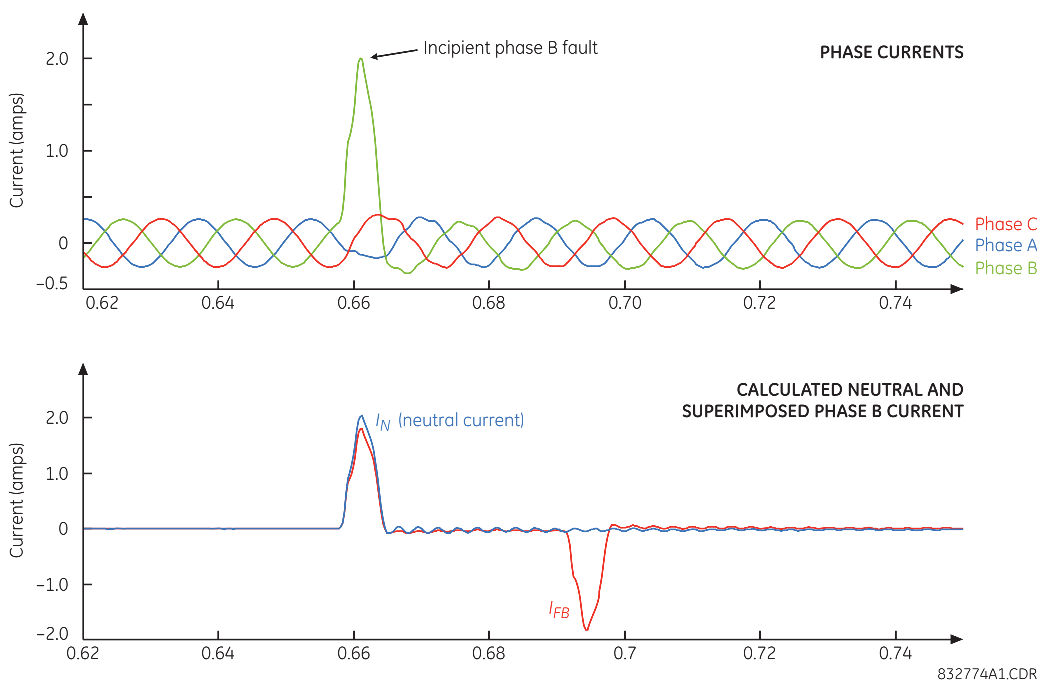

Figure 5–127: ILLUSTRATION OF THE INCIPIENT FAULT DETECTOR ALGORITHM

The following settings are available for each incipient cable fault detector.

- **INCIPIENT FAULT 1 FUNCTION**: This setting enable and disables operation of the incipient fault detection element.
- **INCIPNT FLT 1 BLOCK**: This setting is used to block operation of the incipient cable fault detector element. Assertion of the FlexLogic™ operand assigned to this setting block operation.
- **INCIPIENT FAULT 1 SOURCE**: This setting selects a current source for the incipient cable fault detector element. This source must be assigned a valid CT bank.
- **INCIPIENT FAULT 1 PICKUP**: This setting specifies pickup level of the overcurrent detector in per-unit values of the CT nominal current.
- **INCIPNT FLT 1 MODE**: There are two modes of operation available for the incipient cable fault detector element. In the “Number of counts” mode, a trip will be initiated only after the selected number of faults is detected. In the “Counts per window” mode, a trip will be initiated only after the selected number of faults is detected within the time specified by the **INCIPNT FLT 1 DETECT WINDOW** setting.
- **INCIPIENT FLT 1 TRIP COUNTS NUMBER**: This setting selects the number of faults required to initiate a trip.
- **INCIPNT FLT 1 DETECT WINDOW**: This setting specifies a time window for “Counts per window” mode of operation.

- **INCIPIENT FAULT 1 RESET DELAY**: This setting specifies a reset time for the output after the trip is initiated.

g) VT FUSE FAILURE

PATH: SETTINGS ⇨⇩ CONTROL ELEMENTS ⇨⇩ MONITORING ELEMENTS ⇨⇩ VT FUSE FAILURE 1(2)

■ VT FUSE FAILURE 1 ■		VT FUSE FAILURE 1 FUNCTION: Disabled	Range: Disabled, Enabled
	MESSAGE	■ NEUTRAL WIRE OPEN 1 ■ DETECTION: Disabled	Range: Disabled, Enabled
	MESSAGE	■ NEUTRAL WIRE OPEN 1 ■ 3 HARM PKP: 0.100	Range: 0.000 to 3.000 pu in steps of 0.001

Every signal source includes a fuse failure scheme.

The VT fuse failure detector can be used to raise an alarm and/or block elements that may operate incorrectly for a full or partial loss of AC potential caused by one or more blown fuses. Some elements that might be blocked (via the BLOCK input) are distance, voltage restrained overcurrent, and directional current.

There are two classes of fuse failure that occur:

- Class A: loss of one or two phases.
- Class B: loss of all three phases.

Different means of detection are required for each class. An indication of class A failures is a significant level of negative-sequence voltage, whereas an indication of class B failures is when positive sequence current is present and there is an insignificant amount of positive sequence voltage. Also rapid decrease in the phase voltages magnitude from a healthy voltage level without disturbance in current can indicate a VT fuse fail conditions. These noted indications of fuse failure can also be present when faults are present on the system, so a means of detecting faults and inhibiting fuse failure declarations during these events is provided.

Once the fuse failure condition is declared, it is sealed-in until the cause that generated it disappears.

An additional condition is introduced to inhibit a fuse failure declaration when the monitored circuit is de-energized; positive-sequence voltage and current are both below threshold levels.

The **VT FUSE FAILURE 1 FUNCTION** setting enables and disables the fuse failure feature for each source.

The VT NEU WIRE OPEN 1 FUNCTION setting enables and disables the VT neutral wire open detection function. When the VT is connected in Delta, do not enabled this function because there is no neutral wire for Delta connected VT.

The VT NEU WIRE OPEN 1 3 HRAM PKP setting specifies the pickup level of 3rd harmonic of 3V0 signal for the VT NEU WIRE OPEN detection logic to pick up.

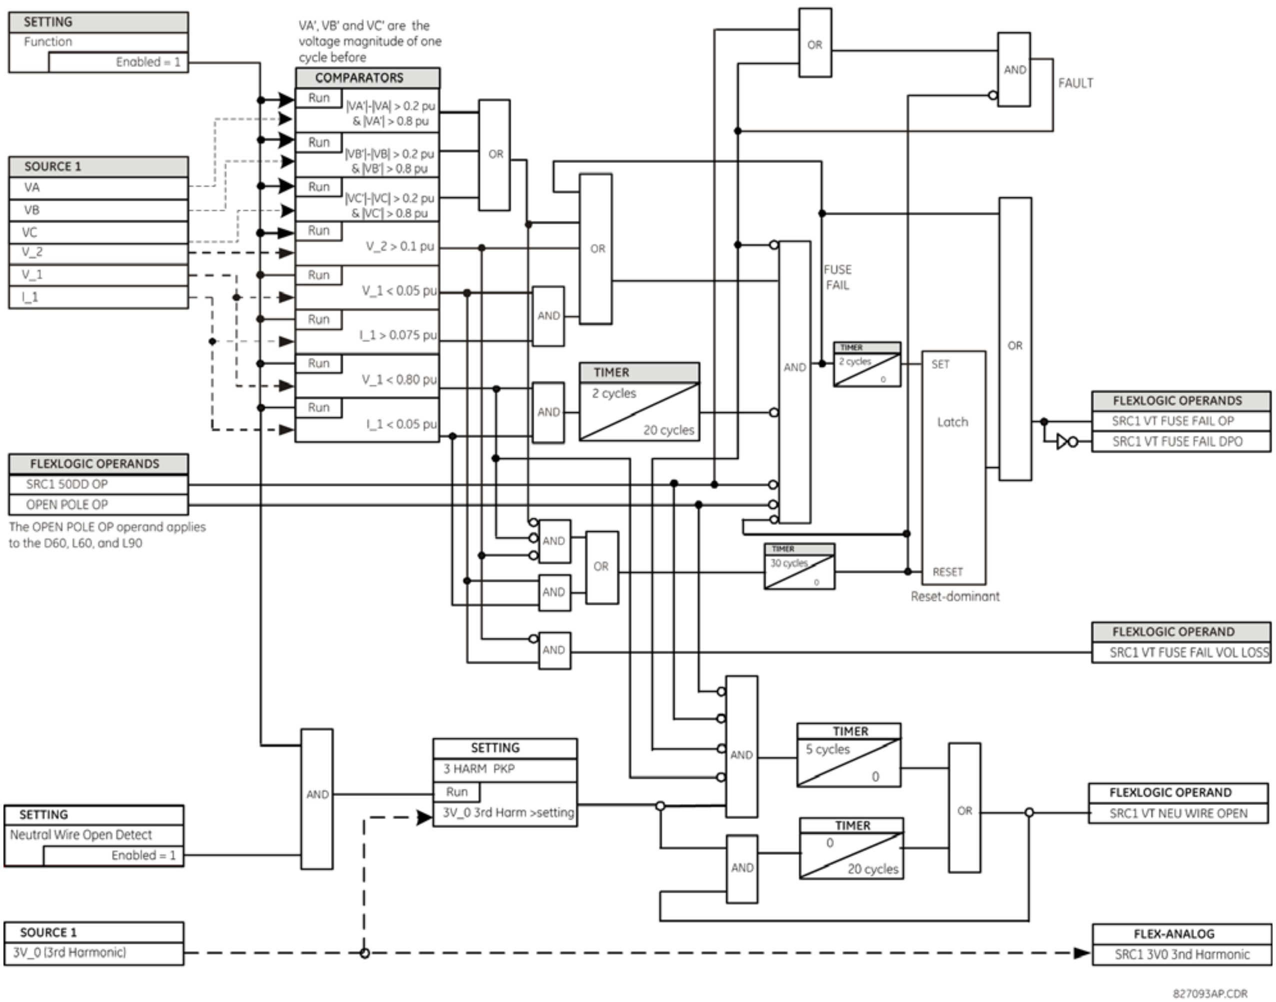

Figure 5–129: VT FUSE FAIL SCHEME LOGIC

Base voltage for this element is PHASE VT SECONDARY setting in the case of WYE VTs and (PHASE VT SECONDARY)/ $\sqrt{3}$ in case of DELTA VTs.

h) BROKEN CONDUCTOR DETECTION

PATH: SETTINGS ⇨⇩ CONTROL ELEMENTS ⇨⇩ MONITORING ELEMENTS ⇨⇩ BROKEN CONDUCTOR 1(2)

5

Two broken conductor detection elements are provided.

The broken conductor function will detect a transmission line broken conductor condition or a single-pole breaker malfunction condition through checking the phase current input signals and the I_2 / I_1 ratio. The intention of this function is to detect a single-phase broken conductor only. As such two-phase or three-phase broken conductors cannot be detected.

To distinguish between single-phase disappearance and system disturbance in all three phases (such as load change, switching, etc.), the broken conductor element monitors the change in all three phase currents at the present instance and at four cycles previous. It also monitors changes in the I_2 / I_1 ratio, I_1 minimum, and I_1 maximum.

The broken conductor function should not be used to respond to fault transients and single-pole tripping/reclosing conditions. Therefore, the time delay should be programmed to a sufficient length to ensure coordination with the breaker dead time of the recloser function.

- **BROKEN CONDUCTOR 1 FUNCTION**: This setting enables and disables the broken conductor function.
- **BROKEN CONDUCTOR 1 SOURCE**: This setting selects a signal source used to provide three-phase current inputs to this function.
- **BROKEN CONDUCTOR 1 I2/I1 RATIO**: This setting specifies the ratio of negative-sequence current to positive-sequence current. When one phase conductor is broken, the I_2 / I_1 ratio with a balanced remaining two phases is 50%. So normally this setting should be set below 50% (for example, to 30%).
- **BROKEN CONDUCTOR 1 I1 MIN**: This setting specifies the minimum positive-sequence current supervision level. Ensure this setting is programmed to a sufficient level to prevent I_2 / I_1 from erratic pickup due to a low I_1 signal. However, this setting should not be set too high, since the broken conductor condition cannot be detected under light load conditions when I_1 is less than the value specified by this setting.
- **BROKEN CONDUCTOR 1 I1 MAX**: This setting specifies the maximum I_1 level allowed for the broken conductor function to operate. When I_1 exceeds this setting, this it is considered a fault. This broken conductor function should not respond to any fault conditions, so normally this setting is programmed to less than the maximum load current.
- **BROKEN CONDUCTOR 1 PKP DELAY**: This setting specifies the pickup time delay for this function to operate after assertion of the broken conductor pickup FlexLogic operand.

The thermal overload protection element corresponds to the IEC 255-8 standard and is used to detect thermal overload conditions in protected power system elements. Choosing an appropriate time constant element can be used to protect different elements of the power system. The cold curve characteristic is applied when the previous averaged load current over the last 5 cycles is less than 10% of the base current. If this current is greater or equal than 10% than the base current, then the hot curve characteristic is applied.

The IEC255-8 cold curve is defined as follows:

$$t_{op} = \tau_{op} \times \ln\left(\frac{I^2}{I^2 - (kI_B)^2}\right) \quad \textbf{(EQ 5.26)}$$

The IEC255-8 hot curve is defined as follows:

$$t_{op} = \tau_{op} \times \ln\left(\frac{I^2 - I_p^2}{I^2 - (kI_B)^2}\right) \quad \textbf{(EQ 5.27)}$$

In the above equations,

- t_{op} = time to operate
- τ_{op} = thermal protection trip time constant
- I = measured overload RMS current
- I_p = measured load RMS current before overload occurs
- k= IEC 255-8 k-factor applied to I_B, defining maximum permissible current above nominal current
- I_B = protected element base (nominal) current

The reset time of the thermal overload protection element is also time delayed using following formula:

$$t_{rst} = \tau_{rst} \times \ln\left(\frac{(kI_B)^2}{\left|I^2 - (kI_B)^2\right|}\right) + T_{min} \quad \textbf{(EQ 5.28)}$$

5

In the above equation,

- τ_{rst} = thermal protection trip time constant
- T_{min} is a minimum reset time setting

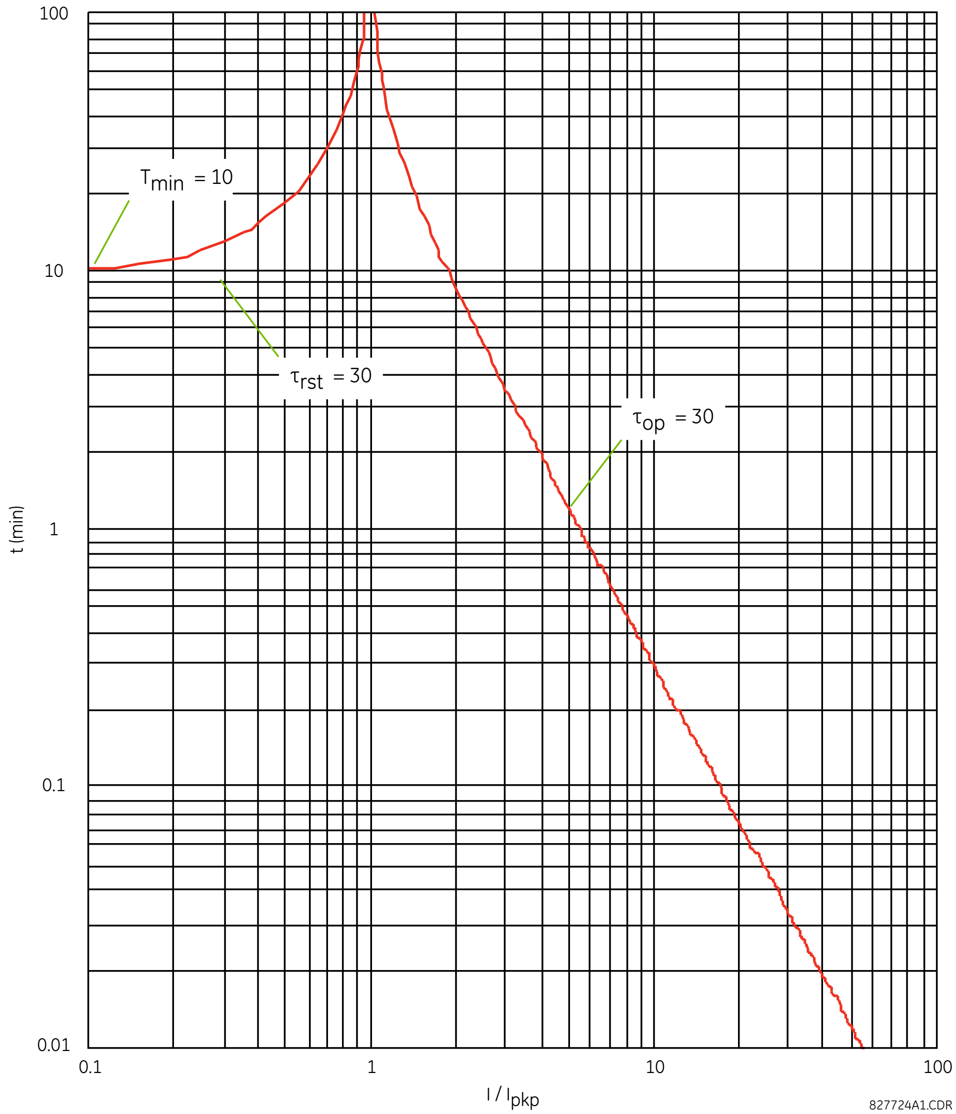

Figure 5–131: IEC 255-8 SAMPLE OPERATE AND RESET CURVES

The thermal overload protection element estimates accumulated thermal energy *E* using the following equations calculated each power cycle. When current is greater than the pickup level, $I_n > k \times I_B$, element starts increasing the thermal energy:

$$E_n = E_{n-1} + \frac{\Delta t}{t_{op(In)}} \qquad \textbf{(EQ 5.29)}$$

When current is less than the dropout level, $I_n > 0.97 \times k \times I_B$, the element starts decreasing the thermal energy:

$$E_n = E_{n-1} - \frac{\Delta t}{t_{rst(In)}} \qquad \textbf{(EQ 5.30)}$$

In the above equations,

- Δt is the power cycle duration
- n is the power cycle index
- $t_{op(In)}$ is the trip time calculated at index n as per the IEC255-8 cold curve or hot curve equations
- $t_{rst(In)}$ is the reset time calculated at index n as per the reset time equation
- I_n is the measured overload RMS current at index n

- E_n is the accumulated energy at index n
- E_{n-1} is the accumulated energy at index $n - 1$

The thermal overload protection element removes the THERMAL PROT 1 OP output operand when $E < 0.05$. In case of emergency, the thermal memory and THERMAL PROT 1 OP output operand can be reset using **THERM PROT 1 RESET** setting. All calculations are performed per phase. If the accumulated energy reaches value 1 in any phase, the thermal overload protection element operates and only resets when energy is less than 0.05 in all three phases.

Table 5–35: TYPICAL TIME CONSTANTS

PROTECTED EQUIPMENT	TIME CONSTANT	MINIMUM RESET TIME
Capacitor bank	10 minutes	30 minutes
Overhead line	10 minutes	20 minutes
Air-core reactor	40 minutes	30 minutes
Busbar	60 minutes	20 minutes
Underground cable	20 to 60 minutes	60 minutes

The logic for the thermal overload protection element is shown below.

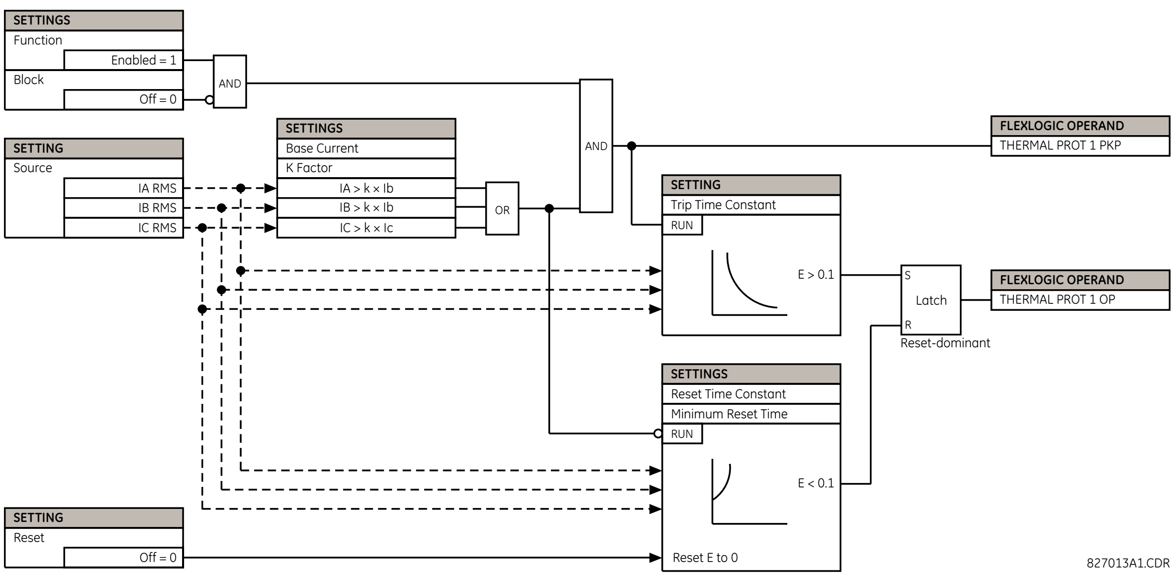

Figure 5–132: THERMAL OVERLOAD PROTECTION SCHEME LOGIC

5.7.13 COLD LOAD PICKUP

PATH: SETTINGS ⇨⇩ CONTROL ELEMENTS ⇨⇩ COLD LOAD PICKUP ⇨ COLD LOAD PICKUP 1(2)

■ COLD LOAD PICKUP 1 ■		COLD LOAD 1 FUNCTION: Disabled	Range: Disabled, Enabled
	MESSAGE	COLD LOAD 1 PICKUP SOURCE: SRC 1	Range: SRC 1, SRC 2

	MESSAGE	ON-LOAD TIME BEFORE RESET1: 100.000	Range: 0.000 to 1000 000.000 s in steps of 0.001

There are two (2) identical Cold Load Pickup features available, numbered 1 and 2.

This feature can be used to change protection element settings when (by changing to another settings group) a cold load condition is expected to occur. A cold load condition can be caused by a prolonged outage of the load, by opening of the circuit breaker, or by a loss of supply even if the breaker remains closed. Upon the return of the source, the circuit will experience inrush current into connected transformers, accelerating currents into motors, and simultaneous demand from many other loads because the normal load diversity has been lost. During the cold load condition, the current level can be above the pickup setting of some protection elements, so this feature can be used to prevent the tripping that would otherwise be caused by the normal settings.

Without historical data on a particular feeder, some utilities assume an initial cold load current of about 500% of normal load, decaying to 300% after 1 second, 200% after 2 seconds, and 150% after 3 seconds.

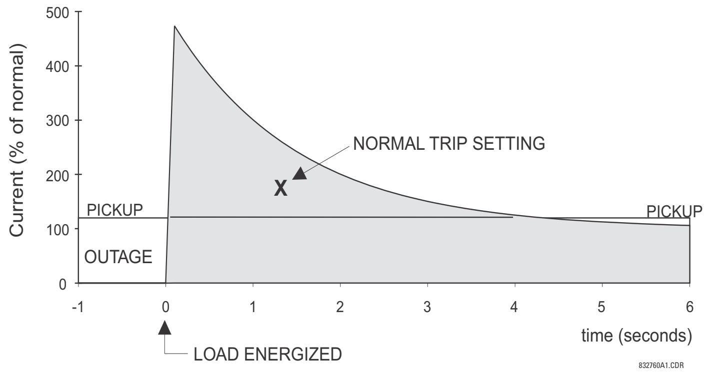

Figure 5–133: TYPICAL COLD LOAD PICKUP CHARACTERISTIC

There are two methods of initiating the operation of this feature.

The first initiation method is intended to automatically respond to a loss of the source to the feeder, by detecting that all phase currents have declined to zero for some time. When zero current on all phases has been detected, a timer is started. This timer is set to an interval after which it is expected the normal load diversity will have been lost, so setting groups are not changed for short duration outages. After the delay interval, the output operand is set.

The second initiation method is intended to automatically respond to an event that will set an operand, such as an operator-initiated virtual input. This second method of initiation sets the output operand immediately.

Both initiating inputs can be inhibited by a blocking input. Once cold load pickup is in operation, the output operand will remain set until at least one phase of the load has returned to a level above 2% of CT nominal for the interval programmed by the **ON-LOAD TIME BEFORE RESET** setting has expired. The reset delay interval is intended to be set to a period until the feeder load has decayed to normal levels, after which other features may be used to switch setting groups.

```

The contact inputs menu contains configuration settings for each contact input as well as voltage thresholds for each group of four contact inputs. Upon startup, the relay processor determines (from an assessment of the installed modules) which contact inputs are available and then display settings for only those inputs.

An alphanumeric ID may be assigned to a contact input for diagnostic, setting, and event recording purposes. The CONTACT IP X On" (Logic 1) FlexLogic operand corresponds to contact input "X" being closed, while CONTACT IP X Off corresponds to contact input "X" being open. The **CONTACT INPUT DEBNCE TIME** defines the time required for the contact to overcome 'contact bouncing' conditions. As this time differs for different contact types and manufacturers, set it as a maximum contact debounce time (per manufacturer specifications) plus some margin to ensure proper operation. If **CONTACT INPUT EVENTS** is set to "Enabled", every change in the contact input state will trigger an event.

A raw status is scanned for all Contact Inputs synchronously at the constant rate of 0.5 ms as shown in the figure below. The DC input voltage is compared to a user-settable threshold. A new contact input state must be maintained for a user-settable debounce time in order for the F60 to validate the new contact state. In the figure below, the debounce time is set at 2.5 ms; thus the 6th sample in a row validates the change of state (mark no. 1 in the diagram). Once validated (debounced), the contact input asserts a corresponding FlexLogic operand and logs an event as per user setting.

A time stamp of the first sample in the sequence that validates the new state is used when logging the change of the contact input into the Event Recorder (mark no. 2 in the diagram).

Protection and control elements, as well as FlexLogic equations and timers, are executed eight times in a power system cycle. The protection pass duration is controlled by the frequency tracking mechanism. The FlexLogic operand reflecting the debounced state of the contact is updated at the protection pass following the validation (marks no. 3 and 4 on the figure below). The update is performed at the beginning of the protection pass so all protection and control functions, as well as FlexLogic equations, are fed with the updated states of the contact inputs.

The FlexLogic operand response time to the contact input change is equal to the debounce time setting plus up to one protection pass (variable and depending on system frequency if frequency tracking enabled). If the change of state occurs just after a protection pass, the recognition is delayed until the subsequent protection pass; that is, by the entire duration of the protection pass. If the change occurs just prior to a protection pass, the state is recognized immediately. Statistically a delay of half the protection pass is expected. Owing to the 0.5 ms scan rate, the time resolution for the input contact is below 1msec.

For example, 8 protection passes per cycle on a 60 Hz system correspond to a protection pass every 2.1 ms. With a contact debounce time setting of 3.0 ms, the FlexLogic operand-assert time limits are: 3.0 + 0.0 = 3.0 ms and 3.0 + 2.1 = 5.1 ms. These time limits depend on how soon the protection pass runs after the debouncing time.

Regardless of the contact debounce time setting, the contact input event is time-stamped with a 1 μs accuracy using the time of the first scan corresponding to the new state (mark no. 2 below). Therefore, the time stamp reflects a change in the DC voltage across the contact input terminals that was not accidental as it was subsequently validated using the debounce timer. Keep in mind that the associated FlexLogic operand is asserted/de-asserted later, after validating the change.

The debounce algorithm is symmetrical: the same procedure and debounce time are used to filter the LOW-HIGH (marks no.1, 2, 3, and 4 in the figure below) and HIGH-LOW (marks no. 5, 6, 7, and 8 below) transitions.

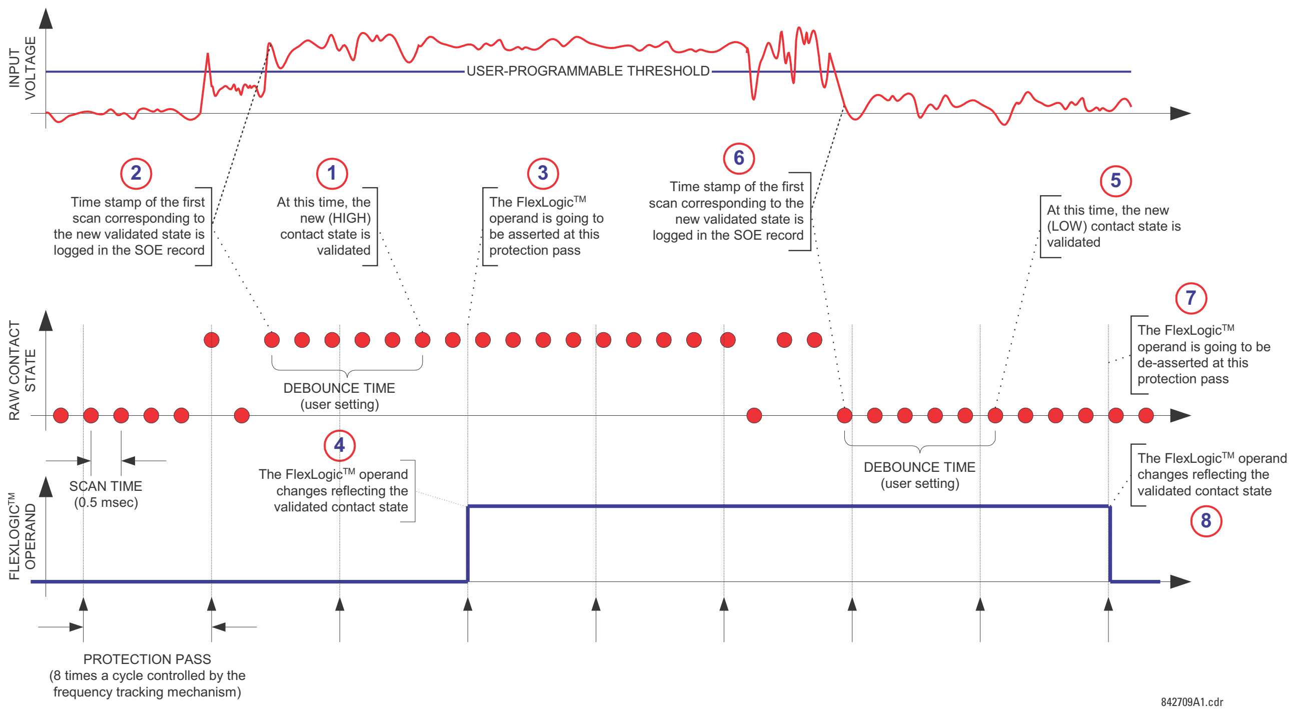

Figure 5–135: INPUT CONTACT DEBOUNCING MECHANISM AND TIME-STAMPING SAMPLE TIMING

Contact inputs are isolated in groups of four to allow connection of wet contacts from different voltage sources for each group. The **CONTACT INPUT THRESHOLDS** determine the minimum voltage required to detect a closed contact input. This value should be selected according to the following criteria: 17 for 24 V sources, 33 for 48 V sources, 84 for 110 to 125 V sources and 166 for 250 V sources.

For example, to use contact input H5a as a status input from the breaker 52b contact to seal-in the trip relay and record it in the Event Records menu, make the following settings changes:

CONTACT INPUT H5A ID: "Breaker Closed (52b)"
CONTACT INPUT H5A EVENTS: "Enabled"

Note that the 52b contact is closed when the breaker is open and open when the breaker is closed.

5.8.2 VIRTUAL INPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ VIRTUAL INPUTS ⇨ VIRTUAL INPUT 1(64)

■ VIRTUAL INPUT 1 ■	◁▷	VIRTUAL INPUT 1 FUNCTION: Disabled	*Range: Disabled, Enabled*
MESSAGE	△▽	VIRTUAL INPUT 1 ID: Virt Ip 1	*Range: Up to 12 alphanumeric characters*
MESSAGE	△▽	VIRTUAL INPUT 1 TYPE: Latched	*Range: Self-Reset, Latched*
MESSAGE	△	VIRTUAL INPUT 1 EVENTS: Disabled	*Range: Disabled, Enabled*

There are 64 virtual inputs that can be individually programmed to respond to input signals from the keypad (via the **COMMANDS** menu) and communications protocols. All virtual input operands are defaulted to “Off” (logic 0) unless the appropriate input signal is received.

If the **VIRTUAL INPUT x FUNCTION** is to “Disabled”, the input will be forced to off (logic 0) regardless of any attempt to alter the input. If set to “Enabled”, the input operates as shown on the logic diagram and generates output FlexLogic operands in response to received input signals and the applied settings.

There are two types of operation: self-reset and latched. If **VIRTUAL INPUT x TYPE** is “Self-Reset”, when the input signal transits from off to on, the output operand will be set to on for only one evaluation of the FlexLogic equations and then return to off. If set to “Latched”, the virtual input sets the state of the output operand to the same state as the most recent received input.

NOTE: The self-reset operating mode generates the output operand for a single evaluation of the FlexLogic equations. If the operand is to be used anywhere other than internally in a FlexLogic equation, it will likely have to be lengthened in time. A FlexLogic timer with a delayed reset can perform this function.

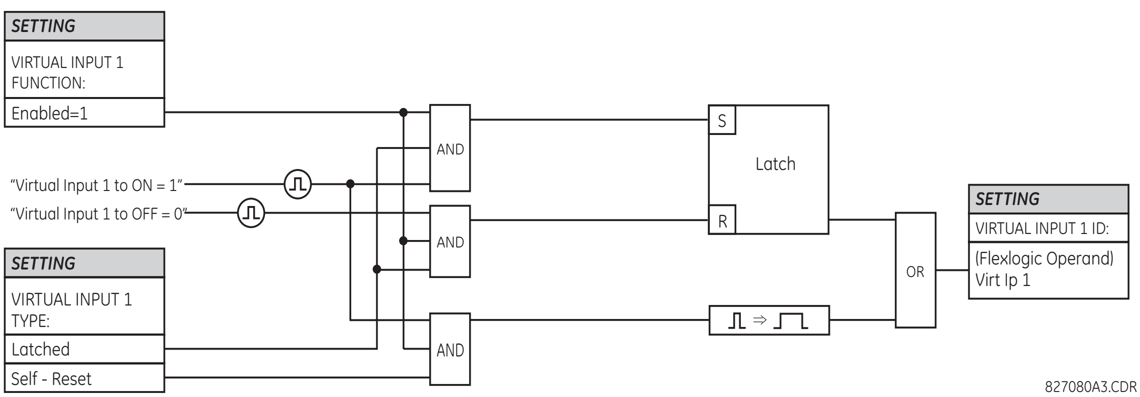

Figure 5–136: VIRTUAL INPUTS SCHEME LOGIC

5.8.3 CONTACT OUTPUTS

a) DIGITAL OUTPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS ⇨ CONTACT OUTPUT H1

■ CONTACT OUTPUT H1 ■	◀▶	CONTACT OUTPUT H1 ID Cont Op 1	Range: *Up to 12 alphanumeric characters*
MESSAGE	▲▼	OUTPUT H1 OPERATE: Off	Range: *FlexLogic operand*
MESSAGE	▲▼	OUTPUT H1 SEAL-IN: Off	Range: *FlexLogic operand*
MESSAGE	▲	CONTACT OUTPUT H1 EVENTS: Enabled	Range: *Disabled, Enabled*

Upon startup of the relay, the main processor will determine from an assessment of the modules installed in the chassis which contact outputs are available and present the settings for only these outputs.

An ID may be assigned to each contact output. The signal that can **OPERATE** a contact output may be any FlexLogic operand (virtual output, element state, contact input, or virtual input). An additional FlexLogic operand may be used to **SEAL-IN** the relay. Any change of state of a contact output can be logged as an Event if programmed to do so.

For example, the trip circuit current is monitored by providing a current threshold detector in series with some Form-A contacts (see the trip circuit example in the *Digital Elements* section). The monitor sets a flag (see the specifications for Form-A). The name of the FlexLogic operand set by the monitor, consists of the output relay designation, followed by the name of the flag; for example, CONT OP 1 ION.

In most breaker control circuits, the trip coil is connected in series with a breaker auxiliary contact used to interrupt current flow after the breaker has tripped, to prevent damage to the less robust initiating contact. This can be done by monitoring an auxiliary contact on the breaker which opens when the breaker has tripped, but this scheme is subject to incorrect operation caused by differences in timing between breaker auxiliary contact change-of-state and interruption of current in the trip circuit. The most dependable protection of the initiating contact is provided by directly measuring current in the tripping circuit, and using this parameter to control resetting of the initiating relay. This scheme is often called *trip seal-in*.

This can be realized in the F60 using the CONT OP 1 ION FlexLogic operand to seal-in the contact output as follows:

CONTACT OUTPUT H1 ID: “Cont Op 1"
OUTPUT H1 OPERATE: *any suitable FlexLogic operand*
OUTPUT H1 SEAL-IN: “Cont Op 1 IOn”
CONTACT OUTPUT H1 EVENTS: “Enabled”

b) LATCHING OUTPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS ⇨ CONTACT OUTPUT H1a

■ CONTACT OUTPUT H1a ■	◀▶	OUTPUT H1a ID L-Cont Op 1	Range: *Up to 12 alphanumeric characters*
MESSAGE	▲▼	OUTPUT H1a OPERATE: Off	Range: *FlexLogic operand*
MESSAGE	▲▼	OUTPUT H1a RESET: Off	Range: *FlexLogic operand*
MESSAGE	▲▼	OUTPUT H1a TYPE: Operate-dominant	Range: *Operate-dominant, Reset-dominant*
MESSAGE	▲	OUTPUT H1a EVENTS: Disabled	Range: *Disabled, Enabled*

The F60 latching output contacts are mechanically bi-stable and controlled by two separate (open and close) coils. As such they retain their position even if the relay is not powered up. The relay recognizes all latching output contact cards and populates the setting menu accordingly. On power up, the relay reads positions of the latching contacts from the hardware before executing any other functions of the relay (such as protection and control features or FlexLogic).

The latching output modules, either as a part of the relay or as individual modules, are shipped from the factory with all latching contacts opened. It is highly recommended to double-check the programming and positions of the latching contacts when replacing a module.

Since the relay asserts the output contact and reads back its position, it is possible to incorporate self-monitoring capabilities for the latching outputs. If any latching outputs exhibits a discrepancy, the **LATCHING OUTPUT ERROR** self-test error is declared. The error is signaled by the LATCHING OUT ERROR FlexLogic operand, event, and target message.

- **OUTPUT H1a OPERATE**: This setting specifies a FlexLogic operand to operate the 'close coil' of the contact. The relay will seal-in this input to safely close the contact. Once the contact is closed and the **RESET** input is logic 0 (off), any activity of the **OPERATE** input, such as subsequent chattering, will not have any effect. With both the **OPERATE** and **RESET** inputs active (logic 1), the response of the latching contact is specified by the **OUTPUT H1A TYPE** setting.
- **OUTPUT H1a RESET**: This setting specifies a FlexLogic operand to operate the 'trip coil' of the contact. The relay will seal-in this input to safely open the contact. Once the contact is opened and the **OPERATE** input is logic 0 (off), any activity of the **RESET** input, such as subsequent chattering, will not have any effect. With both the **OPERATE** and **RESET** inputs active (logic 1), the response of the latching contact is specified by the **OUTPUT H1A TYPE** setting.
- **OUTPUT H1a TYPE**: This setting specifies the contact response under conflicting control inputs; that is, when both the **OPERATE** and **RESET** signals are applied. With both control inputs applied simultaneously, the contact will close if set to "Operate-dominant" and will open if set to "Reset-dominant".

Application Example 1:

A latching output contact H1a is to be controlled from two user-programmable pushbuttons (buttons number 1 and 2). The following settings should be applied.

Program the Latching Outputs by making the following changes in the **SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS ⇨ CONTACT OUTPUT H1a** menu (assuming an H4L module):

OUTPUT H1a OPERATE: "PUSHBUTTON 1 ON"
OUTPUT H1a RESET: "PUSHBUTTON 2 ON"

Program the pushbuttons by making the following changes in the **PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE PUSHBUTTONS ⇨⇩ USER PUSHBUTTON 1** and **USER PUSHBUTTON 2** menus:

PUSHBUTTON 1 FUNCTION: "Self-reset"
PUSHBTN 1 DROP-OUT TIME: "0.00 s"

PUSHBUTTON 2 FUNCTION: "Self-reset"
PUSHBTN 2 DROP-OUT TIME: "0.00 s"

Application Example 2:

A relay, having two latching contacts H1a and H1c, is to be programmed. The H1a contact is to be a Type-a contact, while the H1c contact is to be a Type-b contact (Type-a means closed after exercising the operate input; Type-b means closed after exercising the reset input). The relay is to be controlled from virtual outputs: VO1 to operate and VO2 to reset.

Program the Latching Outputs by making the following changes in the **SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS ⇨ CONTACT OUTPUT H1a** and **CONTACT OUTPUT H1c** menus (assuming an H4L module):

OUTPUT H1a OPERATE: "VO1"
OUTPUT H1a RESET: "VO2"

OUTPUT H1c OPERATE: "VO2"
OUTPUT H1c RESET: "VO1"

Since the two physical contacts in this example are mechanically separated and have individual control inputs, they will not operate at exactly the same time. A discrepancy in the range of a fraction of a maximum operating time may occur. Therefore, a pair of contacts programmed to be a multi-contact relay will not guarantee any specific sequence of operation (such as make before break). If required, the sequence of operation must be programmed explicitly by delaying some of the control inputs as shown in the next application example.

Application Example 3:

A make before break functionality must be added to the preceding example. An overlap of 20 ms is required to implement this functionality as described below:

5

Write the following FlexLogic equation (EnerVista UR Setup example shown):

FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Virtual Outputs On	Virt Op 1 On (VO1)
FlexLogic Entry 2	TIMER	Timer 1
FlexLogic Entry 3	Assign Virtual Output	= Virt Op 3 (VO3)
FlexLogic Entry 4	Virtual Outputs On	Virt Op 2 On (VO2)
FlexLogic Entry 5	TIMER	Timer 2
FlexLogic Entry 6	Assign Virtual Output	= Virt Op 4 (VO4)
FlexLogic Entry 7	End of List	

Both timers (Timer 1 and Timer 2) should be set to 20 ms pickup and 0 ms dropout.

Program the Latching Outputs by making the following changes in the **SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS ⇨ CONTACT OUTPUT H1a** and **CONTACT OUTPUT H1c** menus (assuming an H4L module):

OUTPUT H1a OPERATE: "VO1"
OUTPUT H1a RESET: "VO4"
OUTPUT H1c OPERATE: "VO2"
OUTPUT H1c RESET: "VO3"

Application Example 4:

A latching contact H1a is to be controlled from a single virtual output VO1. The contact should stay closed as long as VO1 is high, and should stay opened when VO1 is low. Program the relay as follows.

Write the following FlexLogic equation (EnerVista UR Setup example shown):

FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Virtual Outputs On	Virt Op 1 On (VO1)
FlexLogic Entry 2	NOT	1 Input
FlexLogic Entry 3	Assign Virtual Output	= Virt Op 2 (VO2)
FlexLogic Entry 4	End of List	

Program the Latching Outputs by making the following changes in the **SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS ⇨ CONTACT OUTPUT H1a** menu (assuming an H4L module):

OUTPUT H1a OPERATE: "VO1"
OUTPUT H1a RESET: "VO2"

5.8.4 VIRTUAL OUTPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ VIRTUAL OUTPUTS ⇨ VIRTUAL OUTPUT 1(96)

■ VIRTUAL OUTPUT 1 ■		VIRTUAL OUTPUT 1 ID Virt Op 1	*Range: Up to 12 alphanumeric characters*
	MESSAGE	VIRTUAL OUTPUT 1 EVENTS: Disabled	*Range: Disabled, Enabled*

There are 96 virtual outputs that may be assigned via FlexLogic. If not assigned, the output will be forced to 'OFF' (Logic 0). An ID may be assigned to each virtual output. Virtual outputs are resolved in each pass through the evaluation of the FlexLogic equations. Any change of state of a virtual output can be logged as an event if programmed to do so.

For example, if Virtual Output 1 is the trip signal from FlexLogic and the trip relay is used to signal events, the settings would be programmed as follows:

VIRTUAL OUTPUT 1 ID: "Trip"
VIRTUAL OUTPUT 1 EVENTS: "Disabled"

5.8.5 REMOTE DEVICES

a) REMOTE INPUTS/OUTPUTS OVERVIEW

Remote inputs and outputs provide a means of exchanging digital state information between Ethernet-networked devices. The IEC 61850 GSSE (Generic Substation State Event) and GOOSE (Generic Object Oriented Substation Event) standards are used.

The sharing of digital point state information between GSSE/GOOSE equipped relays is essentially an extension to FlexLogic, allowing distributed FlexLogic by making operands available to/from devices on a common communications network. In addition to digital point states, GSSE/GOOSE messages identify the originator of the message and provide other information required by the communication specification. All devices listen to network messages and capture data only from messages that have originated in selected devices.

IEC 61850 GSSE messages are compatible with UCA GOOSE messages and contain a fixed set of digital points. IEC 61850 GOOSE messages can, in general, contain any configurable data items. When used by the remote input/output feature, IEC 61850 GOOSE messages contain the same data as GSSE messages.

Both GSSE and GOOSE messages are designed to be short, reliable, and high priority. GOOSE messages have additional advantages over GSSE messages due to their support of VLAN (virtual LAN) and Ethernet priority tagging functionality. The GSSE message structure contains space for 128 bit pairs representing digital point state information. The IEC 61850 specification provides 32 “DNA” bit pairs that represent the state of two pre-defined events and 30 user-defined events. All remaining bit pairs are “UserSt” bit pairs, which are status bits representing user-definable events. The F60 implementation provides 32 of the 96 available UserSt bit pairs.

The IEC 61850 specification includes features that are used to cope with the loss of communication between transmitting and receiving devices. Each transmitting device will send a GSSE/GOOSE message upon a successful power-up, when the state of any included point changes, or after a specified interval (the *default update* time) if a change-of-state has not occurred. The transmitting device also sends a ‘hold time’ which is set greater than four times the programmed default time required by the receiving device.

Receiving devices are constantly monitoring the communications network for messages they require, as recognized by the identification of the originating device carried in the message. Messages received from remote devices include the message *time allowed to live*. The receiving relay sets a timer assigned to the originating device to this time interval, and if it has not received another message from this device at time-out, the remote device is declared to be non-communicating, so it will use the programmed default state for all points from that specific remote device. If a message is received from a remote device before the *time allowed to live* expires, all points for that device are updated to the states contained in the message and the hold timer is restarted. The status of a remote device, where “Offline” indicates non-communicating, can be displayed.

The remote input/output facility provides for 32 remote inputs and 64 remote outputs.

b) LOCAL DEVICES: ID OF DEVICE FOR TRANSMITTING GSSE MESSAGES

In a F60 relay, the device ID that represents the IEC 61850 GOOSE application ID (GoID) name string sent as part of each GOOSE message is programmed in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ FIXED GOOSE ⇨⇩ GOOSE ID** setting.

Likewise, the device ID that represents the IEC 61850 GSSE application ID name string sent as part of each GSSE message is programmed in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ GSSE ⇨⇩ GSSE ID** setting.

In F60 releases previous to 5.0x, these name strings were represented by the **RELAY NAME** setting.

c) REMOTE DEVICES: ID OF DEVICE FOR RECEIVING GSSE/GOOSE MESSAGES

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ REMOTE DEVICES ⇨ REMOTE DEVICE 1(16)

■ REMOTE DEVICE 1 ■	◀▶	REMOTE DEVICE 1 ID: Remote Device 1	Range: up to 20 alphanumeric characters
MESSAGE	▲▼	REMOTE DEVICE 1 ETYPE APPID: 0	Range: 0 to 16383 in steps of 1
MESSAGE	▲	REMOTE DEVICE 1 DATASET: Fixed	Range: Fixed, GOOSE 1 through GOOSE 16

Remote devices are available for setting purposes. A receiving relay must be programmed to capture messages from only those originating remote devices of interest. This setting is used to select specific remote devices by entering (bottom row) the exact identification (ID) assigned to those devices.

The **REMOTE DEVICE 1 ETYPE APPID** setting is only used with GOOSE messages; they are not applicable to GSSE messages. This setting identifies the Ethernet application identification in the GOOSE message. It should match the corresponding settings on the sending device.

The **REMOTE DEVICE 1 DATASET** setting provides for the choice of the F60 fixed (DNA/UserSt) dataset (that is, containing DNA and UserSt bit pairs), or one of the configurable datasets.

Note that the dataset for the received data items must be made up of existing items in an existing logical node. For this reason, logical node GGIO3 is instantiated to hold the incoming data items. GGIO3 is not necessary to make use of the received data. The remote input data item mapping takes care of the mapping of the inputs to remote input FlexLogic operands. However, GGIO3 data can be read by IEC 61850 clients.

5

5.8.6 REMOTE INPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ REMOTE INPUTS ⇨ REMOTE INPUT 1(32)

■ REMOTE INPUT 1 ■	◀▶	REMOTE INPUT 1 ID: Remote Ip 1	Range: up to 12 alphanumeric characters
MESSAGE	▲▼	REMOTE IN 1 DEVICE: Remote Device 1	Range: Remote Device 1 to Remote device 16
MESSAGE	▲▼	REMOTE IN 1 ITEM: None	Range: None, DNA-1 to DNA-32, UserSt-1 to UserSt-32, Config Item 1 to Config Item 32
MESSAGE	▲▼	REMOTE IN 1 DEFAULT STATE: Off	Range: On, Off, Latest/On, Latest/Off
MESSAGE	▲	REMOTE IN 1 EVENTS: Disabled	Range: Disabled, Enabled

Remote Inputs that create FlexLogic operands at the receiving relay are extracted from GSSE/GOOSE messages originating in remote devices. Each remote input can be selected from a list consisting of: DNA-1 through DNA-32, UserSt-1 through UserSt-32, and Dataset Item 1 through Dataset Item 32. The function of DNA inputs is defined in the IEC 61850 specification and is presented in the IEC 61850 DNA Assignments table in the *Remote Outputs* section. The function of UserSt inputs is defined by the user selection of the FlexLogic operand whose state is represented in the GSSE/GOOSE message. A user must program a DNA point from the appropriate FlexLogic operand.

Remote input 1 must be programmed to replicate the logic state of a specific signal from a specific remote device for local use. This programming is performed via the three settings shown above.

The **REMOTE INPUT 1 ID** setting allows the user to assign descriptive text to the remote input. The **REMOTE IN 1 DEVICE** setting selects the remote device which originates the required signal, as previously assigned to the remote device via the setting **REMOTE DEVICE (16) ID** (see the *Remote Devices* section). The **REMOTE IN 1 ITEM** setting selects the specific bits of the GSSE/GOOSE message required.

The **REMOTE IN 1 DEFAULT STATE** setting selects the logic state for this point if the local relay has just completed startup or the remote device sending the point is declared to be non-communicating. The following choices are available:

- Setting **REMOTE IN 1 DEFAULT STATE** to "On" value defaults the input to logic 1.
- Setting **REMOTE IN 1 DEFAULT STATE** to "Off" value defaults the input to logic 0.
- Setting **REMOTE IN 1 DEFAULT STATE** to "Latest/On" freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to logic 1. When communication resumes, the input becomes fully operational.
- Setting **REMOTE IN 1 DEFAULT STATE** to "Latest/Off" freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to logic 0. When communication resumes, the input becomes fully operational.

NOTE: For additional information on GSSE/GOOOSE messaging, see the *Remote Devices* section in this chapter.

5.8.7 REMOTE DOUBLE-POINT STATUS INPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ REMOTE DPS INPUTS ⇨ REMOTE DPS INPUT 1(5)

Menu		Setting	Range
■ REMOTE DPS INPUT 1 ■		REM DPS IN 1 ID: RemDPS Ip 1	Range: up to 12 alphanumeric characters
	MESSAGE	REM DPS IN 1 DEV: Remote Device 1	Range: Remote Device 1 to Remote device 16
	MESSAGE	REM DPS IN 1 ITEM: None	Range: None, Dataset Item 1 to Dataset Item 32
	MESSAGE	REM DPS IN 1 EVENTS: Disabled	Range: Enabled, Disabled

Remote double-point status inputs are extracted from GOOSE messages originating in the remote device. Each remote double point status input must be programmed to replicate the logic state of a specific signal from a specific remote device for local use. This functionality is accomplished with the five remote double-point status input settings.

- **REM DPS IN 1 ID**: This setting assigns descriptive text to the remote double-point status input.
- **REM DPS IN 1 DEV**: This setting selects a remote device ID to indicate the origin of a GOOSE message. The range is selected from the remote device IDs specified in the *Remote Devices* section.
- **REM DPS IN 1 ITEM**: This setting specifies the required bits of the GOOSE message.

The configurable GOOSE dataset items must be changed to accept a double-point status item from a GOOSE dataset (changes are made in the SETTINGS ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ GSSE/GOOSE CONFIGURATION ⇨⇩ RECEPTION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1(16) ⇨ CONFIG GSE 1 DATASET ITEMS menus). Dataset items configured to receive any of "GGIO3.ST.IndPos1.stV" to "GGIO3.ST.IndPos5.stV" will accept double-point status information that will be decoded by the remote double-point status inputs configured to this dataset item.

The remote double point status is recovered from the received IEC 61850 dataset and is available as through the RemDPS Ip 1 BAD, RemDPS Ip 1 INTERM, RemDPS Ip 1 OFF, and RemDPS Ip 1 ON FlexLogic operands. These operands can then be used in breaker or disconnect control schemes.

5.8.8 REMOTE OUTPUTS

a) DNA BIT PAIRS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ REMOTE OUTPUTS DNA BIT PAIRS ⇨ REMOTE OUTPUTS DNA- 1(32) BIT PAIR

Menu		Setting	Range
■ REMOTE OUTPUTS ■ DNA- 1 BIT PAIR		DNA- 1 OPERAND: Off	Range: FlexLogic operand
	MESSAGE	DNA- 1 EVENTS: Disabled	Range: Disabled, Enabled

Remote outputs (1 to 32) are FlexLogic operands inserted into GSSE/GOOSE messages that are transmitted to remote devices on a LAN. Each digital point in the message must be programmed to carry the state of a specific FlexLogic operand. The above operand setting represents a specific DNA function (as shown in the following table) to be transmitted.

Table 5–36: IEC 61850 DNA ASSIGNMENTS

DNA	IEC 61850 DEFINITION	FLEXLOGIC OPERAND
1	Test	IEC 61850 TEST MODE
2	ConfRev	IEC 61850 CONF REV

b) USERST BIT PAIRS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ REMOTE OUTPUTS UserSt BIT PAIRS ⇨ REMOTE OUTPUTS UserSt- 1(32) BIT PAIR

```
■ REMOTE OUTPUTS
■ UserSt- 1 BIT PAIR
```

```
UserSt- 1 OPERAND:
Off
```
Range: *FlexLogic operand*

MESSAGE
```
UserSt- 1 EVENTS:
Disabled
```
Range: *Disabled, Enabled*

Remote outputs 1 to 32 originate as GSSE/GOOSE messages to be transmitted to remote devices. Each digital point in the message must be programmed to carry the state of a specific FlexLogic operand. The setting above is used to select the operand which represents a specific UserSt function (as selected by the user) to be transmitted.

NOTE: For more information on GSSE/GOOSE messaging, see the Remote Inputs/Outputs Overview in the *Remote Devices* section.

5

5.8.9 RESETTING

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ RESETTING

```
■ RESETTING
■
```

```
RESET OPERAND:
Off
```
Range: *FlexLogic operand*

Some events can be programmed to latch the faceplate LED event indicators and the target message on the display. Once set, the latching mechanism will hold all of the latched indicators or messages in the set state after the initiating condition has cleared until a RESET command is received to return these latches (not including FlexLogic latches) to the reset state. The RESET command can be sent from the faceplate Reset button, a remote device via a communications channel, or any programmed operand.

When the RESET command is received by the relay, two FlexLogic operands are created. These operands, which are stored as events, reset the latches if the initiating condition has cleared. The three sources of RESET commands each create the RESET OP FlexLogic operand. Each individual source of a RESET command also creates its individual operand RESET OP (PUSHBUTTON), RESET OP (COMMS) or RESET OP (OPERAND) to identify the source of the command. The setting shown above selects the operand that will create the RESET OP (OPERAND) operand.

5.8.10 DIRECT INPUTS AND OUTPUTS

a) DIRECT INPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ DIRECT INPUTS ⇨ DIRECT INPUT 1(32)

■ DIRECT INPUT 1 ■	◀▶	DIRECT INPUT 1 NAME: Dir Ip 1	Range: up to 12 alphanumeric characters
MESSAGE	▲▼	DIRECT INPUT 1 DEVICE ID: 1	Range: 1 to 16
MESSAGE	▲▼	DIRECT INPUT 1 BIT NUMBER: 1	Range: 1 to 32
MESSAGE	▲▼	DIRECT INPUT 1 DEFAULT STATE: Off	Range: On, Off, Latest/On, Latest/Off
MESSAGE	▲	DIRECT INPUT 1 EVENTS: Disabled	Range: Enabled, Disabled

These settings specify how the direct input information is processed. The **DIRECT INPUT 1 NAME** setting allows the user to assign a descriptive name to the direct input. The **DIRECT INPUT 1 DEVICE ID** represents the source of direct input 1. The specified direct input is driven by the device identified here.

The **DIRECT INPUT 1 BIT NUMBER** is the bit number to extract the state for direct input 1. Direct Input 1 is driven by the bit identified as **DIRECT INPUT 1 BIT NUMBER**. This corresponds to the direct output number of the sending device.

The **DIRECT INPUT 1 DEFAULT STATE** represents the state of the direct input when the associated direct device is offline. The following choices are available:

- Setting **DIRECT INPUT 1 DEFAULT STATE** to "On" value defaults the input to Logic 1.
- Setting **DIRECT INPUT 1 DEFAULT STATE** to "Off" value defaults the input to Logic 0.
- Setting **DIRECT INPUT 1 DEFAULT STATE** to "Latest/On" freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to Logic 1. When communication resumes, the input becomes fully operational.
- Setting **DIRECT INPUT 1 DEFAULT STATE** to "Latest/Off" freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to Logic 0. When communication resumes, the input becomes fully operational.

b) DIRECT OUTPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ DIRECT OUTPUTS ⇨ DIRECT OUTPUT 1(32)

■ DIRECT OUTPUT 1 ■	◀▶	DIRECT OUT 1 NAME: Dir Out 1	Range: up to 12 alphanumeric characters
MESSAGE	▲▼	DIRECT OUT 1 OPERAND: Off	Range: FlexLogic operand
MESSAGE	▲	DIRECT OUTPUT 1 EVENTS: Disabled	Range: Enabled, Disabled

The **DIRECT OUT 1 NAME** setting allows the user to assign a descriptive name to the direct output. The **DIR OUT 1 OPERAND** is the FlexLogic operand that determines the state of this direct output.

c) APPLICATION EXAMPLES

The examples introduced in the earlier *Direct Inputs and Outputs* section (part of the *Product Setup* section) are continued below to illustrate usage of the direct inputs and outputs.

EXAMPLE 1: EXTENDING INPUT/OUTPUT CAPABILITIES OF A F60 RELAY

Consider an application that requires additional quantities of digital inputs or output contacts or lines of programmable logic that exceed the capabilities of a single UR-series chassis. The problem is solved by adding an extra UR-series IED, such as the C30, to satisfy the additional inputs/outputs and programmable logic requirements. The two IEDs are connected via single-channel digital communication cards as shown below.

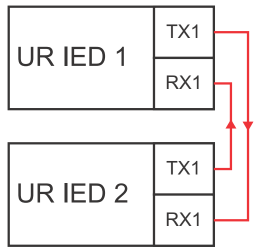

Figure 5–137: INPUT AND OUTPUT EXTENSION VIA DIRECT INPUTS AND OUTPUTS

Assume contact input 1 from UR IED 2 is to be used by UR IED 1. The following settings should be applied (Direct Input 5 and bit number 12 are used, as an example):

UR IED 1: **DIRECT INPUT 5 DEVICE ID** = “2”
DIRECT INPUT 5 BIT NUMBER = “12”

UR IED 2: **DIRECT OUT 12 OPERAND** = “Cont Ip 1 On”

The Cont Ip 1 On operand of UR IED 2 is now available in UR IED 1 as DIRECT INPUT 5 ON.

EXAMPLE 2: INTERLOCKING BUSBAR PROTECTION

A simple interlocking busbar protection scheme can be accomplished by sending a blocking signal from downstream devices, say 2, 3 and 4, to the upstream device that monitors a single incomer of the busbar, as shown in the figure below.

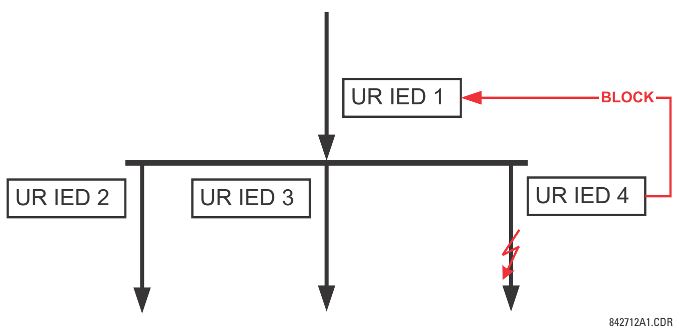

Figure 5–138: SAMPLE INTERLOCKING BUSBAR PROTECTION SCHEME

Assume that Phase Instantaneous Overcurrent 1 is used by Devices 2, 3, and 4 to block Device 1. If not blocked, Device 1 would trip the bus upon detecting a fault and applying a short coordination time delay.

The following settings should be applied (assume Bit 3 is used by all 3 devices to send the blocking signal and Direct Inputs 7, 8, and 9 are used by the receiving device to monitor the three blocking signals):

UR IED 2: **DIRECT OUT 3 OPERAND**: "PHASE IOC1 OP"

UR IED 3: **DIRECT OUT 3 OPERAND**: "PHASE IOC1 OP"

UR IED 4: **DIRECT OUT 3 OPERAND**: "PHASE IOC1 OP"

UR IED 1: **DIRECT INPUT 7 DEVICE ID**: "2"
DIRECT INPUT 7 BIT NUMBER: "3"
DIRECT INPUT 7 DEFAULT STATE: select "On" for security, select "Off" for dependability

DIRECT INPUT 8 DEVICE ID: "3"
DIRECT INPUT 8 BIT NUMBER: "3"
DIRECT INPUT 8 DEFAULT STATE: select "On" for security, select "Off" for dependability

DIRECT INPUT 9 DEVICE ID: "4"
DIRECT INPUT 9 BIT NUMBER: "3"
DIRECT INPUT 9 DEFAULT STATE: select "On" for security, select "Off" for dependability

Now the three blocking signals are available in UR IED 1 as DIRECT INPUT 7 ON, DIRECT INPUT 8 ON, and DIRECT INPUT 9 ON. Upon losing communications or a device, the scheme is inclined to block (if any default state is set to “On”), or to trip the bus on any overcurrent condition (all default states set to “Off”).

EXAMPLE 2: PILOT-AIDED SCHEMES

Consider a three-terminal line protection application shown in the figure below.

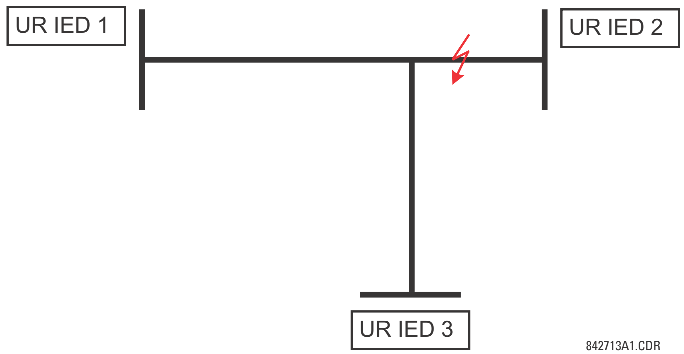

Figure 5–139: THREE-TERMINAL LINE APPLICATION

Assume the Hybrid Permissive Overreaching Transfer Trip (Hybrid POTT) scheme is applied using the architecture shown below. The scheme output operand HYB POTT TX1 is used to key the permission.

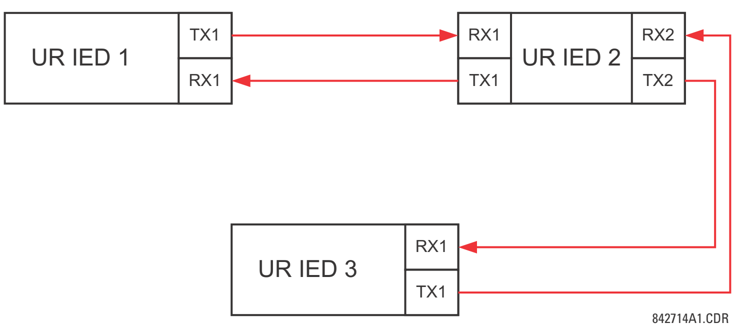

Figure 5–140: SINGLE-CHANNEL OPEN-LOOP CONFIGURATION

In the above architecture, Devices 1 and 3 do not communicate directly. Therefore, Device 2 must act as a ‘bridge’. The following settings should be applied:

UR IED 1: **DIRECT OUT 2 OPERAND:** "HYB POTT TX1"
DIRECT INPUT 5 DEVICE ID: "2"
DIRECT INPUT 5 BIT NUMBER: "2" (this is a message from IED 2)
DIRECT INPUT 6 DEVICE ID: "2"
DIRECT INPUT 6 BIT NUMBER: "4" (effectively, this is a message from IED 3)

UR IED 3: **DIRECT OUT 2 OPERAND:** "HYB POTT TX1"
DIRECT INPUT 5 DEVICE ID: "2"
DIRECT INPUT 5 BIT NUMBER: "2" (this is a message from IED 2)
DIRECT INPUT 6 DEVICE ID: "2"
DIRECT INPUT 6 BIT NUMBER: "3" (effectively, this is a message from IED 1)

UR IED 2: **DIRECT INPUT 5 DEVICE ID:** "1"
DIRECT INPUT 5 BIT NUMBER: "2"
DIRECT INPUT 6 DEVICE ID: "3"
DIRECT INPUT 6 BIT NUMBER: "2"

DIRECT OUT 2 OPERAND: "HYB POTT TX1"
DIRECT OUT 3 OPERAND: "DIRECT INPUT 5" (forward a message from 1 to 3)
DIRECT OUT 4 OPERAND: "DIRECT INPUT 6" (forward a message from 3 to 1)

Signal flow between the three IEDs is shown in the figure below:

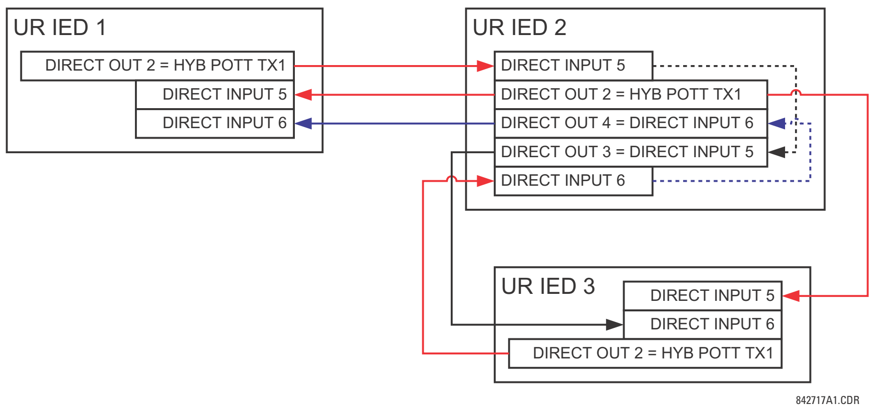

Figure 5–141: SIGNAL FLOW FOR DIRECT INPUT AND OUTPUT – EXAMPLE 3

In three-terminal applications, both the remote terminals must grant permission to trip. Therefore, at each terminal, direct inputs 5 and 6 should be ANDed in FlexLogic and the resulting operand configured as the permission to trip (**HYB POTT RX1** setting).

5

5.8.11 TELEPROTECTION INPUTS AND OUTPUTS

a) OVERVIEW

The relay provides sixteen teleprotection inputs on communications channel 1 (numbered 1-1 through 1-16) and sixteen teleprotection inputs on communications channel 2 (on two-terminals two-channel and three-terminal systems only, numbered 2-1 through 2-16). The remote relay connected to channels 1 and 2 of the local relay is programmed by assigning FlexLogic operands to be sent via the selected communications channel. This allows the user to create distributed protection and control schemes via dedicated communications channels. Some examples are directional comparison pilot schemes and direct transfer tripping. It should be noted that failures of communications channels will affect teleprotection functionality. The teleprotection function must be enabled to utilize the inputs.

b) TELEPROTECTION INPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ TELEPROTECTION ⇨ TELEPROT INPUTS

■ TELEPROT INPUTS ■		TELEPROT INPUT 1-1 DEFAULT: Off	*Range: Off, On, Latest/Off, Latest/On*
	MESSAGE	TELEPROT INPUT 1-2 DEFAULT: Off	*Range: Off, On, Latest/Off, Latest/On*
		↓	
	MESSAGE	TELEPROT INPUT 1-16 DEFAULT: Off	*Range: Off, On, Latest/Off, Latest/On*
	MESSAGE	TELEPROT INPUT 2-1 DEFAULT: Off	*Range: Off, On, Latest/Off, Latest/On*
	MESSAGE	TELEPROT INPUT 2-2 DEFAULT: Off	*Range: Off, On, Latest/Off, Latest/On*
		↓	
	MESSAGE	TELEPROT INPUT 2-16 DEFAULT: Off	*Range: Off, On, Latest/Off, Latest/On*

Setting the **TELEPROT INPUT ~~ DEFAULT** setting to “On” defaults the input to logic 1 when the channel fails. A value of “Off” defaults the input to logic 0 when the channel fails.

The “Latest/On” and “Latest/Off” values freeze the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, then the input defaults to logic 1 for “Latest/On” and logic 0 for “Latest/Off”.

c) TELEPROTECTION OUTPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ TELEPROTECTION ⇨⇩ TELEPROT OUTPUTS

■ TELEPROT OUTPUTS ■		TELEPROT OUTPUT 1-1: Off	*Range: FlexLogic operand*
	MESSAGE	TELEPROT OUTPUT 1-2: Off	*Range: FlexLogic operand*
		↓	
	MESSAGE	TELEPROT OUTPUT 1-16: Off	*Range: FlexLogic operand*
	MESSAGE	TELEPROT OUTPUT 2-1: Off	*Range: FlexLogic operand*
	MESSAGE	TELEPROT OUTPUT 2-2: Off	*Range: FlexLogic operand*
		↓	
	MESSAGE	TELEPROT OUTPUT 2-16: Off	*Range: FlexLogic operand*

As the following figure demonstrates, processing of the teleprotection inputs/outputs is dependent on the number of communication channels and terminals. On two-terminal two-channel systems, they are processed continuously on each channel and mapped separately per channel. Therefore, to achieve redundancy, the user must assign the same operand on both channels (teleprotection outputs at the sending end or corresponding teleprotection inputs at the receiving end). On three-terminal two-channel systems, redundancy is achieved by programming signal re-transmittal in the case of channel failure between any pair of relays.

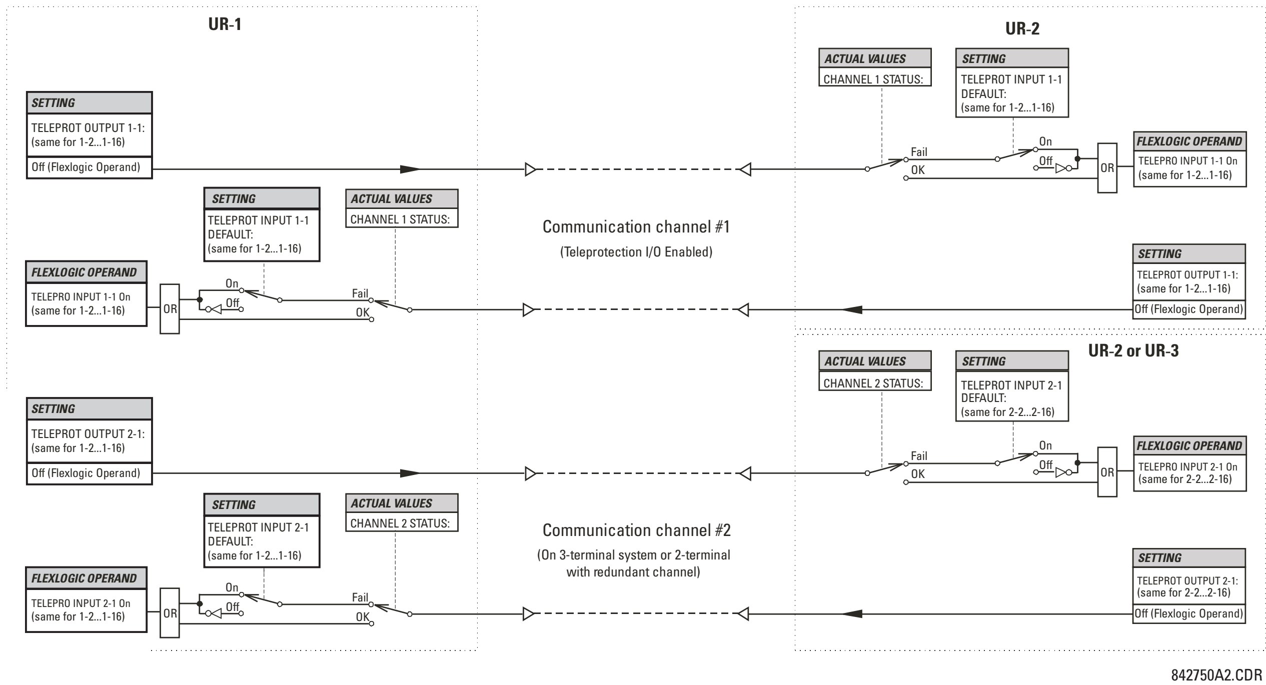

Figure 5–142: TELEPROTECTION INPUT/OUTPUT PROCESSING

5.8.12 IEC 61850 GOOSE ANALOGS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ IEC 61850 GOOSE ANALOGS ⇨⇩ GOOSE ANALOG INPUT 1(32)

■ GOOSE ANALOG ■ INPUT 1	◀▶	ANALOG 1 DEFAULT: 1000.000	Range: –1000000.000 to 1000000.000 in steps of 0.001
MESSAGE	▲▼	ANALOG 1 DEFAULT MODE: Default Value	Range: Default Value, Last Known
MESSAGE	▲▼	GOOSE ANALOG 1 UNITS:	Range: up to 4 alphanumeric characters
MESSAGE	▲	GOOSE ANALOG 1 PU: 1.000	Range: 0.000 to 1000000000.000 in steps of 0.001

The IEC 61850 GOOSE analog inputs feature allows the transmission of analog values between any two UR-series devices. The following settings are available for each GOOSE analog input.

- **ANALOG 1 DEFAULT**: This setting specifies the value of the GOOSE analog input when the sending device is offline and the **ANALOG 1 DEFAULT MODE** is set to “Default Value”.This setting is stored as an IEEE 754 / IEC 60559 floating point number. Because of the large range of this setting, not all possible values can be stored. Some values may be rounded to the closest possible floating point number.
- **ANALOG 1 DEFAULT MODE**: When the sending device is offline and this setting is “Last Known”, the value of the GOOSE analog input remains at the last received value. When the sending device is offline and this setting value is “Default Value”, then the value of the GOOSE analog input is defined by the **ANALOG 1 DEFAULT** setting.
- **GOOSE ANALOG 1 UNITS**: This setting specifies a four-character alphanumeric string that can is used in the actual values display of the corresponding GOOSE analog input value.
- **GOOSE ANALOG 1 PU**: This setting specifies the per-unit base factor when using the GOOSE analog input FlexAnalog values in other F60 features, such as FlexElements. The base factor is applied to the GOOSE analog input FlexAnalog quantity to normalize it to a per-unit quantity. The base units are described in the following table.

Table 5–37: GOOSE ANALOG INPUT BASE UNITS

ELEMENT	BASE UNITS
BREAKER ARCING AMPS (Brk X Arc Amp A, B, and C)	BASE = 2000 $kA^2 \times$ cycle
dcmA	BASE = maximum value of the **DCMA INPUT MAX** setting for the two transducers configured under the +IN and –IN inputs.
FREQUENCY	f_{BASE} = 1 Hz
FREQUENCY RATE OF CHANGE	df/dt_{BASE} = 1 Hz/s
PHASE ANGLE	φ_{BASE} = 360 degrees (see the UR angle referencing convention)
POWER FACTOR	PF_{BASE} = 1.00
RTDs	BASE = 100°C
SENSITIVE DIR POWER (Sns Dir Power)	P_{BASE} = maximum value of $3 \times V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs of the sources configured for the sensitive power directional element(s).
SOURCE CURRENT	I_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SOURCE ENERGY (Positive and Negative Watthours, Positive and Negative Varhours)	E_{BASE} = 10000 MWh or MVAh, respectively
SOURCE POWER	P_{BASE} = maximum value of $V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs
SOURCE THD & HARMONICS	BASE = 1%
SOURCE VOLTAGE	V_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SYNCHROCHECK (Max Delta Volts)	V_{BASE} = maximum primary RMS value of all the sources related to the +IN and –IN inputs

The GOOSE analog input FlexAnalog values are available for use in other F60 functions that use FlexAnalog values.

5

5.8.13 IEC 61850 GOOSE INTEGERS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ IEC 61850 GOOSE UINTEGERS ⇨⇩ GOOSE UINTEGER INPUT 1(16)

```
■ GOOSE UINTEGER          UINTEGER  1 DEFAULT:       Range: 0 to 429496295 in steps of 1
■ INPUT 1                      1000

              MESSAGE     UINTEGER  1 DEFAULT        Range: Default Value, Last Known
                          MODE: Default Value
```

The IEC 61850 GOOSE uinteger inputs feature allows the transmission of FlexInteger values between any two UR-series devices. The following settings are available for each GOOSE uinteger input.

- **UINTEGER 1 DEFAULT**: This setting specifies the value of the GOOSE uinteger input when the sending device is offline and the **UINTEGER 1 DEFAULT MODE** is set to “Default Value”.This setting is stored as a 32-bit unsigned integer number.
- **UINTEGER 1 DEFAULT MODE**: When the sending device is offline and this setting is “Last Known”, the value of the GOOSE uinteger input remains at the last received value. When the sending device is offline and this setting value is “Default Value”, then the value of the GOOSE uinteger input is defined by the **UINTEGER 1 DEFAULT** setting.

The GOOSE integer input FlexInteger values are available for use in other F60 functions that use FlexInteger values.

5.9.1 DCMA INPUTS

PATH: SETTINGS ⇨⇩ TRANSDUCER I/O ⇨⇩ DCMA INPUTS ⇨ DCMA INPUT H1(W8)

■ DCMA INPUT H1 ■	DCMA INPUT H1 FUNCTION: Disabled	*Range: Disabled, Enabled*
MESSAGE	DCMA INPUT H1 ID: DCMA Ip 1	*Range: up to 20 alphanumeric characters*
MESSAGE	DCMA INPUT H1 UNITS: µA	*Range: 6 alphanumeric characters*
MESSAGE	DCMA INPUT H1 RANGE: 0 to -1 mA	*Range: 0 to –1 mA, 0 to +1 mA, –1 to +1 mA, 0 to 5 mA, 0 to 10mA, 0 to 20 mA, 4 to 20 mA*
MESSAGE	DCMA INPUT H1 MIN VALUE: 0.000	*Range: –9999.999 to +9999.999 in steps of 0.001*
MESSAGE	DCMA INPUT H1 MAX VALUE: 0.000	*Range: –9999.999 to +9999.999 in steps of 0.001*

Hardware and software is provided to receive signals from external transducers and convert these signals into a digital format for use as required. The relay will accept inputs in the range of –1 to +20 mA DC, suitable for use with most common transducer output ranges; all inputs are assumed to be linear over the complete range. Specific hardware details are contained in chapter 3.

Before the dcmA input signal can be used, the value of the signal measured by the relay must be converted to the range and quantity of the external transducer primary input parameter, such as DC voltage or temperature. The relay simplifies this process by internally scaling the output from the external transducer and displaying the actual primary parameter.

dcmA input channels are arranged in a manner similar to CT and VT channels. The user configures individual channels with the settings shown here.

The channels are arranged in sub-modules of two channels, numbered from 1 through 8 from top to bottom. On power-up, the relay will automatically generate configuration settings for every channel, based on the order code, in the same general manner that is used for CTs and VTs. Each channel is assigned a slot letter followed by the row number, 1 through 8 inclusive, which is used as the channel number. The relay generates an actual value for each available input channel.

Settings are automatically generated for every channel available in the specific relay as shown above for the first channel of a type 5F transducer module installed in slot H.

The function of the channel may be either "Enabled" or "Disabled". If "Disabled", no actual values are created for the channel. An alphanumeric "ID" is assigned to each channel; this ID will be included in the channel actual value, along with the programmed units associated with the parameter measured by the transducer, such as volts, °C, megawatts, etc. This ID is also used to reference the channel as the input parameter to features designed to measure this type of parameter. The **DCMA INPUT H1 RANGE** setting specifies the mA DC range of the transducer connected to the input channel.

The **DCMA INPUT H1 MIN VALUE** and **DCMA INPUT H1 MAX VALUE** settings are used to program the span of the transducer in primary units. For example, a temperature transducer might have a span from 0 to 250°C; in this case the **DCMA INPUT H1 MIN VALUE** value is "0" and the **DCMA INPUT H1 MAX VALUE** value is "250". Another example would be a watts transducer with a span from –20 to +180 MW; in this case the **DCMA INPUT H1 MIN VALUE** value would be "–20" and the **DCMA INPUT H1 MAX VALUE** value "180". Intermediate values between the min and max values are scaled linearly.

5.9.2 RTD INPUTS

PATH: SETTINGS ⇨⇩ TRANSDUCER I/O ⇨⇩ RTD INPUTS ⇨ RTD INPUT H1(W8)

■ RTD INPUT H1 ■	◁▷	RTD INPUT H1 FUNCTION: Disabled	*Range: Disabled, Enabled*
MESSAGE	△▽	RTD INPUT H1 ID: RTD Ip 1	*Range: Up to 20 alphanumeric characters*
MESSAGE	△	RTD INPUT H1 TYPE: 100Ω Nickel	*Range: 100Ω Nickel, 10Ω Copper, 100Ω Platinum, 120Ω Nickel*

Hardware and software is provided to receive signals from external resistance temperature detectors and convert these signals into a digital format for use as required. These channels are intended to be connected to any of the RTD types in common use. Specific hardware details are contained in chapter 3.

RTD input channels are arranged in a manner similar to CT and VT channels. The user configures individual channels with the settings shown here.

The channels are arranged in sub-modules of two channels, numbered from 1 through 8 from top to bottom. On power-up, the relay will automatically generate configuration settings for every channel, based on the order code, in the same general manner that is used for CTs and VTs. Each channel is assigned a slot letter followed by the row number, 1 through 8 inclusive, which is used as the channel number. The relay generates an actual value for each available input channel.

Settings are automatically generated for every channel available in the specific relay as shown above for the first channel of a type 5C transducer module installed in the first available slot.

The function of the channel may be either “Enabled” or “Disabled”. If “Disabled”, there will not be an actual value created for the channel. An alphanumeric ID is assigned to the channel; this ID will be included in the channel actual values. It is also used to reference the channel as the input parameter to features designed to measure this type of parameter. Selecting the type of RTD connected to the channel configures the channel.

Actions based on RTD overtemperature, such as trips or alarms, are done in conjunction with the FlexElements feature. In FlexElements, the operate level is scaled to a base of 100°C. For example, a trip level of 150°C is achieved by setting the operate level at 1.5 pu. FlexElement operands are available to FlexLogic for further interlocking or to operate an output contact directly.

Refer to the following table for reference temperature values for each RTD type.

5

Table 5–38: RTD TEMPERATURE VS. RESISTANCE

TEMPERATURE		RESISTANCE (IN OHMS)			
°C	°F	100 Ω PT (DIN 43760)	120 Ω NI	100 Ω NI	10 Ω CU

5.9.3 DCMA OUTPUTS

PATH: SETTINGS ⇨⇩ TRANSDUCER I/O ⇨⇩ DCMA OUTPUTS ⇨ DCMA OUTPUT H1(W8)

■ DCMA OUTPUT H1 ■	◁▷	DCMA OUTPUT H1 SOURCE: Off	Range: Off, any analog actual value parameter
MESSAGE	△▽	DCMA OUTPUT H1 RANGE: -1 to 1 mA	Range: –1 to 1 mA, 0 to 1 mA, 4 to 20 mA
MESSAGE	△▽	DCMA OUTPUT H1 MIN VAL: 0.000 pu	Range: –90.000 to 90.000 pu in steps of 0.001
MESSAGE	△	DCMA OUTPUT H1 MAX VAL: 1.000 pu	Range: –90.000 to 90.000 pu in steps of 0.001

Hardware and software is provided to generate dcmA signals that allow interfacing with external equipment. Specific hardware details are contained in chapter 3. The dcmA output channels are arranged in a manner similar to transducer input or CT and VT channels. The user configures individual channels with the settings shown below.

The channels are arranged in sub-modules of two channels, numbered 1 through 8 from top to bottom. On power-up, the relay automatically generates configuration settings for every channel, based on the order code, in the same manner used for CTs and VTs. Each channel is assigned a slot letter followed by the row number, 1 through 8 inclusive, which is used as the channel number.

Both the output range and a signal driving a given output are user-programmable via the following settings menu (an example for channel M5 is shown).

The relay checks the driving signal (x in equations below) for the minimum and maximum limits, and subsequently rescales so the limits defined as **MIN VAL** and **MAX VAL** match the output range of the hardware defined as **RANGE**. The following equation is applied:

$$I_{out} = \begin{cases} I_{min} & \text{if } x < \textbf{MIN VAL} \\ I_{max} & \text{if } x > \textbf{MAX VAL} \\ k(x - \textbf{MIN VAL}) + I_{min} & \text{otherwise} \end{cases} \quad \textbf{(EQ 5.31)}$$

where: x is a driving signal specified by the **SOURCE** setting
I_{min} and I_{max} are defined by the **RANGE** setting
k is a scaling constant calculated as:

$$k = \frac{I_{max} - I_{min}}{\textbf{MAX VAL} - \textbf{MIN VAL}} \quad \textbf{(EQ 5.32)}$$

The feature is intentionally inhibited if the **MAX VAL** and **MIN VAL** settings are entered incorrectly, e.g. when **MAX VAL** – **MIN VAL** < 0.1 pu. The resulting characteristic is illustrated in the following figure.

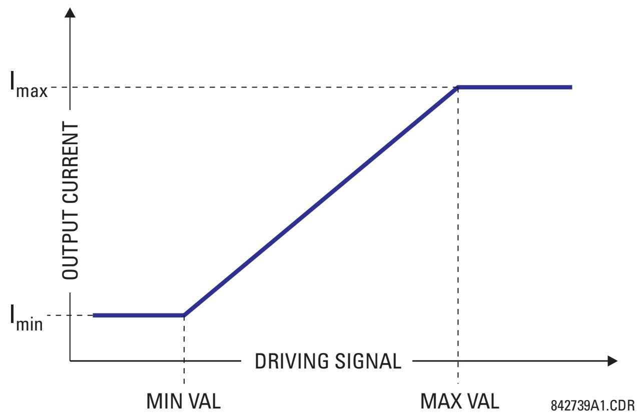

Figure 5–143: DCMA OUTPUT CHARACTERISTIC

The dcmA output settings are described below.

- **DCMA OUTPUT H1 SOURCE**: This setting specifies an internal analog value to drive the analog output. Actual values (FlexAnalog parameters) such as power, current amplitude, voltage amplitude, power factor, etc. can be configured as sources driving dcmA outputs. Refer to Appendix A for a complete list of FlexAnalog parameters.
- **DCMA OUTPUT H1 RANGE**: This setting allows selection of the output range. Each dcmA channel may be set independently to work with different ranges. The three most commonly used output ranges are available.
- **DCMA OUTPUT H1 MIN VAL**: This setting allows setting the minimum limit for the signal that drives the output. This setting is used to control the mapping between an internal analog value and the output current. The setting is entered in per-unit values. The base units are defined in the same manner as the FlexElement base units.
- **DCMA OUTPUT H1 MAX VAL**: This setting allows setting the maximum limit for the signal that drives the output. This setting is used to control the mapping between an internal analog value and the output current. The setting is entered in per-unit values. The base units are defined in the same manner as the FlexElement base units.

NOTE

The **DCMA OUTPUT H1 MIN VAL** and **DCMA OUTPUT H1 MAX VAL** settings are ignored for power factor base units (i.e. if the **DCMA OUTPUT H1 SOURCE** is set to FlexAnalog value based on power factor measurement).

Three application examples are described below.

EXAMPLE: POWER MONITORING

A three phase active power on a 13.8 kV system measured via UR-series relay source 1 is to be monitored by the dcmA H1 output of the range of –1 to 1 mA. The following settings are applied on the relay: CT ratio = 1200:5, VT secondary 115, VT connection is delta, and VT ratio = 120. The nominal current is 800 A primary and the nominal power factor is 0.90. The power is to be monitored in both importing and exporting directions and allow for 20% overload compared to the nominal.

5

The nominal three-phase power is:

$$P = \sqrt{3} \times 13.8 \text{ kV} \times 0.8 \text{ kA} \times 0.9 = 17.21 \text{ MW} \quad \textbf{(EQ 5.33)}$$

The three-phase power with 20% overload margin is:

$$P_{max} = 1.2 \times 17.21 \text{ MW} = 20.65 \text{ MW} \quad \textbf{(EQ 5.34)}$$

The base unit for power (refer to the FlexElements section in this chapter for additional details) is:

$$P_{BASE} = 115 \text{ V} \times 120 \times 1.2 \text{ kA} = 16.56 \text{ MW} \quad \textbf{(EQ 5.35)}$$

The minimum and maximum power values to be monitored (in pu) are:

$$\text{minimum power} = \frac{-20.65 \text{ MW}}{16.56 \text{ MW}} = -1.247 \text{ pu}, \quad \text{maximum power} = \frac{20.65 \text{ MW}}{16.56 \text{ MW}} = 1.247 \text{ pu} \quad \textbf{(EQ 5.36)}$$

The following settings should be entered:

DCMA OUTPUT H1 SOURCE: “SRC 1 P”
DCMA OUTPUT H1 RANGE: “–1 to 1 mA”
DCMA OUTPUT H1 MIN VAL: “–1.247 pu”
DCMA OUTPUT H1 MAX VAL: “1.247 pu”

With the above settings, the output will represent the power with the scale of 1 mA per 20.65 MW. The worst-case error for this application can be calculated by superimposing the following two sources of error:

- ±0.5% of the full scale for the analog output module, or $\pm 0.005 \times (1-(-1)) \times 20.65 \text{ MW} = \pm 0.207 \text{ MW}$
- ±1% of reading error for the active power at power factor of 0.9

For example at the reading of 20 MW, the worst-case error is 0.01 × 20 MW + 0.207 MW = 0.407 MW.

EXAMPLE: CURRENT MONITORING

The phase A current (true RMS value) is to be monitored via the H2 current output working with the range from 4 to 20 mA. The CT ratio is 5000:5 and the maximum load current is 4200 A. The current should be monitored from 0 A upwards, allowing for 50% overload.

The phase current with the 50% overload margin is:

$$I_{max} = 1.5 \times 4.2\text{ kA} = 6.3\text{ kA} \quad \textbf{(EQ 5.37)}$$

The base unit for current (refer to the *FlexElements* section in this chapter for additional details) is:

$$I_{BASE} = 5\text{ kA} \quad \textbf{(EQ 5.38)}$$

The minimum and maximum power values to be monitored (in pu) are:

$$\text{minimum current} = \frac{0\text{ kA}}{5\text{ kA}} = 0\text{ pu}, \quad \text{maximum current} = \frac{6.3\text{ kA}}{5\text{ kA}} = 1.26\text{ pu} \quad \textbf{(EQ 5.39)}$$

The following settings should be entered:

DCMA OUTPUT H2 SOURCE: “SRC 1 Ia RMS”
DCMA OUTPUT H2 RANGE: “4 to 20 mA”
DCMA OUTPUT H2 MIN VAL: “0.000 pu”
DCMA OUTPUT H2 MAX VAL: “1.260 pu”

The worst-case error for this application could be calculated by superimposing the following two sources of error:

- ±0.5% of the full scale for the analog output module, or $\pm 0.005 \times (20 - 4) \times 6.3\text{ kA} = \pm 0.504\text{ kA}$
- ±0.25% of reading or ±0.1% of rated (whichever is greater) for currents between 0.1 and 2.0 of nominal

For example, at the reading of 4.2 kA, the worst-case error is max(0.0025 × 4.2 kA, 0.001 × 5 kA) + 0.504 kA = 0.515 kA.

EXAMPLE: VOLTAGE MONITORING

A positive-sequence voltage on a 400 kV system measured via source 2 is to be monitored by the dcmA H3 output with a range of 0 to 1 mA. The VT secondary setting is 66.4 V, the VT ratio setting is 6024, and the VT connection setting is “Delta”. The voltage should be monitored in the range from 70% to 110% of nominal.

The minimum and maximum positive-sequence voltages to be monitored are:

$$V_{min} = 0.7 \times \frac{400\text{ kV}}{\sqrt{3}} = 161.66\text{ kV}, \quad V_{max} = 1.1 \times \frac{400\text{ kV}}{\sqrt{3}} = 254.03\text{ kV} \quad \textbf{(EQ 5.40)}$$

The base unit for voltage (refer to the *FlexElements* section in this chapter for additional details) is:

$$V_{BASE} = 0.0664\text{ kV} \times 6024 = 400\text{ kV} \quad \textbf{(EQ 5.41)}$$

The minimum and maximum voltage values to be monitored (in pu) are:

$$\text{minimum voltage} = \frac{161.66\text{ kV}}{400\text{ kV}} = 0.404\text{ pu}, \quad \text{maximum voltage} = \frac{254.03\text{ kV}}{400\text{ kV}} = 0.635\text{ pu} \quad \textbf{(EQ 5.42)}$$

The following settings should be entered:

DCMA OUTPUT H3 SOURCE: “SRC 2 V_1 mag”
DCMA OUTPUT H3 RANGE: “0 to 1 mA”
DCMA OUTPUT H3 MIN VAL: “0.404 pu”
DCMA OUTPUT H3 MAX VAL: “0.635 pu”

The limit settings differ from the expected 0.7 pu and 1.1 pu because the relay calculates the positive-sequence quantities scaled to the phase-to-ground voltages, even if the VTs are connected in “Delta” (see the *Metering Conventions* section in chapter 6), while at the same time the VT nominal voltage is 1 pu for the settings. Consequently the settings required in this example differ from naturally expected by the factor of $\sqrt{3}$.

The worst-case error for this application could be calculated by superimposing the following two sources of error:

- ±0.5% of the full scale for the analog output module, or $\pm 0.005 \times (1 - 0) \times 254.03\text{ kV} = \pm 1.27\text{ kV}$
- ±0.5% of reading

For example, under nominal conditions, the positive-sequence reads 230.94 kV and the worst-case error is 0.005 x 230.94 kV + 1.27 kV = 2.42 kV.

5

5.10.1 TEST MODE

PATH: SETTINGS ⇨⇩ TESTING ⇨ TEST MODE

```
■■ SETTINGS           TEST MODE                Range: Disabled, Isolated, Forcible
■■ TESTING            FUNCTION: Disabled

           MESSAGE    TEST MODE FORCING:       Range: FlexLogic operand
                      On
```

The F60 provides a test facility to verify the functionality of contact inputs and outputs, some communication channels and the phasor measurement unit (where applicable), using simulated conditions. The test mode is indicated on the relay face-plate by a Test Mode LED indicator.

The test mode may be in any of three states: disabled, isolated, or forcible.

In the "Disabled" mode, F60 operation is normal and all test features are disabled.

In the "Isolated" mode, the F60 is prevented from performing certain control actions, including tripping via contact outputs. All relay contact outputs, including latching outputs, are disabled. Channel tests and phasor measurement unit tests remain usable on applicable UR-series models.

In the "Forcible" mode, the operand selected by the **TEST MODE FORCING** setting controls the relay inputs and outputs. If the test mode is forcible, and the operand assigned to the **TEST MODE FORCING** setting is "Off", the F60 inputs and outputs operate normally. If the test mode is forcible, and the operand assigned to the **TEST MODE FORCING** setting is "On", the F60 contact inputs and outputs are forced to the values specified in the following sections. Forcing may be controlled by manually changing the operand selected by the **TEST MODE FORCING** setting between on and off, or by selecting a user-programmable pushbutton, contact input, or communication-based input operand. Channel tests and phasor measurement unit tests remain usable on applicable UR-series models.

5

NOTE

Communications based inputs and outputs remain fully operational in test mode. If a control action is programmed using direct inputs and outputs or remote inputs and outputs, then the test procedure must take this into account.

When in "Forcible" mode, the operand selected by the **TEST MODE FORCING** setting dictates further response of the F60 to testing conditions. To force contact inputs and outputs through relay settings, set **TEST MODE FORCING** to "On". To force contact inputs and outputs through a user-programmable condition, such as FlexLogic operand (pushbutton, digital input, communication-based input, or a combination of these), set **TEST MODE FORCING** to the desired operand. The contact input or output is forced when the selected operand assumes a logic 1 state.

The F60 remains fully operational in test mode, allowing for various testing procedures. In particular, the protection and control elements, FlexLogic, and communication-based inputs and outputs function normally.

The only difference between the normal operation and the test mode is the behavior of the input and output contacts. The contact inputs can be forced to report as open or closed or remain fully operational, whereas the contact outputs can be forced to open, close, freeze, or remain fully operational. The response of the digital input and output contacts to the test mode is programmed individually for each input and output using the force contact inputs and force contact outputs test functions described in the following sections.

The test mode state is indicated on the relay faceplate by a combination of the Test Mode LED indicator, the In-Service LED indicator, and by the critical fail relay, as shown in the following table.

Table 5–39: TEST MODE OPERATION

TEST MODE FUNCTION	TEST MODE FORCING OPERAND	IN-SERVICE LED	TEST MODE LED	CRITICAL FAIL RELAY	INPUT AND OUTPUT BEHAVIOR
Disabled	No effect	Unaffected	Off	Unaffected	Contact outputs and inputs are under normal operation. Channel tests and PMU tests not operational (where applicable).
Isolated	No effect	Off	On	De-energized	Contact outputs are disabled and contact inputs are operational. Channel tests and PMU tests are also operational (where applicable).
Forcible	On (logic 1)	Off	Flashing	De-energized	Contact inputs and outputs are controlled by the force contact input and force contact output functions. Channel tests and PMU tests are operational (where applicable).
	Off (logic 0)	Off	Flashing	De-energized	Contact outputs and inputs are under normal operation. Channel tests and PMU tests are also operational (where applicable).

The **TEST MODE FUNCTION** setting can only be changed by a direct user command. Following a restart, power up, settings upload, or firmware upgrade, the test mode will remain at the last programmed value. This allows a F60 that has been placed in isolated mode to remain isolated during testing and maintenance activities. On restart, the **TEST MODE FORCING** setting and the force contact input and force contact output settings all revert to their default states.

5.10.2 FORCE CONTACT INPUTS

PATH: SETTINGS ⇨⇩ TESTING ⇨⇩ FORCE CONTACT INPUTS

```
■ FORCE CONTACT          FORCE Cont Ip 1        Range: Disabled, Open, Closed
■ INPUTS                 :Disabled

              MESSAGE    FORCE Cont Ip 2        Range: Disabled, Open, Closed
                         :Disabled
                              ↓
              MESSAGE    FORCE Cont Ip xx       Range: Disabled, Open, Closed
                         :Disabled
```

5

The relay digital inputs (contact inputs) could be pre-programmed to respond to the test mode in the following ways:

- If set to “Disabled”, the input remains fully operational. It is controlled by the voltage across its input terminals and can be turned on and off by external circuitry. This value should be selected if a given input must be operational during the test. This includes, for example, an input initiating the test, or being a part of a user pre-programmed test sequence.
- If set to “Open”, the input is forced to report as opened (Logic 0) for the entire duration of the test mode regardless of the voltage across the input terminals.
- If set to “Closed”, the input is forced to report as closed (Logic 1) for the entire duration of the test mode regardless of the voltage across the input terminals.

The force contact inputs feature provides a method of performing checks on the function of all contact inputs. Once enabled, the relay is placed into test mode, allowing this feature to override the normal function of contact inputs. The Test Mode LED will be on, indicating that the relay is in test mode. The state of each contact input may be programmed as “Disabled”, “Open”, or “Closed”. All contact input operations return to normal when all settings for this feature are disabled.

5.10.3 FORCE CONTACT OUTPUTS

PATH: SETTINGS ⇨⇩ TESTING ⇨⇩ FORCE CONTACT OUTPUTS

■ FORCE CONTACT ■ OUTPUTS		FORCE Cont Op 1 :Disabled	Range: Disabled, Energized, De-energized, Freeze
	MESSAGE	FORCE Cont Op 2 :Disabled	Range: Disabled, Energized, De-energized, Freeze
		↓	
	MESSAGE	FORCE Cont Op xx :Disabled	Range: Disabled, Energized, De-energized, Freeze

The relay contact outputs can be pre-programmed to respond to the test mode.

If set to “Disabled”, the contact output remains fully operational. If operates when its control operand is logic 1 and will resets when its control operand is logic 0. If set to “Energized”, the output will close and remain closed for the entire duration of the test mode, regardless of the status of the operand configured to control the output contact. If set to “De-energized”, the output will open and remain opened for the entire duration of the test mode regardless of the status of the operand configured to control the output contact. If set to “Freeze”, the output retains its position from before entering the test mode, regardless of the status of the operand configured to control the output contact.

These settings are applied two ways. First, external circuits may be tested by energizing or de-energizing contacts. Second, by controlling the output contact state, relay logic may be tested and undesirable effects on external circuits avoided.

5

Example 1: Initiating test mode through user-programmable pushbutton 1

For example, the test mode can be initiated from user-programmable pushbutton 1. The pushbutton will be programmed as “Latched” (pushbutton pressed to initiate the test, and pressed again to terminate the test). During the test, digital input 1 should remain operational, digital inputs 2 and 3 should open, and digital input 4 should close. Also, contact output 1 should freeze, contact output 2 should open, contact output 3 should close, and contact output 4 should remain fully operational. The required settings are shown below.

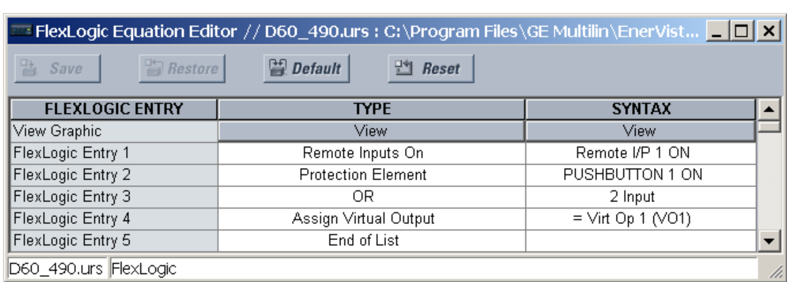
To enable user-programmable pushbutton 1 to initiate the test mode, make the following changes in the **SETTINGS ⇨⇩ TESTING ⇨ TEST MODE** menu: **TEST MODE FUNCTION:** “Enabled” and **TEST MODE INITIATE:** “PUSHBUTTON 1 ON”

Make the following changes to configure the contact inputs and outputs. In the **SETTINGS ⇨⇩ TESTING ⇨⇩ FORCE CONTACT INPUTS** and **FORCE CONTACT OUTPUTS** menus, set:

FORCE Cont Ip 1: “Disabled”, **FORCE Cont Ip 2:** “Open”, **FORCE Cont Ip 3:** “Open”, and **FORCE Cont Ip 4:** “Closed”
FORCE Cont Op 1: “Freeze”, **FORCE Cont Op 2:** “De-energized”, **FORCE Cont Op 3:** “Energized”, and **FORCE Cont Op 4:** “Disabled”

Example 2: Initiating a test from user-programmable pushbutton 1 or through remote input 1

In this example, the test can be initiated locally from user-programmable pushbutton 1 or remotely through remote input 1. Both the pushbutton and the remote input will be programmed as “Latched”. Write the following FlexLogic equation:



FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Remote Inputs On	Remote I/P 1 ON
FlexLogic Entry 2	Protection Element	PUSHBUTTON 1 ON
FlexLogic Entry 3	OR	2 Input
FlexLogic Entry 4	Assign Virtual Output	= Virt Op 1 (VO1)
FlexLogic Entry 5	End of List	

Set the user-programmable pushbutton as latching by changing **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE PUSHBUTTONS ⇨ USER PUSHBUTTON 1 ⇨ PUSHBUTTON 1 FUNCTION** to “Latched”. To enable either pushbutton 1 or remote input 1 to initiate the Test mode, make the following changes in the **SETTINGS ⇨⇩ TESTING ⇨ TEST MODE** menu:

TEST MODE FUNCTION: “Enabled” and **TEST MODE INITIATE:** “VO1”

5.10.4 PHASOR MEASUREMENT UNIT TEST VALUES

PATH: SETTINGS ⇨⇩ TESTING ⇨⇩ PMU TEST VALUES ⇨ PMU 1 TEST VALUES

■ PMU 1 ■ TEST VALUES	◁▷	PMU 1 TEST FUNCTION: Disabled	Range: Enabled, Disabled
MESSAGE	△▽	PMU 1 VA TEST MAGNITUDE: 500.00 kV	Range: 0.00 to 700.00 kV in steps of 0.01

MESSAGE	△	PMU 1 TEST df/dt: 0.000 Hz/s	Range: –10.000 to 10.000 Hz/s in steps of 0.001

The relay must be in test mode to use the PMU test mode. That is, the **TESTING ⇨ TEST MODE FUNCTION** setting must be “Enabled” and the **TESTING ⇨⇩ TEST MODE INITIATE** initiating signal must be “On”.

5

During the PMU test mode, the physical channels (VA, VB, VC, VX, IA, IB, IC, and IG), frequency, and rate of change of frequency are substituted with user values, while the symmetrical components are calculated from the physical channels. The test values are not explicitly marked in the outgoing data frames. When required, it is recommended to use the user-programmable digital channels to signal the IEEE C37.118 client that test values are being sent in place of the real measurements.

The UR Synchrophasor Implementation defines a test mode which sends a pre-defined set of Synchrophasors out over the communication channel when the test mode function setting is enabled. In test mode, the following actions take place:

a. The Data Invalid / Test Mode bit (bit 15 in the STAT word) is set.

b. The Sim bit in all output datasets is set.

MESSAGE	▲	Virt Ip 64 Off	*Range:* *On, Off*

The present status of the 64 virtual inputs is shown here. The first line of a message display indicates the ID of the virtual input. For example, 'Virt Ip 1' refers to the virtual input in terms of the default name. The second line of the display indicates the logic state of the virtual input.

6.2.3 REMOTE INPUTS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ REMOTE INPUTS

■ REMOTE INPUTS ■	◀▶	REMOTE INPUT 1 STATUS: Off	*Range:* *On, Off*
MESSAGE	▲▼	REMOTE INPUT 2 STATUS: Off	*Range:* *On, Off*
		↓	
MESSAGE	▲	REMOTE INPUT 32 STATUS: Off	*Range:* *On, Off*

The present state of the 32 remote inputs is shown here.

The state displayed will be that of the remote point unless the remote device has been established to be "Offline" in which case the value shown is the programmed default state for the remote input.

6.2.4 REMOTE DOUBLE-POINT STATUS INPUTS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ REMOTE DPS INPUTS

■ REMOTE DPS INPUTS ■	◁▷	REMOTE DPS INPUT 1 STATUS: Bad	Range: On, Off, Intermediate, Bad
MESSAGE	△▽	REMOTE DPS INPUT 2 STATUS: Bad	Range: On, Off, Intermediate, Bad
		↓	
MESSAGE	△	REMOTE DPS INPUT 5 STATUS: Bad	Range: On, Off, Intermediate, Bad

The present state of the remote double-point status inputs is shown here. The actual values indicate if the remote double-point status inputs are in the on (close), off (open), intermediate, or bad state.

6.2.5 TELEPROTECTION INPUTS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ TELEPROTECTION INPUTS

■ TELEPROTECTION ■ INPUTS	◁▷	TELEPROTECTION INPUT 1-1: Off	Range: Off, On
MESSAGE	△▽	TELEPROTECTION INPUT 1-2: Off	Range: Off, On
		↓	
MESSAGE	△▽	TELEPROTECTION INPUT 1-16: Off	Range: Off, On
MESSAGE	△▽	TELEPROTECTION INPUT 2-1: Off	Range: Off, On
MESSAGE	△▽	TELEPROTECTION INPUT 2-2: Off	Range: Off, On
		↓	
MESSAGE	△	TELEPROTECTION INPUT 2-16: Off	Range: Off, On

The present state of teleprotection inputs from communication channels 1 and 2 are shown here. The state displayed will be that of corresponding remote output unless the channel is declared failed.

6.2.6 CONTACT OUTPUTS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ CONTACT OUTPUTS

■ CONTACT OUTPUTS ■	◁▷	Cont Op 1 Off	Range: On, Off, VOff, VOn, IOn, IOff
MESSAGE	△▽	Cont Op 2 Off	Range: On, Off, VOff, VOn, IOn, IOff
		↓	
MESSAGE	△	Cont Op xx Off	Range: On, Off, VOff, VOn, IOn, IOff

The present state of the contact outputs is shown here. The first line of a message display indicates the ID of the contact output. For example, 'Cont Op 1' refers to the contact output in terms of the default name-array index. The second line of the display indicates the logic state of the contact output.

6

NOTE: For form-A contact outputs, the state of the voltage and current detectors is displayed as Off, VOff, IOff, On, IOn, and VOn. For form-C contact outputs, the state is displayed as Off or On.

6.2.7 VIRTUAL OUTPUTS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ VIRTUAL OUTPUTS

■ VIRTUAL OUTPUTS ■		Virt Op 1 Off	*Range: On, Off*
	MESSAGE	Virt Op 2 Off	*Range: On, Off*
		↓	
	MESSAGE	Virt Op 96 Off	*Range: On, Off*

The present state of up to 96 virtual outputs is shown here. The first line of a message display indicates the ID of the virtual output. For example, 'Virt Op 1' refers to the virtual output in terms of the default name-array index. The second line of the display indicates the logic state of the virtual output, as calculated by the FlexLogic equation for that output.

6.2.8 AUTORECLOSE

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ AUTORECLOSE ⇨ AUTORECLOSE 1(2)

■ AUTORECLOSE 1 ■		AUTORECLOSE 1 SHOT COUNT: 0	*Range: 0, 1, 2, 3, 4*

The automatic reclosure shot count is shown here.

6

6.2.9 REMOTE DEVICES

a) STATUS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ REMOTE DEVICES STATUS

■ REMOTE DEVICES ■ STATUS		All REMOTE DEVICES ONLINE: No	*Range: Yes, No*
	MESSAGE	REMOTE DEVICE 1 STATUS: Offline	*Range: Online, Offline*
	MESSAGE	REMOTE DEVICE 2 STATUS: Offline	*Range: Online, Offline*
		↓	
	MESSAGE	REMOTE DEVICE 16 STATUS: Offline	*Range: Online, Offline*

The present state of the programmed remote devices is shown here. The **ALL REMOTE DEVICES ONLINE** message indicates whether or not all programmed remote devices are online. If the corresponding state is "No", then at least one required remote device is not online.

b) STATISTICS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ REMOTE DEVICES STATISTICS ⇨ REMOTE DEVICE 1(16)

```
■ REMOTE DEVICE  1          REMOTE DEVICE  1
■                           StNum:          0

                  MESSAGE   REMOTE DEVICE  1
                            SqNum:          0
```

Statistical data (two types) for up to 16 programmed remote devices is shown here.

The **STNUM** number is obtained from the indicated remote device and increments whenever a change of state of at least one item occurs in the GSSE/GOOSE message. The **SQNUM** number is obtained from the indicated remote device and increments whenever a GSSE/GOOSE message, without a state change, is sent. When the GSSE/GOOSE message trasmits a state change, the **SQNUM** resets to 0. This number rolls over to zero when a count of 4,294,967,295 is incremented.

6.2.10 DIGITAL COUNTERS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ DIGITAL COUNTERS ⇨ DIGITAL COUNTERS Counter 1(8)

```
■ DIGITAL COUNTERS          Counter 1     ACCUM:
■ Counter 1                              0

                  MESSAGE   Counter 1    FROZEN:
                                         0

                  MESSAGE   Counter 1    FROZEN:
                            YYYY/MM/DD HH:MM:SS

                  MESSAGE   Counter 1    MICROS:
                                         0
```

The present status of the eight digital counters is shown here. The status of each counter, with the user-defined counter name, includes the accumulated and frozen counts (the count units label will also appear). Also included, is the date and time stamp for the frozen count. The **COUNTER 1 MICROS** value refers to the microsecond portion of the time stamp.

6.2.11 SELECTOR SWITCHES

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ SELECTOR SWITCHES

```
■ SELECTOR SWITCHES         SELECTOR SWITCH 1       Range: Current Position / 7
■                           POSITION:  0/7

                  MESSAGE   SELECTOR SWITCH 2       Range: Current Position / 7
                            POSITION:  0/7
```

The display shows both the current position and the full range. The current position only (an integer from 0 through 7) is the actual value.

6.2.12 FLEX STATES

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ FLEX STATES

■ FLEX STATES ■	◀▶	PARAM 1: Off Off	Range: Off, On
MESSAGE	▲▼	PARAM 2: Off Off	Range: Off, On
		↓	
MESSAGE	▲	PARAM 256: Off Off	Range: Off, On

There are 256 FlexState^{TM} bits available. The second line value indicates the state of the given FlexState bit.

6.2.13 ETHERNET

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ ETHERNET

■ ETHERNET ■	◀▶	ETHERNET PRI LINK STATUS: Fail	Range: Fail, OK
MESSAGE	▲	ETHERNET SEC LINK STATUS: Fail	Range: Fail, OK
MESSAGE	▲	ETHERNET TRD LINK STATUS: Fail	Range: Fail, OK

These values indicate the status of the first, second, and third Ethernet links.

6.2.14 REAL TIME CLOCK SYNCHRONIZING

6

PATH: ACTUAL VALUES ⇨⇩ STATUS ⇨⇩ REAL TIME CLOCK SYNCHRONIZING

■ REAL TIME CLOCK ■ SYNCHRONIZING	◀▶	RTC Sync Source: None	Range: See text below
MESSAGE	▲▼	GrandMaster ID: 0X0000000000000000	Range: Any 8 octet value
MESSAGE	▲▼	Accuracy: 999,999,999 ns	Range: 0 to 999, 999, 999 ns
MESSAGE	▲▼	Port 1 PTP State: NO SIGNAL	Range: Disabled, No Signal, Calibrating, Synch'd (No Pdelay), Synchronized
MESSAGE	▲▼	Port 2 PTP State: NO SIGNAL	Range: Disabled, No Signal, Calibrating, Synch'd (No Pdelay), Synchronized
MESSAGE	▲▼	Port 3 PTP State: NO SIGNAL	Range: Disabled, No Signal, Calibrating, Synch'd (No Pdelay), Synchronized
MESSAGE	▲	PTP - IRIG-B Delta: 500,000,000 ns	Range: -500,000,000 to +500,000,000 ns

The RTC Sync Source actual value is the time synchronizing source the relay is using at present. Possible sources are: Port 1 PTP Clock, Port 2 PTP Clock, Port 3 PTP Clock, IRIG-B, SNTP, and None.

The Grandmaster ID is the grandmasterIdentity code being received from the present PTP grandmaster, if any. When the relay is not using any PTP grandmaster, this actual value is zero. The grandmasterIdentity code is specified by PTP to be globally unique, so one can always know which clock is grandmaster in a system with multiple grandmaster-capable clocks.

Accuracy is the estimated maximum time error at present in the RTC, considering the quality information imbedded in the received time signal. The value 999,999,999 indicates that the magnitude of the estimated error is one second or more, or that the error cannot be estimated.

PORT 1...3 PTP STATE is the present state of the port's PTP clock. The PTP clock state is:

- **DISABLED** is the port's function setting is Disabled,
- **NO SIGNAL** if enabled but no signal from an active master has been found and selected,
- **CALIBRATING** if an active master has been selected but lock is not at present established,
- **SYNCH'D (NO PDELAY)** if the port is synchronized, but the peer delay mechanism is non-operational, and
- **SYNCHRONIZED** if synchronized.

PTP— IRIG-B DELTA is the time difference, measured in nanoseconds, between the fractional seconds portion of the time being received via PTP and that being received via IRIG-B. A positive value indicates that PTP time is fast compared to IRIG-B time.

6.2.15 HI-Z STATUS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ HIZ STATUS

■ HIZ STATUS ■	◁▷	HIZ STATUS: NORMAL	*Range: Normal, Coordination Timeout, Armed, Arcing, Down Conductor*
MESSAGE	△	ARC CONFIDENCE A:100 B:100 C:100 N:100 %	

The current status of high-impedance fault detection element is displayed here. Refer to *Theory of operation* for information on element status determination. The arc fault detection confidence is also displayed.

6.2.16 DIRECT INPUTS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ DIRECT INPUTS

■ DIRECT INPUTS ■	◁▷	AVG MSG RETURN TIME CH1: 0 ms
MESSAGE	△▽	UNRETURNED MSG COUNT CH1: 0
MESSAGE	△▽	CRC FAIL COUNT CH1: 0
MESSAGE	△▽	AVG MSG RETURN TIME CH2: 0 ms
MESSAGE	△▽	UNRETURNED MSG COUNT CH2: 0
MESSAGE	△▽	CRC FAIL COUNT CH2: 0
MESSAGE	△▽	DIRECT INPUT 1: On
MESSAGE	△▽	DIRECT INPUT 2: On
		↓
MESSAGE	△	DIRECT INPUT 32: On

6

The **AVERAGE MSG RETURN TIME** is the time taken for direct output messages to return to the sender in a direct input/output ring configuration (this value is not applicable for non-ring configurations). This is a rolling average calculated for the last ten messages. There are two return times for dual-channel communications modules.

The **UNRETURNED MSG COUNT** values (one per communications channel) count the direct output messages that do not make the trip around the communications ring. The **CRC FAIL COUNT** values (one per communications channel) count the direct output messages that have been received but fail the CRC check. High values for either of these counts may indicate on a problem with wiring, the communication channel, or one or more relays. The **UNRETURNED MSG COUNT** and **CRC FAIL COUNT** values can be cleared using the **CLEAR DIRECT I/O COUNTERS** command.

The **DIRECT INPUT 1** to **DIRECT INPUT (32)** values represent the state of each direct input.

6.2.17 DIRECT DEVICES STATUS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ DIRECT DEVICES STATUS

■ DIRECT DEVICES ■ STATUS	◀▶	DIRECT DEVICE 1 STATUS: Offline	*Range: Offline, Online*
MESSAGE	▲▼	DIRECT DEVICE 2 STATUS: Offline	*Range: Offline, Online*
		↓	
MESSAGE	▲	DIRECT DEVICE 16 STATUS: Offline	*Range: Offline, Online*

These actual values represent the state of direct devices 1 through 16.

6.2.18 IEC 61850 GOOSE INTEGERS

PATH: ACTUAL VALUES ⇨⇩ STATUS ⇨⇩ IEC 61850 GOOSE UINTEGERS

■ IEC 61850 ■ GOOSE UINTEGERS	◀▶	UINT INPUT 1 0
MESSAGE	▲▼	UINT INPUT 2 0
		↓
MESSAGE	▲	UINT INPUT 16 0

The F60 Feeder Protection System is provided with optional IEC 61850 communications capability. This feature is specified as a software option at the time of ordering. See the *Order Codes* section in chapter 2 for details.

The IEC 61850 GGIO5 integer input data points are displayed in this menu. The GGIO5 integer data values are received via IEC 61850 GOOSE messages sent from other devices.

6.2.19 EGD PROTOCOL STATUS

a) FAST EXCHANGE

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ EGD PROTOCOL STATUS ⇨ PRODUCER STATUS ⇨ FAST EXCHANGE 1

■ FAST EXCHANGE 1 ■	◀▶	FAST EXCHANGE 1 SIGNATURE: 0

MESSAGE	▲	FAST EXCHANGE 1 DATA LENGTH: 0

These values provide information that may be useful for debugging an EGD network. The EGD signature and packet size for the fast EGD exchange is displayed.

b) SLOW EXCHANGE

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ EGD PROTOCOL STATUS ⇨ PRODUCER STATUS ⇨⇩ SLOW EXCHANGE 1(2)

■ SLOW EXCHANGE 1 ■	◀▶	SLOW EXCHANGE 1 SIGNATURE: 0
MESSAGE	▲	SLOW EXCHANGE 1 DATA LENGTH: 0

These values provide information that may be useful for debugging an EGD network. The EGD signature and packet size for the slow EGD exchanges are displayed.

6.2.20 TELEPROTECTION CHANNEL TESTS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ TELEPROT CH TESTS

■ TELEPROT CH TESTS ■	◀▶	CHANNEL 1 STATUS: n/a	Range: n/a, FAIL, OK
MESSAGE	▲▼	CHANNEL 1 LOST PACKETS: 1	Range: 1 to 65535 in steps of 1
MESSAGE	▲▼	CHANNEL 2 STATUS: n/a	Range: n/a, FAIL, OK
MESSAGE	▲▼	CHANNEL 2 LOST PACKETS: 1	Range: 1 to 65535 in steps of 1
MESSAGE	▲	VALIDITY OF CHANNEL CONFIGURATION: FAIL	Range: n/a, FAIL, OK

The status information for two channels is shown here.

- **CHANNEL 1 STATUS**: This represents the receiver status of each channel. If the value is “OK”, teleprotection is enabled and data is being received from the remote terminal; If the value is “FAIL”, teleprotection enabled and data is not being received from the remote terminal. If “n/a”, teleprotection is disabled.
- **CHANNEL 1 LOST PACKETS**: Data is transmitted to the remote terminals in data packets at a rate of two packets per cycle. The number of lost packets represents data packets lost in transmission; this count can be reset to 0 through the COMMANDS ⇨⇩ CLEAR RECORDS menu.
- **VALIDITY OF CHANNEL CONFIGURATION**: This value displays the current state of the communications channel identification check, and hence validity. If a remote relay ID does not match the programmed ID at the local relay, the “FAIL” message will be displayed. The “N/A” value appears if the local relay ID is set to a default value of “0”, the channel is failed, or if the teleprotection inputs/outputs are not enabled.

6.2.21 INCIPIENT FAULT DETECTOR

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ INCIPIENT FAULT ⇨ INCIPIENT FAULT 1(2)

■ INCIPIENT FAULT 1 ■	◁▷	INCIPIENT FAULT 1 PH A FAULTS: 0	*Range: 0 to 65535 in steps of 1*
MESSAGE	△▽	INCIPIENT FAULT 1 PH B FAULTS: 0	*Range: 0 to 65535 in steps of 1*
MESSAGE	△	INCIPIENT FAULT 1 PH C FAULTS: 0	*Range: 0 to 65535 in steps of 1*

The number of detected incipient faults for each incipient fault element are displayed here for each phase. These values can be reset to zero with the COMMANDS ⇨⇩ CLEAR RECORDS ⇨⇩ CLEAR INCIPIENT FAULT COUNTERS command.

6.2.22 REMAINING CONNECTION STATUS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ COMM STATUS TCP REMAINING CONNECT

■ COMM STATUS ■ REMAINING CONNECT	◁▷	MMS (max 5) 5	*Range: 0 to 5*
MESSAGE	△▽	MODBUS TCP (max 4) 4	*Range: 0 to 4*
MESSAGE	△▽	DNP (max 2) 2	*Range: 0 to 2*
MESSAGE	△▽	IEC-104 (max 2) 2	*Range: 0 to 2*
MESSAGE	△	PMU 4	

6

These values specify the remaining number of TCP connections still available for each protocol. Every time a connection is used, the remaining number of connections decrements. When released, the remaining number of connections increments. If no connection is made over the specific protocol, the number equals the maximum number available for the specific protocol.

For example, the maximum number of Modbus TCP connections is 4. Once an EnerVista session is opened on a computer connected to the UR over Ethernet, the Modbus TCP status shows 3. If the EnerVista application is closed, the Modbus TCP status shows 4.

Note that the maximum number of PMU TCP connections matches the number of aggregators.

6.2.23 PARALLEL REDUNDANCY PROTOCOL (PRP)

The Parallel Redundancy Protocol (PRP) defines a redundancy protocol for high availability in substation automation networks.

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ PRP

■ PRP ■	◀▶	Total Rx Port A:	Range: 0 to 4G, blank if PRP disabled
MESSAGE	▲▼	Total Rx Port B:	Range: 0 to 4G, blank if PRP disabled
MESSAGE	▲▼	Total Errors:	Range: 0 to 4G, blank if PRP disabled
MESSAGE	▲▼	Mismatches Port A:	Range: 0 to 4G, blank if PRP disabled
MESSAGE	▲	Mismatches Port B:	Range: 0 to 4G, blank if PRP disabled

The F60 Feeder Protection System is provided with optional PRP capability. This feature is specified as a software option at the time of ordering. See the *Order Codes* section in chapter 2 for details.

TOTAL RECEIVED PORT A is a counter for total messages received (either from DANPs or from SANs) on Port A.

TOTAL RECEIVED PORT B is a counter for total messages received (either from DANPs or from SANs) on Port B.

TOTAL ERRORS is a counter for total messages received with an error (bad port code, frame length too short).

MISMATCHES PORT A is a counter for total messages received with an error on Port A (PRP frame, but port received through and LAN ID in the frame do not match).

MISMATCHES PORT B is a counter for total messages received with an error on Port B (PRP frame, but port received through and LAN ID in the frame do not match).

6.3.1 METERING CONVENTIONS

a) UR CONVENTION FOR MEASURING POWER AND ENERGY

The following figure illustrates the conventions established for use in UR-series relays.

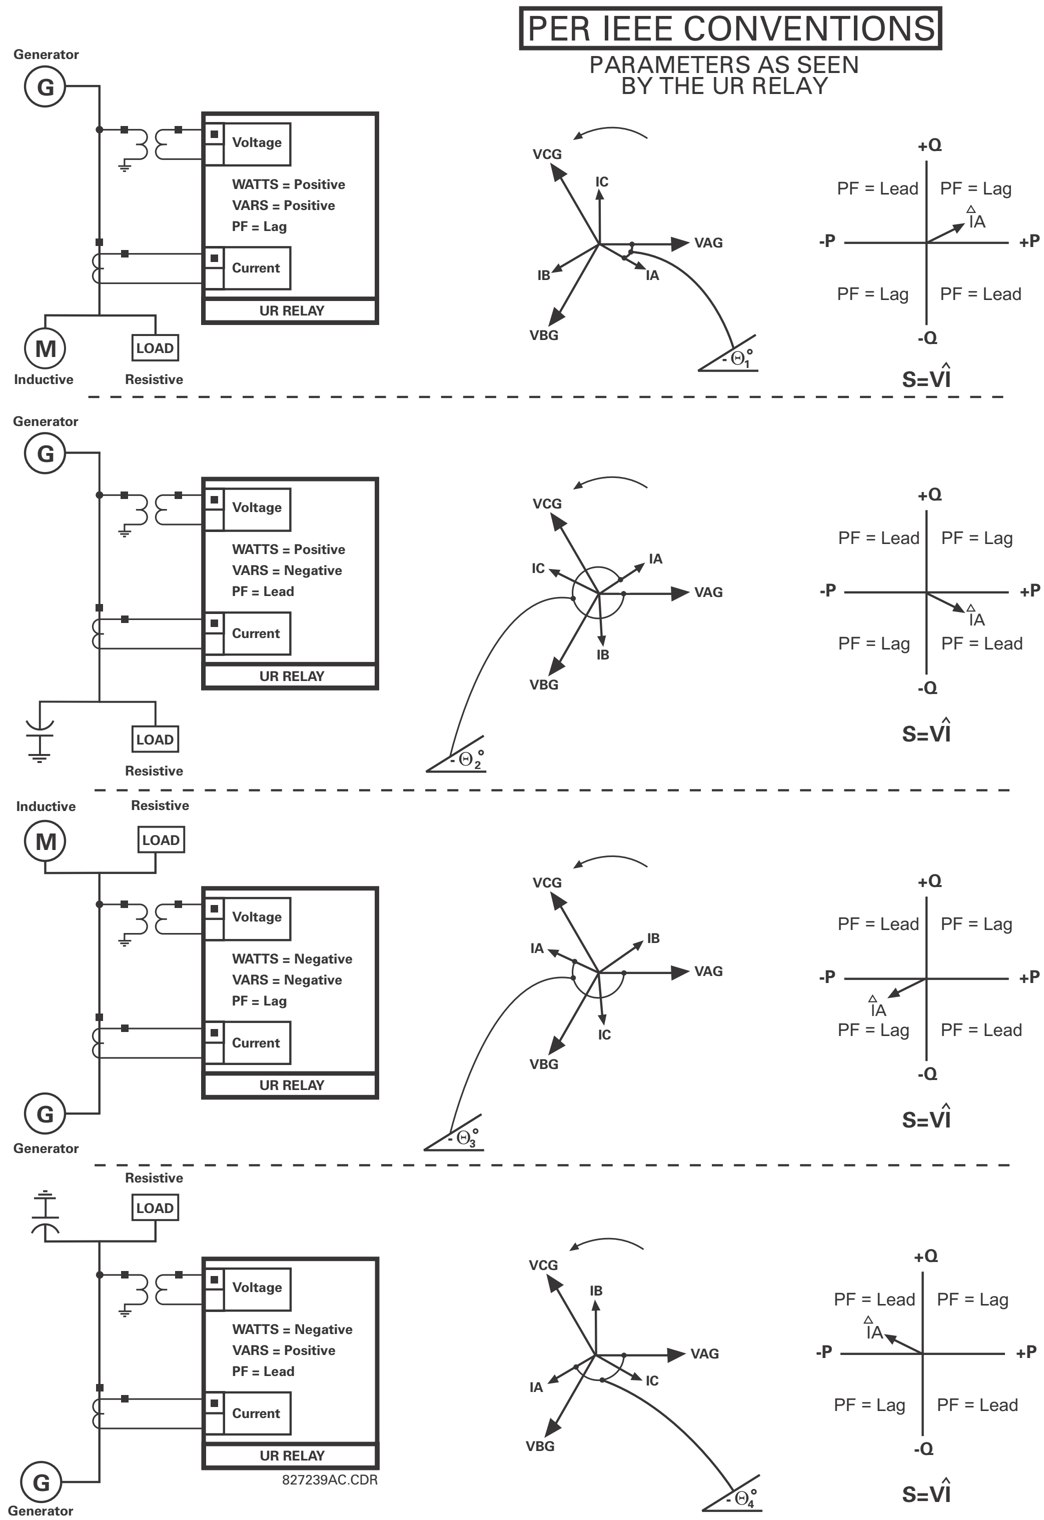

Figure 6–1: FLOW DIRECTION OF SIGNED VALUES FOR WATTS AND VARS

b) UR CONVENTION FOR MEASURING PHASE ANGLES

All phasors calculated by UR-series relays and used for protection, control and metering functions are rotating phasors that maintain the correct phase angle relationships with each other at all times.

For display and oscillography purposes, all phasor angles in a given relay are referred to an AC input channel pre-selected by the **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ POWER SYSTEM ⇨⇩ FREQUENCY AND PHASE REFERENCE** setting. This setting defines a particular AC signal source to be used as the reference.

The relay will first determine if any “Phase VT” bank is indicated in the source. If it is, voltage channel VA of that bank is used as the angle reference. Otherwise, the relay determines if any “Aux VT” bank is indicated; if it is, the auxiliary voltage channel of that bank is used as the angle reference. If neither of the two conditions is satisfied, then two more steps of this hierarchical procedure to determine the reference signal include “Phase CT” bank and “Ground CT” bank.

If the AC signal pre-selected by the relay upon configuration is not measurable, the phase angles are not referenced. The phase angles are assigned as positive in the leading direction, and are presented as negative in the lagging direction, to more closely align with power system metering conventions. This is illustrated below.

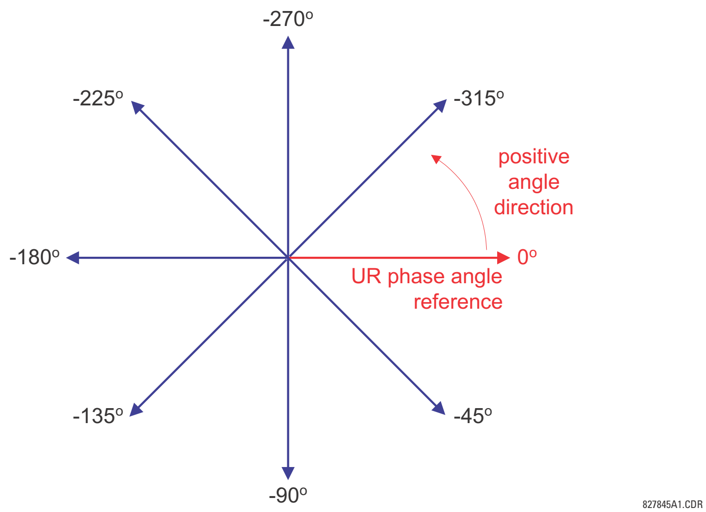

Figure 6–2: UR PHASE ANGLE MEASUREMENT CONVENTION

c) UR CONVENTION FOR SYMMETRICAL COMPONENTS

The UR-series of relays calculate voltage symmetrical components for the power system phase A line-to-neutral voltage, and symmetrical components of the currents for the power system phase A current. Owing to the above definition, phase angle relations between the symmetrical currents and voltages stay the same irrespective of the connection of instrument transformers. This is important for setting directional protection elements that use symmetrical voltages.

For display and oscillography purposes the phase angles of symmetrical components are referenced to a common reference as described in the previous sub-section.

WYE-CONNECTED INSTRUMENT TRANSFORMERS:

- ABC phase rotation:

$$V\_0 = \frac{1}{3}(V_{AG} + V_{BG} + V_{CG})$$

$$V\_1 = \frac{1}{3}(V_{AG} + aV_{BG} + a^2 V_{CG})$$

$$V\_2 = \frac{1}{3}(V_{AG} + a^2 V_{BG} + aV_{CG})$$

- ACB phase rotation:

$$V\_0 = \frac{1}{3}(V_{AG} + V_{BG} + V_{CG})$$

$$V\_1 = \frac{1}{3}(V_{AG} + a^2 V_{BG} + aV_{CG})$$

$$V\_2 = \frac{1}{3}(V_{AG} + aV_{BG} + a^2 V_{CG})$$

The above equations apply to currents as well.

DELTA-CONNECTED INSTRUMENT TRANSFORMERS:

- ABC phase rotation:

$$V\_0 = N/A$$
$$V\_1 = \frac{1\angle -30°}{3\sqrt{3}}(V_{AB} + aV_{BC} + a^2V_{CA})$$
$$V\_2 = \frac{1\angle 30°}{3\sqrt{3}}(V_{AB} + a^2V_{BC} + aV_{CA})$$

- ACB phase rotation:

$$V\_0 = N/A$$
$$V\_1 = \frac{1\angle 30°}{3\sqrt{3}}(V_{AB} + a^2V_{BC} + aV_{CA})$$
$$V\_2 = \frac{1\angle -30°}{3\sqrt{3}}(V_{AB} + aV_{BC} + a^2V_{CA})$$

The zero-sequence voltage is not measurable under the Delta connection of instrument transformers and is defaulted to zero. The table below shows an example of symmetrical components calculations for the ABC phase rotation.

Table 6–1: SYMMETRICAL COMPONENTS CALCULATION EXAMPLE

SYSTEM VOLTAGES, SEC. V *						VT CONN.	RELAY INPUTS, SEC. V			SYMM. COMP, SEC. V		
V_{AG}	V_{BG}	V_{CG}	V_{AB}	V_{BC}	V_{CA}		F5AC	F6AC	F7AC	V_0	V_1	V_2
13.9 ∠0°	76.2 ∠–125°	79.7 ∠–250°	84.9 ∠–313°	138.3 ∠–97°	85.4 ∠–241°	WYE	13.9 ∠0°	76.2 ∠–125°	79.7 ∠–250°	19.5 ∠–192°	56.5 ∠–7°	23.3 ∠–187°
UNKNOWN (only V_1 and V_2 can be determined)			84.9 ∠0°	138.3 ∠–144°	85.4 ∠–288°	DELTA	84.9 ∠0°	138.3 ∠–144°	85.4 ∠–288°	N/A	56.5 ∠–54°	23.3 ∠–234°

* The power system voltages are phase-referenced – for simplicity – to *VAG* and *VAB*, respectively. This, however, is a relative matter. It is important to remember that the F60 displays are always referenced as specified under **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ POWER SYSTEM ⇨⇩ FREQUENCY AND PHASE REFERENCE**.

The example above is illustrated in the following figure.

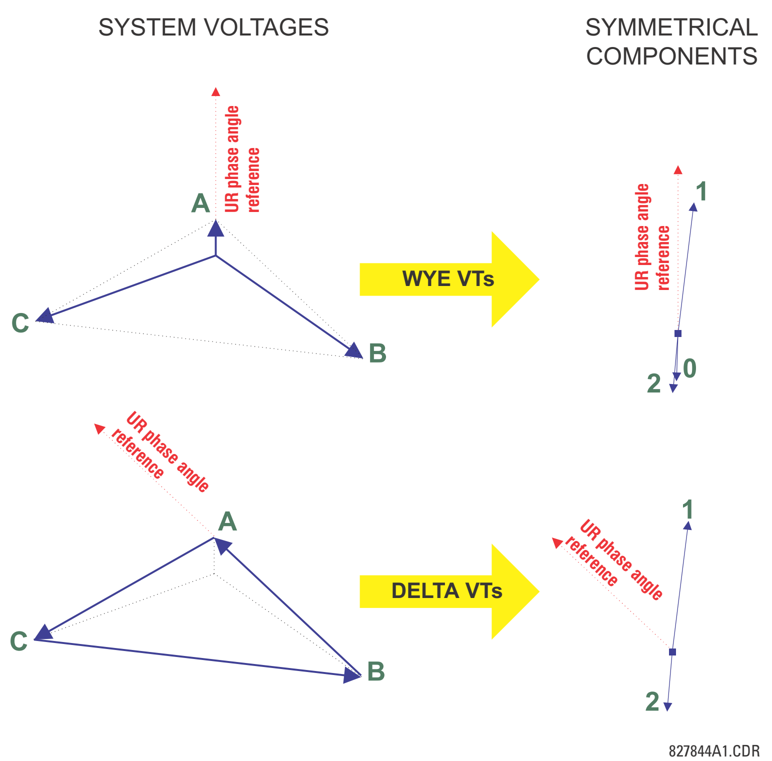

Figure 6–3: MEASUREMENT CONVENTION FOR SYMMETRICAL COMPONENTS

6.3.2 SOURCES

a) MAIN MENU

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ SOURCE SRC1

■ SOURCE SRC 1 ■	■ PHASE CURRENT ■ SRC 1	See page 6–17.
MESSAGE	■ GROUND CURRENT ■ SRC 1	See page 6–18.
MESSAGE	■ PHASE VOLTAGE ■ SRC 1	See page 6–18.
MESSAGE	■ AUXILIARY VOLTAGE ■ SRC 1	See page 6–19.
MESSAGE	■ POWER ■ SRC 1	See page 6–19.
MESSAGE	■ ENERGY ■ SRC 1	See page 6–20.
MESSAGE	■ DEMAND ■ SRC 1	See page 6–20.
MESSAGE	■ FREQUENCY ■ SRC 1	See page 6–21.
MESSAGE	■ CURRENT HARMONICS ■ SRC 1	See page 6–22.
MESSAGE	■ VOLTAGE HARMONICS ■ SRC 1	See page 6–22.

This menu displays the metered values available for each source.

Metered values presented for each source depend on the phase and auxiliary VTs and phase and ground CTs assignments for this particular source. For example, if no phase VT is assigned to this source, then any voltage, energy, and power values will be unavailable.

b) PHASE CURRENT METERING

MESSAGE	SRC 1 DMD VA MAX: 0.000 VA
MESSAGE	SRC 1 DMD VA DATE: 2001/07/31 16:30:07

The metered values for current and power demand are displayed in this menu. The "SRC 1" text will be replaced by whatever name was programmed by the user for the associated source (see **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ SIGNAL SOURCES**).

The relay measures (absolute values only) the source demand on each phase and average three phase demand for real, reactive, and apparent power. These parameters can be monitored to reduce supplier demand penalties or for statistical metering purposes. Demand calculations are based on the measurement type selected in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ DEMAND** menu. For each quantity, the relay displays the demand over the most recent demand time interval, the maximum demand since the last maximum demand reset, and the time and date stamp of this maximum demand value. Maximum demand quantities can be reset to zero with the **CLEAR RECORDS ⇨⇩ CLEAR DEMAND RECORDS** command.

i) FREQUENCY METERING

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨ SOURCE SRC 1 ⇨⇩ FREQUENCY

■ FREQUENCY ■ SRC 1	SRC 1 FREQUENCY: 0.00 Hz

The metered frequency values are displayed in this menu. The "SRC 1" text will be replaced by whatever name was programmed by the user for the associated source (see **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ SIGNAL SOURCES**).

SOURCE FREQUENCY is measured via software-implemented zero-crossing detection of an AC signal. The signal is either a Clarke transformation of three-phase voltages or currents, auxiliary voltage, or ground current as per source configuration (see the **SYSTEM SETUP ⇨⇩ POWER SYSTEM** settings). The signal used for frequency estimation is low-pass filtered. The final frequency measurement is passed through a validation filter that eliminates false readings due to signal distortions and transients.

j) CURRENT HARMONICS AND THD METERING

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨ SOURCE SRC 1 ⇨⇩ CURRENT HARMONICS

```
■ CURRENT HARMONICS         SRC 1    THD Ia:  0.0

```

6

The metered current harmonics values are displayed in this menu. The “SRC 1” text will be replaced by the programmed name for the associated source (see the **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ SIGNAL SOURCES** menu).

To extract the 2nd to 25th voltage harmonics, each harmonic is computed on a per-phase basis, where:

N = 64 is the number of samples per cycle
$\omega_0 = 2\pi f$ is the angular frequency based on the system frequency (50 or 60 Hz)
$k = 1, 2, \ldots, N - 1$ is the index over one cycle for the Fast Fourier Transform (FFT)
m is the last sample number for the sliding window
$h = 1, 2, \ldots, 25$ is the harmonic number

The short-time Fourier transform is applied to the unfiltered signal:

$$F_{\text{real}}(m, h) = \frac{2}{N}\sum_{k}(f(m-k)\cdot\cos(h\cdot\omega_0\cdot t(k)))$$

$$F_{\text{imag}}(m, h) = \frac{2}{N}\sum_{k}(f(m-k)\cdot\sin(h\cdot\omega_0\cdot t(k))) \qquad \textbf{(EQ 6.1)}$$

$$F_{\text{ampl}}(m, h) = \sqrt{F_{\text{real}}(m, h)^2 + F_{\text{imag}}(m, h)^2}$$

The harmonics are a percentage of the fundamental signal obtained as a ratio of harmonic amplitude to fundamental amplitude multiplied by 100%. The total harmonic distortion (THD) is the ratio of the total harmonic content to the fundamental:

$$\text{THD} = \sqrt{F_2^2 + F_3^2 + \ldots + F_{25}^2} \qquad \textbf{(EQ 6.2)}$$

NOTE: Voltage harmonics are not available on F60 relays configured with the high-impedance fault detection (Hi-Z) feature.

NOTE: Voltage harmonics are calculated only for Wye connected phase VTs. Ensure the **SYSTEM SETUP ⇨ AC INPUTS ⇨⇩ VOLTAGE BANK F5 ⇨⇩ PHASE VT XX CONNECTION** setting is “Wye” to enable voltage harmonics metering.

6.3.3 SENSITIVE DIRECTIONAL POWER

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ SENSITIVE DIRECTIONAL POWER

■ SENSITIVE ■ DIRECTIONAL POWER	◀▶	DIRECTIONAL POWER 1 3Φ: 0.000 W
MESSAGE	▲	DIRECTIONAL POWER 2 3Φ: 0.000 W

The effective operating quantities of the sensitive directional power elements are displayed here. The display may be useful to calibrate the feature by compensating the angular errors of the CTs and VTs with the use of the **RCA** and **CALIBRATION** settings.

6.3.4 SYNCHROCHECK

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ SYNCHROCHECK ⇨ SYNCHROCHECK 1(2)

■ SYNCHROCHECK 1 ■	◀▶	SYNCHROCHECK 1 DELTA VOLT: 0.000 V
MESSAGE	▲▼	SYNCHROCHECK 1 DELTA PHASE: 0.0°
MESSAGE	▲	SYNCHROCHECK 1 DELTA FREQ: 0.00 Hz

The actual values menu for synchrocheck 2 is identical to that of synchrocheck 1. If a synchrocheck function setting is "Disabled", the corresponding actual values menu item will not be displayed.

6.3.5 TRACKING FREQUENCY

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ TRACKING FREQUENCY

■ TRACKING FREQUENCY ■	◀▶	TRACKING FREQUENCY: 60.00 Hz

The tracking frequency is displayed here. The frequency is tracked based on the selection of the reference source with the **FREQUENCY AND PHASE REFERENCE** setting in the **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ POWER SYSTEM** menu. See the *Power System* section of chapter 5 for details.

6.3.6 FREQUENCY RATE OF CHANGE

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ FREQUENCY RATE OF CHANGE

■ FREQUENCY RATE ■ OF CHANGE		◀▶	FREQUENCY RATE OF CHANGE 1: 0.00 Hz/s
	MESSAGE	▲▼	FREQUENCY RATE OF CHANGE 2: 0.00 Hz/s
	MESSAGE	▲▼	FREQUENCY RATE OF CHANGE 3: 0.00 Hz/s
	MESSAGE	▲	FREQUENCY RATE OF CHANGE 4: 0.00 Hz/s

The metered frequency rate of change for the frequency rate of change elements is shown here.

6.3.7 FLEXELEMENTS

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ FLEXELEMENTS ⇨ FLEXELEMENT 1(8)

■ FLEXELEMENT 1 ■	◀▶	FLEXELEMENT 1 OpSig: 0.000 pu

The operating signals for the FlexElements are displayed in pu values using the following definitions of the base units.

Table 6–2: FLEXELEMENT BASE UNITS

BREAKER ARCING AMPS (Brk X Arc Amp A, B, and C)	BASE = 2000 $kA^2 \times$ cycle
dcmA	BASE = maximum value of the **DCMA INPUT MAX** setting for the two transducers configured under the +IN and –IN inputs.
FREQUENCY	f_{BASE} = 1 Hz
FREQUENCY RATE OF CHANGE	df/dt_{BASE} = 1 Hz/s
PHASE ANGLE	φ_{BASE} = 360 degrees (see the UR angle referencing convention)
POWER FACTOR	PF_{BASE} = 1.00
RTDs	BASE = 100°C
SENSITIVE DIR POWER (Sns Dir Power)	P_{BASE} = maximum value of $3 \times V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs of the sources configured for the sensitive power directional element(s).
SOURCE CURRENT	I_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SOURCE ENERGY (Positive and Negative Watthours, Positive and Negative Varhours)	E_{BASE} = 10000 MWh or MVAh, respectively
SOURCE POWER	P_{BASE} = maximum value of $V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs
SOURCE THD & HARMONICS	BASE = 1%
SOURCE VOLTAGE	V_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SYNCHROCHECK (Max Delta Volts)	V_{BASE} = maximum primary RMS value of all the sources related to the +IN and –IN inputs

6.3.8 IEC 61580 GOOSE ANALOG VALUES

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ IEC 61850 GOOSE ANALOGS

■ IEC 61850 ■ GOOSE ANALOGS	◁▷	ANALOG INPUT 1 0.000	
MESSAGE	△▽	ANALOG INPUT 2 0.000	
MESSAGE	△▽	ANALOG INPUT 3 0.000	
		↓	
MESSAGE	△	ANALOG INPUT 32 0.000	

The F60 Feeder Protection System is provided with optional IEC 61850 communications capability. This feature is specified as a software option at the time of ordering. See the *Order Codes* section of chapter 2 for details.

The IEC 61850 GGIO3 analog input data points are displayed in this menu. The GGIO3 analog data values are received via IEC 61850 GOOSE messages sent from other devices.

6.3.9 WATTMETRIC GROUND FAULT

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ WATTMETRIC GROUND FAULT 1(2)

■ WATTMETRIC ■ GROUND FAULT 1	◁▷	WATT GND FLT 1: 0.000 W	

This menu displays the wattmetric zero-sequence directional element operating power values.

6.3.10 PHASOR MEASUREMENT UNIT

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ PHASOR MEASUREMENT UNIT ⇨ PMU 1

■ PMU 1 ■	◁▷	PMU 1 VA: 0.0000 kV, 0.00°	*Range: Va or Vab per VT bank connection*

MESSAGE	PMU 1 I0: 0.0000 kA, 0.00°	
MESSAGE	PMU 1 FREQUENCY: 0.0000 Hz	
MESSAGE	PMU 1 df/dt: 0.0000 Hz/s	
MESSAGE	PMU 1 CONFIG CHANGE COUNTER: 0	Range: 0 to 65535

The above actual values are displayed without the corresponding time stamp as they become available per the recording rate setting. Also, the recording post-filtering setting is applied to these values.

6.3.11 PMU AGGREGATOR

6

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ PHASOR MEASUREMENT UNIT ⇨ PMU AGGREGATOR 1

■ PMU AGGREGATOR 1 ■	PMU AGGREGATOR 1 PDU SIZE: 0

Actual values for the IEC 61850-90-5 PDU size are provided. These values allow you to know the approximate Ethernet frame size for the data streams from each aggregator. This can help to estimate network loading. The PDU size shown in the displays does not include the Ethernet, UDP, or IP layers. PDU sizes approaching approximately 1500 bytes result in fragmented data frames, causing increased network traffic.

6.3.12 TRANSDUCER INPUTS AND OUTPUTS

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ TRANSDUCER I/O DCMA INPUTS ⇨ DCMA INPUT xx

■ DCMA INPUT xx ■	DCMA INPUT xx 0.000 mA

Actual values for each dcmA input channel that is enabled are displayed with the top line as the programmed channel ID and the bottom line as the value followed by the programmed units.

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ TRANSDUCER I/O RTD INPUTS ⇨ RTD INPUT xx

■ RTD INPUT xx ■	RTD INPUT xx -50 °C

Actual values for each RTD input channel that is enabled are displayed with the top line as the programmed channel ID and the bottom line as the value.

6.4.1 FAULT REPORTS

PATH: ACTUAL VALUES ⇨⇩ RECORDS ⇨ FAULT REPORTS ⇨ FAULT REPORT 1(15)

NO FAULTS TO REPORT			
or			
■ FAULT REPORT 1 ■	◁▷	FAULT 1 LINE ID: SRC 1	*Range: SRC 1, SRC 2*
	MESSAGE	FAULT 1 DATE: 2000/08/11	*Range: YYYY/MM/DD*
	MESSAGE	FAULT 1 TIME: 00:00:00.000000	*Range: HH:MM:SS.ssssss*
	MESSAGE	FAULT 1 TYPE: ABG	*Range: not available if the source VTs are in the “Delta” configuration*
	MESSAGE	FAULT 1 LOCATION 00.0 km	*Range: not available if the source VTs are in the “Delta” configuration*
	MESSAGE	FAULT 1 RECLOSE SHOT: 0	*Range: where applicable*

The latest 15 fault reports can be stored. The most recent fault location calculation (when applicable) is displayed in this menu, along with the date and time stamp of the event which triggered the calculation. See the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ FAULT REPORTS** menu for assigning the source and trigger for fault calculations. Refer to the **COMMANDS ⇨⇩ CLEAR RECORDS** menu for manual clearing of the fault reports and to the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ CLEAR RELAY RECORDS** menu for automated clearing of the fault reports.

6.4.2 EVENT RECORDS

PATH: ACTUAL VALUES ⇨⇩ RECORDS ⇨⇩ EVENT RECORDS

■ EVENT RECORDS ■	◁▷	EVENT: XXXX RESET OP(PUSHBUTTON)		
		↓		
	MESSAGE	EVENT: 3 POWER ON	◁▷	EVENT 3 DATE: 2000/07/14
	MESSAGE	EVENT: 2 POWER OFF		EVENT 3 TIME: 14:53:00.03405
	MESSAGE	EVENT: 1 EVENTS CLEARED		*Date and Time Stamps*

The event records menu shows the contextual data associated with up to the last 1024 events, listed in chronological order from most recent to oldest. If all 1024 event records have been filled, the oldest record will be removed as a new record is added. Each event record shows the event identifier/sequence number, cause, and date/time stamp associated with the event trigger. Refer to the **COMMANDS ⇩ CLEAR RECORDS** menu for clearing event records.

6.4.3 OSCILLOGRAPHY

PATH: ACTUAL VALUES ⇨⇩ RECORDS ⇨⇩ OSCILLOGRAPHY

■ OSCILLOGRAPHY ■	◀▶	FORCE TRIGGER? No	Range: No, Yes
MESSAGE	▲▼	NUMBER OF TRIGGERS: 0	
MESSAGE	▲▼	AVAILABLE RECORDS: 0	
MESSAGE	▲▼	CYCLES PER RECORD: 0.0	
MESSAGE	▲	LAST CLEARED DATE: 2000/07/14 15:40:16	

This menu allows the user to view the number of triggers involved and number of oscillography traces available. The **CYCLES PER RECORD** value is calculated to account for the fixed amount of data storage for oscillography. See the *Oscillography* section of chapter 5 for additional details.

A trigger can be forced here at any time by setting “Yes” to the **FORCE TRIGGER?** command. Refer to the **COMMANDS ⇨⇩ CLEAR RECORDS** menu for information on clearing the oscillography records.

6.4.4 DATA LOGGER

PATH: ACTUAL VALUES ⇨⇩ RECORDS ⇨⇩ DATA LOGGER

■ DATA LOGGER ■	◀▶	OLDEST SAMPLE TIME: 2000/01/14 13:45:51
MESSAGE	▲	NEWEST SAMPLE TIME: 2000/01/14 15:21:19

The **OLDEST SAMPLE TIME** represents the time at which the oldest available samples were taken. It will be static until the log gets full, at which time it will start counting at the defined sampling rate. The **NEWEST SAMPLE TIME** represents the time the most recent samples were taken. It counts up at the defined sampling rate. If the data logger channels are defined, then both values are static.

Refer to the **COMMANDS ⇨⇩ CLEAR RECORDS** menu for clearing data logger records.

6.4.5 PHASOR MEASUREMENT UNIT RECORDS

PATH: ACTUAL VALUES ⇨ RECORDS ⇨⇩ PMU RECORDS

■ PMU ■ RECORDS	◁▷	NUMBER OF TRIGGERS: 0	Range: 0 to 65535 in steps of 1
MESSAGE	△	■ PMU 1 ■ RECORDING	See below.

The number of triggers applicable to the phasor measurement unit recorder is indicated by the **NUMBER OF TRIGGERS** value. The status of the phasor measurement unit recorder is indicated as follows:

PATH: ACTUAL VALUES ⇨ RECORDS ⇨⇩ PMU RECORDS ⇨ PMU 1 RECORDING

	CLEAR PMU 1 CONFIG CHANGE COUNTER? No	Range: No, Yes
	CLEAR TELEPROTECT COUNTERS? No	Range: No, Yes
	CLEAR INCIPIENT FAULT COUNTERS? No	Range: No, Yes
	CLEAR ALL RELAY RECORDS? No	Range: No, Yes

This menu contains commands for clearing historical data such as the event records. Data is cleared by changing a command setting to “Yes” and pressing the ENTER key. After clearing data, the command setting automatically reverts to “No”.

7.1.4 SET DATE AND TIME

PATH: COMMANDS ⇨⇩ SET DATE AND TIME

Menu	Setting	Range
■■ COMMANDS ■■ SET DATE AND TIME	SET DATE AND TIME: 2000/01/14 13:47:03	(YYYY/MM/DD HH:MM:SS)

The date and time can be entered on the faceplate keypad. The time setting is based on the 24-hour clock. The complete date, as a minimum, must be entered to allow execution of this command. The new time and date take effect when the ENTER key is pressed.

When the relay is synchronizing to an external time source such as PTP, IRIG-B, or SNTP, the manually entered time is over-written.

The timescale of the entered time is **local time**, including daylight savings time where and when applicable.

7.1.5 RELAY MAINTENANCE

PATH: COMMANDS ⇨⇩ RELAY MAINTENANCE

```
■■ COMMANDS
■■ RELAY MAINTENANCE

PERFORM LAMPTEST?
No
```
Range: No, Yes

```
UPDATE ORDER CODE?
No
```
Range: No, Yes

```
REBOOT RELAY?
No
```
Range: No, Yes

```
SERVICE COMMAND:
0
```
Range: 0, 101

This menu contains commands for relay maintenance purposes. Commands for the lamp test and order code are activated by changing a command setting to “Yes” and pressing the ENTER key. The command setting will then automatically revert to “No”. The service command is activated by entering a numerical code and pressing the ENTER key.

The **PERFORM LAMPTEST** command turns on all faceplate LEDs and display pixels for a short duration. The **UPDATE ORDER CODE** command causes the relay to scan the backplane for the hardware modules and update the order code to match. If an update occurs, the following message is shown.

```
UPDATING...
PLEASE WAIT
```

There is no impact if there have been no changes to the hardware modules. When an update does not occur, the **ORDER CODE NOT UPDATED** message will be shown.

The **SERVICE COMMAND** is used to perform specific F60 service actions. Presently, there is only one service action available. Code “101” is used to clear factory diagnostic information stored in the non-volatile memory. If a code other than “101” is entered, the command will be ignored and no actions will be taken. Various self-checking diagnostics are performed in the background while the F60 is running, and diagnostic information is stored on the non-volatile memory from time to time based on the self-checking result. Although the diagnostic information is cleared before the F60 is shipped from the factory, the user may want to clear the diagnostic information for themselves under certain circumstances. For example, it may be desirable to clear diagnostic information after replacement of hardware. Once the diagnostic information is cleared, all self-checking variables are reset to their initial state and diagnostics will restart from scratch.

The **REBOOT RELAY COMMAND** reboots the relay so that changes to configuration settings can take effect. In most cases, if changes are made to the configuration settings these changes do not take effect unless the relay is rebooted.

NOTE: With the CyberSentry option, the Administrator or Operator role can initiate the Reboot Relay command.

7.1.6 PHASOR MEASUREMENT UNIT ONE-SHOT

PATH: COMMANDS ⇨⇩ PMU ONE-SHOT

```
■■ COMMANDS
■■ PMU ONE-SHOT

PMU ONE-SHOT
FUNCTION: Disabled
```
Range: Enabled, Disabled

```
PMU ONE-SHOT
SEQUENCE NUMBER: 0
```
Range: 0 to nominal frequency – 1 in steps of 1

```
PMU ONE-SHOT TIME:
2013/06/14 7:58:35
```
Range: 24h time format

This feature allows pre-scheduling a PMU measurement at a specific point in time. This functionality can be used to test for accuracy of the PMU, and for manual collection of synchronized measurements through the system, as explained below.

When enabled, the function continuously compares the present time with the pre-set **PMU ONE-SHOT TIME**. When the two times match, the function compares the present sequence number of the measured synchrophasors with the pre-set **PMU ONE-SHOT SEQUENCE NUMBER**. When the two numbers match, the function freezes the synchrophasor actual values and the corresponding protocol data items for 30 seconds. This allows manual read-out of the synchrophasor values for the pre-set time and pre-set sequence number (via the faceplate display, supported communication protocols such as Modbus or DNP, and the EnerVista UR Setup software).

When freezing the actual values the function also asserts a PMU ONE-SHOT OP FlexLogic operand. This operand may be configured to drive an output contact and trigger an external measuring device such as a digital scope with the intent to verify the accuracy of the PMU under test.

With reference to the figure below, the PMU one-shot function (when enabled) controls three FlexLogic operands:

- The PMU ONE-SHOT EXPIRED operand indicates that the one-shot operation has been executed, and the present time is at least 30 seconds past the scheduled one-shot time.
- The PMU ONE-SHOT PENDING operand indicates that the one-shot operation is pending; that is, the present time is before the scheduled one-shot time.
- The PMU ONE-SHOT OP operand indicates the one-shot operation and remains asserted for 30 seconds afterwards.

When the function is disabled, all three operands are de-asserted. The one-shot function applies to all logical PMUs of a given F60 relay.

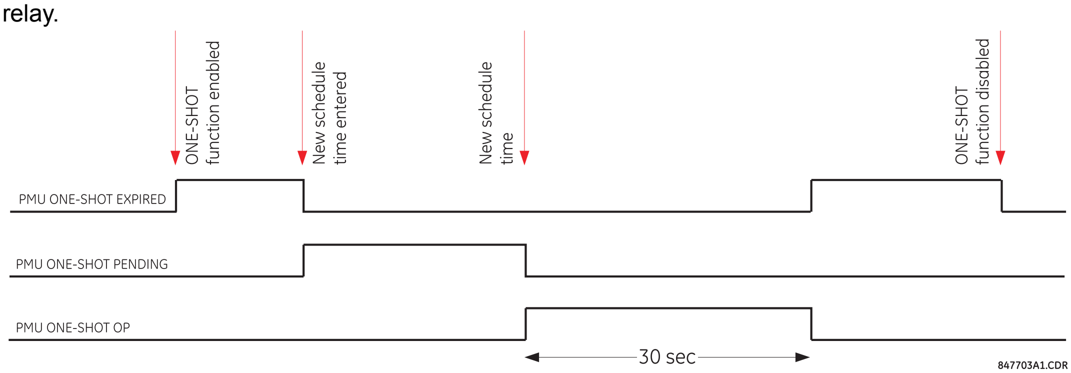

Figure 7–1: PMU ONE-SHOT FLEXLOGIC OPERANDS

TESTING ACCURACY OF THE PMU:

The one-shot feature can be used to test accuracy of the synchrophasor measurement. GPS-synchronized tests sets perform a similar function to PMUs: instead of measuring the phasor from physical signals with respect to the externally provided time reference, they produce the physical signals with respect to the externally provided time reference, given the desired phasor values. Therefore the GPS-synchronized test sets cannot be automatically assumed more accurate than the PMUs under test. This calls for a method to verify both the measuring device (PMU) and the source of signal (test set).

With reference to the figure below, the one-shot feature could be configured to trigger a high-accuracy scope to capture both the time reference signal (rising edge of the 1 pps signal of the IRIG-B time reference), and the measured waveform. The high-accuracy high-sampling rate record of the two signals captured by the scope can be processed using digital tools to verify the magnitude and phase angle with respect to the time reference signal. As both the time reference and the measured signals are raw inputs to the PMU under test, their independently captured record, processed using third-party software, is a good reference point for accuracy calculations. Such a record proves useful when discussing the test results, and should be retained as a part of the testing documentation.

Note that the PMU under such test does not have to be connected to a real GPS receiver as the accuracy is measured with respect to the timing reference provided to the PMU and not to the absolute UTC time. Therefore a simple IRIG-B generator could be used instead. Also, the test set does not have to support GPS synchronization. Any stable signal source can be used. If both the PMU under test and the test set use the timing reference, they should be driven from the same IRIG-B signal: either the same GPS receiver or IRIG-B generator. Otherwise, the setpoints of the test set and the PMU measurements should not be compared as they are referenced to different time scales.

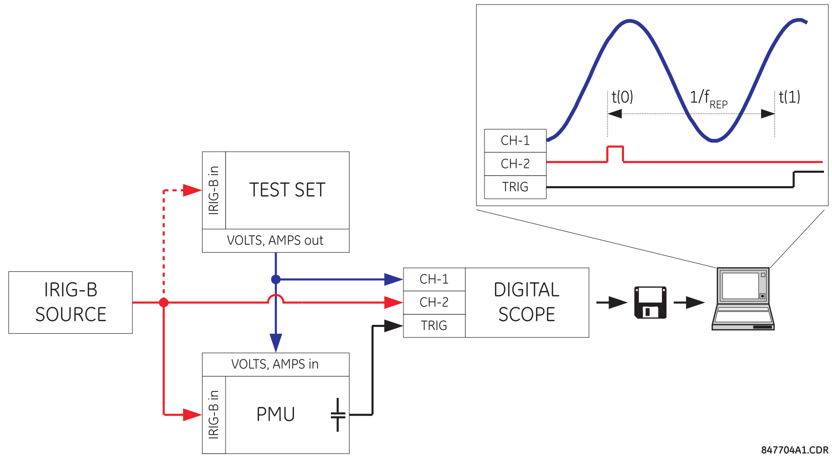

Figure 7–2: USING THE PMU ONE-SHOT FEATURE TO TEST SYNCHROPHASOR MEASUREMENT ACCURACY

COLLECTING SYNCHRONIZED MEASUREMENTS *AD HOC*:

The one-shot feature can be used for ad hoc collection of synchronized measurements in the network. Two or more PMU can be pre-scheduled to freeze their measurements at the same time. When frozen the measurements could be collected using EnerVista UR Setup or a protocol client.

7.1.7 SECURITY

PATH: COMMANDS ⇨⇩ SECURITY

```
■■ SECURITY
■■
```

ADMINISTRATOR LOGOFF: No	*Range: Yes, No* *Default: No*
ENGINEER LOGOFF: No	*Range: Yes, No* *Default: No*
OPERATOR LOGOFF: No	*Range: Yes, No* *Default: No*
CLEAR SECURITY DATA:	*Range: Yes, No* *Default: No*

With the CyberSentry option, this setting is available to enable or disable the following commands:

- **Administrator Logoff:** Selecting 'Yes' allows the Supervisor to forcefully logoff an administrator session.
- **Engineer Logoff:** Selecting 'Yes' allows the Supervisor to forcefully logoff an engineer session.
- **Operator Logoff:** Selecting 'Yes' allows the Supervisor to forcefully logoff an operator session.
- **Clear Security Data**: Selecting 'Yes' allows the Supervisor to forcefully clear all the security logs and clears all the operands associated with the self-tests.

MESSAGE   ▲▼   DIGITAL ELEMENT 48:      Displayed only if targets for this element are active.
               LATCHED                  Example shown.
MESSAGE   ▲          ↓
                     ↓
```

The status of any active targets will be displayed in the targets menu. If no targets are active, the display will read **NO ACTIVE TARGETS**:

7.2.2 TARGET MESSAGES

When there are no active targets, the first target to become active will cause the display to immediately default to that message. If there are active targets and the user is navigating through other messages, and when the default message timer times out (i.e. the keypad has not been used for a determined period of time), the display will again default back to the target message.

The range of variables for the target messages is described below. Phase information will be included if applicable. If a target message status changes, the status with the highest priority will be displayed.

Table 7–1: TARGET MESSAGE PRIORITY STATUS

PRIORITY	ACTIVE STATUS	DESCRIPTION
1	OP	element operated and still picked up
2	PKP	element picked up and timed out
3	LATCHED	element had operated but has dropped out

If a self test error is detected, a message appears indicating the cause of the error. For example **UNIT NOT PROGRAMMED** indicates that the minimal relay settings have not been programmed.

7.2.3 RELAY SELF-TESTS

a) DESCRIPTION

The relay performs a number of self-test diagnostic checks to ensure device integrity. The two types of self-tests (major and minor) are listed in the tables below. When either type of self-test error occurs, the Trouble LED Indicator will turn on and a target message displayed. All errors record an event in the event recorder. Latched errors can be cleared by pressing the RESET key, providing the condition is no longer present.

Major self-test errors also result in the following:

- The critical fail relay on the power supply module is de-energized.
- All other output relays are de-energized and are prevented from further operation.
- The faceplate In Service LED indicator is turned off.
- A RELAY OUT OF SERVICE event is recorded.

b) MAJOR SELF-TEST ERROR MESSAGES

The major self-test errors are outlined in this section.

```
MODULE FAILURE___:
Contact Factory (xxx)
```

- *Latched target message*: Yes.
- *Description of problem*: Module hardware failure detected.
- *How often the test is performed*: Module dependent.
- *What to do*: Contact the factory and supply the failure code noted in the display. The “xxx” text identifies the failed module (for example, F8L).

```
INCOMPATIBLE H/W:
Contact Factory (xxx)
```

- *Latched target message*: Yes.
- *Description of problem*: One or more installed hardware modules is not compatible with the F60 order code.
- *How often the test is performed*: Module dependent.
- *What to do*: Contact the factory and supply the failure code noted in the display. The “xxx” text identifies the failed module (for example, F8L).

```
EQUIPMENT MISMATCH:
with 2nd line detail
```

- *Latched target message*: No.
- *Description of problem*: The configuration of modules does not match the order code stored in the F60.
- *How often the test is performed*: On power up. Afterwards, the backplane is checked for missing cards every five seconds.
- *What to do*: Check all modules against the order code, ensure they are inserted properly, and cycle control power. If the problem persists, contact the factory.

```
FLEXLOGIC ERROR:
with 2nd line detail
```

- *Latched target message*: No.
- *Description of problem*: A FlexLogic equation is incorrect.
- *How often the test is performed*: The test is event driven, performed whenever FlexLogic equations are modified.
- *What to do*: Finish all equation editing and use self tests to debug any errors.

```
UNIT NOT PROGRAMMED:
Check Settings
```

- *Latched target message*: No.
- *Description of problem*: The **PRODUCT SETUP ⇨⇩ INSTALLATION ⇨ RELAY SETTINGS** setting indicates the F60 is not programmed.
- *How often the test is performed*: On power up and whenever the **PRODUCT SETUP ⇨⇩ INSTALLATION ⇨ RELAY SETTINGS** setting is altered.
- *What to do*: Program all settings and then set **PRODUCT SETUP ⇨⇩ INSTALLATION ⇨ RELAY SETTINGS** to “Programmed”.

c) MINOR SELF-TEST ERROR MESSAGES

Most of the minor self-test errors can be disabled. See the settings in the *User-programmable Self-tests* section in chapter 5.

```
IEC 61850 DATA SET:
LLN0 GOOSE# Error
```

- *Latched target message*: No.
- *Description of problem*: A data item in a configurable GOOSE data set is not supported by the F60 order code.
- *How often the test is performed*: On power up.
- *What to do*: Verify that all the items in the GOOSE data set are supported by the F60. The EnerVista UR Setup software will list the valid items. An IEC61850 client will also show which nodes are available for the F60.

```
IEC 61850 DATA SET:
LLN0 BR# Error
```

- *Latched target message*: No.
- *Description of problem*: A data item in a configurable report data set is not supported by the F60 order code.
- *How often the test is performed*: On power up.
- *What to do*: Verify that all the items in the configurable report data set are supported by the F60. The EnerVista UR Setup software will list the valid items. An IEC61850 client will also show which nodes are available for the F60.

```
MAINTENANCE ALERT:
Replace Battery
```

- *Latched target message*: Yes.
- *Description of problem*: The battery is not functioning.
- *How often the test is performed*: The battery is monitored every five seconds. The error message displays after 60 seconds if the problem persists.
- *What to do*: Replace the battery as outlined in the Maintenance chapter.

```
MAINTENANCE ALERT:
Direct I/O Ring Break
```

- *Latched target message*: No.
- *Description of problem*: Direct input and output settings are configured for a ring, but the connection is not in a ring.
- *How often the test is performed*: Every second.
- *What to do*: Check direct input and output configuration and wiring.

```
MAINTENANCE ALERT:
ENET PORT # OFFLINE
```

- *Latched target message*: No.
- *Description of problem*: The Ethernet connection has failed for the specified port.
- *How often the test is performed*: Every five seconds.
- *What to do*: Check the Ethernet port connection on the switch.

```
MAINTENANCE ALERT:
**Bad IRIG-B Signal**
```

- *Latched target message*: No.
- *Description of problem*: A bad IRIG-B input signal has been detected.
- *How often the test is performed*: Monitored whenever an IRIG-B signal is received.
- *What to do*: Ensure the following:
  - The IRIG-B cable is properly connected.
  - Proper cable functionality (that is, check for physical damage or perform a continuity test).
  - The IRIG-B receiver is functioning.
  - Check the input signal level (it may be less than specification).

  If none of these apply, then contact the factory.

```
MAINTENANCE ALERT:
**Bad PTP Signal**
```

- *Latched target message*: No.
- *Description of problem*: No PTP enabled port has good PTP signal input.
- *How often the test is performed*: Activated when no acceptable signal is being received.
- *What to do*: Ensure the following:
  - The Ethernet cable(s) are properly connected.
  - At least one PTP grandmaster-capable clock is functioning.
  - If strict PP is enabled, that entire network is PP compliant.
  - The network is delivering PTP messages to the relay.

```
MAINTENANCE ALERT:
Port ## Failure
```

- *Latched target message*: No.
- *Description of problem*: An Ethernet connection has failed.
- *How often the test is performed*: Monitored every five seconds.
- *What to do*: Check Ethernet connections. Port 1 is the primary port and port 2 is the secondary port.

7

```
MAINTENANCE ALERT:
SNTP Failure
```

- *Latched target message*: No.
- *Description of problem*: The SNTP server is not responding.
- *How often the test is performed*: Every 10 to 60 seconds.
- *What to do*: Check that Ethernet cable(s) are properly connected. Check that configuration for the SNTP server corresponds to the actual server settings. Check connectivity to the server (ping the server IP address.

```
MAINTENANCE ALERT:
4L Discrepancy
```

- *Latched target message*: No.
- *Description of problem*: A discrepancy has been detected between the actual and desired state of a latching contact output of an installed type “4L” module.
- *How often the test is performed*: Upon initiation of a contact output state change.
- *What to do*: Verify the state of the output contact and contact the factory if the problem persists.

```
MAINTENANCE ALERT:
GGIO Ind xxx oscill
```

- *Latched target message*: No.
- *Description of problem*: A data item in a configurable GOOSE data set is oscillating.
- *How often the test is performed*: Upon scanning of each configurable GOOSE data set.
- *What to do*: The “xxx” text denotes the data item that has been detected as oscillating. Evaluate all logic pertaining to this item.

```
DIRECT I/O FAILURE:
COMM Path Incomplete
```

- *Latched target message*: No.
- *Description of problem*: A direct device is configured but not connected.
- *How often the test is performed*: Every second.
- *What to do*: Check direct input and output configuration and wiring.

```
REMOTE DEVICE FAIL:
COMM Path Incomplete
```

- *Latched target message*: No.
- *Description of problem*: One or more GOOSE devices are not responding.
- *How often the test is performed*: Event driven. The test is performed when a device programmed to receive GOOSE messages stops receiving. This can be from 1 to 60 seconds, depending on GOOSE packets.
- *What to do*: Check GOOSE setup.

```
TEMP MONITOR:
OVER TEMPERATURE
```

- *Latched target message*: Yes.
- *Description of problem*: The ambient temperature is greater than the maximum operating temperature (+80°C).
- *How often the test is performed*: Every hour.
- *What to do*: Remove the F60 from service and install in a location that meets operating temperature standards.

```
UNEXPECTED RESTART:
Press “RESET” key
```

- *Latched target message*: Yes.
- *Description of problem*: Abnormal restart from modules being removed or inserted while the F60 is powered-up, when there is an abnormal DC supply, or as a result of internal relay failure.
- *How often the test is performed*: Event driven.
- *What to do*: Contact the factory.

```
FIRST ETHERNET FAIL
```

```
SECOND ETHERNET FAIL
```

```
THIRD ETHERNET FAIL
```

- *Latched target message*: Yes.
- *Description of problem*: A link loss detection on an Ethernet port. The link loss is due to unplugging the cable or the switch port being down.
- *How often the test is performed*:
- *What to do*: Check the connection.

d) WRONG TRANSCEIVER MESSAGES

Description: The type of SFP does not match the CPU type.

T-type CPU = All ports support fiber SFPs only

Type: minor

Target: latched

Message: "WRONG TRANSCEIVER"

A webpage "SFP Transceiver Information" is provided. This page displays the type of the SFP in it. This data is to be used with the CPU type to know the cause of the problem.

e) SFP X MODULE FAIL MESSAGES

Description: A faulty SFP or unplugging the SFP would generate this self test.

Type: minor

Target: self reset

Message: SFP MODULE x FAIL

The webpage "SFP Transceiver Information" described in the previous section applies for this self test as well. The "SFP Module Fail" has higher priority and it suppresses the "Ethernet Fail" target message. The "SFP MODULE FAIL FUNCTION" setting enables/disables this self test. The target for this self test is priority-based, with the third one being the highest priority. For example, if all three SFP modules fail, then the third SFP target is activated. If the third SFP module failure resolves, then the second SFP target is activated.

HARDFIBER SELF-TEST ERROR MESSAGES

In addition to those provided by the standard UR-series devices, the UR devices implement HardFiber self-tests. These are listed below. Any abnormal diagnostic condition indicated by the LEDs or the critical failure relay also results in a self-test message, so troubleshooting is described here. For other relays, such at the B95^{Plus}, see that product's instruction manual.

Equipment Mismatch Major Self-Test

Description: The number or type of installed hardware modules does not match the order code stored in the CPU. The standard UR-series Equipment Mismatch self-test is extended to cover the possible presence of a Process Card.

Severity: Protection is not available and all contact outputs and shared outputs are de-asserted.

If this message appears, check all modules against the order code. Ensure they are inserted properly, and cycle the control power. If a module has intentionally been added or removed use the **Update Order Code** command to notify the relay that the current module configuration is correct.

Module Failure Major Self-Test

Description: UR-series device module hardware failure detected.

Severity: Protection is not available and all contact outputs and shared outputs are de-asserted.

If this message appears, contact the factory and supply the failure code noted in the display. Text in the message identifies the failed module (for example, H81). If operated on a Process Card failure, the Module Fail self-test seals-in (latches) till the UR-series device is restarted.

Process Bus Failure Major Self-test

Description: Mission critical data is not available via the process bus. An AC quantity is considered critical if both AC bank origins and the crosschecking settings are other than none. This self-test is also initiated by an AC input discrepancy being detected. See the description of the crosschecking setting in this manual for further information. In addition, this self-test can be initiated by user logic responding to loss of critical contact input/output or other data using the **Process Bus Failure Operand** user-programmable self-test setting. This setting is located in the **Settings > Product Setup > User-Programmable Self Test** menu.

Severity: Protection is not available and all contact outputs and shared outputs are de-asserted.

If this message appears, first rectify any Process Bus Trouble and Brick Trouble self-test errors. Check the actual value of the operand referenced by the **Process Bus Failure Operand** setting, and if “On”, determine the cause and rectify.

Should the problem persist with the foregoing all clear, the cause must be an AC input discrepancy, which is typically the result of problems in the input signals to the Bricks, or faults in the Brick input conditioning hardware. If the error was annunciated the first time significant signal was encountered, suspect the former cause and check the copper connections external to the Brick. Where multiple UR-series devices have self-test errors, look for common causes.

To further isolate AC input discrepancy errors, put the relay in test-isolated mode, then one by one, temporally change an AC bank crosschecking setting to none, until the Process Bus Failure clears. Once the problem AC bank has been identified, the values from each of the two Bricks can be examined individually by temporarily mapping each to an AC bank with a single origin.

Process Bus Trouble Minor Self-Test

Description: Communications problems with one or more Bricks. The text of the message identifies the affected field units. This self-test is initiated by low received signal levels at either the Brick or Process Card end, and by the sustained failure to receive poll responses from the proper Brick.

Severity: This self-test error does not directly inhibit protection. However, the affected Brick inputs/outputs may not be available to the UR-series device.

If this message appears, check the field unit actual values. An indication of equipment mismatch means that messages are being received from a Brick, but there is a discrepancy between the settings and the actual Brick serial number, order code, and/or core number. Check that the correct core on the correct Brick is patched through to the correct Process Card port, and that the field unit settings are correct. An indication of communications loss means that no messages are being received. Check that the patching is correct, and that the Brick has power. If that is not the problem, use a professional optical fiber connector cleaning kit to clean both sides of all optical fiber connections from the Process Card through to the affected Brick. If the problem continues after cleaning, consult the factory.

Brick Trouble Minor Self-Test

Description: Brick internal self-testing has detected a trouble internal to the Brick.

Severity: This self-test error does not directly inhibit protection. However, some or all of the affected Brick inputs/outputs may not be available to the UR-series device.

If this message appears, check the Brick environment for over/under temperatures and the voltage of its power source. If the ambient temperature and supply voltage are within Brick specifications, consult the factory. Troubles resulting from a Brick output failing to respond to an output command can only be detected while the command is active, and so in this case the target is latched. A latched target can be unlatched by pressing the faceplate reset key if the command has ended, however the output may still be non-functional.

8.1.1 DESCRIPTION

The Hi-Z element accomplishes high-impedance fault detection using a variety of algorithms, all coordinated by an expert system. At the heart of the high-impedance fault-detection system is the identification of arcing on a feeder. If the Hi-Z element detects arcing, it then determines whether or not the arcing persists for a significant period of time. If it does, the Hi-Z element determines whether the persistent arcing is from a downed conductor or from an intact conductor and then generates an output to indicate either the detection of a downed conductor or the detection of arcing, respectively.

Distinction between an arcing intact conductor and an arcing downed conductor is determined by looking at patterns in the load current at the beginning of the fault. A downed conductor is indicated only when a precipitous loss of load or an overcurrent condition precedes arcing detection. Otherwise, the Hi-Z element assumes that the line is intact, even if arcing is present. In such a case, if the detected arcing can be classified as persistent, and an output contact is configured for 'arcing detected', the Hi-Z element will close that contact.

In some cases, arcing is determined to be present, but not persistent. For example, if it is caused by tree limb contact or insulator degradation, arcing will typically be present intermittently with relatively long periods of inactivity (e.g. minutes) interspersed. In such cases, arcing may be affected by such factors as the motion of a tree limb or the moisture and contamination on an insulator. Conditions such as these, characterized by a high number of brief occurrences of arcing over an extended period of time (e.g. from a fraction of an hour to one or two hours), lead the Hi-Z element to recognize and flag an “arcing suspected” event. None of these brief occurrences of arcing, if taken individually, are sufficient to indicate detection of a downed conductor or to set off an alarm indicating that persistent arcing has been detected. When considered cumulatively, however, they do indicate a need for attention. If an output contact is configured to indicate 'arcing suspected', the Hi-Z element recognition of such sporadic arcing will close that contact and appropriate actions can be taken.

If the Hi-Z element determines that a downed conductor exists, oscillography and fault data are captured. In addition, target messages and appropriate LEDs are activated on the relay faceplate.

The detection of a downed conductor or arcing condition is accomplished through the execution of the following algorithms:

- Energy Algorithm
- Randomness Algorithm
- Expert Arc Detector Algorithm
- Load Event Detector Algorithm
- Load Analysis Algorithm
- Load Extraction Algorithm
- Arc Burst Pattern Analysis Algorithm
- Spectral Analysis Algorithm
- Arcing-Suspected Identifier Algorithm
- Even Harmonic Restraint Algorithm
- Voltage Supervision Algorithm

8.1.2 ENERGY ALGORITHM

The Energy algorithm monitors a specific set of non-fundamental frequency component energies of phase and neutral current. After establishing an average value for a given component energy, the algorithm indicates arcing if it detects a sudden, sustained increase in the value of that component. The Hi-Z element runs the Energy algorithm on each of the following parameters for each phase current and for the neutral:

- even harmonics
- odd harmonics
- non-harmonics

On a 60 Hz system, the non-harmonic component consists of a sum of the 30, 90, 150,..., 750 Hz components, while on a 50 Hz system, it consists of a sum of the 25, 75, 125,..., 625 Hz components. If the Energy Algorithm detects a sudden, sustained increase in one of these component energies, it reports this to the Expert Arc Detector algorithm, resets itself, and continues to monitor for another sudden increase.

8.1.3 RANDOMNESS ALGORITHM

The Randomness algorithm monitors the same set of component energies as the Energy algorithm. However, rather than checking for a sudden, sustained increase in the value of the monitored component energy, it looks for a sudden increase in a component followed by highly erratic behavior. This type of highly erratic behavior is indicative of many arcing faults. Just as with the Energy algorithm, if the Randomness algorithm detects a suspicious event in one of its monitored components, it reports it to the Expert Arc Detector algorithm, resets itself, and continues to monitor for another suspicious event.

8.1.4 EXPERT ARC DETECTOR ALGORITHM

The purpose of the Expert Arc Detector Algorithm is to assimilate the outputs of the basic arc detection algorithms into one "arcing confidence" level per phase. Note that there are actually 24 independent basic arc detection algorithms, since both the Energy Algorithm and the Randomness Algorithm are run for the even harmonics, odd harmonics, and non-harmonics for each phase current and for the neutral. The assimilation performed by the Expert Arc Detector Algorithm, then, is accomplished by counting the number of arcing indications determined by any one of the twenty-four algorithms over a short period of time (e.g. the last 30 seconds). Also taken into account is the number of different basic algorithms that indicate arcing.

In the Expert Arc Detector Algorithm, the arcing confidence level for each phase increases as the number of basic algorithms that indicate arcing (per phase) increases. It also increases with increasing numbers of indications from any one basic algorithm. These increases in confidence levels occur because multiple, consecutive indications from a given algorithm and indications from multiple independent algorithms are more indicative of the presence of arcing than a single algorithm giving a single indication.

8.1.5 SPECTRAL ANALYSIS ALGORITHM

The Spectral Analysis algorithm is the third and final confirmation algorithm performed only when a high impedance condition is suspected.

The Spectral Analysis algorithm receives five seconds of averaged non-harmonic residual current spectrum data and compares it to an ideal 1 / *f* curve. Depending on the result, three percent can be added to the arcing confidence level generated by the Expert Arc Detector Algorithm.

8.1.6 LOAD EVENT DETECTOR ALGORITHM

The Load Event Detector Algorithm examines, on a per-phase basis, one reading of RMS values per two-cycle interval for each phase current and the neutral. It then sets flags for each phase current and for the neutral based on the following events:

- an overcurrent condition
- a precipitous loss of load
- a high rate-of-change
- a significant three-phase event
- a breaker open condition.

These flags are examined by the Load Analysis Algorithm. Their states contribute to that algorithm's differentiation between arcing downed conductors and arcing intact conductors, and inhibit the Expert Arc Detector Algorithm from indicating the need for an arcing alarm for a limited time following an overcurrent or breaker open condition.

Any of the above five flags will zero the Expert Arc Detector buffer, since the power system is in a state of change and the values being calculated for use by the Energy and Randomness algorithms are probably not valid.

An extremely high rate of change is not characteristic of most high impedance faults and is more indicative of a breaker closing, causing associated inrush. Since this type of inrush current causes substantial variations in the harmonics used by the high impedance algorithms, these algorithms ignore all data for several seconds following a high rate-of-change event that exceeds the associated rate-of-change threshold, in order to give the power system a chance to stabilize.

8.1.7 LOAD ANALYSIS ALGORITHM

The purpose of the Load Analysis algorithm is to differentiate between arcing downed conductors and arcing intact conductors by looking for a precipitous loss of load and/or an overcurrent disturbance at the beginning of an arcing episode. The presence of arcing on the system is determined based on the output of the Expert Arc Detector algorithm. If the Hi-Z element finds persistent arcing on the power system, the Load Analysis algorithm then considers the type of incident that initiated the arcing and classifies the arcing conductor as either downed or intact. Another function of the algorithm is to provide coordination between the Hi-Z element and the power system's conventional overcurrent protection by observing a timeout, via the **HI-Z OC PROTECTION COORD TIMEOUT** setting from the beginning of the arcing before giving an indication of arcing.

If the Load Analysis algorithm determines that a downed conductor or arcing exists, it attempts to determine the phase on which the high impedance fault condition exists. It does this in a hierarchical manner. First, if a significant loss of load triggered the Load Analysis algorithm, and if there was a significant loss on only one phase, that phase is identified. If there was not a single phase loss of load, and if an overcurrent condition on only one phase triggered the algorithm, that phase is identified. If both of these tests fail to identify the phase, the phase with a significantly higher confidence level (e.g. higher than the other two phases by at least 25%) is identified. Finally, if none of these tests provides phase identification, the result of the Arc Burst Pattern Analysis algorithm is checked. If that test fails, the phase is not identified.

8.1.8 LOAD EXTRACTION ALGORITHM

The Load Extraction Algorithm attempts to find a quiescent period during an arcing fault so that it can determine the background load current level in the neutral current. If it is successful in doing so, it then removes the load component from the total measured current, resulting in a signal which consists only of the fault component of the neutral current. This information is then provided as input to the Arc Burst Pattern Analysis Algorithm.

8.1.9 ARC BURST PATTERN ANALYSIS ALGORITHM

The Arc Burst Pattern Analysis algorithm attempts to provide faulted phase identification information based on a correlation between the fault component of the measured neutral current and the phase voltages. The phase identified will be the one whose phase voltage peak lines up with the neutral current burst. The fault component is received from the Load Extraction algorithm. The result of the analysis is checked by the Load Analysis algorithm if its other phase identification methods prove unsuccessful.

8.1.10 ARCING SUSPECTED ALGORITHM

The purpose of the Arcing Suspected Algorithm is to detect multiple, sporadic arcing events. If taken individually, such events are not sufficient to warrant an arcing alarm. When taken cumulatively, however, these events do warrant an alarm to system operators so that the cause of the recurrent arcing can be investigated.

8.1.11 OVERCURRENT DISTURBANCE MONITORING

This function is part of High Impedance Fault Detection and should not be confused with conventional overcurrent protection. The Hi-Z element monitors for an overcurrent condition on the feeder by establishing overcurrent thresholds for the phases and for the neutral and then checking for a single two-cycle RMS current that exceeds those thresholds. Oscillography and fault data are captured if it is determined that an overcurrent condition exists.

8.1.12 HI-Z EVEN HARMONIC RESTRAINT ALGORITHM

Every two-cycle interval the algorithm evaluates the even harmonic content of each phase current. The even harmonic content is evaluated as a percentage of the phase RMS current. If for any phase the percentage is greater than the **HI-Z EVEN HARMONIC RESTRAINT** setting, the algorithm will inhibit setting of the overcurrent flags. This is to prevent a cold-load pickup event from starting the Hi-Z logic sequence (which requires the overcurrent flag or the loss-of-load flag to be set at the beginning of an arcing event). The duration over which the algorithm inhibits the setting of the overcurrent flag(s) is from the time the even-harmonic level (as a percentage of RMS) increases above the threshold until one second after it falls back below the threshold.

8.1.13 HI-Z VOLTAGE SUPERVISION ALGORITHM

This algorithm was implemented to minimize the probability of a false Hi-Z indication due to bus voltage dips (e.g. from parallel feeder faults). A fault on a parallel line can cause voltage dips that will produce a decrease in the line load which can be mistaken by Hi-Z element as Loss of Load.

Every two cycle the voltage on each phase is checked against the **HI-Z V SUPV THRESHOLD**. If the voltage on any phase has dropped by a percentage greater then or equal to this setting, the Loss of Load flag will be blocked. The blocking is not done on a per- phase basis. If one phase voltage shows a dip, the block is applied for all phases. Also the High Impedance Oscillography will record that a voltage dip was experienced. The Oscillography record is phase specific.

8.2.1 FAULT TYPE DETERMINATION

Fault type determination is required for calculation of fault location – the algorithm uses the angle between the negative and positive sequence components of the relay currents. To improve accuracy and speed of operation, the fault components of the currents are used; that is, the pre-fault phasors are subtracted from the measured current phasors. In addition to the angle relationships, certain extra checks are performed on magnitudes of the negative and zero-sequence currents.

The single-ended fault location method assumes that the fault components of the currents supplied from the local (A) and remote (B) systems are in phase. The figure below shows an equivalent system for fault location.

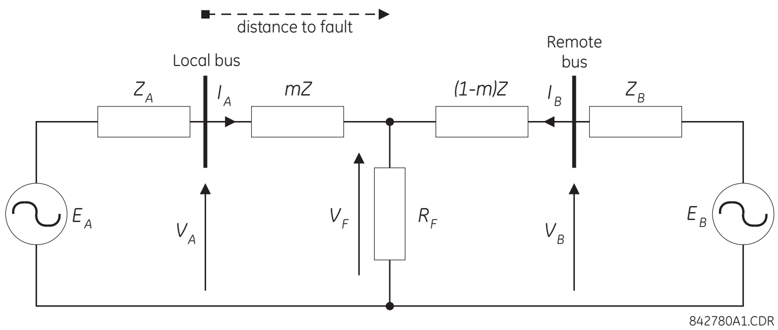

Figure 8–1: EQUIVALENT SYSTEM FOR FAULT LOCATION

The following equations hold true for this equivalent system.

$$V_A = m \cdot Z \cdot I_A + R_F \cdot (I_A + I_B) \quad \textbf{(EQ 8.1)}$$

where: m = sought pu distance to fault, Z = positive sequence impedance of the line.

The currents from the local and remote systems can be parted between their fault (F) and pre-fault load (pre) components:

$$I_A = I_{AF} + I_{Apre} \quad \textbf{(EQ 8.2)}$$

and neglecting shunt parameters of the line:

$$I_B = I_{BF} - I_{Apre} \quad \textbf{(EQ 8.3)}$$

Inserting the I_A and I_B equations into the V_A equation and solving for the fault resistance yields:

$$R_F = \frac{V_A - m \cdot Z \cdot I_A}{I_{AF} \cdot \left(1 + \frac{I_{BF}}{I_{AF}}\right)} \quad \textbf{(EQ 8.4)}$$

Assuming the fault components of the currents, I_{AF} and I_{BF} are in phase, and observing that the fault resistance, as impedance, does not have any imaginary part gives:

$$\mathrm{Im}\left(\frac{V_A - m \cdot Z \cdot I_A}{I_{AF}}\right) = 0 \quad \textbf{(EQ 8.5)}$$

where: Im() represents the imaginary part of a complex number. Solving the above equation for the unknown m creates the following fault location algorithm:

$$m = \frac{\mathrm{Im}(V_A \cdot I_{AF}^*)}{\mathrm{Im}(Z \cdot I_A \cdot I_{AF}^*)} \quad \textbf{(EQ 8.6)}$$

where * denotes the complex conjugate and $I_{AF} = I_A - I_{Apre}$.

Depending on the fault type, appropriate voltage and current signals are selected from the phase quantities before applying the two equations above (the superscripts denote phases, the subscripts denote stations).

For AG faults:

$$V_A = V_A^A, \quad I_A = I_A^A + K_0 \cdot I_{0A} \quad \textbf{(EQ 8.7)}$$

8

For BG faults:

$$V_A = V_A^B, \quad I_A = I_A^B + K_0 \cdot I_{0A} \qquad \textbf{(EQ 8.8)}$$

For CG faults:

$$V_A = V_A^C, \quad I_A = I_A^{BC} + K_0 \cdot I_{0A} \qquad \textbf{(EQ 8.9)}$$

For AB and ABG faults:

$$V_A = V_A^A - V_A^B, \quad I_A = I_A^A - I_A^B \qquad \textbf{(EQ 8.10)}$$

For BC and BCG faults:

$$V_A = V_A^B - V_A^C, \quad I_A = I_A^B - I_A^C \qquad \textbf{(EQ 8.11)}$$

For CA and CAG faults:

$$V_A = V_A^C - V_A^A, \quad I_A = I_A^C - I_A^A \qquad \textbf{(EQ 8.12)}$$

where K_0 is the zero sequence compensation factor (for the first six equations above)

For ABC faults, all three AB, BC, and CA loops are analyzed and the final result is selected based upon consistency of the results

The element calculates the distance to the fault (with m in miles or kilometers) and the phases involved in the fault.

The relay allows locating faults from delta-connected VTs. If the **FAULT REPORT 1 VT SUBSTITUTION** setting is set to "None", and the VTs are connected in wye, the fault location is performed based on the actual phase to ground voltages. If the VTs are connected in delta, fault location is suspended.

If the **FAULT REPORT 1 VT SUBSTITUTION** setting value is "V0" and the VTs are connected in a wye configuration, the fault location is performed based on the actual phase to ground voltages. If the VTs are connected in a delta configuration, fault location is performed based on the delta voltages and externally supplied neutral voltage:

$$\begin{aligned} V_A &= \frac{1}{3}(V_N + V_{AB} - V_{CA}) \\ V_B &= \frac{1}{3}(V_N + V_{BC} - V_{AB}) \\ V_B &= \frac{1}{3}(V_N + V_{CA} - V_{BC}) \end{aligned} \qquad \textbf{(EQ 8.13)}$$

If the **FAULT REPORT 1 VT SUBSTITUTION** setting value is "I0" and the VTs are connected in a wye configuration, the fault location is performed based on the actual phase to ground voltages. If the VTs are connected in a delta configuration, fault location is performed based on the delta voltages and zero-sequence voltage approximated based on the zero-sequence current:

$$\begin{aligned} V_A &= \frac{1}{3}(V_{AB} - V_{CA}) - Z_{SYS0} I_0 \\ V_B &= \frac{1}{3}(V_{BC} - V_{AB}) - Z_{SYS0} I_0 \\ V_B &= \frac{1}{3}(V_{CA} - V_{BC}) - Z_{SYS0} I_0 \end{aligned} \qquad \textbf{(EQ 8.14)}$$

where Z_{SYS0} is the equivalent zero-sequence impedance behind the relay as entered under the fault report setting menu.

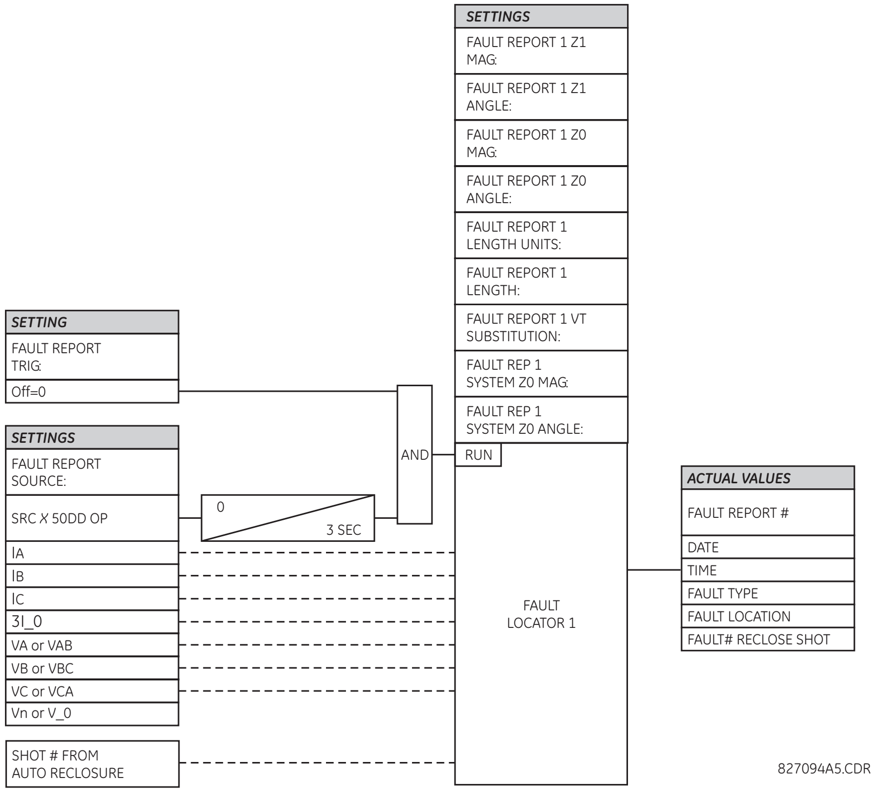

Figure 8–2: FAULT LOCATOR SCHEME

8

9.1.1 TESTING UNDERFREQUENCY AND OVERFREQUENCY ELEMENTS

Underfrequency and overfrequency protection requires techniques with subtle testing implications. Whereas most protection is designed to detect changes from normal to fault conditions that occur virtually instantaneously, power system inertia requires frequency protection to pickup while the frequency is changing slowly. Frequency measurement is inherently sensitive to noise, making high precision in combination with high speed challenging for both relays and test equipment.

Injection to a particular F60 frequency element must be to its configured source and to the channels the source uses for frequency measurement. For frequency measurement, a source will use the first quantity configured in the following order:

1. Phase voltages.
2. Auxiliary voltage.
3. Phase currents.
4. Ground current.

For example, if only auxiliary voltage and phase currents are configured, the source will use the auxiliary voltage, not the phase voltages or any of the currents.

When phase voltages or phase currents are used, the source applies a filter that rejects the zero-sequence component. As such, the same signal must not be injected to all three phases, or the injected signal will be completely filtered out. For an underfrequency element using phase quantities, the phase A signal must be above the **MIN VOLT/AMP** setting value. Therefore, either inject into phase A only, or inject a balanced three-phase signal.

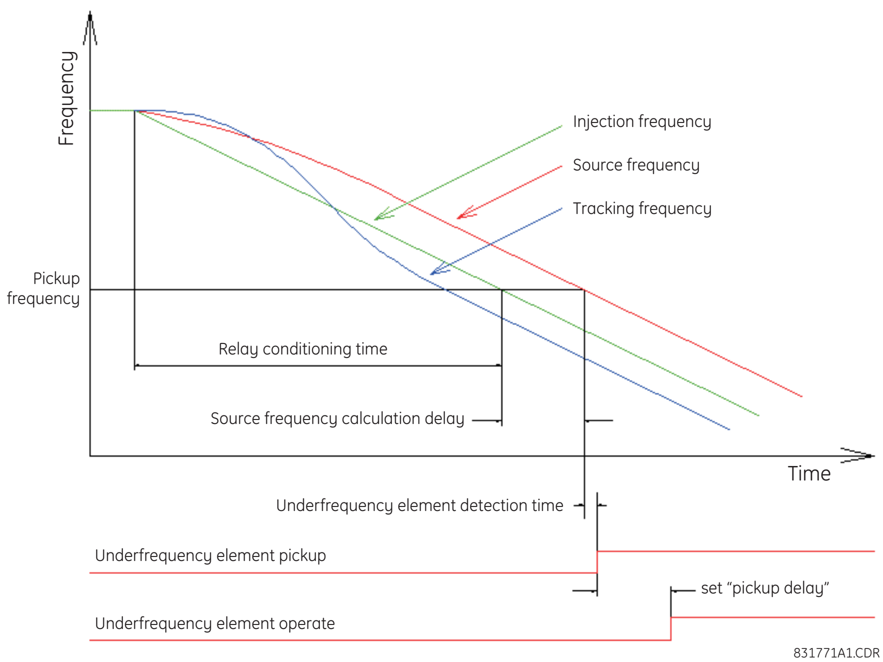

Figure 9–1: TYPICAL UNDERFREQUENCY ELEMENT TEST TIMING

The static accuracy of the frequency threshold may be determined by slowly adjusting the frequency of the injected signal about the set pickup. If the F60 frequency metering feature is used to determine the injected frequency, the metering accuracy should be verified by checking it against a known standard (for example, the power system).

To accurately measure the time delay of a frequency element, a test emulating realistic power system dynamics is required. The injected frequency should smoothly ramp through the set threshold, with the ramp starting frequency sufficiently outside the threshold so the relay becomes conditioned to the trend before operation. For typical interconnected power systems, the recommended testing ramp rate is 0.20 Hz/s.

The desired delay time is the interval from the point the frequency crosses the set threshold to the point the element operates. Some test sets can measure only the time from the ramp start to element operation, necessitating the subtraction of the pre-threshold ramp time from the reading. For example, with a ramp rate of 0.20 Hz/s, start the ramp 0.20 Hz before the threshold and subtract 1 second from test set time reading of ramp start to relay operation.

Note that the F60 event records only show the “pickup delay” component, a definite time timer. This is exclusive of the time taken by the frequency responding component to pickup.

The F60 oscillography can be used to measure the time between the calculated source frequency crossing the threshold and element operation; however, this method omits the delay in the calculated source frequency. The security features of the source frequency measurement algorithm result in the calculated frequency being delayed by 2 to 4 cycles (or longer with noise on the input). In addition, oscillography resolution is 0.004 Hz, which at 0.20 Hz/s corresponds to a delay of 20 ms. The tracking frequency should not be used in timing measurements, as its algorithm involves phase locking, which purposely sets its frequency high or low to allow the F60 sample clock to catch-up or wait as necessary to reach synchronism with the power system.

10.1.1 REPLACE A MODULE

⚠WARNING **Withdraw or insert a module only when control power has been removed from the unit, and be sure to insert only the correct module type into a slot, else personal injury, damage to the unit or connected equipment, or undesired operation can result.**

NOTICE To avoid damage to the equipment, use proper electrostatic discharge protection (for example, a static strap) when coming in contact with modules while the relay is energized.

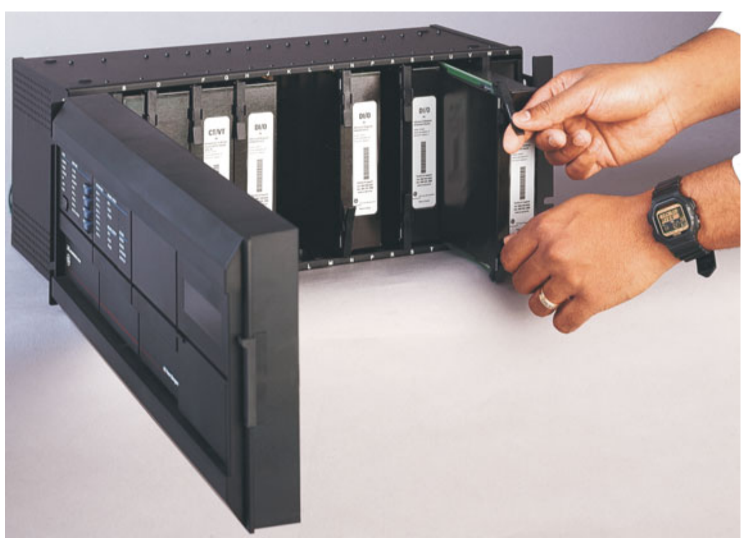
The relay, being modular in design, allows for the withdrawal and insertion of modules. Modules must only be replaced with like modules in their original factory configured slots.

The enhanced faceplate can be opened to the left, once the thumb screw has been removed, as shown below. This allows for easy accessibility of the modules for withdrawal. The new wide-angle hinge assembly in the enhanced front panel opens completely and allows easy access to all modules in the F60.

842812A1.CDR

Figure 10–1: UR MODULE WITHDRAWAL AND INSERTION (ENHANCED FACEPLATE)

The standard faceplate can be opened to the left, once the sliding latch on the right side has been pushed up, as shown below. This allows for easy accessibility of the modules for withdrawal.



842760A1.CDR

Figure 10–2: UR MODULE WITHDRAWAL AND INSERTION (STANDARD FACEPLATE)

To properly remove a module, the ejector/inserter clips, located at the top and bottom of each module, must be pulled simultaneously. Before performing this action, **control power must be removed from the relay**. Record the original location of the module to ensure that the same or replacement module is inserted into the correct slot. Modules with current input provide automatic shorting of external CT circuits.

To properly insert a module, ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/ inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module will be fully inserted.

NOTE: CPU connections must be individually disconnected from the module before the module can be removed from the chassis.

NOTE: The new CT/VT modules can only be used with new CPUs; similarly, old CT/VT modules can only be used with old CPUs. In the event that there is a mismatch between the CPU and CT/VT module, the relay does not function and a **DSP ERROR** or **HARDWARE MISMATCH** error displays.

10.2.1 REPLACE BATTERY

When required, the battery can be replaced. Because the power supply module contains the battery and there are two possible power supplies, two procedures are possible. Check the power supply module or use the photographs here to determine which procedure to use.

a) REPLACE BATTERY FOR RH POWER SUPPLY

When required, the battery can be replaced. The power supply module contains the battery.

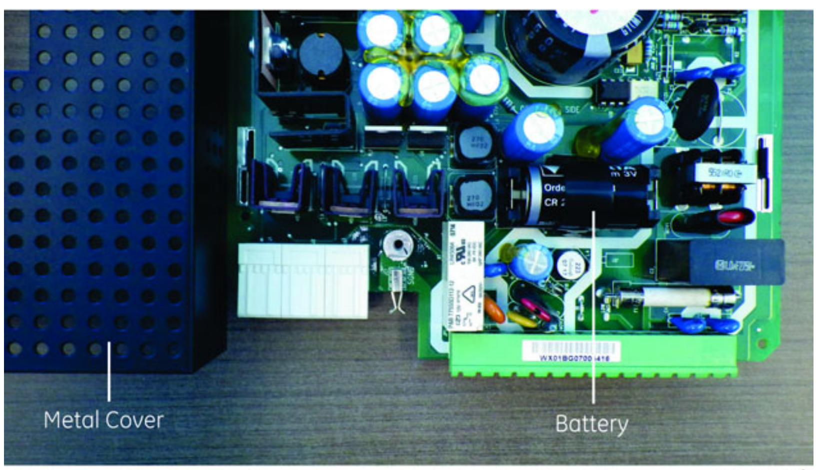
⚠CAUTION **To avoid injury, ensure that the unit has been powered off for a minimum of three minutes before replacing the battery.**

Risk of fire if battery is replaced with incorrect type or polarity.

To replace the battery:

1. Turn off the power to the unit.
2. Wait a minimum of three minutes to ensure that there is no power to the battery.
3. As outlined in the previous section, open the unit by sliding up the latch on the right side of the front panel and opening the panel to the left.
4. Unscrew the bracket on the front left of the unit so that you can open fully the front panel to access the power supply module, which is typically in the first slot on the left side.
5. Simultaneously pull the ejector clips at the top and bottom of the power supply module and remove the module.
6. Unscrew the screw that attaches the metal cover to the module.
7. Slide the metal cover away from the clips about 1 cm (1/4 inch) and remove the cover.
8. Unclip the black plastic holder that keeps the battery in place. The plastic clips into the socket at the bottom on both sides. Use a flat-head screwdriver if you cannot unclip the plastic with your fingers.
9. Observe the + and - polarity of the battery and replace it with the same polarity as marked on the battery holder. Replace the battery with the identical make and model. For example, do not use a rechargeable battery.

Figure 10–3: BATTERY LOCATION ON RH POWER SUPPLY MODULE



859718A1.cdr

10. Reinstall the battery clip and the metal cover, and reinsert the power supply module into the unit.
11. Power on the unit.
12. Dispose of the old battery as outlined in the next section.

10

b) REPLACE BATTERY FOR RH REV B MAXIMUM POWER SUPPLY

When required, the battery can be replaced. The power supply module contains the battery.

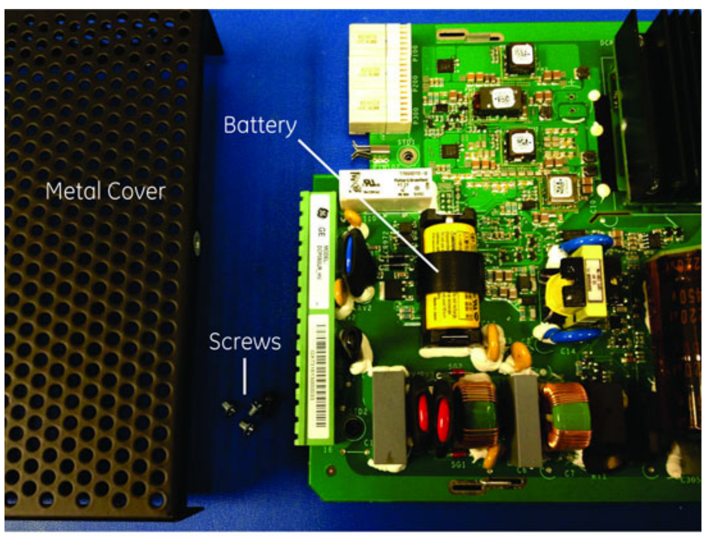
CAUTION **To avoid injury, ensure that the unit has been powered off for a minimum of three minutes before replacing the battery.**

Risk of fire if battery is replaced with incorrect type or polarity.

To replace the battery:

1. Turn off the power to the unit.
2. Wait a minimum of three minutes to ensure that there is no power to the battery.
3. As outlined in the previous section, open the unit by sliding up the latch on the right side of the front panel and opening the panel to the left.
4. Unscrew the bracket on the front left of the unit so that you can open fully the front panel to access the power supply module, which is typically in the first slot on the left side.
5. Simultaneously pull the ejector clips at the top and bottom of the power supply module and remove the module.
6. Unscrew all four screws (not three) that attach the metal cover to the module.
7. Slide the metal cover away from the clips about 1 cm (1/4 inch) and remove the cover.
8. Unclip the black plastic holder that keeps the battery in place. The plastic clips into the socket at the bottom on both sides. Use a flat-head screwdriver if you cannot unclip the plastic with your fingers.
9. Observe the + and - polarity of the battery and replace it with the same polarity as marked on the battery holder. Replace the battery with the identical make and model. For example, do not use a rechargeable battery.

Figure 10–4: BATTERY LOCATION ON RH REV B POWER SUPPLY MODULE



859717A1.cdr

10. Reinstall the battery clip and the metal cover, and reinsert the power supply module into the unit.
11. Power on the unit.
12. Dispose of the old battery as outlined in the next section.

10

10.2.2 DISPOSE OF BATTERY

EN Battery Disposal

This product contains a battery that cannot be disposed of as unsorted municipal waste in the European Union. See the product documentation for specific battery information. The battery is marked with this symbol, which may include lettering to indicate cadmium (Cd), lead (Pb), or mercury (Hg). For proper recycling return the battery to your supplier or to a designated collection point. For more information see: www.recyclethis.info.

CS Nakládání s bateriemi

Tento produkt obsahuje baterie, které nemohou být zneškodněny v Evropské unii jako netříděný komunální odpadu. Viz dokumentace k produktu pro informace pro konkrétní baterie. Baterie je označena tímto symbolem, který může zahrnovat i uvedena písmena, kadmium (Cd), olovo (Pb), nebo rtuť (Hg). Pro správnou recyklaci baterií vraťte svémudodavateli nebo na určeném sběrném místě. Pro více informací viz: www.recyclethis.info.

DA Batteri affald

Dette produkt indeholder et batteri som ikke kan bortskaffes sammen med almindeligt husholdningsaffald i Europa. Se produktinformation for specifikke informationer om batteriet. Batteriet er forsynet med indgraveret symboler for hvad batteriet indeholder: kadmium (Cd), bly (Pb) og kviksølv (Hg). Europæiske brugere af elektrisk udstyr skal aflevere kasserede produkter til genbrug eller til leverandøren. Yderligere oplysninger findes på webstedet www.recyclethis.info.

DE Entsorgung von Batterien

Dieses Produkt beinhaltet eine Batterie, die nicht als unsortierter städtischer Abfall in der europäischen Union entsorgt werden darf. Beachten Sie die spezifischen Batterie-informationen in der Produktdokumentation. Die Batterie ist mit diesem Symbol gekennzeichnet, welches auch Hinweise auf möglicherweise enthaltene Stoffe wie Kadmium (Cd), Blei (Pb) oder Quecksilber (Hektogramm) darstellt. Für die korrekte Wiederverwertung bringen Sie diese Batterie zu Ihrem lokalen Lieferanten zurück oder entsorgen Sie das Produkt an den gekennzeichneten Sammelstellen. Weitere Informationen hierzu finden Sie auf der folgenden Website: www.recyclethis.info.

EL Απόρριψη μπαταριών

Αυτό το προϊόν περιέχει μια μπαταρία που δεν πρέπει να απορρίπτεται σε δημόσια συστήματα απόρριψης στην Ευρωπαϊκή Κοινότητα. Δείτε την τεκμηρίωση του προϊόντος για συγκεκριμένες πληροφορίες που αφορούν τη μπαταρία. Η μπαταρία είναι φέρει σήμανση με αυτό το σύμβολο, το οποίο μπορεί να περιλαμβάνει γράμματα για να δηλώσουν το κάδμιο (Cd), τον μόλυβδο (Pb), ή τον υδράργυρο (Hg). Για την κατάλληλη ανακύκλωση επιστρέψτε την μπαταρία στον προμηθευτή σας ή σε καθορισμένο σημείο συλλογής. Για περισσότερες πληροφορίες δείτε: www.recyclethis.info.

ES Eliminacion de baterias

Este producto contiene una batería que no se pueda eliminar como basura normal sin clasificar en la Unión Europea. Examine la documentación del producto para la información específica de la batería. La batería se marca con este símbolo, que puede incluir siglas para indicar el cadmio (Cd), el plomo (Pb), o el mercurio (Hg). Para el reciclaje apropiado, devuelva este producto a su distribuidor ó deshágase de él en los puntos de reciclaje designados. Para mas información : wwwrecyclethis.info.

ET Patareide kõrvaldamine

Käesolev toode sisaldab patareisid, mida Euroopa Liidus ei tohi kõrvaldada sorteerimata olmejäätmetena. Andmeid patareide kohta vaadake toote dokumentatsioonist. Patareid on märgistatud käesoleva sümboliga, millel võib olla kaadmiumi (Cd), pliid (Pb) või elavhõbedat (Hg) tähistavad tähed. Nõuetekohaseks ringlusse võtmiseks tagastage patarei tarnijale või kindlaksmääratud vastuvõtupunkti. Lisainformatsiooni saab Internetist aadressil: www.recyclethis.info.

FI Paristoje ja akkujen hävittäminen

Tuote sisältää pariston, jota ei saa hävittää Euroopan Unionin alueella talousjätteen mukana. Tarkista tuoteselosteesta tuotteen tiedot. Paristo on merkitty tällä symbolilla ja saattaa sisältää cadmiumia (Cd), lyijyä (Pb) tai elohopeaa (Hg). Oikean kierrätystavan varmistamiseksi palauta tuote paikalliselle jälleenmyyjälle tai palauta se paristojen keräyspisteeseen. Lisätietoja sivuilla www.recyclethis.info.

FR Élimination des piles

Ce produit contient une batterie qui ne peuvent être éliminés comme déchets municipaux non triés dans l'Union européenne. Voir la documentation du produit au niveau des renseignements sur la pile. La batterie est marqué de ce symbole, qui comprennent les indications cadmium (Cd), plomb (Pb), ou mercure (Hg). Pour le recyclage, retourner la batterie à votre fournisseur ou à un point de collecte. Pour plus d'informations, voir: www.recyclethis.info.

HU Akkumulátor hulladék kezelése
Ezen termék akkumulátort tartalmaz, amely az Európai Unión belül csak a kijelölt módon és helyen dobható ki. A terméken illetve a mellékelt ismertetőn olvasható a kadmium (Cd), ólom (Pb) vagy higany (Hg) tartalomra utaló betűjelzés. A hulladék akkumulátor leadható a termék forgalmazójánál új akkumulátor vásárlásakor, vagy a kijelölt elektronikai hulladékudvarokban. További információ a www.recyclethis.info oldalon.

IT Smaltimento batterie
Questo prodotto contiene una batteria che non può essere smaltita nei comuni contenitori per lo smaltimento rifiuti, nell' Unione Europea. Controllate la documentazione del prodotto per le informazioni specifiche sulla batteria. La batteria è contrassegnata con questo simbolo e può includere alcuni caratteri ad indicare la presenza di cadmio (Cd), piombo (Pb) oppure mercurio (Hg). Per il corretto smaltimento, potete restituirli al vostro fornitore locale, oppure rivolgervi e consegnarli presso i centri di raccolta preposti. Per maggiori informazioni vedere: ww.recyclethis.info.

LT Baterijų šalinimas
Šios įrangos sudėtyje yra baterijų, kurias draudžiama šalinti Europos Sąjungos viešose nerūšiuotų atliekų šalinimo sistemose. Informaciją apie baterijas galite rasti įrangos techninėje dokumentacijoje. Baterijos žymimos šiuo simboliu, papildomai gali būti nurodoma kad baterijų sudėtyje yra kadmio (Cd), švino (Pb) ar gyvsidabrio (Hg). Eksploatavimui nebetinkamas baterijas pristatykite į tam skirtas surinkimo vietas arba grąžinkite jas tiesioginiam tiekėjui, kad jos būtų tinkamai utilizuotos. Daugiau informacijos rasite šioje interneto svetainėje: www.recyclethis.info.

LV Bateriju likvidēšana
Šis produkts satur bateriju vai akumulatoru, kuru nedrīkst izmest Eiropas Savienībā esošajās sadzīves atkritumu sistēmās. Sk. produkta dokumentācijā, kur ir norādīta konkrēta informācija par bateriju vai akumulatoru. Baterijas vai akumulatora marķējumā ir šis simbols, kas var ietvert burtus, kuri norāda kadmiju (Cd), svinu (Pb) vai dzīvsudrabu (Hg). Pēc ekspluatācijas laika beigām baterijas vai akumulatori jānodod piegādātājam vai specializētā bateriju savākšanas vietā. Sīkāku informāciju var iegūt vietnē: www.recyclethis.info.

NL Verwijderen van baterijen
Dit product bevat een batterij welke niet kan verwijdert worden via de gemeentelijke huisvuilscheiding in de Europese Gemeenschap. Gelieve de product documentatie te controleren voor specifieke batterij informatie. De batterijen met deze label kunnen volgende indictaies bevatten cadium (Cd), lood (Pb) of kwik (Hg). Voor correcte vorm van kringloop, geef je de producten terug aan jou locale leverancier of geef het af aan een gespecialiseerde verzamelpunt. Meer informatie vindt u op de volgende website: www.recyclethis.info.

NO Retur av batteri
Dette produkt inneholder et batteri som ikke kan kastes med usortert kommunalt søppel i den Europeiske Unionen. Se produktdokumentasjonen for spesifikk batteriinformasjon. Batteriet er merket med dette symbolet som kan inkludere symboler for å indikere at kadmium (Cd), bly (Pb), eller kvikksølv (Hg) forekommer. Returner batteriet til leverandøren din eller til et dedikert oppsamlingspunkt for korrekt gjenvinning. For mer informasjon se: www.recyclethis.info.

PL Pozbywanie się zużytych baterii
Ten produkt zawiera baterie, które w Unii Europejskiej mogą być usuwane tylko jako posegregowane odpady komunalne. Dokładne informacje dotyczące użytych baterii znajdują się w dokumentacji produktu. Baterie oznaczone tym symbolem mogą zawierać dodatkowe oznaczenia literowe wskazujące na zawartość kadmu (Cd), ołowiu (Pb) lub rtęci (Hg). Dla zapewnienia właściwej utylizacji, należy zwrócić baterie do dostawcy albo do wyznaczonego punktu zbiórki. Więcej informacji można znaleźć na stronie internetowej www.recyclethis.info.

PT Eliminação de Baterias
Este produto contêm uma bateria que não pode ser considerado lixo municipal na União Europeia. Consulte a documentação do produto para obter informação específica da bateria. A bateria é identificada por meio de este símbolo, que pode incluir a rotulação para indicar o cádmio (Cd), chumbo (Pb), ou o mercúrio (hg). Para uma reciclagem apropriada envie a bateria para o seu fornecedor ou para um ponto de recolha designado. Para mais informação veja: www.recyclethis.info.

RU Утилизация батарей
Согласно европейской директиве об отходах электрического и электронного оборудования, продукты, содержащие батареи, нельзя утилизировать как обычные отходы на территории ЕС. Более подробную информацию вы найдете в документации к продукту. На этом символе могут присутствовать буквы, которые означают, что батарея собержит кадмий (Cd), свинец (Pb) или ртуть (Hg). Для надлежащей утилизации по окончании срока эксплуатации пользователь должен возвратить батареи локальному поставщику или сдать в специальный пункт приема. Подробности можно найти на веб-сайте: www.recyclethis.info.

SK Zaobchádzanie s batériami
Tento produkt obsahuje batériu, s ktorou sa v Európskej únii nesmie nakladať ako s netriedeným komunálnym odpadom. Dokumentácia k produktu obsahuje špecifické informácie o batérii. Batéria je označená týmto symbolom, ktorý môže obsahovať písmená na označenie kadmia (Cd), olova (Pb), alebo ortuti (Hg). Na správnu recykláciu vráťte batériu vášmu lokálnemu dodávateľovi alebo na určené zberné miesto. Pre viac informácii pozrite: www.recyclethis.info.

SL Odlaganje baterij
Ta izdelek vsebuje baterijo, ki je v Evropski uniji ni dovoljeno odstranjevati kot nesortiran komunalni odpadek. Za posebne informacije o bateriji glejte dokumentacijo izdelka. Baterija je označena s tem simbolom, ki lahko vključuje napise, ki označujejo kadmij (Cd), svinec (Pb) ali živo srebro (Hg). Za ustrezno recikliranje baterijo vrnite dobavitelju ali jo odstranite na določenem zbirališču. Za več informacij obiščite spletno stran: www.recyclethis.info.

SV Kassering av batteri

Denna produkt innehåller ett batteri som inte får kastas i allmänna sophanteringssytem inom den europeiska unionen. Se produktdokumentationen för specifik batteriinformation. Batteriet är märkt med denna symbol, vilket kan innebära att det innehåller kadmium (Cd), bly (Pb) eller kvicksilver (Hg). För korrekt återvinning skall batteriet returneras till leverantören eller till en därför avsedd deponering. För mer information, se: www.recyclethis.info.

TR Pil Geri Dönüşümü

Bu ürün Avrupa Birliği genel atık sistemlerine atılmaması gereken pil içermektedir. Daha detaylı pil bilgisi için ürünün kataloğunu inceleyiniz. Bu sembolle işaretlenmiş piller Kadmiyum(Cd), Kurşun(Pb) ya da Civa(Hg) içerebilir. Doğru geri dönüşüm için ürünü yerel tedarikçinize geri veriniz ya da özel işaretlenmiş toplama noktlarına atınız. Daha fazla bilgi için: www.recyclethis.info.

B.1.1 INTRODUCTION

The UR-series relays support a number of communications protocols to allow connection to equipment such as personal computers, RTUs, SCADA masters, and programmable logic controllers. The Modicon Modbus RTU protocol is the most basic protocol supported by the UR. Modbus is available via RS232 or RS485 serial links or via ethernet (using the Modbus/TCP specification). The following description is intended primarily for users who wish to develop their own master communication drivers and applies to the serial Modbus RTU protocol. Note that:

- The UR always acts as a slave device, meaning that it never initiates communications; it only listens and responds to requests issued by a master computer.
- For Modbus, a subset of the Remote Terminal Unit (RTU) protocol format is supported that allows extensive monitoring, programming, and control functions using read and write register commands.

B.1.2 PHYSICAL LAYER

The Modbus RTU protocol is hardware-independent so that the physical layer can be any of a variety of standard hardware configurations including RS232 and RS485. The relay includes a faceplate (front panel) RS232 port and two rear terminal communications ports that may be configured as RS485, fiber optic, 10Base-T, or 10Base-F. Data flow is half-duplex in all configurations. See chapter 3 for communications wiring.

Each data byte is transmitted in an asynchronous format consisting of 1 start bit, 8 data bits, 1 stop bit, and possibly 1 parity bit. This produces a 10 or 11 bit data frame. This can be important for transmission through modems at high bit rates (11 bit data frames are not supported by many modems at baud rates greater than 300).

The baud rate and parity are independently programmable for each communications port. Baud rates of 300, 1200, 2400, 4800, 9600, 14400, 19200, 28800, 33600, 38400, 57600, or 115200 bps are available. Even, odd, and no parity are available. See the *Communications* section of chapter 5 for details.

The master device in any system must know the address of the slave device with which it is to communicate. The relay will not act on a request from a master if the address in the request does not match the relay's slave address (unless the address is the broadcast address – see below).

A single setting selects the slave address used for all ports, with the exception that for the faceplate port, the relay will accept any address when the Modbus RTU protocol is used.

B.1.3 DATA LINK LAYER

Communications takes place in packets which are groups of asynchronously framed byte data. The master transmits a packet to the slave and the slave responds with a packet. The end of a packet is marked by *dead-time* on the communications line. The following describes general format for both transmit and receive packets. For exact details on packet formatting, refer to subsequent sections describing each function code.

Table B–1: MODBUS PACKET FORMAT

DESCRIPTION	SIZE
SLAVE ADDRESS	1 byte
FUNCTION CODE	1 byte
DATA	*N* bytes
CRC	2 bytes
DEAD TIME	3.5 bytes transmission time

- **SLAVE ADDRESS:** This is the address of the slave device that is intended to receive the packet sent by the master and to perform the desired action. Each slave device on a communications bus must have a unique address to prevent bus contention. All of the relay's ports have the same address which is programmable from 1 to 254; see chapter 5 for details. Only the addressed slave will respond to a packet that starts with its address. Note that the faceplate port is an exception to this rule; it will act on a message containing any slave address.

  A master transmit packet with slave address 0 indicates a broadcast command. All slaves on the communication link take action based on the packet, but none respond to the master. Broadcast mode is only recognized when associated with function code 05h. For any other function code, a packet with broadcast mode slave address 0 will be ignored.

- **FUNCTION CODE:** This is one of the supported functions codes of the unit which tells the slave what action to perform. See the *Supported Function Codes* section for details. An exception response from the slave is indicated by setting the high order bit of the function code in the response packet. See the *Exception Responses* section for details.
- **DATA:** This will be a variable number of bytes depending on the function code. This may include actual values, settings, or addresses sent by the master to the slave or by the slave to the master.
- **CRC:** This is a two byte error checking code. The RTU version of Modbus includes a 16-bit cyclic redundancy check (CRC-16) with every packet which is an industry standard method used for error detection. If a Modbus slave device receives a packet in which an error is indicated by the CRC, the slave device will not act upon or respond to the packet thus preventing any erroneous operations. See the *CRC-16 Algorithm* section for details on calculating the CRC.
- **DEAD TIME:** A packet is terminated when no data is received for a period of 3.5 byte transmission times (about 15 ms at 2400 bps, 2 ms at 19200 bps, and 300 µs at 115200 bps). Consequently, the transmitting device must not allow gaps between bytes longer than this interval. Once the dead time has expired without a new byte transmission, all slaves start listening for a new packet from the master except for the addressed slave.

B.1.4 CRC-16 ALGORITHM

The CRC-16 algorithm essentially treats the entire data stream (data bits only; start, stop and parity ignored) as one continuous binary number. This number is first shifted left 16 bits and then divided by a characteristic polynomial (11000000000000101B). The 16-bit remainder of the division is appended to the end of the packet, MSByte first. The resulting packet including CRC, when divided by the same polynomial at the receiver will give a zero remainder if no transmission errors have occurred. This algorithm requires the characteristic polynomial to be reverse bit ordered. The most significant bit of the characteristic polynomial is dropped, since it does not affect the value of the remainder.

A C programming language implementation of the CRC algorithm will be provided upon request.

Table B–2: CRC-16 ALGORITHM

SYMBOLS:	-->	data transfer
	A	16 bit working register
	Alow	low order byte of A
	Ahigh	high order byte of A
	CRC	16 bit CRC-16 result
	i,j	loop counters
	(+)	logical EXCLUSIVE-OR operator
	N	total number of data bytes
	Di	i-th data byte (i = 0 to N-1)
	G	16 bit characteristic polynomial = 1010000000000001 (binary) with MSbit dropped and bit order reversed
	shr (x)	right shift operator (th LSbit of x is shifted into a carry flag, a '0' is shifted into the MSbit of x, all other bits are shifted right one location)

ALGORITHM:	1.	FFFF (hex) --> A	
	2.	0 --> i	
	3.	0 --> j	
	4.	Di (+) Alow --> Alow	
	5.	j + 1 --> j	
	6.	shr (A)	
	7.	Is there a carry?	No: go to 8; Yes: G (+) A --> A and continue.
	8.	Is j = 8?	No: go to 5; Yes: continue
	9.	i + 1 --> i	
	10.	Is i = N?	No: go to 3; Yes: continue
	11.	A --> CRC	

B.2.1 SUPPORTED FUNCTION CODES

Modbus officially defines function codes from 1 to 127 though only a small subset is generally needed. The relay supports some of these functions, as summarized in the following table. Subsequent sections describe each function code in detail.

FUNCTION CODE		MODBUS DEFINITION	GE MULTILIN DEFINITION
HEX	DEC		
03	3	Read holding registers	Read actual values or settings
04	4	Read holding registers	Read actual values or settings
05	5	Force single coil	Execute operation
06	6	Preset single register	Store single setting
10	16	Preset multiple registers	Store multiple settings

B.2.2 READ ACTUAL VALUES OR SETTINGS (FUNCTION CODE 03/04H)

This function code allows the master to read one or more consecutive data registers (actual values or settings) from a relay. Data registers are always 16-bit (two-byte) values transmitted with high order byte first. The maximum number of registers that can be read in a single packet is 125. See the *Modbus memory map* table for exact details on the data registers.

Since some PLC implementations of Modbus only support one of function codes 03h and 04h. The F60 interpretation allows either function code to be used for reading one or more consecutive data registers. The data starting address will determine the type of data being read. Function codes 03h and 04h are therefore identical.

The following table shows the format of the master and slave packets. The example shows a master device requesting three register values starting at address 4050h from slave device 11h (17 decimal); the slave device responds with the values 40, 300, and 0 from registers 4050h, 4051h, and 4052h, respectively.

Table B–3: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION	
PACKET FORMAT	EXAMPLE (HEX)
SLAVE ADDRESS	11
FUNCTION CODE	04
DATA STARTING ADDRESS - high	40
DATA STARTING ADDRESS - low	50
NUMBER OF REGISTERS - high	00
NUMBER OF REGISTERS - low	03
CRC - low	A7
CRC - high	4A

SLAVE RESPONSE	
PACKET FORMAT	EXAMPLE (HEX)
SLAVE ADDRESS	11
FUNCTION CODE	04
BYTE COUNT	06
DATA #1 - high	00
DATA #1 - low	28
DATA #2 - high	01
DATA #2 - low	2C
DATA #3 - high	00
DATA #3 - low	00
CRC - low	0D
CRC - high	60

B.2.3 EXECUTE OPERATION (FUNCTION CODE 05H)

This function code allows the master to perform various operations in the relay. Available operations are shown in the *Summary of operation codes* table below.

The following table shows the format of the master and slave packets. The example shows a master device requesting the slave device 11h (17 decimal) to perform a reset. The high and low code value bytes always have the values "FF" and "00" respectively and are a remnant of the original Modbus definition of this function code.

Table B–4: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	**EXAMPLE (HEX)**	**PACKET FORMAT**	**EXAMPLE (HEX)**
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	05	FUNCTION CODE	05
OPERATION CODE - high	00	OPERATION CODE - high	00
OPERATION CODE - low	01	OPERATION CODE - low	01
CODE VALUE - high	FF	CODE VALUE - high	FF
CODE VALUE - low	00	CODE VALUE - low	00
CRC - low	DF	CRC - low	DF
CRC - high	6A	CRC - high	6A

Table B–5: SUMMARY OF OPERATION CODES FOR FUNCTION 05H

OPERATION CODE (HEX)	DEFINITION	DESCRIPTION
0000	NO OPERATION	Does not do anything.
0001	RESET	Performs the same function as the faceplate RESET key.
0005	CLEAR EVENT RECORDS	Performs the same function as the faceplate **CLEAR EVENT RECORDS** menu command.
0006	CLEAR OSCILLOGRAPHY	Clears all oscillography records.
1000 to 103F	VIRTUAL IN 1 to 64 ON/OFF	Sets the states of Virtual Inputs 1 to 64 either "ON" or "OFF".

B.2.4 STORE SINGLE SETTING (FUNCTION CODE 06H)

This function code allows the master to modify the contents of a single setting register in an relay. Setting registers are always 16 bit (two byte) values transmitted high order byte first. The following table shows the format of the master and slave packets. The example shows a master device storing the value 200 at memory map address 4051h to slave device 11h (17 dec).

Table B–6: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	**EXAMPLE (HEX)**	**PACKET FORMAT**	**EXAMPLE (HEX)**
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	06	FUNCTION CODE	06
DATA STARTING ADDRESS - high	40	DATA STARTING ADDRESS - high	40
DATA STARTING ADDRESS - low	51	DATA STARTING ADDRESS - low	51
DATA - high	00	DATA - high	00
DATA - low	C8	DATA - low	C8
CRC - low	CE	CRC - low	CE
CRC - high	DD	CRC - high	DD

B.2.5 STORE MULTIPLE SETTINGS (FUNCTION CODE 10H)

This function code allows the master to modify the contents of a one or more consecutive setting registers in a relay. Setting registers are 16-bit (two byte) values transmitted high order byte first. The maximum number of setting registers that can be stored in a single packet is 60. The following table shows the format of the master and slave packets. The example shows a master device storing the value 200 at memory map address 4051h, and the value 1 at memory map address 4052h to slave device 11h (17 decimal).

Table B–7: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION	
PACKET FORMAT	**EXAMPLE (HEX)**
SLAVE ADDRESS	11
FUNCTION CODE	10
DATA STARTING ADDRESS - hi	40
DATA STARTING ADDRESS - lo	51
NUMBER OF SETTINGS - hi	00
NUMBER OF SETTINGS - lo	02
BYTE COUNT	04
DATA #1 - high order byte	00
DATA #1 - low order byte	C8
DATA #2 - high order byte	00
DATA #2 - low order byte	01
CRC - low order byte	12
CRC - high order byte	62

SLAVE RESPONSE	
PACKET FORMAT	**EXAMPLE (HEX)**
SLAVE ADDRESS	11
FUNCTION CODE	10
DATA STARTING ADDRESS - hi	40
DATA STARTING ADDRESS - lo	51
NUMBER OF SETTINGS - hi	00
NUMBER OF SETTINGS - lo	02
CRC - lo	07
CRC - hi	64

B.2.6 EXCEPTION RESPONSES

Programming or operation errors usually happen because of illegal data in a packet. These errors result in an exception response from the slave. The slave detecting one of these errors sends a response packet to the master with the high order bit of the function code set to 1.

The following table shows the format of the master and slave packets. The example shows a master device sending the unsupported function code 39h to slave device 11.

Table B–8: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION	
PACKET FORMAT	**EXAMPLE (HEX)**
SLAVE ADDRESS	11
FUNCTION CODE	39
CRC - low order byte	CD
CRC - high order byte	F2

SLAVE RESPONSE	
PACKET FORMAT	**EXAMPLE (HEX)**
SLAVE ADDRESS	11
FUNCTION CODE	B9
ERROR CODE	01
CRC - low order byte	93
CRC - high order byte	95

B.3.1 OBTAINING RELAY FILES VIA MODBUS

a) DESCRIPTION

The UR relay has a generic file transfer facility, meaning that you use the same method to obtain all of the different types of files from the unit. The Modbus registers that implement file transfer are found in the "Modbus File Transfer (Read/Write)" and "Modbus File Transfer (Read Only)" modules, starting at address 3100 in the Modbus Memory Map. To read a file from the UR relay, use the following steps:

1. Write the filename to the "Name of file to read" register using a write multiple registers command. If the name is shorter than 80 characters, you may write only enough registers to include all the text of the filename. Filenames are not case sensitive.
2. Repeatedly read all the registers in "Modbus File Transfer (Read Only)" using a read multiple registers command. It is not necessary to read the entire data block, since the UR relay will remember which was the last register you read. The "position" register is initially zero and thereafter indicates how many bytes (2 times the number of registers) you have read so far. The "size of..." register indicates the number of bytes of data remaining to read, to a maximum of 244.
3. Keep reading until the "size of..." register is smaller than the number of bytes you are transferring. This condition indicates end of file. Discard any bytes you have read beyond the indicated block size.
4. If you need to re-try a block, read only the "size of.." and "block of data", without reading the position. The file pointer is only incremented when you read the position register, so the same data block will be returned as was read in the previous operation. On the next read, check to see if the position is where you expect it to be, and discard the previous block if it is not (this condition would indicate that the UR relay did not process your original read request).

The UR relay retains connection-specific file transfer information, so files may be read simultaneously on multiple Modbus connections.

b) OTHER PROTOCOLS

All the files available via Modbus may also be retrieved using the standard file transfer mechanisms in other protocols (for example, TFTP or MMS).

c) COMTRADE, OSCILLOGRAPHY, AND DATA LOGGER FILES

Oscillography and data logger files are formatted using the COMTRADE file format per IEEE C37.111-1999 Standard Common Format for Transient Data Exchange (COMTRADE) for Power Systems. The files can be obtained in either text or binary COMTRADE format.

d) READING OSCILLOGRAPHY FILES

Familiarity with the oscillography feature is required to understand the following description. See the *Oscillography* section in chapter 5 for details.

The Oscillography Number of Triggers register increments by one every time a new oscillography file is triggered (captured) and cleared to zero when oscillography data is cleared. When a new trigger occurs, the associated oscillography file is assigned a file identifier number equal to the incremented value of this register; the newest file number is equal to the Oscillography_Number_of_Triggers register. This register can be used to determine if any new data has been captured by periodically reading it to see if the value has changed; if the number has increased then new data is available.

The Oscillography Number of Records register specifies the maximum number of files (and the number of cycles of data per file) that can be stored in memory of the relay. The Oscillography Available Records register specifies the actual number of files that are stored and still available to be read out of the relay.

Writing “Yes” (i.e. the value 1) to the Oscillography Clear Data register clears oscillography data files, clears both the Oscillography Number of Triggers and Oscillography Available Records registers to zero, and sets the Oscillography Last Cleared Date to the present date and time.

To read binary COMTRADE oscillography files, read the following filenames:

`OSCnnnn.CFG` and `OSCnnn.DAT`

Replace “nnn” with the desired oscillography trigger number. For ASCII format, use the following file names

`OSCAnnnn.CFG` and `OSCAnnn.DAT`

e) READING DATA LOGGER FILES

Familiarity with the data logger feature is required to understand this description. Refer to the Data Logger section of Chapter 5 for details. To read the entire data logger in binary COMTRADE format, read the following files.

`datalog.cfg` and `datalog.dat`

To read the entire data logger in ASCII COMTRADE format, read the following files.

`dataloga.cfg` and `dataloga.dat`

To limit the range of records to be returned in the COMTRADE files, append the following to the filename before writing it:

- To read from a specific time to the end of the log: <space> startTime
- To read a specific range of records: <space> startTime <space> endTime
- Replace <startTime> and <endTime> with Julian dates (seconds since Jan. 1 1970) as numeric text.

f) READING EVENT RECORDER FILES

To read the entire event recorder contents in ASCII format (the only available format), use the following filename:

`EVT.TXT`

To read from a specific record to the end of the log, use the following filename:

`EVTnnn.TXT` (replace `nnn` with the desired starting record number)

To read from a specific record to another specific record, use the following filename:

`EVT.TXT xxxxx yyyyy` (replace `xxxxx` with the starting record number and `yyyyy` with the ending record number)

g) READING FAULT REPORT FILES

Fault report data has been available via the F60 file retrieval mechanism since UR firmware version 2.00. The file name is **`faultReport#####.htm`**. The ##### refers to the fault report record number. The fault report number is a counter that indicates how many fault reports have ever occurred. The counter rolls over at a value of 65535. Only the last ten fault reports are available for retrieval; a request for a non-existent fault report file will yield a null file. The current value fault report counter is available in “Number of Fault Reports” Modbus register at location 0x3020.

For example, if 14 fault reports have occurred then the files `faultReport5.htm`, `faultReport6.htm`, up to `faultReport14.htm` are available to be read. The expected use of this feature has an external master periodically polling the “Number of Fault Reports' register. If the value changes, then the master reads all the new files.

The contents of the file is in standard HTML notation and can be viewed via any commercial browser.

B.3.2 MODBUS PASSWORD OPERATION

The F60 supports password entry from a local or remote connection.

Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the faceplate RS232 connection. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

When entering a settings or command password via EnerVista or any serial interface, the user must enter the corresponding connection password. If the connection is to the back of the F60, the remote password must be used. If the connection is to the RS232 port of the faceplate, the local password must be used.

The command password is set up at memory location 4000. Command security is required to change the command password. Similarly, the setting password is set up at memory location 4002. These are the same settings found in the **SETTINGS ⇨ PRODUCT SETUP ⇨ PASSWORD SECURITY** menu via the keypad. Enabling password security for the faceplate display will also enable it for Modbus, and *vice-versa*.

To gain command level security access, the command password must be entered at memory location 4008. To gain setting level security access, the setting password must be entered at memory location 400A. The entered setting password must match the current setting password setting, or must be zero, to change settings or download firmware.

Command and setting passwords each have a 30 minute timer. Each timer starts when you enter the particular password, and is re-started whenever you *use* it. For example, writing a setting re-starts the setting password timer and writing a command register or forcing a coil re-starts the command password timer. The value read at memory location 4010 can be used to confirm whether a command password is enabled or disabled (a value of 0 represents disabled). The value read at memory location 4011 can be used to confirm whether a setting password is enabled or disabled.

Command or setting password security access is restricted to the particular port or particular TCP/IP connection on which the entry was made. Passwords must be entered when accessing the relay through other ports or connections, and the passwords must be re-entered after disconnecting and re-connecting on TCP/IP.

B.4.1 MODBUS MEMORY MAP

The map is also viewable in a web browser. In the browser, enter the IP address of the UR and click the option.

Table B–9: MODBUS MEMORY MAP (Sheet 1 of 72)

ADDR	REGISTER NAME	RANGE	UNITS	STEP	FORMAT	DEFAULT

B.4.2 DATA FORMATS

F001
UR_UINT16 UNSIGNED 16 BIT INTEGER

F002
UR_SINT16 SIGNED 16 BIT INTEGER

F003
UR_UINT32 UNSIGNED 32 BIT INTEGER (2 registers)

High order word is stored in the first register.
Low order word is stored in the second register.

F004
UR_SINT32 SIGNED 32 BIT INTEGER (2 registers)

High order word is stored in the first register.
Low order word is stored in the second register.

F011
UR_UINT16 FLEXCURVE DATA (120 points)

A FlexCurve is an array of 120 consecutive data points (x, y) which are interpolated to generate a smooth curve. The y-axis is the user defined trip or operation time setting; the x-axis is the pickup ratio and is pre-defined. Refer to format F119 for a listing of the pickup ratios; the enumeration value for the pickup ratio indicates the offset into the FlexCurve base address where the corresponding time value is stored.

F013
POWER_FACTOR (SIGNED 16 BIT INTEGER)

Positive values indicate lagging power factor; negative values indicate leading.

F050
UR_UINT32 TIME and DATE (UNSIGNED 32 BIT INTEGER)

Gives the current time in seconds elapsed since 00:00:00 January 1, 1970.

F051
UR_UINT32 DATE in SR format (alternate format for F050)

First 16 bits are Month/Day (MM/DD/xxxx). Month: 1=January, 2=February,...,12=December; Day: 1 to 31 in steps of 1
Last 16 bits are Year (xx/xx/YYYY): 1970 to 2106 in steps of 1

F052
UR_UINT32 TIME in SR format (alternate format for F050)

First 16 bits are Hours/Minutes (HH:MM:xx.xxx).
Hours: 0=12am, 1=1am,...,12=12pm,...23=11pm;
Minutes: 0 to 59 in steps of 1

Last 16 bits are Seconds (xx:xx:.SS.SSS): 0=00.000s, 1=00.001,...,59999=59.999s)

F060
FLOATING_POINT IEEE FLOATING POINT (32 bits)

F072
HEX6 6 BYTES - 12 ASCII DIGITS

F073
HEX8 8 BYTES - 16 ASCII DIGITS

F074
HEX20 20 BYTES - 40 ASCII DIGITS

UR_UINT32: FLEXLOGIC BASE TYPE (15-bit type)

The FlexLogic BASE type is 7 bits and is combined with an 8-bit descriptor and 1 bit for protection element to form a 16-bit value. The combined bits are of the form: PTTTTTTTDDDDDDDD, where P bit if set, indicates that the FlexLogic type is associated with a protection element state and T represents bits for the BASE type, and D represents bits for the descriptor.

The values in square brackets indicate the base type with P prefix [PTTTTTTT] and the values in round brackets indicate the descriptor range. The right most T bit indicates whether the type is an ON or OFF type. There can be a total of 64 types (plus protection elements). There can be a total of 256 descriptors of each type.

[0] Off (0) – this is boolean FALSE value
[1] On (1) – this is boolean TRUE value

F491
ENUMERATION: ANALOG INPUT MODE

0 = Default Value, 1 = Last Known

F500
UR_UINT16: PACKED BITFIELD

First register indicates input/output state with bits 0 (MSB) to 15 (LSB) corresponding to input/output state 1 to 16. The second register indicates input/output state with bits 0 to 15 corresponding to input/output state 17 to 32 (if required) The third register indicates input/output state with bits 0 to 15 corresponding to input/output state 33 to 48 (if required). The fourth register indicates input/output state with bits 0 to 15 corresponding to input/output state 49 to 64 (if required).

The number of registers required is determined by the specific data item. A bit value of 0 = Off and 1 = On.

F501
UR_UINT16: LED STATUS

Low byte of register indicates LED status with bit 0 representing the top LED and bit 7 the bottom LED. A bit value of 1 indicates the LED is on, 0 indicates the LED is off.

F502
BITFIELD: ELEMENT OPERATE STATES

Each bit contains the operate state for an element. See the F124 format code for a list of element IDs. The operate bit for element ID X is bit [X mod 16] in register [X/16].

0 = English, 1 = French, 2 = Chinese, 3 = Russian, 4 = Turkish, 5 = German

F542
ENUMERATION: PMU TRIGGERING MODE

0 = Automatic Overwrite, 1 = Protected

F543
ENUMERATION: PMU PHASORS

Value	Phasor
0	Off
1	Va
2	Vb
3	Vc
4	Vx
5	Ia
6	Ib
7	Ic

Value	Phasor
8	Ig
9	V_1
10	V_2
11	V_0
12	I_1
13	I_2
14	I_0

F544
ENUMERATION: PMU RECORDING/REPORTING RATE

Value	Rate
0	1/second
1	2/second
2	4/second
3	5/second
4	10/second
5	12/second
6	15/second

Value	Rate
7	20second
8	25/second
9	30/second
10	50/second
11	60/second
12	100/second
13	120/second

F546
ENUMERATION: PMU REPORTING STYLE

0 = Polar, 1 = Rectangular

F547
ENUMERATION: PMU REPORTING FORMAT

0 = Integer, 1 = Floating

F550
ENUMERATION: RTD INPUT APPLICATION

Enumeration	RTD input application
0	None
1	Stator
2	Bearing
3	Ambient
4	Group 1
5	Group 2

F551
ENUMERATION: RTD TRIP VOTING

Enumeration	RTD trip voting
0	None
1	Group
2	RTD Input 1
3	RTD Input 2
4	RTD Input 3
5	RTD Input 4
6	RTD Input 5
7	RTD Input 6
8	RTD Input 7
9	RTD Input 8
10	RTD Input 9
11	RTD Input 10
12	RTD Input 11
13	RTD Input 12

F552
ENUMERATION: RTD INPUT OPEN

Enumeration	RTD open
0	None
1	Alarm
2	Block

F600
UR_UINT16: FLEXANALOG PARAMETER

Corresponds to the Modbus address of the value used when this parameter is selected. Only certain values may be used as FlexAnalogs (basically all metering quantities used in protection).

F601
ENUMERATION: COM2 PORT USAGE

Enumeration	COM2 port usage
0	RS485
1	RRTD
2	GPM-F
3	RRTD and GPM-F

F605
ENUMERATION: REMOTE DOUBLE-POINT STATUS INPUT STATUS

Enumeration	Remote DPS input status
0	Intermediate
1	Off
2	On
3	Bad

F606
ENUMERATION: REMOTE DOUBLE-POINT STATUS INPUT

Enumeration	Remote double-point status input
0	None
1	Remote input 1
2	Remote input 2
3	Remote input 3
↓	↓
64	Remote input 64

F611
ENUMERATION: GOOSE RETRANSMISSION SCHEME

Enumeration	Configurable GOOSE retransmission scheme
0	Heartbeat
1	Aggressive
2	Medium
3	Relaxed

F612
UR_UINT16: FLEXINTEGER PARAMETER

This 16-bit value corresponds to the Modbus address of the selected FlexInteger parameter. Only certain values may be used as FlexIntegers.

F615
ENUMERATION: IEC 61850 REPORT DATASET ITEMS

Enumeration	IEC 61850 report dataset items
0	None
1	PDIF1.ST.Str.general
2	PDIF1.ST.Op.general
3	PDIF2.ST.Str.general
4	PDIF2.ST.Op.general
5	PDIF3.ST.Str.general

C.1.1 INTRODUCTION

The IEC 61850 standard is the result of electric utilities and vendors of electronic equipment to produce standardized communications systems. IEC 61850 is a series of standards describing client/server and peer-to-peer communications, substation design and configuration, testing, environmental and project standards. The complete set includes:

- IEC 61850-1: Introduction and overview
- IEC 61850-2: Glossary
- IEC 61850-3: General requirements
- IEC 61850-4: System and project management
- IEC 61850-5: Communications and requirements for functions and device models
- IEC 61850-6: Configuration description language for communication in electrical substations related to IEDs
- IEC 61850-7-1: Basic communication structure for substation and feeder equipment - Principles and models
- IEC 61850-7-2: Basic communication structure for substation and feeder equipment - Abstract communication service interface (ACSI)
- IEC 61850-7-3: Basic communication structure for substation and feeder equipment – Common data classes
- IEC 61850-7-4: Basic communication structure for substation and feeder equipment – Compatible logical node classes and data classes
- IEC 61850-8-1: Specific Communication Service Mapping (SCSM) – Mappings to MMS (ISO 9506-1 and ISO 9506-2) and to ISO/IEC 8802-3
- IEC 61850-9-1: Specific Communication Service Mapping (SCSM) – Sampled values over serial unidirectional multidrop point to point link
- IEC 61850-9-2: Specific Communication Service Mapping (SCSM) – Sampled values over ISO/IEC 8802-3
- IEC 61850-10: Conformance testing

These documents can be obtained from the IEC (http://www.iec.ch). It is strongly recommended that all those involved with any IEC 61850 implementation obtain this document set.

C.1.2 COMMUNICATION PROFILES

IEC 61850 specifies the use of the Manufacturing Message Specification (MMS) at the upper (application) layer for transfer of real-time data. This protocol has been in existence for several of years and provides a set of services suitable for the transfer of data within a substation LAN environment. Actual MMS protocol services are mapped to IEC 61850 abstract services in IEC 61850-8-1.

The F60 relay supports IEC 61850 server services over TCP/IP. The TCP/IP profile requires the F60 to have an IP address to establish communications. These addresses are located in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ NETWORK** menu. It is possible to have up to five simultaneous connections (in addition to DNP and Modbus/TCP (non-IEC 61850) connections).

- **Client/server**: This is a connection-oriented type of communication. The connection is initiated by the client, and communication activity is controlled by the client. IEC 61850 clients are often substation computers running HMI programs or SOE logging software. Servers are usually substation equipment such as protection relays, meters, RTUs, transformer tap changers, or bay controllers.
- **Peer-to-peer**: This is a non-connection-oriented, high speed type of communication usually between substation equipment such as protection relays. GSSE and GOOSE are methods of peer-to-peer communication.
- **Substation configuration language (SCL)**: A substation configuration language is a number of files used to describe the configuration of substation equipment. Each configured device has an *IEC Capability Description* (ICD) file. The substation single line information is stored in a *System Specification Description* (SSD) file. The entire substation configuration is stored in a *Substation Configuration Description* (SCD) file. The SCD file is the combination of the individual ICD files and the SSD file.

C.2.1 OVERVIEW

IEC 61850 defines an object-oriented approach to data and services. An IEC 61850 *physical device* can contain one or more *logical device(s)*. Each logical device can contain many *logical nodes*. Each logical node can contain many *data objects*. Each data object is composed of *data attributes* and *data attribute components*. Services are available at each level for performing various functions, such as reading, writing, control commands, and reporting.

Each F60 IED represents one IEC 61850 physical device. The physical device contains one logical device, and the logical device contains many logical nodes. The logical node LPHD1 contains information about the F60 IED physical device. The logical node LLN0 contains information about the F60 IED logical device.

C.2.2 GGIO1: DIGITAL STATUS VALUES

The GGIO1 logical node is available in the F60 to provide access to as many 128 digital status points and associated time-stamps and quality flags. The data content must be configured before the data can be used. GGIO1 provides digital status points for access by clients.

It is intended that clients use GGIO1 in order to access digital status values from the F60. Configuration settings are provided to allow the selection of the number of digital status indications available in GGIO1 (8 to 128), and to allow the choice of the F60 FlexLogic operands that drive the status of the GGIO1 status indications. Clients can utilize the IEC 61850 buffered and unbuffered reporting features available from GGIO1 in order to build sequence of events (SOE) logs and HMI display screens. Buffered reporting should generally be used for SOE logs since the buffering capability reduces the chances of missing data state changes. Unbuffered reporting should generally be used for local status display.

C.2.3 GGIO2: DIGITAL CONTROL VALUES

The GGIO2 logical node is available to provide access to the F60 virtual inputs. Virtual inputs are single-point control (binary) values that can be written by clients. They are generally used as control inputs. GGIO2 provides access to the virtual inputs through the IEC 61850 standard control model (ctlModel) services:

- Status only.
- Direct control with normal security.
- SBO control with normal security.

Configuration settings are available to select the control model for each point. Each virtual input used through GGIO2 should have its **VIRTUAL INPUT 1(64) FUNCTION** setting programmed as “Enabled” and its corresponding **GGIO2 CF SPSCO1(64) CTLMODEL** setting programmed to the appropriate control configuration.

C.2.4 GGIO3: DIGITAL STATUS AND ANALOG VALUES FROM GOOSE DATA

The GGIO3 logical node is available to provide access for clients to values received via configurable GOOSE messages. The values of the digital status indications and analog values in GGIO3 originate in GOOSE messages sent from other devices.

C.2.5 GGIO4: GENERIC ANALOG MEASURED VALUES

The GGIO4 logical node provides access to as many as 32 analog value points, as well as associated timestamps and quality flags. The data content must be configured before the data can be used. GGIO4 provides analog values for access by clients.

It is intended that clients use GGIO4 to access generic analog values from the F60. Configuration settings allow the selection of the number of analog values available in GGIO4 (4 to 32) and the choice of the FlexAnalog values that determine the value of the GGIO4 analog inputs. Clients can utilize polling or the IEC 61850 unbuffered reporting feature available from GGIO4 in order to obtain the analog values provided by GGIO4.

C.2.6 MMXU: ANALOG MEASURED VALUES

A limited number of measured analog values are available through the MMXU logical nodes.

Each MMXU logical node provides data from a F60 current and voltage source. There is one MMXU available for each configurable source (programmed in the **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ SIGNAL SOURCES** menu). MMXU1 provides data from F60 source 1, and MMXU2 provides data from F60 source 2.

MMXU data is provided in two forms: instantaneous and deadband. The instantaneous values are updated every time a read operation is performed by a client. The deadband values are calculated as described in IEC 61850 parts 7-1 and 7-3. The selection of appropriate deadband settings for the F60 is described in chapter 5 of this manual.

IEC 61850 buffered and unbuffered reporting capability is available in all MMXU logical nodes. MMXUx logical nodes provide the following data for each source:

- MMXU1.MX.TotW: three-phase real power
- MMXU1.MX.TotVAr: three-phase reactive power
- MMXU1.MX.TotVA: three-phase apparent power
- MMXU1.MX.TotPF: three-phase power factor
- MMXU1.MX.Hz: frequency
- MMXU1.MX.PPV.phsAB: phase AB voltage magnitude and angle
- MMXU1.MX.PPV.phsBC: phase BC voltage magnitude and angle
- MMXU1.MX.PPV.phsCA: Phase CA voltage magnitude and angle
- MMXU1.MX.PhV.phsA: phase AG voltage magnitude and angle
- MMXU1.MX.PhV.phsB: phase BG voltage magnitude and angle
- MMXU1.MX.PhV.phsC: phase CG voltage magnitude and angle
- MMXU1.MX.A.phsA: phase A current magnitude and angle
- MMXU1.MX.A.phsB: phase B current magnitude and angle
- MMXU1.MX.A.phsC: phase C current magnitude and angle
- MMXU1.MX.A.neut: ground current magnitude and angle
- MMXU1.MX.W.phsA: phase A real power
- MMXU1.MX.W.phsB: phase B real power
- MMXU1.MX.W.phsC: phase C real power
- MMXU1.MX.VAr.phsA: phase A reactive power
- MMXU1.MX.VAr.phsB: phase B reactive power
- MMXU1.MX.VAr.phsC: phase C reactive power
- MMXU1.MX.VA.phsA: phase A apparent power
- MMXU1.MX.VA.phsB: phase B apparent power
- MMXU1.MX.VA.phsC: phase C apparent power
- MMXU1.MX.PF.phsA: phase A power factor
- MMXU1.MX.PF.phsB: phase B power factor
- MMXU1.MX.PF.phsC: phase C power factor

C.2.7 PROTECTION AND OTHER LOGICAL NODES

The following list describes the protection elements for all UR-series relays. The F60 relay will contain a subset of protection elements from this list.

- PDIF: bus differential, transformer instantaneous differential, transformer percent differential, current differential

- PDIS: phase distance, ground distance
- PIOC: phase instantaneous overcurrent, neutral instantaneous overcurrent, ground instantaneous overcurrent, negative-sequence instantaneous overcurrent.
- PTOC: phase time overcurrent, neutral time overcurrent, ground time overcurrent, negative-sequence time overcurrent, neutral directional overcurrent, negative-sequence directional overcurrent
- PTUV: phase undervoltage, auxiliary undervoltage, third harmonic neutral undervoltage
- PTOV: phase overvoltage, neutral overvoltage, auxiliary overvoltage, negative sequence overvoltage
- RBRF: breaker failure
- RREC: autoreclosure
- RPSB: power swing detection
- RFLO: fault locator
- XCBR: breaker control
- XSWI: circuit switch
- CSWI: switch controller

The protection elements listed above contain *start* (pickup) and *operate* flags. For example, the start flag for PIOC1 is PIOC1.ST.Str.general. The operate flag for PIOC1 is PIOC1.ST.Op.general. For the F60 protection elements, these flags take their values from the pickup and operate FlexLogic operands for the corresponding element.

Some protection elements listed above contain directional start values. For example, the directional start value for PDIS1 is PDIS1.ST.Str.dirGeneral. This value is built from the directional FlexLogic operands for the element.

The RFLO logical node contains the measurement of the distance to fault calculation in kilometers. This value originates in the fault locator function.

The XCBR logical node is directly associated with the breaker control feature.

- XCBR1.ST.Loc: This is the state of the XCBR1 local/remote switch. A setting is provided to assign a FlexLogic operand to determine the state. When local mode is true, IEC 61850 client commands will be rejected.
- XCBR1.ST.Opcnt: This is an operation counter as defined in IEC 61850. Command settings are provided to allow the counter to be cleared.
- XCBR1.ST.Pos: This is the position of the breaker. The breaker control FlexLogic operands are used to determine this state.
  - Intermediate state (00) is indicated when the BREAKER 1 OPEN and BREAKER 1 CLOSED operands are both On.
  - Off state (01) is indicated when the BREAKER 1 OPEN operand is On.
  - On state (10) is indicated when the BREAKER 1 CLOSED operand is On.
  - Bad state (11) is indicated when the BREAKER 1 OPEN and BREAKER 1 CLOSED operands are Off.
- XCBR1.ST.BlkOpn: This is the state of the block open command logic. When true, breaker open commands from IEC 61850 clients will be rejected.
- XCBR1.ST.BlkCls: This is the state of the block close command logic. When true, breaker close commands from IEC 61850 clients will be rejected.
- XCBR1.CO.Pos: This is where IEC 61850 clients can issue open or close commands to the breaker. SBO control with normal security is the only supported IEC 61850 control model.
- XCBR1.CO.BlkOpn: This is where IEC 61850 clients can issue block open commands to the breaker. Direct control with normal security is the only supported IEC 61850 control model.
- XCBR1.CO.BlkCls: This is where IEC 61850 clients can issue block close commands to the breaker. Direct control with normal security is the only supported IEC 61850 control model.

C.3.1 BUFFERED/UNBUFFERED REPORTING

IEC 61850 buffered and unbuffered reporting is provided in the GGIO1 logical nodes (for binary status values) and MMXU1 to MMXU6 (for analog measured values). Report settings can be configured using the EnerVista UR Setup software, substation configurator software, or via an IEC 61850 client. The following items can be configured:

- **TrgOps**: Trigger options. The following bits are supported by the F60:
  - Bit 1: data-change
  - Bit 4: integrity
  - Bit 5: general interrogation
- **OptFlds**: Option Fields. The following bits are supported by the F60:
  - Bit 1: sequence-number
  - Bit 2: report-time-stamp
  - Bit 3: reason-for-inclusion
  - Bit 4: data-set-name
  - Bit 5: data-reference
  - Bit 6: buffer-overflow (for buffered reports only)
  - Bit 7: entryID (for buffered reports only)
  - Bit 8: conf-revision
  - Bit 9: segmentation
- **IntgPd**: Integrity period.
- **BufTm**: Buffer time.

C.3.2 FILE TRANSFER

MMS file services are supported to allow transfer of oscillography, event record, or other files from a F60 relay.

C.3.3 TIMESTAMPS AND SCANNING

The timestamp values associated with all IEC 61850 data items represent the *time of the last change* of either the value or quality flags of the data item. To accomplish this functionality, all IEC 61850 data items must be regularly scanned for data changes, and the timestamp updated when a change is detected, regardless of the connection status of any IEC 61850 clients. For applications where there is no IEC 61850 client in use, the IEC 61850 **SERVER SCANNING** setting can be programmed as "Disabled". If a client is in use, this setting should be programmed as "Enabled" to ensure the proper generation of IEC 61850 timestamps.

C.3.4 LOGICAL DEVICE NAME

The logical device name is used to identify the IEC 61850 logical device that exists within the F60. This name is composed of two parts: the IED name setting and the logical device instance. The complete logical device name is the combination of the two character strings programmed in the **IEDNAME** and **LD INST** settings. The default values for these strings are "IEDName" and "LDInst". These values should be changed to reflect a logical naming convention for all IEC 61850 logical devices in the system.

C.3.5 LOCATION

The LPHD1 logical node contains a data attribute called *location* (LPHD1.DC.PhyNam.location). This is a character string meant to describe the physical location of the F60. This attribute is programmed through the **LOCATION** setting and its default value is "Location". This value should be changed to describe the actual physical location of the F60.

C.3.6 LOGICAL NODE NAME PREFIXES

IEC 61850 specifies that each logical node can have a name with a total length of 11 characters. The name is composed of:

- A five or six-character name prefix.
- A four-character standard name (for example, MMXU, GGIO, PIOC, etc.).
- A one or two-character instantiation index.

Complete names are of the form `xxxxxxPIOC1`, where the `xxxxxx` character string is configurable. Details regarding the logical node naming rules are given in IEC 61850 parts 6 and 7-2. It is recommended that a consistent naming convention be used for an entire substation project.

C.3.7 CONNECTION TIMING

A built-in TCP/IP connection timeout of two minutes is employed by the F60 to detect 'dead' connections. If there is no data traffic on a TCP connection for greater than two minutes, the connection will be aborted by the F60. This frees up the connection to be used by other clients. Therefore, when using IEC 61850 reporting, clients should configure report control block items such that an integrity report will be issued at least every 2 minutes (120000 ms). This ensures that the F60 will not abort the connection. If other MMS data is being polled on the same connection at least once every 2 minutes, this timeout will not apply.

C.3.8 NON-IEC 61850 DATA

The F60 relay makes available a number of non-IEC 61850 data items. These data items can be accessed through the "UR" MMS domain. IEC 61850 data can be accessed through the standard IEC 61850 logical device. To access the non-IEC data items, the **INCLUDE NON-IEC DATA** setting must be "Enabled".

C.3.9 COMMUNICATION SOFTWARE UTILITIES

The exact structure and values of the supported IEC 61850 logical nodes can be seen by connecting to a F60 relay with an MMS browser, such as the "MMS Object Explorer and AXS4-MMS" DDE/OPC server from Sisco Inc.

C.4.1 OVERVIEW

IEC 61850 specifies two types of peer-to-peer data transfer services: Generic Substation State Events (GSSE) and Generic Object Oriented Substation Events (GOOSE). GSSE services are compatible with UCA 2.0 GOOSE. IEC 61850 GOOSE services provide virtual LAN (VLAN) support, Ethernet priority tagging, and Ethertype Application ID configuration. The support for VLANs and priority tagging allows for the optimization of Ethernet network traffic. GOOSE messages can be given a higher priority than standard Ethernet traffic, and they can be separated onto specific VLANs. Because of the additional features of GOOSE services versus GSSE services, it is recommended that GOOSE be used wherever backwards compatibility with GSSE (or UCA 2.0 GOOSE) is not required.

Devices that transmit GSSE and/or GOOSE messages also function as servers. Each GSSE publisher contains a “GSSE control block” to configure and control the transmission. Each GOOSE publisher contains a “GOOSE control block” to configure and control the transmission. The transmission is also controlled via device settings. These settings can be seen in the ICD and/or SCD files, or in the device configuration software or files.

IEC 61850 recommends a default priority value of 4 for GOOSE. Ethernet traffic that does not contain a priority tag has a default priority of 1. More details are specified in IEC 61850 part 8-1.

IEC 61850 recommends that the Ethertype Application ID number be configured according to the GOOSE source. In the F60, the transmitted GOOSE Application ID number must match the configured receive Application ID number in the receiver. A common number may be used for all GOOSE transmitters in a system. More details are specified in IEC 61850 part 8-1.

C

C.4.2 GSSE CONFIGURATION

IEC 61850 Generic Substation Status Event (GSSE) communication is compatible with UCA GOOSE communication. GSSE messages contain a number of double point status data items. These items are transmitted in two pre-defined data structures named DNA and UserSt. Each DNA and UserSt item is referred to as a ‘bit pair’. GSSE messages are transmitted in response to state changes in any of the data points contained in the message. GSSE messages always contain the same number of DNA and UserSt bit pairs. Depending the on the configuration, only some of these bit pairs may have values that are of interest to receiving devices.

The **GSSE FUNCTION**, **GSSE ID**, and **GSSE DESTINATION MAC ADDRESS** settings are used to configure GSSE transmission. **GSSE FUNCTION** is set to “Enabled” to enable the transmission. If a valid multicast Ethernet MAC address is entered for the **GSSE DESTINATION MAC ADDRESS** setting, this address will be used as the destination MAC address for GSSE messages. If a valid multicast Ethernet MAC address is not entered (for example, 00 00 00 00 00 00), the F60 will use the source Ethernet MAC address as the destination, with the multicast bit set.

C.4.3 FIXED GOOSE

The F60 supports two types of IEC 61850 Generic Object Oriented Substation Event (GOOSE) communication: fixed GOOSE and configurable GOOSE. All GOOSE messages contain IEC 61850 data collected into a *dataset*. It is this dataset that is transferred using GOOSE message services. The dataset transferred using the F60 fixed GOOSE is the same data that is transferred using the GSSE feature; that is, the DNA and UserSt bit pairs. The FlexLogic operands that determine the state of the DNA and UserSt bit pairs are configurable via settings, but the fixed GOOSE dataset always contains the same DNA/UserSt data structure. Upgrading from GSSE to GOOSE services is simply a matter of enabling fixed GOOSE and disabling GSSE. The remote inputs and outputs are configured in the same manner for both GSSE and fixed GOOSE.

It is recommended that the fixed GOOSE be used for implementations that require GOOSE data transfer between UR-series IEDs. Configurable GOOSE may be used for implementations that require GOOSE data transfer between UR-series IEDs and devices from other manufacturers.

C.4.4 CONFIGURABLE GOOSE

The configurable GOOSE feature allows for the configuration of the datasets to be transmitted or received from the F60. The F60 supports the configuration of eight (8) transmission and reception datasets, allowing for the optimization of data transfer between devices.

Items programmed for dataset 1 and 2 will have changes in their status transmitted as soon as the change is detected. Dataset 1 should be used for high-speed transmission of data that is required for applications such as transfer tripping, blocking, and breaker fail initiate. At least one digital status value needs to be configured in dataset 1 to enable transmission of all data configured for dataset 1. Configuring analog data only to dataset 1 will not activate transmission.

Items programmed for datasets 3 through 8 will have changes in their status transmitted at a maximum rate of every 100 ms. Datasets 3 through 8 will regularly analyze each data item configured within them every 100 ms to identify if any changes have been made. If any changes in the data items are detected, these changes will be transmitted through a GOOSE message. If there are no changes detected during this 100 ms period, no GOOSE message will be sent.

For all datasets 1 through 8, the integrity GOOSE message will still continue to be sent at the pre-configured rate even if no changes in the data items are detected.

The GOOSE functionality was enhanced to prevent the relay from flooding a communications network with GOOSE messages due to an oscillation being created that is triggering a message.

C

The F60 has the ability of detecting if a data item in one of the GOOSE datasets is erroneously oscillating. This can be caused by events such as errors in logic programming, inputs improperly being asserted and de-asserted, or failed station components. If erroneously oscillation is detected, the F60 will stop sending GOOSE messages from the dataset for a minimum period of one second. Should the oscillation persist after the one second time-out period, the F60 will continue to block transmission of the dataset. The F60 will assert the **MAINTENANCE ALERT: GGIO Ind XXX oscill** self-test error message on the front panel display, where **XXX** denotes the data item detected as oscillating.

The configurable GOOSE feature is recommended for applications that require GOOSE data transfer between UR-series IEDs and devices from other manufacturers. Fixed GOOSE is recommended for applications that require GOOSE data transfer between UR-series IEDs.

IEC 61850 GOOSE messaging contains a number of configurable parameters, all of which must be correct to achieve the successful transfer of data. It is critical that the configured datasets at the transmission and reception devices are an exact match in terms of data structure, and that the GOOSE addresses and name strings match exactly. Manual configuration is possible, but third-party substation configuration software may be used to automate the process. The EnerVista UR Setupsoftware can produce IEC 61850 ICD files and import IEC 61850 SCD files produced by a substation configurator (see the IEC 61850 IED configuration information later in this appendix).

NOTICE Use independent ports for IEC 61850 communication and take care when configuring the settings, else loss of protection or misoperation of the relay can result.

The following example illustrates the configuration required to transfer IEC 61850 data items between two devices. The general steps required for transmission configuration are:

1. Configure the transmission dataset.
2. Configure the GOOSE service settings.
3. Configure the data.

The general steps required for reception configuration are:

1. Configure the reception dataset.
2. Configure the GOOSE service settings.
3. Configure the data.

This example shows how to configure the transmission and reception of three IEC 61850 data items: a single point status value, its associated quality flags, and a floating point analog value.

The following procedure illustrates the transmission configuration.

1. Configure the transmission dataset by making the following changes in the **PRODUCT SETUP ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1 ⇨⇩ CONFIG GSE 1 DATASET ITEMS** settings menu:
   - Set **ITEM 1** to “GGIO1.ST.Ind1.q” to indicate quality flags for GGIO1 status indication 1.
   - Set **ITEM 2** to “GGIO1.ST.Ind1.stVal” to indicate the status value for GGIO1 status indication 1.

   The transmission dataset now contains a set of quality flags and a single point status Boolean value. The reception dataset on the receiving device must exactly match this structure.

2. Configure the GOOSE service settings by making the following changes in the **PRODUCT SETUP ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨ TRANSMISSION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1** settings menu:
   – Set **CONFIG GSE 1 FUNCTION** to “Enabled”.
   – Set **CONFIG GSE 1 ID** to an appropriate descriptive string (the default value is “GOOSEOut_1”).
   – Set **CONFIG GSE 1 DST MAC** to a multicast address (for example, 01 00 00 12 34 56).
   – Set the **CONFIG GSE 1 VLAN PRIORITY**; the default value of “4” is OK for this example.
   – Set the **CONFIG GSE 1 VLAN ID** value; the default value is “0”, but some switches may require this value to be “1”.
   – Set the **CONFIG GSE 1 ETYPE APPID** value. This setting represents the Ethertype application ID and must match the configuration on the receiver (the default value is “0”).
   – Set the **CONFIG GSE 1 CONFREV** value. This value changes automatically as described in IEC 61850 part 7-2. For this example it can be left at its default value.
3. Configure the data by making the following changes in the **PRODUCT SETUP ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨ GGIO1 STATUS CONFIGURATION** settings menu:
   – Set **GGIO1 INDICATION 1** to a FlexLogic operand used to provide the status of GGIO1.ST.Ind1.stVal (for example, a contact input, virtual input, a protection element status, etc.).

The F60 must be rebooted (control power removed and re-applied) before these settings take effect.

The following procedure illustrates the reception configuration.

1. Configure the reception dataset by making the following changes in the **PRODUCT SETUP ⇨⇩ COMMUNICATION ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION ⇨⇩ RECEPTION ⇨⇩ CONFIGURABLE GOOSE ⇨ CONFIGURABLE GOOSE 1 ⇨⇩ CONFIG GSE 1 DATASET ITEMS** settings menu:
   – Set **ITEM 1** to “GGIO3.ST.Ind1.q” to indicate quality flags for GGIO3 status indication 1.
   – Set **ITEM 2** to “GGIO3.ST.Ind1.stVal” to indicate the status value for GGIO3 status indication 1.

   The reception dataset now contains a set of quality flags, a single point status Boolean value, and a floating point analog value. This matches the transmission dataset configuration above.
2. Configure the GOOSE service settings by making the following changes in the **INPUTS/OUTPUTS ⇨⇩ REMOTE DEVICES ⇨⇩ REMOTE DEVICE 1** settings menu:
   – Set **REMOTE DEVICE 1 ID** to match the GOOSE ID string for the transmitting device. Enter “GOOSEOut_1”.
   – Set **REMOTE DEVICE 1 ETYPE APPID** to match the Ethertype application ID from the transmitting device. This is “0” in the example above.
   – Set the **REMOTE DEVICE 1 DATASET** value. This value represents the dataset number in use. Since we are using configurable GOOSE 1 in this example, program this value as “GOOSEIn 1”.
3. Configure the data by making the following changes in the **INPUTS/OUTPUTS ⇨⇩ REMOTE INPUTS ⇨⇩ REMOTE INPUT 1** settings menu:
   – Set **REMOTE IN 1 DEVICE** to “GOOSEOut_1”.
   – Set **REMOTE IN 1 ITEM** to “Dataset Item 2”. This assigns the value of the GGIO3.ST.Ind1.stVal single point status item to remote input 1.

Remote input 1 can now be used in FlexLogic equations or other settings. The F60 must be rebooted (control power removed and re-applied) before these settings take effect.

The value of remote input 1 (Boolean on or off) in the receiving device will be determined by the GGIO1.ST.Ind1.stVal value in the sending device. The above settings will be automatically populated by the EnerVista UR Setup software when a complete SCD file is created by third party substation configurator software.

C.4.5 ETHERNET MAC ADDRESS FOR GSSE/GOOSE

Ethernet capable devices each contain a unique identifying address called a Media Access Control (MAC) address. This address cannot be changed and is unique for each Ethernet device produced worldwide. The address is six bytes in length and is usually represented as six hexadecimal values (for example, 00 A0 F4 01 02 03). It is used in all Ethernet frames as the ‘source’ address of the frame. Each Ethernet frame also contains a *destination* address. The destination address can be different for each Ethernet frame depending on the intended destination of the frame.

A special type of destination address called a *multicast* address is used when the Ethernet frame can be received by more than one device. An Ethernet MAC address is multicast when the least significant bit of the first byte is set (for example, 01 00 00 00 00 00 is a multicast address).

GSSE and GOOSE messages must have multicast destination MAC addresses.

By default, the F60 is configured to use an automated multicast MAC scheme. If the F60 destination MAC address setting is not a valid multicast address (that is, the least significant bit of the first byte is not set), the address used as the destination MAC will be the same as the local MAC address, but with the multicast bit set. Thus, if the local MAC address is 00 A0 F4 01 02 03, then the destination MAC address will be 01 A0 F4 01 02 03.

C.4.6 GSSE ID AND GOOSE ID SETTINGS

GSSE messages contain an identifier string used by receiving devices to identify the sender of the message, defined in IEC 61850 part 8-1 as GsID. This is a programmable 65-character string. This string should be chosen to provide a descriptive name of the originator of the GSSE message.

GOOSE messages contain an identifier string used by receiving devices to identify the sender of the message, defined in IEC 61850 part 8-1 as GoID. This programmable 65-character string should be a descriptive name of the originator of the GOOSE message. GOOSE messages also contain two additional character strings used for identification of the message: DatSet - the name of the associated dataset, and GoCBRef - the reference (name) of the associated GOOSE control block. These strings are automatically populated and interpreted by the F60; no settings are required.

C.5.1 OVERVIEW

The F60 can be configured for IEC 61850 via the EnerVista UR Setup software as follows.

1. An ICD file is generated for the F60 by the EnerVista UR Setup software that describe the capabilities of the IED.
2. The ICD file is then imported into a system configurator along with other ICD files for other IEDs (from GE or other vendors) for system configuration.
3. The result is saved to a SCD file, which is then imported back to EnerVista UR Setup to create one or more settings file(s). The settings file(s) can then be used to update the relay(s) with the new configuration information.

The configuration process is illustrated below.

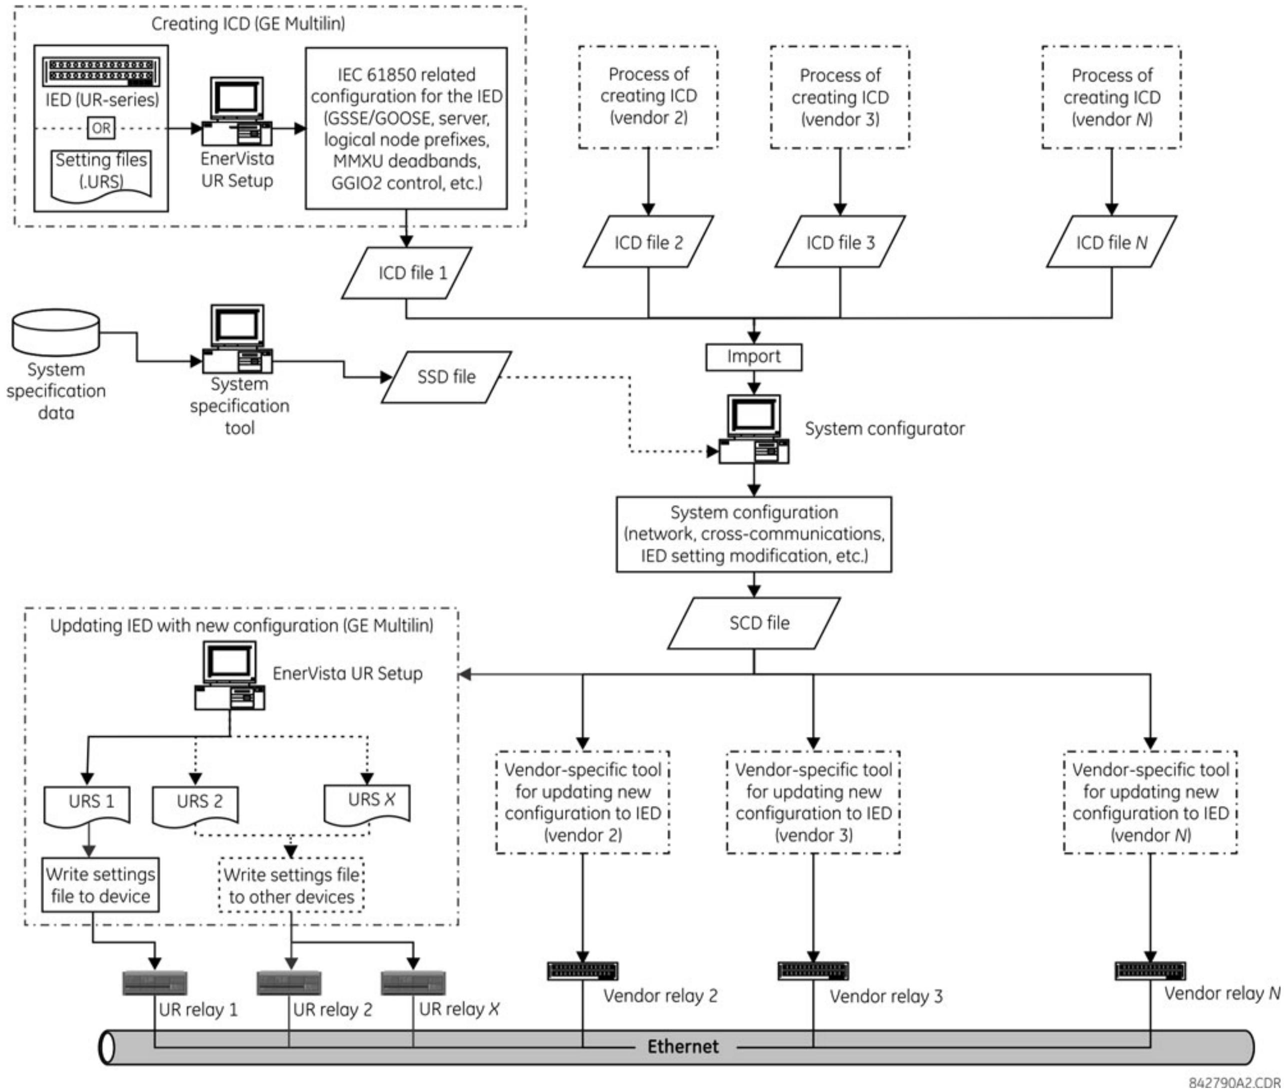

Figure C–1: IED CONFIGURATION PROCESS

The following acronyms and abbreviations are used in the procedures describing the IED configuration process for IEC 61850:

- BDA: Basic Data Attribute, that is not structured
- DAI: Instantiated Data Attribute
- DO: Data Object type or instance, depending on the context

- DOI: Instantiated Data Object
- IED: Intelligent Electronic Device
- LDInst: Instantiated Logical Device
- LNInst: Instantiated Logical Node
- SCL: Substation Configuration Description Language. The configuration language is an application of the Extensible Markup Language (XML) version 1.0.
- SDI: Instantiated Sub DATA; middle name part of a structured DATA name
- UR: GE Multilin Universal Relay series
- URI: Universal Resource Identifier
- URS: UR-series relay setting file
- XML: Extensible Markup Language

The following SCL variants are also used:

- ICD: IED Capability Description
- CID: Configured IED Description
- SSD: System Specification Description
- SCD: Substation Configuration Description

The following IEC related tools are referenced in the procedures that describe the IED configuration process for IEC 61850:

- **System configurator** or **Substation configurator**: This is an IED independent system level tool that can import or export configuration files defined by IEC 61850-6. It can import configuration files (ICD) from several IEDs for system level engineering and is used to add system information shared by different IEDs. The system configuration generates a substation related configuration file (SCD) which is fed back to the IED configurator (for example, EnerVista UR Setup) for system related IED configuration. The system configurator should also be able to read a system specification file (SSD) to use as base for starting system engineering, or to compare it with an engineered system for the same substation.
- **IED configurator**: This is a vendor specific tool that can directly or indirectly generate an ICD file from the IED (for example, from a settings file). It can also import a system SCL file (SCD) to set communication configuration parameters (that is, required addresses, reception GOOSE datasets, IDs of incoming GOOSE datasets, etc.) for the IED. The IED configurator functionality is implemented in the GE Multilin EnerVista UR Setup software.

C.5.2 CONFIGURING IEC 61850 SETTINGS

Before creating an ICD file, the user can customize the IEC 61850 related settings for the IED. For example, the IED name and logical device instance can be specified to uniquely identify the IED within the substation, or transmission GOOSE datasets created so that the system configurator can configure the cross-communication links to send GOOSE messages from the IED. Once the IEC 61850 settings are configured, the ICD creation process will recognize the changes and generate an ICD file that contains the updated settings.

Some of the IED settings will be modified during they system configuration process. For example, a new IP address may be assigned, line items in a Transmission GOOSE dataset may be added or deleted, or prefixes of some logical nodes may be changed. While all new configurations will be mapped to the F60 settings file when importing an SCD file, all unchanged settings will preserve the same values in the new settings file.

These settings can be configured either directly through the relay panel or through the EnerVista UR Setup software (preferred method). The full list of IEC 61850 related settings for are as follows:

- Network configuration: IP address, IP subnet mask, and default gateway IP address (access through the **Settings > Product Setup > Communications > Network** menu tree in EnerVista UR Setup).
- Server configuration: IED name and logical device instance (access through the **Settings > Product Setup > Communications > IEC 61850 > Server Configuration** menu tree in EnerVista UR Setup).
- Logical node prefixes, which includes prefixes for all logical nodes except LLN0 (access through the **Settings > Product Setup > Communications > IEC 61850 > Logical Node Prefixes** menu tree in EnerVista UR Setup).

- MMXU deadbands, which includes deadbands for all available MMXUs. The number of MMXUs is related to the number of CT/VT modules in the relay. There are two MMXUs for each CT/VT module. For example, if a relay contains two CT/VT modules, there will be four MMXUs available (access through the **Settings > Product Setup > Communications > IEC 61850 > MMXU Deadbands** menu tree in EnerVista UR Setup).
- GGIO1 status configuration, which includes the number of status points in GGIO1 as well as the potential internal mappings for each GGIO1 indication. However only the number of status points will be used in the ICD creation process (access through the **Settings > Product Setup > Communications > IEC 61850 > GGIO1 Status Configuration** menu tree in EnerVista UR Setup).
- GGIO2 control configuration, which includes ctlModels for all SPCSOs within GGIO2 (access through the **Settings > Product Setup > Communications > IEC 61850 > GGIO2 Control Configuration** menu tree in EnerVista UR Setup).
- Configurable transmission GOOSE, which includes eight configurable datasets that can be used for GOOSE transmission. The GOOSE ID can be specified for each dataset (it must be unique within the IED as well as across the whole substation), as well as the destination MAC address, VLAN priority, VLAN ID, ETYPE APPID, and the dataset items. The selection of the dataset item is restricted by firmware version; for version 7.2x, only GGIO1.ST.Indx.stVal and GGIO1.ST.Indx.q are valid selection (where *x* is between 1 to *N*, and *N* is determined by number of GGIO1 status points). Although configurable transmission GOOSE can also be created and altered by some third-party system configurators, we recommend configuring transmission GOOSE for GE Multilin IEDs before creating the ICD, and strictly within EnerVista UR Setup software or the front panel display (access through the **Settings > Product Setup > Communications > IEC 61850 > GSSE/GOOSE Configuration > Transmission > Tx Configurable GOOSE** menu tree in EnerVista UR Setup).
- Configurable reception GOOSE, which includes eight configurable datasets that can be used for GOOSE reception. However, unlike datasets for transmission, datasets for reception only contains dataset items, and they are usually created automatically by process of importing the SCD file (access through the **Settings > Product Setup > Communications > IEC 61850 > GSSE/GOOSE Configuration > Reception > Rx Configurable GOOSE** menu tree in EnerVista UR Setup).
- Remote devices configuration, which includes remote device ID (GOOSE ID or GoID of the incoming transmission GOOSE dataset), ETYPE APPID (of the GSE communication block for the incoming transmission GOOSE), and DATASET (which is the name of the associated reception GOOSE dataset). These settings are usually done automatically by process of importing SCD file (access through the **Settings > Inputs/Outputs > Remote Devices** menu tree in EnerVista UR Setup).
- Remote inputs configuration, which includes device (remote device ID) and item (which dataset item in the associated reception GOOSE dataset to map) values. Only the items with cross-communication link created in SCD file should be mapped. These configurations are usually done automatically by process of importing SCD file (access through the **Settings > Inputs/Outputs > Remote Inputs** menu tree in EnerVista UR Setup).

C

C.5.3 ABOUT ICD FILES

The SCL language is based on XML, and its syntax definition is described as a W3C XML Schema. ICD is one type of SCL file (which also includes SSD, CID and SCD files). The ICD file describes the capabilities of an IED and consists of four major sections:

- Header
- Communication
- IEDs
- DataTypeTemplates

The root file structure of an ICD file is illustrated below.

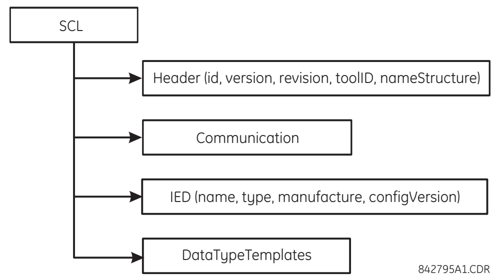

Figure C–2: ICD FILE STRUCTURE, SCL (ROOT) NODE

C

The **Header** node identifies the ICD file and its version, and specifies options for the mapping of names to signals

The **Communication** node describes the direct communication connection possibilities between logical nodes by means of logical buses (sub-networks) and IED access ports. The communication section is structured as follows.

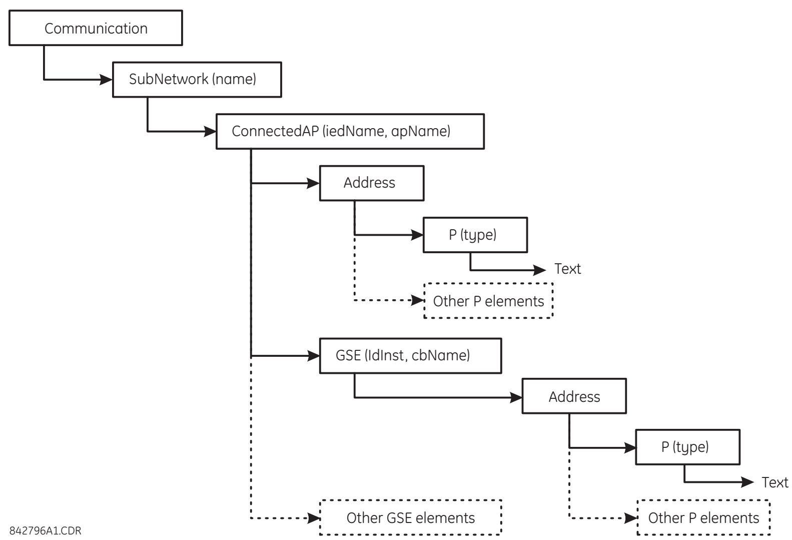

Figure C–3: ICD FILE STRUCTURE, COMMUNICATIONS NODE

The **SubNetwork** node contains all access points which can (logically) communicate with the sub-network protocol and without the intervening router. The **ConnectedAP** node describes the IED access point connected to this sub-network. The **Address** node contains the address parameters of the access point. The **GSE** node provides the address element for stating the control block related address parameters, where **IdInst** is the instance identification of the logical device within the IED on which the control block is located, and **cbName** is the name of the control block.

The **IED** node describes the (pre-)configuration of an IED: its access points, the logical devices, and logical nodes instantiated on it. Furthermore, it defines the capabilities of an IED in terms of communication services offered and, together with its **LNType**, instantiated data (DO) and its default or configuration values. There should be only one IED section in an ICD since it only describes one IED.

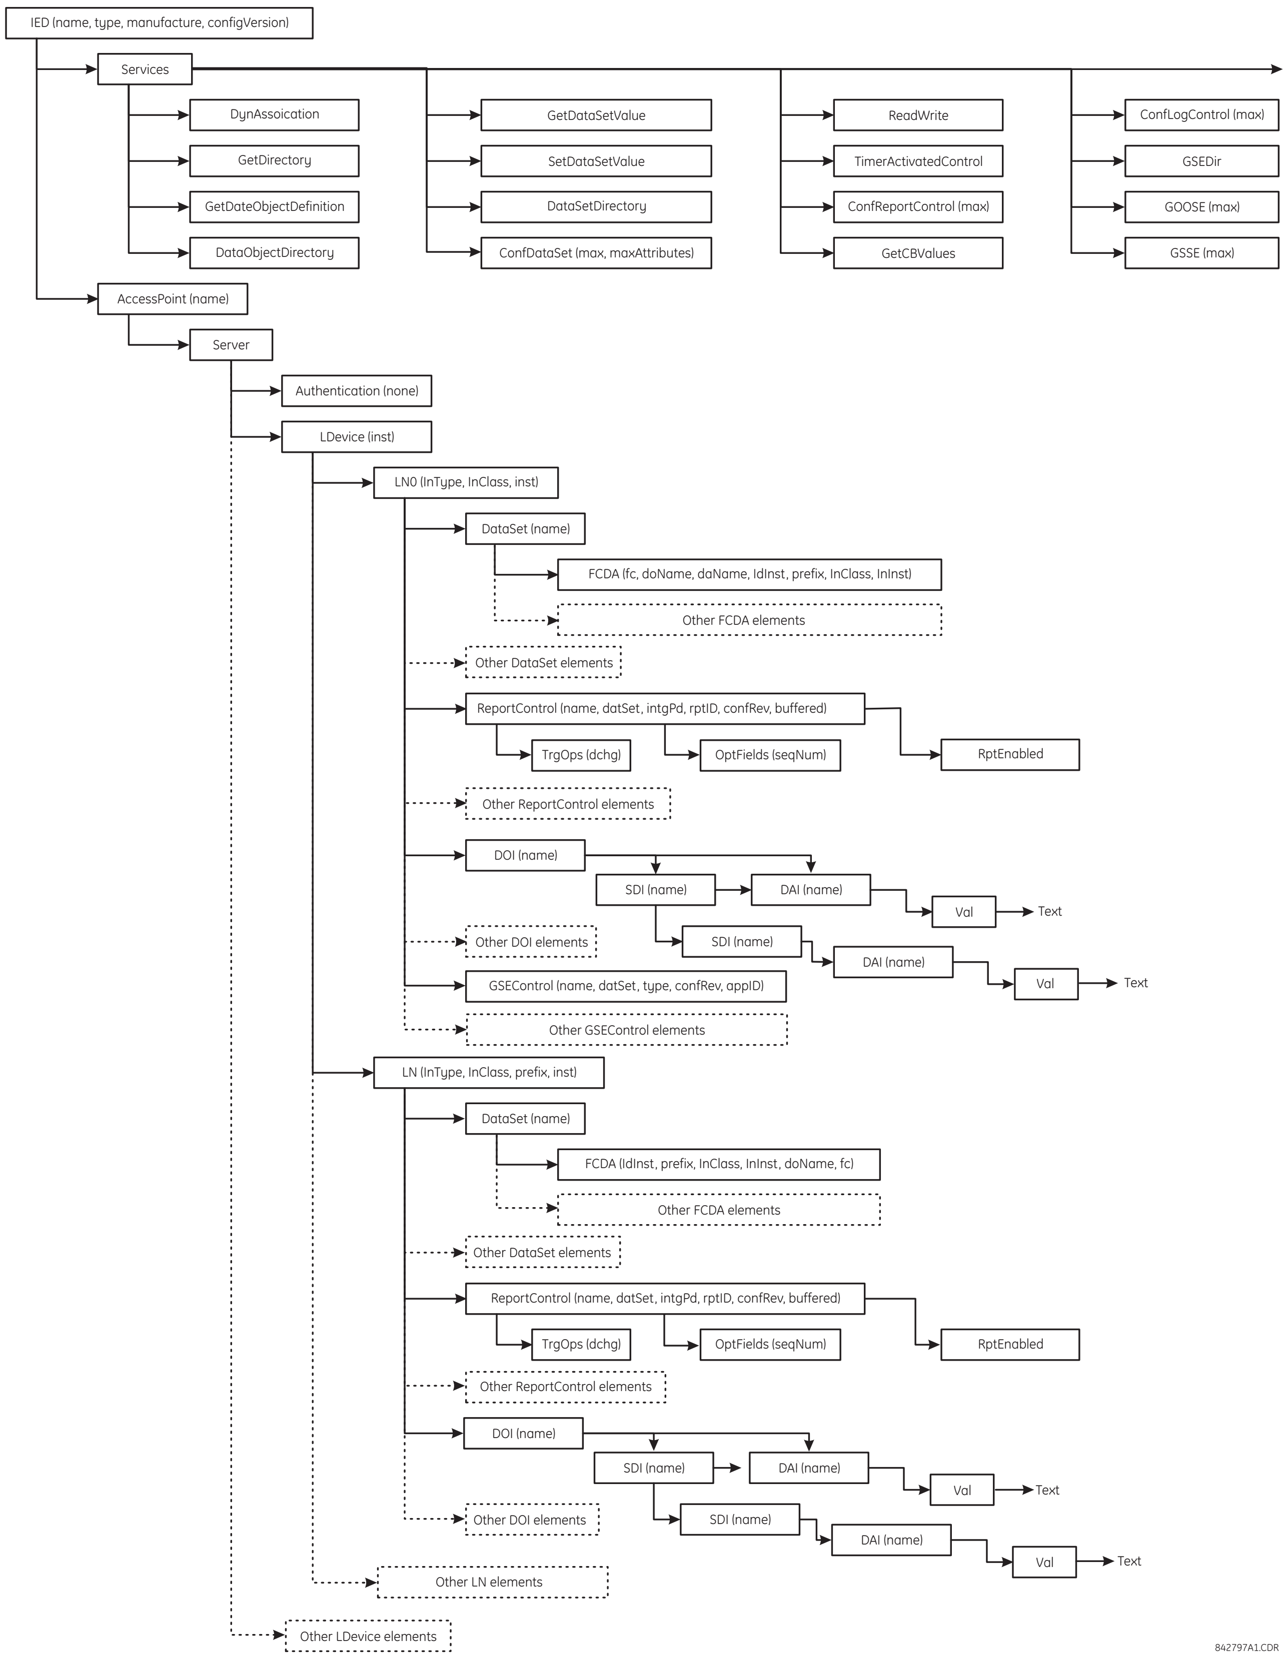

Figure C–4: ICD FILE STRUCTURE, IED NODE

The **DataTypeTemplates** node defines instantiable logical node types. A logical node type is an instantiable template of the data of a logical node. A **LnodeType** is referenced each time that this instantiable type is needed with an IED. A logical node type template is built from DATA (DO) elements, which again have a DO type, which is derived from the DATA classes (CDC). DOs consist of attributes (DA) or of elements of already defined DO types (SDO). The attribute (DA) has a functional constraint, and can either have a basic type, be an enumeration, or a structure of a **DAType**. The DAType is built from BDA elements, defining the structure elements, which again can be **BDA** elements of have a base type such as DA.

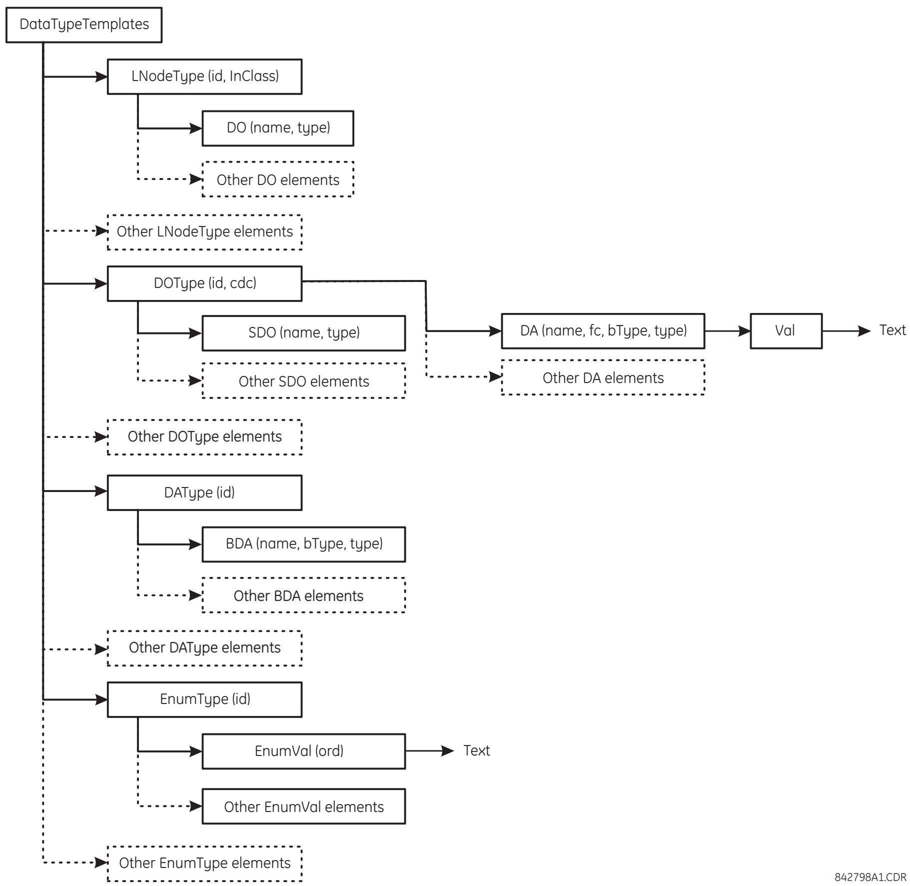

Figure C–5: ICD FILE STRUCTURE, DATATYPETEMPLATES NODE

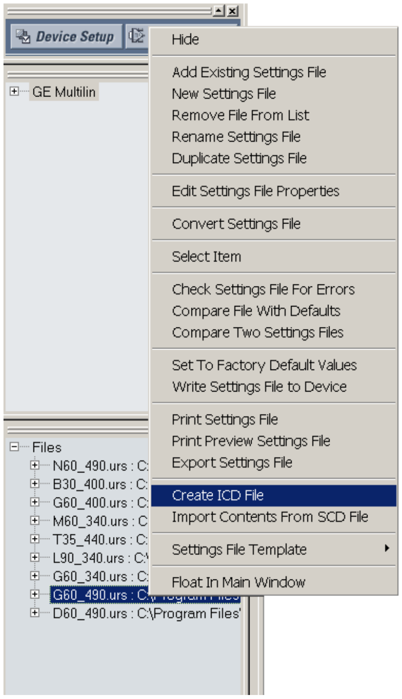
C.5.4 CREATING AN ICD FILE WITH ENERVISTA UR SETUP

An ICD file can be created directly from a connected F60 IED or from an offline F60 settings file with the EnerVista UR Setup software using the following procedure:

1. Right-click the connected UR-series relay or settings file and select **Create ICD File**.



2. The EnerVista UR Setup will prompt to save the file. Select the file path and enter the name for the ICD file, then click **OK** to generate the file.

The time to create an ICD file from the offline F60 settings file is typically much quicker than create an ICD file directly from the relay.

C.5.5 ABOUT SCD FILES

System configuration is performed in the system configurator. While many vendors (including GE Multilin) are working their own system configuration tools, there are some system configurators available in the market (for example, Siemens DIGSI version 4.6 or above and ASE Visual SCL Beta 0.12).

Although the configuration tools vary from one vendor to another, the procedure is pretty much the same. First, a substation project must be created, either as an empty template or with some system information by importing a system specification file (SSD). Then, IEDs are added to the substation. Since each IED is represented by its associated ICD, the ICD files are imported into the substation project, and the system configurator validates the ICD files during the importing process. If the ICD files are successfully imported into the substation project, it may be necessary to perform some additional minor steps to attach the IEDs to the substation (see the system configurator manual for details).

Once all IEDs are inserted into the substation, further configuration is possible, such as:

- Assigning network addresses to individual IEDs.
- Customizing the prefixes of logical nodes.
- Creating cross-communication links (configuring GOOSE messages to send from one IED to others).

When system configurations are complete, the results are saved to an SCD file, which contains not only the configuration for each IED in the substation, but also the system configuration for the entire substation. Finally, the SCD file is passed back to the IED configurator (vendor specific tool) to update the new configuration into the IED.

The SCD file consists of at least five major sections:

- Header.
- Substation.
- Communication.
- IED section (one or more).
- DataTypeTemplates.

The root file structure of an SCD file is illustrated below.

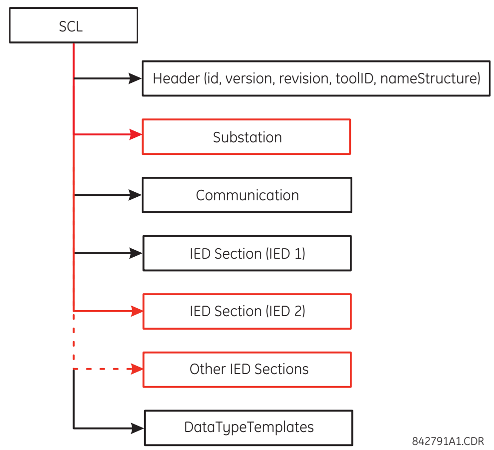


Figure C–6: SCD FILE STRUCTURE, SCL (ROOT) NODE

Like ICD files, the **Header** node identifies the SCD file and its version, and specifies options for the mapping of names to signals.

The **Substation** node describes the substation parameters:

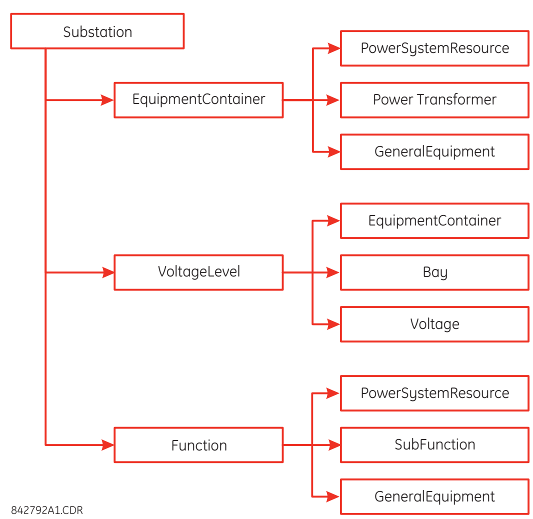

Figure C–7: SCD FILE STRUCTURE, SUBSTATION NODE

The **Communication** node describes the direct communication connection possibilities between logical nodes by means of logical buses (sub-networks) and IED access ports. The communication section is structured as follows.

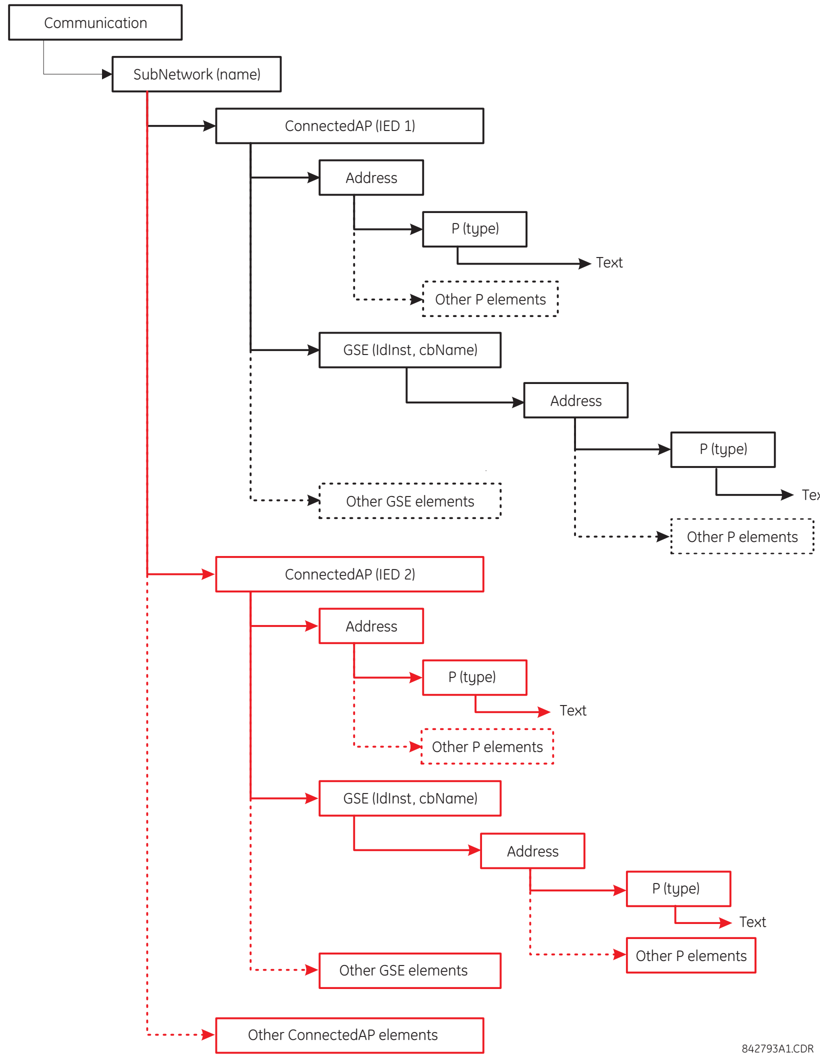

Figure C–8: SCD FILE STRUCTURE, COMMUNICATIONS NODE

The **SubNetwork** node contains all access points which can (logically) communicate with the sub-network protocol and without the intervening router. The **ConnectedAP** node describes the IED access point connected to this sub-network. The **Address** node contains the address parameters of the access point. The **GSE** node provides the address element for stating the control block related address parameters, where **IdInst** is the instance identification of the logical device within the IED on which the control block is located, and **cbName** is the name of the control block.

The **IED Section** node describes the configuration of an IED.

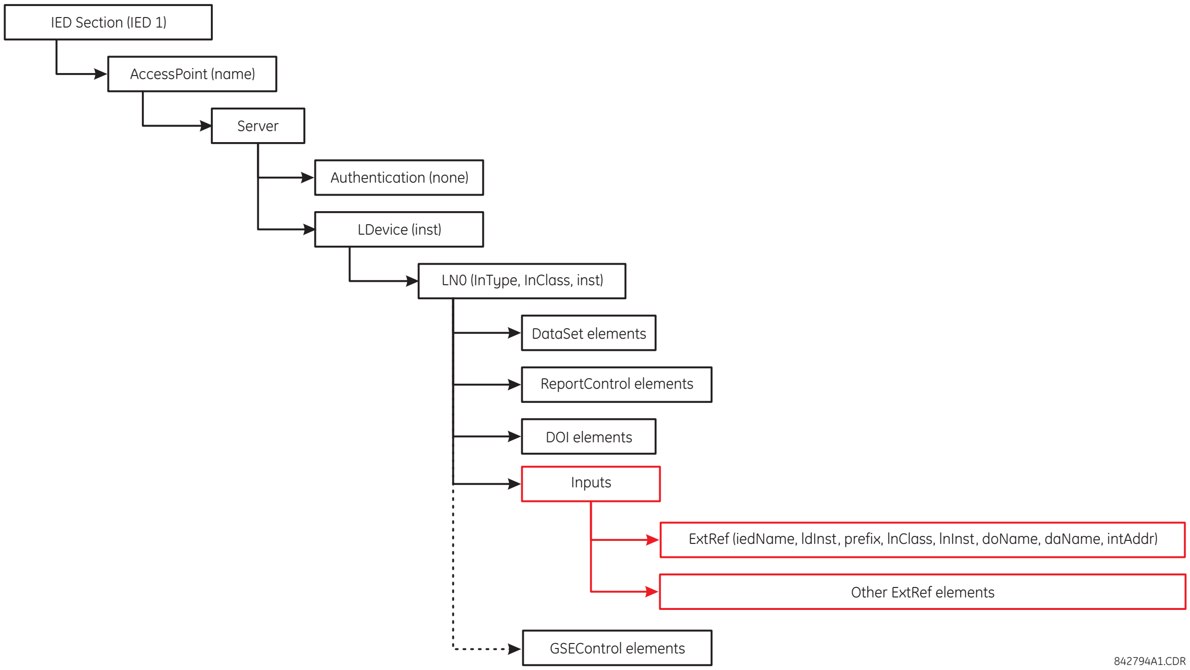

Figure C–9: SCD FILE STRUCTURE, IED NODE

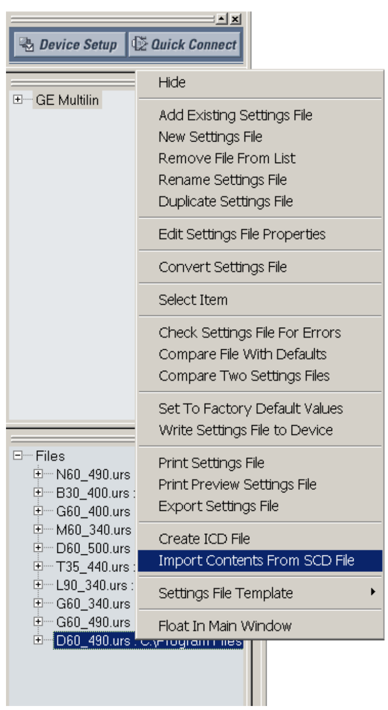
C.5.6 IMPORTING AN SCD FILE WITH ENERVISTA UR SETUP

The following procedure describes how to update the F60 with the new configuration from an SCD file with the EnerVista UR Setup software.

1. Right-click anywhere in the files panel and select the **Import Contents From SCD File** item.



2. Select the saved SCD file and click **Open**.

3. The software will open the SCD file and then prompt the user to save a UR-series settings file. Select a location and name for the URS (UR-series relay settings) file.

   If there is more than one GE Multilin IED defined in the SCD file, the software prompt the user to save a UR-series settings file for each IED.

4. After the URS file is created, modify any settings (if required).

5. To update the relay with the new settings, right-click on the settings file in the settings tree and select the **Write Settings File to Device** item.

6. The software will prompt for the target device. Select the target device from the list provided and click **Send**. The new settings will be updated to the selected device.

c10: shall declare support for at least one (SendMSVMessage or SendUSVMessage)

C.7.1 LOGICAL NODES TABLE

The UR-series of relays supports IEC 61850 logical nodes as indicated in the following table. Note that the actual instantiation of each logical node is determined by the product order code. For example. the logical node “PDIS” (distance protection) is available only in the D60 Line Distance Relay.

Table C–1: IEC 61850 LOGICAL NODES (Sheet 1 of 4)

NODES	UR-FAMILY
L: SYSTEM LOGICAL NODES	
LPHD: Physical device information	Yes
LLN0: Logical node zero	Yes

ZTRC: Thyristor controlled reactive component	---

D.1.1 OVERVIEW

IEC 60870-5-103 is defined as a companion standard for the informative element of the protection equipment. IEC 60870-5-103 defines communication for a serial, unbalanced link only. Communication speeds are defined as either 9600 or 19200 baud.

This manual assumes basic knowledge of the IEC 60870-5-103 protocol and the standard IEC 60870 documents relating to the protocol.

Standard IEC 60870 documents relating to IEC 60870-5-103:

- IEC 60870-5-1 Transmission frame formats
- IEC 60870-5-2 Link transmission procedures
- IEC 60870-5-3 General structure of application data
- IEC 60870-5-4 Definition and coding of application information elements
- IEC 60870-5-5 Basic application functions
- IEC 60870-5-6 Conformance testing guidelines

An IEC 60870-5-103 device is required to provide an interoperability table. Interoperability means that any required application data in the device, which can be coded into an IEC 60870-5-103 data type, can be mapped into the IEC 60870-5-103 address space. This data is recognized by any IEC 60870-5-103 master.

D.1.2 FACTOR AND OFFSET CALCULATION TO TRANSMIT MEASURAND

The general formula for the transmitted value is Xt = a * X + b

where X is the measurand, a is the multiplication factor, b is the offset and Xt is the value transmitted.

The conditions for determining a and b, when the values exceed the range are:

4096 = a*Xmax + b (Xmax is the maximum value for the measurand)

-4095 =a*Xmin + b (Xmin is the minimum value for the measurand)

By solving the above system of equations for a and b, we find that:

a = 8191 / (Xmax - Xmin)

b = -4096 * (Xmax + Xmin) / (Xmax - Xmin)

So

Xt = 8191/(Xmax - Xmin)) * X - 4096 * (Xmax + Xmin) / (Xmax - Xmin)

We may further simplify the above formula for situations where:

1)

Xmin = -Xmax (positive and negative values) :

Xt = (8191/2*Xmax) * X

a = 4096/Xmax

b = 0

2)

If Xmin = 0 (only positive values)

Xt = (8191/Xmax) * X - 4096

a = 2 * 4096/Xmax

b = -4096

To calculate Xmax, one needs to know the rated value for the specific type of measurand.

Xmax = 2.4 * Xrated

D.1.3 INTEROPERABILITY DOCUMENT

The boxes indicate the following: ☒ – used in standard direction; ☐ – not used.

1. PHYSICAL LAYER

Electrical interface

☒ EIA RS-485

32 Number of loads for one protection equipment

Transmission Speed (monitor direction):

Unbalanced Interchange Circuit V.24/V.28 Standard:	Unbalanced Interchange Circuit V.24/V.28 Recommended if >1200 bits/s:	Balanced Interchange Circuit X.24/X.27:
■ ~~100 bits/sec.~~	■ ~~2400 bits/sec.~~	■ ~~2400 bits/sec.~~
■ ~~200 bits/sec.~~	■ ~~4800 bits/sec.~~	■ ~~4800 bits/sec.~~
■ ~~300 bits/sec.~~	■ ~~9600 bits/sec.~~	■ ~~9600 bits/sec.~~
■ ~~600 bits/sec.~~		■ ~~19200 bits/sec.~~
■ ~~1200 bits/sec.~~		■ ~~38400 bits/sec.~~
		■ ~~56000 bits/sec.~~
		■ ~~64000 bits/sec.~~

4. LINK LAYER

Link Transmission Procedure:	Address Field of the Link:
■ ~~Balanced Transmission~~	■ ~~Not Present (Balanced Transmission Only)~~
■ ~~Unbalanced Transmission~~	■ ~~One Octet~~
	■ ~~Two Octets~~
	■ ~~Structured~~
	■ ~~Unstructured~~
Frame Length (maximum length, number of octets): Not selectable in companion IEC 60870-5-104 standard	

E

When using an unbalanced link layer, the following ADSU types are returned in class 2 messages (low priority) with the indicated causes of transmission:

■ ~~The standard assignment of ADSUs to class 2 messages is used as follows~~:

■ ~~A special assignment of ADSUs to class 2 messages is used as follows~~:

5. APPLICATION LAYER

Transmission Mode for Application Data:
Mode 1 (least significant octet first), as defined in Clause 4.10 of IEC 60870-5-4, is used exclusively in this companion standard.

Common Address of ADSU:

■ ~~One Octet~~

⊠ Two Octets

Information Object Address:

■ ~~One Octet~~

■ ~~Two Octets~~

⊠ Three Octets

⊠ Structured

⊠ Unstructured

Cause of Transmission:

■ ~~One Octet~~

⊠ Two Octets (with originator address). Originator address is set to zero if not used.

Maximum Length of APDU: 253 (the maximum length may be reduced by the system.

Selection of standard ASDUs:

For the following lists, the boxes indicate the following: ⊠ – used in standard direction; ☐ – not used; ■ – cannot be selected in IEC 60870-5-104 standard.

Process information in monitor direction

⊠ <1> := Single-point information	M_SP_NA_1
■ ~~<2> := Single-point information with time tag~~	~~M_SP_TA_1~~
☐ <3> := Double-point information	M_DP_NA_1

6. BASIC APPLICATION FUNCTIONS

Station Initialization:

☒ Remote initialization

Cyclic Data Transmission:

☒ Cyclic data transmission

Read Procedure:

☒ Read procedure

Spontaneous Transmission:

☒ Spontaneous transmission

Double transmission of information objects with cause of transmission spontaneous:

The following type identifications may be transmitted in succession caused by a single status change of an information object. The particular information object addresses for which double transmission is enabled are defined in a project-specific list.

☐ Single point information: M_SP_NA_1, M_SP_TA_1, M_SP_TB_1, and M_PS_NA_1

☐ Double point information: M_DP_NA_1, M_DP_TA_1, and M_DP_TB_1

☐ Step position information: M_ST_NA_1, M_ST_TA_1, and M_ST_TB_1

☐ Bitstring of 32 bits: M_BO_NA_1, M_BO_TA_1, and M_BO_TB_1 (if defined for a specific project)

☐ Measured value, normalized value: M_ME_NA_1, M_ME_TA_1, M_ME_ND_1, and M_ME_TD_1

☐ Measured value, scaled value: M_ME_NB_1, M_ME_TB_1, and M_ME_TE_1

☐ Measured value, short floating point number: M_ME_NC_1, M_ME_TC_1, and M_ME_TF_1

Station interrogation:

☒ Global

☒ Group 1	☒ Group 5	☒ Group 9	☒ Group 13
☒ Group 2	☒ Group 6	☒ Group 10	☒ Group 14
☒ Group 3	☒ Group 7	☒ Group 11	☒ Group 15
☒ Group 4	☒ Group 8	☒ Group 12	☒ Group 16

Clock synchronization:

☒ Clock synchronization (optional, see Clause 7.6)

Command transmission:

☒ Direct command transmission

☐ Direct setpoint command transmission

☒ Select and execute command

☐ Select and execute setpoint command

☒ C_SE ACTTERM used

☒ No additional definition

☒ Short pulse duration (duration determined by a system parameter in the outstation)

☒ Long pulse duration (duration determined by a system parameter in the outstation)

☒ Persistent output

☒ Supervision of maximum delay in command direction of commands and setpoint commands

Maximum allowable delay of commands and setpoint commands: **10 s**

Transmission of integrated totals:

☒ Mode A: Local freeze with spontaneous transmission

☒ Mode B: Local freeze with counter interrogation

☒ Mode C: Freeze and transmit by counter-interrogation commands

☒ Mode D: Freeze by counter-interrogation command, frozen values reported simultaneously

☒ Counter read

☒ Counter freeze without reset

☒ Counter freeze with reset

☒ Counter reset

☒ General request counter

☒ Request counter group 1

☒ Request counter group 2

☒ Request counter group 3

☒ Request counter group 4

Parameter loading:

☒ Threshold value

☐ Smoothing factor

☐ Low limit for transmission of measured values

☐ High limit for transmission of measured values

Parameter activation:

☐ Activation/deactivation of persistent cyclic or periodic transmission of the addressed object

Test procedure:

☐ Test procedure

File transfer:

File transfer in monitor direction:

☐ Transparent file

☐ Transmission of disturbance data of protection equipment

☐ Transmission of sequences of events

☐ Transmission of sequences of recorded analog values

File transfer in control direction:

☐ Transparent file

Background scan:

☐ Background scan

Acquisition of transmission delay:

■ ~~Acquisition of transmission delay~~

Definition of time outs:

PARAMETER	DEFAULT VALUE	REMARKS	SELECTED VALUE
t_0	30 s	Timeout of connection establishment	120 s
t_1	15 s	Timeout of send or test APDUs	15 s
t_2	10 s	Timeout for acknowledgements in case of no data messages $t_2 < t_1$	10 s
t_3	20 s	Timeout for sending test frames in case of a long idle state	20 s

Maximum range of values for all time outs: 1 to 255 s, accuracy 1 s

Maximum number of outstanding I-format APDUs *k* and latest acknowledge APDUs (*w*):

PARAMETER	DEFAULT VALUE	REMARKS	SELECTED VALUE
k	12 APDUs	Maximum difference receive sequence number to send state variable	12 APDUs
w	8 APDUs	Latest acknowledge after receiving *w* I-format APDUs	8 APDUs

E

Maximum range of values *k*: 1 to 32767 (2^{15} – 1) APDUs, accuracy 1 APDU

Maximum range of values *w*: 1 to 32767 APDUs, accuracy 1 APDU
Recommendation: *w* should not exceed two-thirds of *k*.

Portnumber:

PARAMETER	VALUE	REMARKS
Portnumber	2404	In all cases

RFC 2200 suite:

RFC 2200 is an official Internet Standard which describes the state of standardization of protocols used in the Internet as determined by the Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects has to be chosen by the user of this standard.

☒ Ethernet 802.3

☐ Serial X.21 interface

☐ Other selection(s) from RFC 2200 (list below if selected)

E.1.2 IEC 60870-5-104 POINT LIST

The IEC 60870-5-104 data points are configured through the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP / IEC104 POINT LISTS** menu. See the *Communications* section of chapter 5 for details.

E

F.1.1 DNP V3.00 DEVICE PROFILE

The following table provides a 'Device Profile Document' in the standard format defined in the DNP 3.0 Subset Definitions Document.

Table F–1: DNP V3.00 DEVICE PROFILE (Sheet 1 of 3)

(Also see the IMPLEMENTATION TABLE in the following section)	
Vendor Name: **General Electric Multilin**	
Device Name: **UR Series Relay**	
Highest DNP Level Supported: For Requests: **Level 2** For Responses: **Level 2**	**Device Function:** ☐ Master ☒ **Slave**
Notable objects, functions, and/or qualifiers supported in addition to the Highest DNP Levels Supported (the complete list is described in the attached table): **Binary Inputs (Object 1)** **Binary Input Changes (Object 2)** **Binary Outputs (Object 10)** **Control Relay Output Block (Object 12)** **Binary Counters (Object 20)** **Frozen Counters (Object 21)** **Counter Change Event (Object 22)** **Frozen Counter Event (Object 23)** **Analog Inputs (Object 30)** **Analog Input Changes (Object 32)** **Analog Deadbands (Object 34)** **Time and Date (Object 50)** **File Transfer (Object 70)** **Internal Indications (Object 80)**	
Maximum Data Link Frame Size (octets): Transmitted: **292** Received: **292**	**Maximum Application Fragment Size (octets):** Transmitted: **configurable up to 2048** Received: **2048**
Maximum Data Link Re-tries: ☒ **None** ☐ Fixed at 3 ☐ Configurable	**Maximum Application Layer Re-tries:** ☒ **None** ☐ Configurable
Requires Data Link Layer Confirmation: ☒ Never ☐ Always ☐ Sometimes ☐ Configurable	

F

Table F–1: DNP V3.00 DEVICE PROFILE (Sheet 2 of 3)

Requires Application Layer Confirmation:

- ☐ Never
- ☐ Always
- ☒ When reporting Event Data
- ☒ When sending multi-fragment responses
- ☐ Sometimes
- ☐ Configurable

Timeouts while waiting for:

Data Link Confirm:	☒ None	☐ Fixed at ____	☐ Variable	☐ Configurable
Complete Appl. Fragment:	☒ **None**	☐ Fixed at ____	☐ Variable	☐ Configurable
Application Confirm:	☐ None	☒ **Fixed at 10 s**	☐ Variable	☐ Configurable
Complete Appl. Response:	☒ **None**	☐ Fixed at ____	☐ Variable	☐ Configurable

Others:

Transmission Delay:	**No intentional delay**
Need Time Interval:	**Configurable (default = 24 hrs.)**
Select/Operate Arm Timeout:	**10 s**
Binary input change scanning period:	**8 times per power system cycle**
Analog input change scanning period:	**500 ms**
Counter change scanning period:	**500 ms**
Frozen counter event scanning period:	**500 ms**
Unsolicited response notification delay:	**100 ms**
Unsolicited response retry delay	**configurable 0 to 60 sec.**

Sends/Executes Control Operations:

WRITE Binary Outputs	☒ **Never**	☐ Always	☐ Sometimes	☐ Configurable
SELECT/OPERATE	☐ Never	☒ **Always**	☐ Sometimes	☐ Configurable
DIRECT OPERATE	☐ Never	☒ **Always**	☐ Sometimes	☐ Configurable
DIRECT OPERATE – NO ACK	☐ Never	☒ **Always**	☐ Sometimes	☐ Configurable

Count > 1	☒ **Never**	☐ Always	☐ Sometimes	☐ Configurable
Pulse On	☐ Never	☐ Always	☒ **Sometimes**	☐ Configurable
Pulse Off	☐ Never	☐ Always	☒ **Sometimes**	☐ Configurable
Latch On	☐ Never	☐ Always	☒ **Sometimes**	☐ Configurable
Latch Off	☐ Never	☐ Always	☒ **Sometimes**	☐ Configurable

Queue	☒ **Never**	☐ Always	☐ Sometimes	☐ Configurable
Clear Queue	☒ **Never**	☐ Always	☐ Sometimes	☐ Configurable

Explanation of 'Sometimes': Object 12 points are mapped to UR Virtual Inputs. The persistence of Virtual Inputs is determined by the **VIRTUAL INPUT X TYPE** settings. Both "Pulse On" and "Latch On" operations perform the same function in the UR; that is, the appropriate Virtual Input is put into the "On" state. If the Virtual Input is set to "Self-Reset", it will reset after one pass of FlexLogic. The On/Off times and Count value are ignored. "Pulse Off" and "Latch Off" operations put the appropriate Virtual Input into the "Off" state. "Trip" and "Close" operations both put the appropriate Virtual Input into the "On" state.

Table F–1: DNP V3.00 DEVICE PROFILE (Sheet 3 of 3)

Reports Binary Input Change Events when no specific variation requested: ☐ Never ☒ **Only time-tagged** ☐ Only non-time-tagged ☐ Configurable	**Reports time-tagged Binary Input Change Events when no specific variation requested:** ☐ Never ☒ Binary Input Change With Time ☐ Binary Input Change With Relative Time ☐ Configurable (attach explanation)
Sends Unsolicited Responses: ☐ **Never** ☒ Configurable ☐ Only certain objects ☐ Sometimes (attach explanation) ☒ ENABLE/DISABLE unsolicited Function codes supported	**Sends Static Data in Unsolicited Responses:** ☒ Never ☐ When Device Restarts ☐ When Status Flags Change No other options are permitted.
Default Counter Object/Variation: ☐ No Counters Reported ☐ Configurable (attach explanation) ☒ **Default Object: 20** **Default Variation: 1** ☒ **Point-by-point list attached**	**Counters Roll Over at:** ☐ No Counters Reported ☐ Configurable (attach explanation) ☒ **16 Bits (Counter 8)** ☒ **32 Bits (Counters 0 to 7, 9)** ☐ Other Value: _____ ☒ **Point-by-point list attached**
Sends Multi-Fragment Responses: ☒ **Yes** ☐ No	

F

F.1.2 IMPLEMENTATION TABLE

The following table identifies the variations, function codes, and qualifiers supported by the F60 in both request messages and in response messages. For static (non-change-event) objects, requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01. Static object requests sent with qualifiers 17 or 28 will be responded with qualifiers 17 or 28. For change-event objects, qualifiers 17 or 28 are always responded.

Table F–2: IMPLEMENTATION TABLE (Sheet 1 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)
1	0	Binary Input (Variation 0 is used to request default variation)	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	Binary Input	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	2	Binary Input with Status	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
2	0	Binary Input Change (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	Binary Input Change without Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	Binary Input Change with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response 130 (unsol. resp.)	17, 28 (index)
	3	Binary Input Change with Relative Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
10	0	Binary Output Status (Variation 0 is used to request default variation)	1 (read)	00, 01(start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	2	Binary Output Status	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
12	1	Control Relay Output Block	3 (select) 4 (operate) 5 (direct op) 6 (dir. op, noack)	00, 01 (start-stop) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	echo of request
20	0	Binary Counter (Variation 0 is used to request default variation)	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01(start-stop) 06(no range, or all) 07, 08(limited quantity) 17, 28(index)		
	1	32-Bit Binary Counter	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. See the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the F60 is not restarted, but the DNP process is restarted.

Table F–2: IMPLEMENTATION TABLE (Sheet 2 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	**VARIATION NO.**	**DESCRIPTION**	**FUNCTION CODES (DEC)**	**QUALIFIER CODES (HEX)**	**FUNCTION CODES (DEC)**	**QUALIFIER CODES (HEX)**
20 cont'd	2	16-Bit Binary Counter	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	5	32-Bit Binary Counter without Flag	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	6	16-Bit Binary Counter without Flag	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
21	0	Frozen Counter (Variation 0 is used to request default variation)	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	32-Bit Frozen Counter	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	2	16-Bit Frozen Counter	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	9	32-Bit Frozen Counter without Flag	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	10	16-Bit Frozen Counter without Flag	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
22	0	Counter Change Event (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	32-Bit Counter Change Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	16-Bit Counter Change Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	5	32-Bit Counter Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	6	16-Bit Counter Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
23	0	Frozen Counter Event (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	32-Bit Frozen Counter Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	16-Bit Frozen Counter Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. See the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the F60 is not restarted, but the DNP process is restarted.

F

Table F–2: IMPLEMENTATION TABLE (Sheet 3 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)

---		No Object (function code only) *see Note 3*	13 (cold restart)			
---		No Object (function code only)	14 (warm restart)			
---		No Object (function code only)	23 (delay meas.)			

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. See the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the F60 is not restarted, but the DNP process is restarted.

F.2.1 BINARY INPUT POINTS

The DNP binary input data points are configured through the **PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP / IEC104 POINT LISTS ⇨ BINARY INPUT / MSP POINTS** menu. See the *Communications* section of Chapter 5 for details. When a freeze function is performed on a binary counter point, the frozen value is available in the corresponding frozen counter point.

BINARY INPUT POINTS

Static (Steady-State) Object Number: **1**

Change Event Object Number: **2**

Request Function Codes supported: **1 (read), 22 (assign class)**

Static Variation reported when variation 0 requested: **2 (Binary Input with status), Configurable**

Change Event Variation reported when variation 0 requested: **2 (Binary Input Change with Time), Configurable**

Change Event Scan Rate: **8 times per power system cycle**

Change Event Buffer Size: **500**

Default Class for All Points: **1**

F.2.2 BINARY AND CONTROL RELAY OUTPUT

Supported Control Relay Output Block fields: Pulse On, Pulse Off, Latch On, Latch Off, Paired Trip, Paired Close.

BINARY OUTPUT STATUS POINTS
Object Number: **10**
Request Function Codes supported: **1 (read)**
Default Variation reported when Variation 0 requested: **2 (Binary Output Status)**
CONTROL RELAY OUTPUT BLOCKS
Object Number: **12**
Request Function Codes supported: **3 (select), 4 (operate), 5 (direct operate), 6 (direct operate, noack)**

F.2.3 COUNTERS

The following table lists both Binary Counters (Object 20) and Frozen Counters (Object 21). When a freeze function is performed on a Binary Counter point, the frozen value is available in the corresponding Frozen Counter point.

BINARY COUNTERS

Static (Steady-State) Object Number: **20**

Change Event Object Number: **22**

Request Function Codes supported: **1 (read), 7 (freeze), 8 (freeze noack), 9 (freeze and clear), 10 (freeze and clear, noack), 22 (assign class)**

Static Variation reported when variation 0 requested: **1 (32-Bit Binary Counter with Flag)**

Change Event Variation reported when variation 0 requested: **1 (32-Bit Counter Change Event without time)**

Change Event Buffer Size: **10**

Default Class for all points: **3**

FROZEN COUNTERS

Static (Steady-State) Object Number: **21**

Change Event Object Number: **23**

Request Function Codes supported: **1 (read)**

Static Variation reported when variation 0 requested: **1 (32-Bit Frozen Counter with Flag)**

Change Event Variation reported when variation 0 requested: **1 (32-Bit Frozen Counter Event without time)**

Change Event Buffer Size: **10**

Default Class for all points: **3**

F

Table F–4: BINARY AND FROZEN COUNTERS

POINT INDEX	NAME/DESCRIPTION
0	Digital Counter 1
1	Digital Counter 2
2	Digital Counter 3
3	Digital Counter 4
4	Digital Counter 5
5	Digital Counter 6
6	Digital Counter 7
7	Digital Counter 8
8	Oscillography Trigger Count
9	Events Since Last Clear

A counter freeze command has no meaning for counters 8 and 9. F60 Digital Counter values are represented as 32-bit integers. The DNP 3.0 protocol defines counters to be unsigned integers. Care should be taken when interpreting negative counter values.

F.2.4 ANALOG INPUTS

The DNP analog input data points are configured through the **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **DNP / IEC104 POINT LISTS** ⇨ **ANALOG INPUT / MME POINTS** menu. See the *Communications* section of Chapter 5 for details.

It is important to note that 16-bit and 32-bit variations of analog inputs are transmitted through DNP as signed numbers. Even for analog input points that are not valid as negative values, the maximum positive representation is 32767 for 16-bit values and 2147483647 for 32-bit values. This is a DNP requirement.

The deadbands for all Analog Input points are in the same units as the Analog Input quantity. For example, an Analog Input quantity measured in volts has a corresponding deadband in units of volts. This is in conformance with DNP Technical Bulletin 9809-001: Analog Input Reporting Deadband. Relay settings are available to set default deadband values according to data type. Deadbands for individual Analog Input Points can be set using DNP Object 34.

Static (Steady-State) Object Number: **30**

Change Event Object Number: **32**

Request Function Codes supported: **1 (read), 2 (write, deadbands only), 22 (assign class)**

Static Variation reported when variation 0 requested: **1 (32-Bit Analog Input)**

Change Event Variation reported when variation 0 requested: **1 (Analog Change Event without Time)**

Change Event Scan Rate: defaults to **500 ms**

Change Event Buffer Size: **256**

Default Class for all Points: **2**

G.1.1 RADIUS SERVER CONFIGURATION

The following procedure is an example of how to set up a simple RADIUS server, where the third-party tool used is also an example.

1. Download and install FreeRADIUS as the RADIUS server.
2. In the RADIUSD.CONF file, locate the "bind_address" field and enter your RADIUS server IP address.
3. In the USERS.CONF file in the <Path_to_Radius>\etc\raddb folder, add the following text to configure a user "Tester" with an Administrator role.

```
Tester:
->User-Password == "Testing1!1"
->GE-UR-Role = Administrator
```

4. In the CLIENTS.CONF file in the <Path_to_Radius>\etc\raddb folder, add the following text to define a RADIUS client, where the client IP address is 10.0.0.2, the subnet mask is 255.255.255.0, the shared secret specified here is also configured on the UR device for successful authentication, and the shortname is a short, optional alias that can be used in place of the IP address.

```
client 10.0.0.2/24 {
secret = testing123
shortname = private-network-1
}
```

5. In the <Path_to_Radius>\etc\raddb folder, create a file called dictionary.ge and add the following content.

```
# ############################################################
#  GE VSAs
#############################################################

VENDOR                          GE              2910

# Management authorization
BEGIN-VENDOR                    GE

# Role ID
ATTRIBUTE                       GE-UR-Role       1              integer

# GE-UR-ROLE values
VALUE GE-UR-Role                Administrator    1
VALUE GE-UR-Role                Supervisor       2
VALUE GE-UR-Role                Engineer         3
VALUE GE-UR-Role                Operator         4
VALUE GE-UR-Role                Observer         5

END-VENDOR                      GE
##############################################################
```

6. In the dictionary file in the <Path_to_Radius>\etc\raddb folder, add the following line.

```
$INCLUDE dictionary.ge
```

7. For the first start, run the RADIUS server in debug mode by entering

```
<Path_to_Radius>/start_radiusd_debug.bat
```

8. Set up the RADIUS client on the UR as follows. Access **Device > Settings > Product Setup > Security**. Configure the IP address and ports for the RADIUS server. Leave the GE vendor ID field at the default of 2910. Update the RADIUS shared secret as specified in the CLIENTS.CONF file.

H.1.1 REVISION HISTORY

MANUAL P/N	F60 REVISION	RELEASE DATE	ECO
1601-0093-A1	1.5x	23 March 1999	N/A
1601-0093-A2	1.6x	10 August 1999	URF-012
1601-0093-A3	1.8x	29 October 1999	URF-014
1601-0093-A4	1.8x	15 November 1999	URF-015
1601-0093-A5	2.0x	17 December 1999	URF-016
1601-0093-A6	2.2x	12 May 2000	URF-017
1601-0093-A7	2.2x	14 June 2000	URF-020
1601-0093-A7a	2.2x	28 June 2000	URF-020a
1601-0093-B1	2.4x	08 September 2000	URF-022
1601-0093-B2	2.4x	03 November 2000	URF-024
1601-0093-B3	2.6x	09 March 2001	URF-025
1601-0093-B4	2.8x	28 September 2001	URF-027
1601-0093-B5	2.9x	03 December 2001	URF-030
1601-0093-B6	2.6x	27 February 2004	URX-120
1601-0093-C1	3.0x	02 July 2002	URF-032
1601-0093-C2	3.1x	30 August 2002	URF-034
1601-0093-C3	3.0x	18 November 2002	URF-036
1601-0093-C4	3.1x	18 November 2002	URF-038
1601-0093-C5	3.0x	11 February 2003	URF-040
1601-0093-C6	3.1x	11 February 2003	URF-042
1601-0093-D1	3.2x	11 February 2003	URF-044
1601-0093-D2	3.2x	02 June 2003	URX-084
1601-0093-E1	3.3x	01 May 2003	URX-080
1601-0093-E2	3.3x	29 May 2003	URX-083
1601-0093-F1	3.4x	10 December 2003	URX-111
1601-0093-F2	3.4x	09 February 2004	URX-115
1601-0093-G1	4.0x	23 March 2004	URX-123
1601-0093-G2	4.0x	17 May 2004	URX-136
1601-0093-H1	4.2x	30 June 2004	URX-145
1601-0093-H2	4.2x	23 July 2004	URX-151
1601-0093-J1	4.4x	15 September 2004	URX-156
1601-0093-K1	4.6x	15 February 2005	URX-176
1601-0093-L1	4.8x	05 August 2005	URX-202
1601-0093-M1	4.9x	15 December 2005	URX-208
1601-0093-M2	4.9x	27 February 2006	URX-214
1601-0093-N1	5.0x	31 March 2006	URX-217
1601-0093-N2	5.0x	26 May 2006	URX-220
1601-0093-P1	5.2x	23 October 2006	URX-230
1601-0093-P2	5.2x	24 January 2007	URX-232
1601-0093-R1	5.4x	26 June 2007	URX-242
1601-0093-R2	5.4x	31 August 2007	URX-246
1601-0093-R3	5.4x	17 October 2007	URX-251
1601-0093-S1	5.5x	7 December 2007	URX-253
1601-0093-S2	5.5x	22 February 2008	URX-258
1601-0093-S3	5.5x	12 March 2008	URX-260
1601-0093-T1	5.6x	27 June 2008	08-0390

MANUAL P/N	F60 REVISION	RELEASE DATE	ECO
1601-0109-U1	5.7x	29 May 2009	09-0938
1601-0109-U2	5.7x	30 September 2009	09-1165

H.1.2 CHANGES TO THE F60 MANUAL

Table H–1: MAJOR UPDATES FOR F60 MANUAL REVISION AA1

PAGE (Z1)	PAGE (AA1)	CHANGE	DESCRIPTION
---	---	Add	Added content for IEC 60870-5-103 throughout document
2-	2-	Update	Updated order codes
2-	2-	Update	Updated specifications
5-117	5-117	Update	Updated hysteresis numbers and logic diagrams in section 5.4.7 Phasor Measurement Unit
5-175	5-175	Update	Updated Neutral Directional Overcurrent settings to include Dual-V and Dual-I settings to reflect enhanced polarity criteria
8-	---	Delete	Deleted chapter 8 on security, moving content to other chapters
---	10-	Add	Added Maintenance chapter, moving content from other chapters and adding new instructions to replace the battery
---	D-	Add	Added new appendix on IEC 60870-5-103 interoperability

Table H–2: MAJOR UPDATES FOR F60 MANUAL REVISION Z1

PAGE (Y3)	PAGE (Z1)	CHANGE	DESCRIPTION
---	---	Add	Added CPU options U and V to order code tables in chapter 2, a note above Rear Terminal View figure in chapter 3, and CPU Module Communications Wiring figure in chapter 3
---	---	Add	Added Parallel Redundancy Protocol (PRP) to order code tables and specifications in chapter 2, section 5.2.5d Settings > Product Setup > Communications > Network, section 6.3.1 Actual Values > Status > PRP, and Appendix B Modbus table and F627 and F628 enumeration tables
1-1	1-1	Add	Added General Cautions and Warnings to section 1.1.1
1-5	1-5	Update	Revised section 1.3.1 on system requirements, including addition of support for Windows 7 and Windows Server 2008
2-10	2-10	Update	Updated several specifications
5-24	5-24	Add	Added section 5.2.5e Routing
5-91	5-91	Update	Updated Figures 5-25 and 5-26 Dual Breaker Control Scheme Logic, sheets 1 and 2
5-95	5-95	Update	Updated Figure 5-27 Disconnect Switch Scheme Logic
5-263	5-263	Add	Reinserted section 5.8.5c Remote Devices: ID of Device for Receiving GSSE/GOOSE Messages, meaning the Settings > Input/Outputs > Remote Devices settings

Table H–3: MAJOR UPDATES FOR F60 MANUAL REVISION Y3

PAGE (Y2)	PAGE (Y3)	CHANGE	DESCRIPTION
--	xi	Add	Added battery disposal information as chapter 0

Table H–4: MAJOR UPDATES FOR F60 MANUAL REVISION Y2

PAGE (Y1)	PAGE (Y2)	CHANGE	DESCRIPTION
All	All	Update	Minor changes throughout document
All	All	Delete	Deleted CPU options U and V
1-1	1-1	Update	Updated Figure 1-1 Rear Nameplate
2-4	2-4	Update	Updated Table 2-4 Order Codes for reduced size vertical units to indicate that modules 8L and 8N cannot be ordered with module 8Z
2-9	2-9	Update	Updated Table 2-8 Order Codes for vertical unit replacement modules to indicate that modules 8L and 8N cannot be ordered with module 8Z
3-8	3-8	Update	Updated Figure 3-10 Rear Terminal View

Table H–5: MAJOR UPDATES FOR F60 MANUAL REVISION Y1 (Sheet 1 of 2)

PAGE (X2)	PAGE (Y1)	CHANGE	DESCRIPTION
All	All	Delete	Deleted content pertaining to Ethernet switch
Title	Title	Update	Changed part numbers. Updated address and contact information.
1-1	1-1	Update	Updated address and contact information
2-	2-	Add	Added CPU options T,U, and V to order code table
2-	2-	Delete	Removed E, G, H, J, S from CPU options from order code tables
2-8	2-8	Delete	Deleted 9S, 2S, 2T from replacement module order code Tables 2-7 and 2-8
3-10	3-10	Update	Updated Figures 3-12 and 3-13 Typical Wiring Diagrams
2-19	2-19	Update	Updated Ethernet fiber table in section 2.2.8 Communications
3-24	3-24	Update	Deleted references to COM 1 RS485 port in section 3.2.9 CPU Communication Ports. Revised text and Figure 3-26 CPU Module Communications Wiring to include only modules T, U, V in section 3.2.9a.
5-1	5-1	Update	Updated the front panel main menu to include the CyberSentry security menu
5-16	5-16	Update	Update Communications main menu to remove the SNTP Protocol submenu
5-16	5-16	Delete	Deleted references to COM 1 RS485 port in section 5.2.4b Serial Ports
5-17	5-17	Add	Added section 5.2.4c Ethernet Network Topology
5-17	5-17	Update	Updated Networks section 5.2.4d to include all three Ethernet ports
5-17	5-17	Update	Added 0 as valid number to section 5.2.4e Modbus Protocol section
5-40	5-	Delete	Deleted Local Time Offset, Daylight Savings Time, DST (start/stop for month/day/hour) from Real Time Clock menu
5-	5-40	Add	Added submenus Precision Time Protocol, SNTP Protocol, and Local Time and Synchronizing Source settings to Real Time Clock menu
5-	5-41	Add	Added new Precision Time Protocol (1588) menu and setting descriptions
5-	5-	Update	Changed Communication to Real Time Clock in SNTP protocol settings path. Moved SNTP Protocol menu and settings descriptions to Real Time Clock subsection
5-37	5-	Delete	Deleted section k) SNTP Protocol and the settings descriptions
5-	5-44	Add	Added new section for Local Time menu settings and settings description
5-	5-55	Add	Added new PTP Fail menu item to the User-Programmable Self Tests menu
5-	5-	Add	Added PTP Failure and CLOCK UNSYNCHRONIZED to Flexlogic Operands table
5-96	5-96	Update	Updated PMU main menu to add aggregator and control block menu items

Table H–5: MAJOR UPDATES FOR F60 MANUAL REVISION Y1 (Sheet 2 of 2)

PAGE (X2)	PAGE (Y1)	CHANGE	DESCRIPTION
5-	5-96	Add	Added UR Synchrophasor Implementation of IEC61850-90-5 to the PMU software option description
5-96	5-96	Update	Updated Figure: Complete Synchrophasor Implementation
5-	5-97	Add	Added Figure: N60 Support For Four Logical Device PMU
5-97	5-97	Update	Updated Table: Implementation By Model Number
5-	5-98	Add	Added Figure: Logical Nodes Supported In Each Logical Device
5-	5-99	Add	Added Figure: Data Set Created From User Selected Internal Items
5-	5-100	Add	Added Figure: Example Of Aggregator Data Sets
5-	5-100	Add	Added Figure: CFG-2 Based Configuration Solution
5-	5-100	Add	Added examples for a syncrophasor dataset and the creation of different datasets
5-	5-100	Add	Added example for a CFG-2 based configuration
5-102	5-102	Update	Updated PMU 1 basic configuration menu to add 37.118 and 90-5 configuration settings submenus
5- 101	5-101	Add	Added PMU 1 configuration menus for 37.118 and 90-5 with settings descriptions
5-	5-103	Update	Changed PMU 1 Function setting description
5-	5-116	Add	Added PMU AGGR 1 configuration menu and setting descriptions
5-	5-96	Add	Added new aggregators section with PMU 1 aggregators menu and setting descriptions
5-116	5-116	Update	Updated PMU 1 aggregators menu to include 37.118 and 90-5 aggregator configuration submenus
5-	5-118	Add	Added 90-5 AGGR 1 configuration menu and setting descriptions
5-	5-118	Add	Added Table 5-11 # Of ASDUs
5-	5-118	Add	Added new control block section with IEC 90-5 MSVCB configuration menu and setting descriptions
5-	5-141	Update	Added row for DeltaTime to Table 5-: FlexElement Base Units
5-174	5-174	Delete	Deleted section 5.8.5c Remote Devices: ID of Device for Receiving GSSE/GOOSE Messages, meaning the Settings > Input/Outputs > Remote Devices settings
5-257	5-257	Delete	Deleted section 5.8.5c Remote Devices: ID of Device for Receiving GSSE/GOOSE Messages, meaning the Settings > Input/Outputs > Remote Devices settings
5-	5-277	Add	Added new CyberSentry security section and main menu, local passwords, session settings, restore defaults, and supervisory subsections to Chapter 5
6-1	6-1	Update	Update Actual Values main menu to include Real Time Clock Synchronization submenu
6-	6-7	Add	Added new section for Real Time Clock synchronizing consisting of the menu of settings and the setting descriptions
6-12	6-12	Delete	Deleted section 6.2.22 Ethernet Switch
6-	6-12	Add	Added new section 6.2.23 Remaining Connection Status
7-	7-1	Add	Added Security command to the Commands main menu
7-	7-3	Add	Added Reboot Relay command and description to the Relay Maintenance menu items
7-	7-	Add	Added Security menu and submenu commands and descriptions to the Command menu
7-	7-	Add	Added to Minor self-test error message **Bad PTP Signal**
8-	8-4	Add	Added new section for CyberSentry software option with overview and security menu subsections
A-	A-	Add	Added Flexanalog item PTP–IRIG-B Delta to Table A-1: Flexanalog Data Items
B-8	B-8	Update	Updated Modbus memory map table to include port 0 for Modbus slave address, TCP, DNP, HTTP, TFTP, MMS, and removed references to COM 1 RS485 port
C-23	C-23	Update	Updated tables in sections C.6.3 ACSI Services Conformance Statement and C.7.1 Logical Nodes Table

H

H.2.1 STANDARD ABBREVIATIONS

A..................... Ampere
AC .... Alternating Current
A/D .... Analog to Digital
AE .... Accidental Energization, Application Entity
AMP .... Ampere
ANG .... Angle
ANSI............... American National Standards Institute
AR .... Automatic Reclosure
ASDU .... Application-layer Service Data Unit
ASYM .... Asymmetry
AUTO .... Automatic
AUX................ Auxiliary
AVG................ Average

BCS................ Best Clock Selector
BER................ Bit Error Rate
BF................... Breaker Fail
BFI.................. Breaker Failure Initiate
BKR................ Breaker
BLK .... Block
BLKG.............. Blocking
BPNT.............. Breakpoint of a characteristic
BRKR .... Breaker

CAP................ Capacitor
CC .... Coupling Capacitor
CCVT .... Coupling Capacitor Voltage Transformer
CFG................ Configure / Configurable
.CFG............... Filename extension for oscillography files
CHK................ Check
CHNL .... Channel
CLS .... Close
CLSD.............. Closed
CMND .... Command
CMPRSN........ Comparison
CO.................. Contact Output
COM............... Communication
COMM............ Communications
COMP .... Compensated, Comparison
CONN............. Connection
CONT .... Continuous, Contact
CO-ORD......... Coordination
CPU................ Central Processing Unit
CRC .... Cyclic Redundancy Code
CRT, CRNT .... Current
CSA................ Canadian Standards Association
CT .... Current Transformer
CVT .... Capacitive Voltage Transformer

D/A .... Digital to Analog
DC (dc)........... Direct Current
DD .... Disturbance Detector
DFLT .... Default
DGNST........... Diagnostics
DI.................... Digital Input
DIFF .... Differential
DIR .... Directional
DISCREP .... Discrepancy
DIST .... Distance
DMD .... Demand
DNP................ Distributed Network Protocol
DPO .... Dropout
DSP................ Digital Signal Processor
dt .... Rate of Change
DTT .... Direct Transfer Trip
DUTT.............. Direct Under-reaching Transfer Trip

ENCRMNT ...... Encroachment
EPRI............... Electric Power Research Institute
.EVT .... Filename extension for event recorder files
EXT .... Extension, External

F..................... Field
FAIL................ Failure
FD .... Fault Detector
FDH................ Fault Detector high-set
FDL .... Fault Detector low-set
FLA................. Full Load Current

FO...................Fiber Optic
FREQ.............Frequency
FSK.................Frequency-Shift Keying
FTP ....File Transfer Protocol
FxE ....FlexElement™
FWD...............Forward

G ....Generator
GE...................General Electric
GND...............Ground
GNTR.............Generator
GOOSE...........General Object Oriented Substation Event
GPS ....Global Positioning System

HARM ....Harmonic / Harmonics
HCT ....High Current Time
HGF ....High-Impedance Ground Fault (CT)
HIZ..................High-Impedance and Arcing Ground
HMI ....Human-Machine Interface
HTTP ....Hyper Text Transfer Protocol
HYB ....Hybrid

I.......................Instantaneous
I_0..................Zero Sequence current
I_1..................Positive Sequence current
I_2..................Negative Sequence current
IA ....Phase A current
IAB ....Phase A minus B current
IB ....Phase B current
IBC.................Phase B minus C current
IC ....Phase C current
ICA.................Phase C minus A current
ID ....Identification
IED.................Intelligent Electronic Device
IEC.................International Electrotechnical Commission
IEEE...............Institute of Electrical and Electronic Engineers
IG ....Ground (not residual) current
Igd..................Differential Ground current
IN ....CT Residual Current (3Io) or Input
INC SEQ ....Incomplete Sequence
INIT ....Initiate
INST...............Instantaneous
INV.................Inverse
I/O ....Input/Output
IOC ....Instantaneous Overcurrent
IOV.................Instantaneous Overvoltage
IRIG ....Inter-Range Instrumentation Group
ISO.................International Standards Organization
IUV.................Instantaneous Undervoltage

K0 ....Zero Sequence Current Compensation
kA...................kiloAmpere
kV...................kiloVolt

LED................Light Emitting Diode
LEO................Line End Open
LFT BLD ....Left Blinder
LOOP.............Loopback
LPU................Line Pickup
LRA................Locked-Rotor Current
LTC ....Load Tap-Changer

M....................Machine
mA ....MilliAmpere
MAG...............Magnitude
MAN...............Manual / Manually
MAX...............Maximum
MIC ....Model Implementation Conformance
MIN ....Minimum, Minutes
MMI................Man Machine Interface
MMS ....Manufacturing Message Specification
MRT ....Minimum Response Time
MSG...............Message
MTA ....Maximum Torque Angle
MTR...............Motor
MVA ....MegaVolt-Ampere (total 3-phase)
MVA_A...........MegaVolt-Ampere (phase A)
MVA_B...........MegaVolt-Ampere (phase B)

MVA_C .... MegaVolt-Ampere (phase C)
MVAR .... MegaVar (total 3-phase)
MVAR_A......... MegaVar (phase A)
MVAR_B......... MegaVar (phase B)
MVAR_C .... MegaVar (phase C)
MVARH .... MegaVar-Hour
MW................. MegaWatt (total 3-phase)
MW_A .... MegaWatt (phase A)
MW_B .... MegaWatt (phase B)
MW_C .... MegaWatt (phase C)
MWH .... MegaWatt-Hour

N..................... Neutral
N/A, n/a .... Not Applicable
NEG .... Negative
NMPLT .... Nameplate
NOM............... Nominal
NTR................ Neutral

O .... Over
OC, O/C .... Overcurrent
O/P, Op........... Output
OP .... Operate
OPER .... Operate
OPERATG...... Operating
O/S .... Operating System
OSI .... Open Systems Interconnect
OSB................ Out-of-Step Blocking
OUT................ Output
OV .... Overvoltage
OVERFREQ ... Overfrequency
OVLD .... Overload

P..................... Phase
PC .... Phase Comparison, Personal Computer
PCNT .... Percent
PF................... Power Factor (total 3-phase)
PF_A .... Power Factor (phase A)
PF_B .... Power Factor (phase B)
PF_C .... Power Factor (phase C)
PFLL............... Phase and Frequency Lock Loop
PHS................ Phase
PICS............... Protocol Implementation & Conformance Statement
PKP .... Pickup
PLC .... Power Line Carrier
POS................ Positive
POTT.............. Permissive Over-reaching Transfer Trip
PRESS .... Pressure
PRI .... Primary
PROT .... Protection
PSEL .... Presentation Selector
pu .... Per Unit
PUIB............... Pickup Current Block
PUIT .... Pickup Current Trip
PUSHBTN ...... Pushbutton
PUTT .... Permissive Under-reaching Transfer Trip
PWM .... Pulse Width Modulated
PWR............... Power

QUAD............. Quadrilateral

R..................... Rate, Reverse
RCA................ Reach Characteristic Angle
REF .... Reference
REM .... Remote
REV................ Reverse
RI.................... Reclose Initiate
RIP .... Reclose In Progress
RGT BLD........ Right Blinder
RMS .... Root Mean Square
ROD .... Remote Open Detector
RST .... Reset
RSTR .... Restrained
RTD................ Resistance Temperature Detector
RTU................ Remote Terminal Unit
RX (Rx) .... Receive, Receiver

s .... second

S .... Sensitive
SAT .... CT Saturation
SBO .... Select Before Operate
SCADA .... Supervisory Control and Data Acquisition
SEC .... Secondary
SEL .... Select / Selector / Selection
SENS .... Sensitive
SEQ .... Sequence
SIR................. Source Impedance Ratio
SNTP .... Simple Network Time Protocol
SRC .... Source
SSB................ Single Side Band
SSEL.............. Session Selector
STATS............ Statistics
SUPN............. Supervision
SUPV .... Supervise / Supervision
SV .... Supervision, Service
SYNC............. Synchrocheck
SYNCHCHK... Synchrocheck

T..................... Time, transformer
TC .... Thermal Capacity
TCP................ Transmission Control Protocol
TCU .... Thermal Capacity Used
TD MULT........ Time Dial Multiplier
TEMP............. Temperature
TFTP.............. Trivial File Transfer Protocol
THD .... Total Harmonic Distortion
TMR .... Timer
TOC .... Time Overcurrent
TOV................ Time Overvoltage
TRANS........... Transient
TRANSF .... Transfer
TSEL.............. Transport Selector
TUC .... Time Undercurrent
TUV................ Time Undervoltage
TX (Tx)........... Transmit, Transmitter

U .... Under
UC.................. Undercurrent
UCA .... Utility Communications Architecture
UDP .... User Datagram Protocol
UL .... Underwriters Laboratories
UNBAL........... Unbalance
UR.................. Universal Relay
URC .... Universal Recloser Control
.URS .... Filename extension for settings files
UV.................. Undervoltage

V/Hz .... Volts per Hertz
V_0 .... Zero Sequence voltage
V_1 .... Positive Sequence voltage
V_2 .... Negative Sequence voltage
VA .... Phase A voltage
VAB................ Phase A to B voltage
VAG................ Phase A to Ground voltage
VARH .... Var-hour voltage
VB .... Phase B voltage
VBA................ Phase B to A voltage
VBG .... Phase B to Ground voltage
VC.................. Phase C voltage
VCA .... Phase C to A voltage
VCG .... Phase C to Ground voltage
VF .... Variable Frequency
VIBR .... Vibration
VT .... Voltage Transformer
VTFF.............. Voltage Transformer Fuse Failure
VTLOS .... Voltage Transformer Loss Of Signal

WDG .... Winding
WH................. Watt-hour
w/ opt .... With Option
WRT............... With Respect To

X .... Reactance
XDUCER........ Transducer
XFMR............. Transformer

Z..................... Impedance, Zone

H

H.3.1 GE MULTILIN WARRANTY

GE MULTILIN RELAY WARRANTY

GE Multilin warrants each relay it manufactures to be free from defects in material and workmanship under normal use and service for a period of 24 months from date of shipment from factory.

In the event of a failure covered by warranty, GE Multilin will undertake to repair or replace the relay providing the warrantor determined that it is defective and it is returned with all transportation charges prepaid to an authorized service centre or the factory. Repairs or replacement under warranty will be made without charge.

Warranty shall not apply to any relay which has been subject to misuse, negligence, accident, incorrect installation or use not in accordance with instructions nor any unit that has been altered outside a GE Multilin authorized factory outlet.

GE Multilin is not liable for special, indirect or consequential damages or for loss of profit or for expenses sustained as a result of a relay malfunction, incorrect application or adjustment.

For complete text of Warranty (including limitations and disclaimers), refer to GE Multilin Standard Conditions of Sale.
