TABLE OF CONTENTS

1. GETTING STARTED

1.1 IMPORTANT PROCEDURES

1.1.1 CAUTIONS AND WARNINGS	1-1
1.1.2 INSPECTION PROCEDURE	1-2

1.2 UR OVERVIEW

1.2.1 INTRODUCTION TO THE UR	1-3
1.2.2 HARDWARE ARCHITECTURE	1-3
1.2.3 SOFTWARE ARCHITECTURE	1-5
1.2.4 IMPORTANT CONCEPTS	1-5

1.3 ENERVISTA UR SETUP SOFTWARE

1.3.1 PC REQUIREMENTS	1-6
1.3.2 INSTALLATION	1-6
1.3.3 CONFIGURING THE L90 FOR SOFTWARE ACCESS	1-7
1.3.4 USING THE QUICK CONNECT FEATURE	1-10
1.3.5 CONNECTING TO THE L90 RELAY	1-15
1.3.6 SETTING UP CYBERSENTRY AND CHANGING DEFAULT PASSWORD ...	1-16

1.4 UR HARDWARE

1.4.1 MOUNTING AND WIRING	1-18
1.4.2 COMMUNICATIONS	1-18
1.4.3 FACEPLATE DISPLAY	1-18

1.5 USING THE RELAY

1.5.1 FACEPLATE KEYPAD	1-19
1.5.2 MENU NAVIGATION	1-19
1.5.3 MENU HIERARCHY	1-19
1.5.4 RELAY ACTIVATION	1-19
1.5.5 RELAY PASSWORDS	1-20
1.5.6 FLEXLOGIC CUSTOMIZATION	1-20
1.5.7 COMMISSIONING	1-21

2. PRODUCT DESCRIPTION

2.1 INTRODUCTION

2.1.1 OVERVIEW	2-1
2.1.2 FEATURES	2-3
2.1.3 SECURITY	2-4
2.1.4 ORDERING	2-8
2.1.5 REPLACEMENT MODULES	2-16

2.2 PILOT CHANNEL RELAYING

2.2.1 INTER-RELAY COMMUNICATIONS	2-19
2.2.2 CHANNEL MONITOR	2-20
2.2.3 LOOPBACK TEST	2-21
2.2.4 DIRECT TRANSFER TRIPPING	2-21

2.3 FUNCTIONALITY

2.3.1 PROTECTION AND CONTROL FUNCTIONS	2-22
2.3.2 METERING AND MONITORING FUNCTIONS	2-22
2.3.3 OTHER FUNCTIONS	2-23

2.4 SPECIFICATIONS

2.4.1 PROTECTION ELEMENTS	2-24
2.4.2 USER-PROGRAMMABLE ELEMENTS	2-29
2.4.3 MONITORING	2-30
2.4.4 METERING	2-31
2.4.5 INPUTS	2-32
2.4.6 POWER SUPPLY	2-33
2.4.7 OUTPUTS	2-33
2.4.8 COMMUNICATIONS	2-34
2.4.9 INTER-RELAY COMMUNICATIONS	2-35
2.4.10 ENVIRONMENTAL	2-35
2.4.11 TYPE TESTS	2-36
2.4.12 PRODUCTION TESTS	2-36
2.4.13 APPROVALS	2-37
2.4.14 MAINTENANCE	2-37

TABLE OF CONTENTS

3. HARDWARE

3.1 DESCRIPTION

3.1.1	PANEL CUTOUT	3-1
3.1.2	REAR TERMINAL LAYOUT	3-6

3.2 WIRING

3.2.1	TYPICAL WIRING	3-8
3.2.2	DIELECTRIC STRENGTH.....	3-9
3.2.3	CONTROL POWER.....	3-9
3.2.4	CT/VT MODULES.....	3-10
3.2.5	PROCESS BUS MODULES	3-12
3.2.6	CONTACT INPUTS AND OUTPUTS.....	3-12
3.2.7	TRANSDUCER INPUTS AND OUTPUTS	3-21
3.2.8	RS232 FACEPLATE PORT	3-22
3.2.9	CPU COMMUNICATION PORTS.....	3-22
3.2.10	IRIG-B	3-25

3.3 PILOT CHANNEL COMMUNICATIONS

3.3.1	DESCRIPTION	3-26
3.3.2	FIBER: LED AND ELED TRANSMITTERS	3-27
3.3.3	FIBER-LASER TRANSMITTERS	3-27
3.3.4	G.703 INTERFACE.....	3-28
3.3.5	RS422 INTERFACE	3-31
3.3.6	TWO-CHANNEL TWO-CLOCK RS422 INTERFACE.....	3-33
3.3.7	RS422 AND FIBER INTERFACE	3-33
3.3.8	G.703 AND FIBER INTERFACE	3-34
3.3.9	IEEE C37.94 INTERFACE.....	3-34
3.3.10	C37.94SM INTERFACE	3-38

4. HUMAN INTERFACES

4.1 ENERVISTA UR SETUP SOFTWARE INTERFACE

4.1.1	INTRODUCTION	4-1
4.1.2	CREATING A SITE LIST	4-1
4.1.3	ENERVISTA UR SETUP OVERVIEW	4-1
4.1.4	ENERVISTA UR SETUP MAIN WINDOW.....	4-3

4.2 EXTENDED ENERVISTA UR SETUP FEATURES

4.2.1	SETTINGS TEMPLATES	4-4
4.2.2	SECURING AND LOCKING FLEXLOGIC EQUATIONS.....	4-8
4.2.3	SETTINGS FILE TRACEABILITY.....	4-10

4.3 FACEPLATE INTERFACE

4.3.1	FACEPLATE	4-13
4.3.2	LED INDICATORS.....	4-14
4.3.3	CUSTOM LABELING OF LEDS	4-17
4.3.4	DISPLAY.....	4-23
4.3.5	KEYPAD	4-23
4.3.6	BREAKER CONTROL	4-23
4.3.7	MENUS.....	4-24
4.3.8	CHANGING SETTINGS	4-26

5. SETTINGS

5.1 OVERVIEW

5.1.1	SETTINGS MENU	5-1
5.1.2	INTRODUCTION TO ELEMENTS	5-4
5.1.3	INTRODUCTION TO AC SOURCES.....	5-5

5.2 PRODUCT SETUP

5.2.1	SECURITY.....	5-8
5.2.2	DISPLAY PROPERTIES	5-23
5.2.3	CLEAR RELAY RECORDS	5-25
5.2.4	COMMUNICATIONS	5-26
5.2.5	MODBUS USER MAP	5-55
5.2.6	REAL TIME CLOCK	5-56
5.2.7	FAULT REPORTS	5-61
5.2.8	OSCILLOGRAPHY	5-63

TABLE OF CONTENTS

5.2.9	DATA LOGGER	5-66
5.2.10	DEMAND.....	5-67
5.2.11	USER-PROGRAMMABLE LEDS.....	5-68
5.2.12	USER-PROGRAMMABLE SELF-TESTS	5-72
5.2.13	CONTROL PUSHBUTTONS	5-72
5.2.14	USER-PROGRAMMABLE PUSHBUTTONS	5-74
5.2.15	FLEX STATE PARAMETERS.....	5-79
5.2.16	USER-DEFINABLE DISPLAYS	5-80
5.2.17	INSTALLATION.....	5-82
5.3 REMOTE RESOURCES		
5.3.1	REMOTE RESOURCES CONFIGURATION.....	5-83
5.4 SYSTEM SETUP		
5.4.1	AC INPUTS	5-84
5.4.2	POWER SYSTEM.....	5-85
5.4.3	SIGNAL SOURCES	5-86
5.4.4	87L POWER SYSTEM.....	5-89
5.4.5	BREAKERS.....	5-95
5.4.6	DISCONNECT SWITCHES	5-99
5.4.7	FLEXCURVES	5-102
5.4.8	PHASOR MEASUREMENT UNIT.....	5-109
5.5 FLEXLOGIC		
5.5.1	INTRODUCTION TO FLEXLOGIC	5-129
5.5.2	FLEXLOGIC RULES.....	5-141
5.5.3	FLEXLOGIC EVALUATION	5-142
5.5.4	FLEXLOGIC EXAMPLE	5-142
5.5.5	FLEXLOGIC EQUATION EDITOR.....	5-147
5.5.6	FLEXLOGIC TIMERS	5-147
5.5.7	FLEXELEMENTS	5-148
5.5.8	NON-VOLATILE LATCHES	5-152
5.6 GROUPED ELEMENTS		
5.6.1	OVERVIEW	5-153
5.6.2	SETTING GROUP	5-153
5.6.3	LINE DIFFERENTIAL ELEMENT.....	5-154
5.6.4	LINE PICKUP.....	5-160
5.6.5	DISTANCE	5-162
5.6.6	POWER SWING DETECT	5-180
5.6.7	LOAD ENCROACHMENT.....	5-189
5.6.8	PHASE CURRENT	5-191
5.6.9	NEUTRAL CURRENT.....	5-201
5.6.10	WATTMETRIC GROUND FAULT	5-209
5.6.11	GROUND CURRENT	5-212
5.6.12	NEGATIVE SEQUENCE CURRENT	5-218
5.6.13	BREAKER FAILURE.....	5-224
5.6.14	VOLTAGE ELEMENTS	5-233
5.6.15	SENSITIVE DIRECTIONAL POWER.....	5-239
5.6.16	SUPERVISING ELEMENTS	5-243
5.7 CONTROL ELEMENTS		
5.7.1	OVERVIEW	5-247
5.7.2	TRIP BUS.....	5-247
5.7.3	SETTING GROUPS	5-249
5.7.4	SELECTOR SWITCH.....	5-251
5.7.5	TRIP OUTPUT	5-257
5.7.6	UNDERFREQUENCY	5-263
5.7.7	OVERFREQUENCY	5-264
5.7.8	FREQUENCY RATE OF CHANGE.....	5-265
5.7.9	SYNCHROCHECK.....	5-267
5.7.10	DIGITAL ELEMENTS.....	5-271
5.7.11	DIGITAL COUNTERS	5-274
5.7.12	MONITORING ELEMENTS	5-276
5.7.13	PILOT SCHEMES	5-299
5.7.14	AUTORECLOSE	5-323
5.8 INPUTS/OUTPUTS		
5.8.1	CONTACT INPUTS.....	5-336
5.8.2	VIRTUAL INPUTS.....	5-338

TABLE OF CONTENTS

5.8.3	CONTACT OUTPUTS	5-339
5.8.4	VIRTUAL OUTPUTS	5-341
5.8.5	REMOTE DEVICES	5-342
5.8.6	REMOTE INPUTS	5-343

1.1.1 CAUTIONS AND WARNINGS

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage, or downtime.

The following safety and equipment symbols are used in this document.

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Indicates practices not related to personal injury.

a) GENERAL CAUTIONS AND WARNINGS

The following general safety precautions and warnings apply.

Ensure that all connections to the product are correct so as to avoid accidental risk of shock and/or fire, for example such as can arise from high voltage connected to low voltage terminals.

Follow the requirements of this manual, including adequate wiring size and type, terminal torque settings, voltage, current magnitudes applied, and adequate isolation/clearance in external wiring from high to low voltage circuits.

Use the device only for its intended purpose and application.

Ensure that all ground paths are uncompromised for safety purposes during device operation and service.

Ensure that the control power applied to the device, the AC current, and voltage input match the ratings specified on the relay nameplate. Do not apply current or voltage in excess of the specified limits.

Only qualified personnel are to operate the device. Such personnel must be thoroughly familiar with all safety cautions and warnings in this manual and with applicable country, regional, utility, and plant safety regulations.

Hazardous voltages can exist in the power supply and at the device connection to current transformers, voltage transformers, control, and test circuit terminals. Make sure all sources of such voltages are isolated prior to attempting work on the device.

Hazardous voltages can exist when opening the secondary circuits of live current transformers. Make sure that current transformer secondary circuits are shorted out before making or removing any connection to the current transformer (CT) input terminals of the device.

For tests with secondary test equipment, ensure that no other sources of voltages or currents are connected to such equipment and that trip and close commands to the circuit breakers or other switching apparatus are isolated, unless this is required by the test procedure and is specified by appropriate utility/plant procedure.

When the device is used to control primary equipment, such as circuit breakers, isolators, and other switching apparatus, all control circuits from the device to the primary equipment must be isolated while personnel are working on or around this primary equipment to prevent any inadvertent command from this device.

Use an external disconnect to isolate the mains voltage supply.

LED transmitters are classified as IEC 60825-1 Accessible Emission Limit (AEL) Class 1M. Class 1M devices are considered safe to the unaided eye. Do not view directly with optical instruments.

This product is rated to Class A emissions levels and is to be used in Utility, Substation Industrial environments. Not to be used near electronic devices rated for Class B levels.

1.1.2 INSPECTION PROCEDURE

1. Open the relay packaging and inspect the unit for physical damage.
2. View the rear nameplate and verify that the correct model has been ordered and delivered.

Figure 1-1: REAR NAMEPLATE (EXAMPLE)

3. Ensure that the following items are included:
 - Instruction manual (if ordered)
 - GE EnerVista™ CD (includes the EnerVista UR Setup software and manuals in PDF format)
 - Mounting screws
4. If there is any noticeable physical damage, or any of the contents listed are missing, please contact GE Digital Energy immediately as follows.

1.2.1 INTRODUCTION TO THE UR

The GE Universal Relay (UR) series is a new generation of digital, modular, and multifunction equipment that is easily incorporated into automation systems, at both the station and enterprise levels.

1.2.2 HARDWARE ARCHITECTURE

a) UR BASIC DESIGN

The UR is a digital-based device containing a central processing unit (CPU) that handles multiple types of input and output signals. The UR device can communicate over a local area network (LAN) with an operator interface, a programming device, or another UR device.

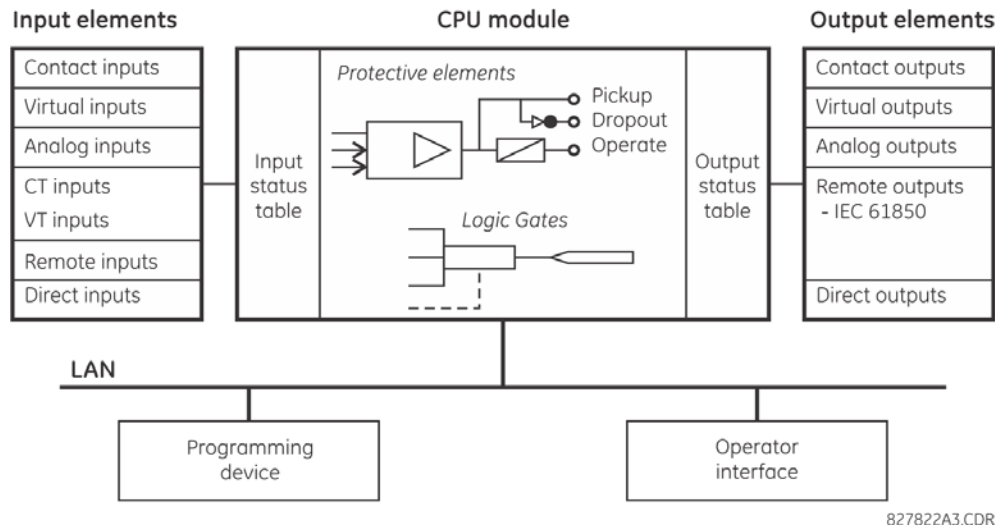

Figure 1-2: UR BLOCK DIAGRAM

The **CPU module** contains firmware that provides protection elements in the form of logic algorithms, as well as programmable logic gates, timers, and latches for control features.

Input elements accept a variety of analog or digital signals from the field. The UR isolates and converts these signals into logic signals used by the relay.

Output elements convert and isolate the logic signals generated by the relay into digital or analog signals that can be used to control field devices.

The software and unit are backwards-compatible with UR devices.

b) UR SIGNAL TYPES

The **contact inputs and outputs** are digital signals associated with connections to hard-wired contacts. Both 'wet' and 'dry' contacts are supported.

The **virtual inputs and outputs** are digital signals associated with UR-series internal logic signals. Virtual inputs include signals generated by the local user interface. The virtual outputs are outputs of FlexLogic™ equations used to customize the device. Virtual outputs can also serve as virtual inputs to FlexLogic equations.

The **analog inputs and outputs** are signals that are associated with transducers, such as Resistance Temperature Detectors (RTDs).

The **CT and VT inputs** refer to analog current transformer and voltage transformer signals used to monitor AC power lines. The UR-series relays support 1 A and 5 A CTs.

The **remote inputs and outputs** provide a means of sharing digital point state information between remote UR-series devices. The remote outputs interface to the remote inputs of other UR-series devices. Remote outputs are FlexLogic operands inserted into IEC 61850 GSSE and GOOSE messages.

The **direct inputs and outputs** provide a means of sharing digital point states between a number of UR-series IEDs over dedicated fiber (single or multimode), RS422, or G.703 interface. No switching equipment is required as the IEDs are connected directly in a ring or redundant (dual) ring configuration. This feature is optimized for speed and intended for pilot-aided schemes, distributed logic applications, or the extension of the input/output capabilities of a single relay chassis.

c) UR SCAN OPERATION

The UR-series devices operate in a cyclic scan fashion. The device reads the inputs into an input status table, solves the logic program (FlexLogic equation), and then sets each output to the appropriate state in an output status table. Any resulting task execution is priority interrupt-driven.

Figure 1–3: UR-SERIES SCAN OPERATION

1.2.3 SOFTWARE ARCHITECTURE

1

Firmware is the software embedded in the relay and is designed in functional modules that can be installed in any relay as required. This is achieved with object-oriented design and programming (OOD/OOP) techniques.

Object-oriented techniques involve the use of *objects* and *classes*. An object is defined as “a logical entity that contains both data and code that manipulates that data”. A class is the generalized form of similar objects. By using this concept, one can create a protection class with the protection elements as objects of the class, such as time overcurrent, instantaneous overcurrent, current differential, undervoltage, overvoltage, underfrequency, and distance. These objects represent completely self-contained software modules. The same object-class concept can be used for metering, input/output control, software interface, communications, or any functional entity in the system.

Employing OOD/OOP in the software architecture of the L90 achieves the same features as the hardware architecture: modularity, scalability, and flexibility. The application software for any UR-series device (for example, feeder protection, transformer protection, distance protection) is constructed by combining objects from the various functional classes. This results in a common interface across the UR series.

1.2.4 IMPORTANT CONCEPTS

As described above, the architecture of the UR-series relays differ from previous devices. To achieve a general understanding of this device, some sections of Chapter 5 are quite helpful. The most important functions of the relay are contained in “elements”. A description of the UR-series elements can be found in the *Introduction to elements* section in chapter 5. Examples of simple elements, and some of the organization of this manual, can be found in the *Control elements* section of chapter 5. An explanation of the use of inputs from CTs and VTs is in the *Introduction to AC sources* section in chapter 5. A description of how digital signals are used and routed within the relay is contained in the *Introduction to FlexLogic* section in chapter 5.

1.3.1 PC REQUIREMENTS

The relay front panel or the EnerVista UR Setup software can be used to communicate with the relay. The EnerVista UR Setup software interface is the preferred method to edit settings and view actual values because the computer monitor can display more information.

The minimum system requirements for the EnerVista UR Setup software are as follows:

- Pentium 4 (Core Duo recommended)
- Windows XP with Service Pack 2 (Service Pack 3 recommended), Windows 7, or Windows Server 2008 Release 2 64-bit
- 1 GB of RAM (2 GB recommended)
- 500 MB free hard drive space (1 GB recommended)
- 1024 x 768 display (1280 x 800 recommended)

The following qualified modems have been tested to be compliant with the L90 and the EnerVista UR Setup software:

- US Robotics external 56K FaxModem 5686
- US Robotics external Sportster 56K X2
- PCTEL 2304WT V.92 MDC internal modem

1.3.2 INSTALLATION

After ensuring that the requirements for using EnerVista UR Setup are met (previous section), install the EnerVista UR Setup software from the GE EnerVista DVD. Or download the UR EnerVista software from <http://www.gedigitalenergy.com/multilin> and install it.

If you are upgrading from version 7.0 or 7.1 to 7.2 or later, some CPU modules require a new boot version. Update this first in EnerVista under **Maintenance > Update Firmware**.

To install the UR EnerVista software from the DVD:

1. Insert the GE EnerVista DVD into the DVD drive of your computer.
2. Click the **Install Now** button and follow the instructions.
3. When installation is complete, start the EnerVista Launchpad application.
4. Click the **IED Setup** section of the **Launch Pad** window.

Figure 1–4: ADDING UR DEVICE IN LAUNCHPAD WINDOW

5. In the EnerVista Launch Pad window, click the **Add Product** button and select the appropriate product, shown as follows. Select the **Web** option to ensure the most recent software release, or select **CD** if you do not have a web connec-

tion, then click the **Add Now** button to list software items for the product. EnerVista Launchpad then obtains the software from the Internet or DVD and automatically starts the installation program.

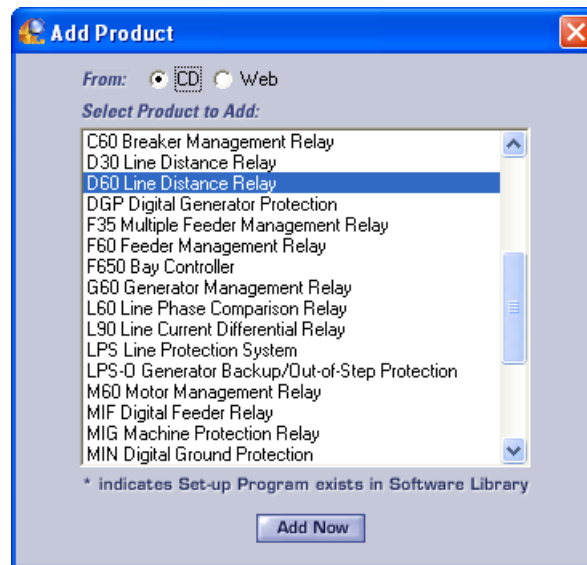

Figure 1-5: IDENTIFYING THE UR DEVICE TYPE

6. Select the complete path, including the new directory name, where the EnerVista UR Setup is to be installed.
7. Click the **Next** button to begin the installation. The files are installed in the directory indicated, and the installation program automatically creates icons and adds EnerVista UR Setup to the Windows start menu.
8. Click **Finish** to complete the installation. The UR device is added to the list of installed intelligent electronic devices (IEDs) in the EnerVista Launchpad window, as shown.

Figure 1-6: UR DEVICE ADDED TO LAUNCHPAD WINDOW

1.3.3 CONFIGURING THE L90 FOR SOFTWARE ACCESS

a) OVERVIEW

You connect remotely to the L90 through the rear RS485 or Ethernet port with a computer running the EnerVista UR Setup software. The L90 can also be accessed locally with a laptop computer through the front panel RS232 port or the rear Ethernet port using the *Quick Connect* feature.

- To configure the L90 for remote access via the rear RS485 port, see the *Configuring Serial Communications* section.
- To configure the L90 for remote access via the rear Ethernet port, see the *Configuring Ethernet Communications* section. An Ethernet module must be specified at the time of ordering.
- To configure the L90 for local access with a laptop through either the front RS232 port or rear Ethernet port, see the *Using the Quick Connect Feature* section.

b) CONFIGURING SERIAL COMMUNICATIONS

A GE Multilin F485 converter (or compatible RS232-to-RS485 converter) is required. See the F485 instruction manual for details.

1. Connect a serial cable to the RS485 terminal on the back of the UR device.
2. In the EnerVista Launchpad software on the computer, select the UR device to start the software.
3. Click the **Device Setup** button to open the Device Setup window, and click the **Add Site** button to define a new site.
4. Enter a site name in the **Site Name** field. Optionally add a short description of the site along with the display order of devices defined for the site. This example uses "Location 1" as the site name. When done, click the **OK** button. The new site appears in the upper-left list in the EnerVista UR Setup window.
5. Click the **Device Setup** button, then select the new site to re-open the Device Setup window.
6. Click the **Add Device** button to define the new device.
7. Enter a name in the "Device Name" field and a description (optional) of the site.
8. Select "Serial" from the **Interface** drop-down list. This displays a number of interface parameters that must be entered for serial communications.

Figure 1–7: CONFIGURING SERIAL COMMUNICATIONS

9. Enter the relay slave address, COM port, baud rate, and parity settings from the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COM-MUNICATIONS** ⇒ **SERIAL PORTS** menu in their respective fields.
10. Click the **Read Order Code** button to connect to the L90 device and upload the order code. If a communications error occurs, ensure that the EnerVista UR Setup serial communications values entered in the previous step correspond to the relay setting values.
11. Click the **OK** button when the relay order code has been received. The new device is added to the Site List window (or Online window) located in the top left corner of the main EnerVista UR Setup window.

The device has now been configured for RS232 communications. Proceed to the *Connecting to the L90* section to begin communication.

c) CONFIGURING ETHERNET COMMUNICATIONS

Before starting, verify that the Ethernet network cable is properly connected to the Ethernet port on the back of the relay. To setup the relay for Ethernet communications, you define a Site, then add the relay as a Device at that site. The computer and UR device must be on the same subnet.

12. Select the “UR” device from the EnerVista Launchpad to start EnerVista UR Setup.
13. Click the **Device Setup** button to open the Device Setup window, then click the **Add Site** button to define a new site.
14. Enter the desired site name in the “Site Name” field. If desired, a short description of site can also be entered along with the display order of devices defined for the site. In this example, we use “Location 2” as the site name. Click the **OK** button when complete.
15. The new site appears in the upper-left list in the EnerVista UR Setup window. Click the **Device Setup** button then select the new site to re-open the Device Setup window.
16. Click the **Add Device** button to define the new device.
17. Enter the desired name in the “Device Name” field and a description (optional) of the site.
18. Select “Ethernet” from the **Interface** drop-down list. This displays a number of interface parameters that must be entered for proper Ethernet functionality.

Figure 1–8: CONFIGURING ETHERNET COMMUNICATIONS

19. Enter the relay IP address specified in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **NETWORK** ⇒ **IP ADDRESS** in the “IP Address” field.
20. Enter the relay slave address and Modbus port address values from the respective settings in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **MODBUS PROTOCOL** menu.
21. Click the **Read Order Code** button to connect to the L90 device and upload the order code. If an communications error occurs, ensure that the three EnerVista UR Setup values entered in the previous steps correspond to the relay setting values.
22. Click **OK** when the relay order code has been received. The new device is added to the Site List window (or Online window) located in the top left corner of the main EnerVista UR Setup window.

The Site Device has now been configured for Ethernet communications. Proceed to the *Connecting to the L90* section to begin communications.

1.3.4 USING THE QUICK CONNECT FEATURE

a) USING QUICK CONNECT VIA THE FRONT PANEL RS232 PORT

Before starting, verify that the serial cable is properly connected from the computer to the front panel RS232 port with a straight-through 9-pin to 9-pin RS232 cable.

1. Verify that the latest version of the EnerVista UR Setup software is installed (available from the GE EnerVista CD or online from <http://www.gedigitalenergy.com/multilin>). See the *Software Installation* section if not already installed.
2. Select the “UR” device from the EnerVista Launchpad to start EnerVista UR Setup.
3. Click the **Quick Connect** button to open the Quick Connect dialog box.

4. Select the **Serial** interface and the correct COM Port, then click **Connect**.
5. The EnerVista UR Setup software creates a site named “Quick Connect” with a corresponding device also named “Quick Connect” and displays them at the upper-left of the screen. Expand the sections to view data directly from the L90 device.

Each time that the EnerVista UR Setup software is initialized, click the **Quick Connect** button to establish direct communications to the L90 device. This ensures that configuration of the EnerVista UR Setup software matches the L90 model number.

b) USING QUICK CONNECT VIA THE REAR ETHERNET PORTS

To use the Quick Connect feature to access the L90 from a computer through Ethernet, first assign an IP address to the relay from the front panel keyboard.

1. Press the MENU key until the SETTINGS menu displays.
2. Navigate to the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **NETWORK** ⇒ **IP ADDRESS** setting.
3. Enter an IP address, for example “1.1.1.1,” and select the ENTER key to save the value.
4. In the same menu, select the **SUBNET IP MASK** setting.
5. Enter a subnet IP address, for example “255.0.0.0,” and press the ENTER key to save the value.

Next, use an Ethernet cross-over cable to connect the computer to the rear Ethernet port. In case you need it, the figure shows the pinout for an Ethernet cross-over cable.

END 1		
Pin	Wire color	Diagram
1	White/orange	
2	Orange	
3	White/green	
4	Blue	
5	White/blue

8	Brown	

842799A1.CDR

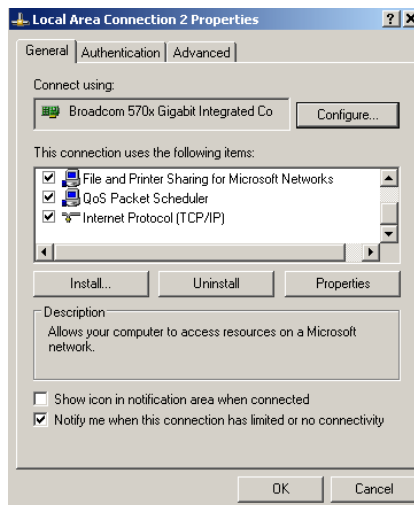

Figure 1-9: ETHERNET CROSS-OVER CABLE PIN LAYOUT

Now, assign the computer an IP address compatible with the relay's IP address.

1. From the Windows desktop, right-click the **My Network Places** icon and select **Properties** to open the network connections window.

2. Right-click the **Local Area Connection** icon and select **Properties**.

3. Select the **Internet Protocol (TCP/IP)** item from the list, and click the **Properties** button.

4. Click the "Use the following IP address" box.

5. Enter an **IP address** with the first three numbers the same as the IP address of the L90 relay and the last number different (in this example, 1.1.1.2).
6. Enter a subnet mask equal to the one set in the L90 (in this example, 255.0.0.0).
7. Click the **OK** button to save the values.

Before continuing, test the Ethernet connection.

1. Open a Windows console window by selecting **Start > Run** from the Windows **Start** menu and typing "cmd".
2. Type the following command, substituting the IP address of 1.1.1.1 with yours:

```
C:\WINNT>ping 1.1.1.1
```

3. If the connection is successful, the system returns four replies similar to the following:

```
Pinging 1.1.1.1 with 32 bytes of data:
```

```
Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
```

```
Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
```

```
Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
```

```
Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
```

```
Ping statistics for 1.1.1.1:
```

```
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
```

```
Approximate round trip time in milliseconds:
```

```
Minimum = 0ms, Maximum = 0ms, Average = 0 ms
```

4. Note that the values for time and TTL vary depending on local network configuration.
5. If the following sequence of messages appears when entering the C:\WINNT>ping 1.1.1.1 command:

```
Pinging 1.1.1.1 with 32 bytes of data:
```

```
Request timed out.
```

```
Request timed out.
```

```
Request timed out.
```

```
Request timed out.
```

```
Ping statistics for 1.1.1.1:
```

```
Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

```
Approximate round trip time in milliseconds:
```

```
Minimum = 0ms, Maximum = 0ms, Average = 0 ms
```

```
Pinging 1.1.1.1 with 32 bytes of data:
```

verify the physical connection between the L90 and the laptop computer, and double-check the programmed IP address in the **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **NETWORK** ⇒ **IP ADDRESS** setting, then repeat step 2.

6. If the following sequence of messages appears when entering the C:\WINNT>ping 1.1.1.1 command:

```
Pinging 1.1.1.1 with 32 bytes of data:
```

```
Hardware error.
```

```
Hardware error.
```

```
Hardware error.
```

```
Hardware error.
```

```
Ping statistics for 1.1.1.1:
```

```
Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

```
Approximate round trip time in milliseconds:
```

```
Minimum = 0ms, Maximum = 0ms, Average = 0 ms
```

```
Pinging 1.1.1.1 with 32 bytes of data:
```

verify the physical connection between the L90 and the laptop computer, and double-check the programmed IP address in the **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **NETWORK** ⇒ **IP ADDRESS** setting, then repeat step 2.

7. If the following sequence of messages appears when entering the C:\WINNT>ping 1.1.1.1 command:

```

Pinging 1.1.1.1 with 32 bytes of data:
Destination host unreachable.
Destination host unreachable.
Destination host unreachable.
Destination host unreachable.

Ping statistics for 1.1.1.1:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
    Approximate round trip time in milliseconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0 ms

Pinging 1.1.1.1 with 32 bytes of data:

```

verify the IP address is programmed in the local computer by entering the ipconfig command in the command window.

```

C:\WINNT>ipconfig

Windows IP Configuration

Ethernet adapter <F4FE223E-5EB6-4BFB-9E34-1BD7BE7F59FF>:

    Connection-specific DNS suffix. . . : 
    IP Address. . . . . : 0.0.0.0
    Subnet Mask . . . . . : 0.0.0.0
    Default Gateway . . . . . : 

Ethernet adapter Local Area Connection:

    Connection-specific DNS suffix . . : 
    IP Address. . . . . : 1.1.1.2
    Subnet Mask . . . . . : 255.0.0.0
    Default Gateway . . . . . : 

C:\WINNT>

```

Before using the Quick Connect feature through the Ethernet port, disable any configured proxy settings in Internet Explorer.

1. Start the Internet Explorer software.
2. Select the **Tools > Internet Options** menu item and click the **Connections** tab.
3. Click on the **LAN Settings** button to open the following window.

4. Ensure that the “Use a proxy server for your LAN” box is not checked.

If this computer is used to connect to the Internet, re-enable any proxy server settings after the laptop has been disconnected from the L90 relay.

1. Start the Internet Explorer software.
2. Select the “UR” device from the EnerVista Launchpad to start EnerVista UR Setup.

1

- Click the **Quick Connect** button to open the Quick Connect dialog box.

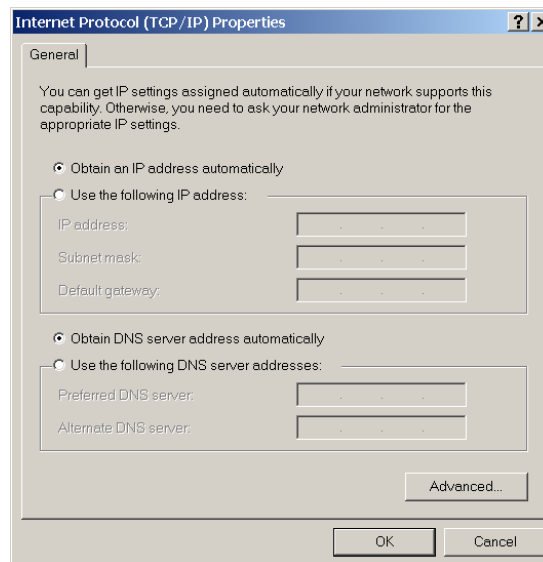

- Select the **Ethernet** interface and enter the IP address assigned to the L90, then click the **Connect** button. The EnerVista UR Setup software creates a site named "Quick Connect" with a corresponding device also named "Quick Connect" and displays them at the upper-left of the screen.
- Expand the sections to view data directly from the L90 device.

Each time the EnerVista UR Setup software is initialized, click the **Quick Connect** button to establish direct communications to the L90. This ensures that configuration of the EnerVista UR Setup software matches the L90 model number.

When direct communications with the L90 via Ethernet is complete, make the following changes:

- From the Windows desktop, right-click the **My Network Places** icon and select **Properties** to open the network connections window.
- Right-click the **Local Area Connection** icon and select the **Properties** item.
- Select the **Internet Protocol (TCP/IP)** item from the list provided and click the **Properties** button.
- Set the computer to "Obtain a relay address automatically" as shown.

If this computer is used to connect to the Internet, re-enable any proxy server settings after the computer has been disconnected from the L90 relay.

AUTOMATIC DISCOVERY OF ETHERNET DEVICES

The EnerVista UR Setup software can automatically discover and communicate to all UR-series IEDs located on an Ethernet network.

Using the Quick Connect feature, a single click of the mouse triggers the software to automatically detect any UR-series relays located on the network. The EnerVista UR Setup software then proceeds to configure all settings and order code options in the **Device Setup** menu. This feature allows the user to identify and interrogate all UR-series devices at a location.

1.3.5 CONNECTING TO THE L90 RELAY

1

1. Open the Display Properties window through the Site List tree as shown. The Display Properties window opens with a status indicator on the lower left of the EnerVista UR Setup window.

2. If the status indicator is red, verify that the Ethernet network cable is properly connected to the Ethernet port on the back of the relay and that the relay has been properly setup for communications (steps A and B earlier).

If a relay icon appears in place of the status indicator, then a report (such as an oscillography or event record) is open. Close the report to re-display the green status indicator.

3. The Display Properties settings can now be edited, printed, or changed.

See chapter 4 in this manual or the EnerVista UR Setup Help File for information about the using the EnerVista UR Setup software interface.

QUICK ACTION HOT LINKS

The EnerVista UR Setup software has several quick action buttons to provide instant access to several functions that are often performed when using L90 relays. From the online window, users can select the relay to interrogate from a pull-down window, then click the button for the action they want to perform. The following quick action functions are available:

- View the L90 event record
- View the last recorded oscillography record
- View the status of all L90 inputs and outputs
- View all of the L90 metering values
- View the L90 protection summary
- Generate a service report

1.3.6 SETTING UP CYBERSENTRY AND CHANGING DEFAULT PASSWORD

If and when first using CyberSentry security, use the following procedure for set up.

1. Log in to the relay as Administrator by using the Value keys on the front panel or through EnerVista connected serially (so that no IP address is required). If logging in through EnerVista choose Device authentication. Enter the default password "ChangeMe1#". Note that the "Lock relay" setting needs to be disabled in the **Security > Supervisory** menu. When this setting is disabled, configuration and firmware upgrade are possible. By default, this setting is disabled.
2. Enable the Supervisor role if you have a need for it.
3. Make any required changes in configuration, such as setting a valid IP address for communication over Ethernet.
4. Log out of the Administrator account by choosing None.

Next, device or server authentication can be chosen on the login screen, but the choice is available only in EnerVista. Use device authentication to log in using the five pre-configured roles (Administrator, Supervisor, Engineer, Operator, Observer). When using a serial connection, only device authentication is supported. When server authentication is required, characteristics for communication with a RADIUS server must be configured on the UR. This is possible only through the EnerVista software. The RADIUS server itself also must be configured. The appendix called RADIUS Server gives an example of how to setup a simple RADIUS server. Once both the RADIUS server and the parameters for connecting UR to the server have been configured, you can choose server authentication on the login screen of EnerVista.

Figure 1-10: LOGIN SCREEN FOR CYBERSENTRY

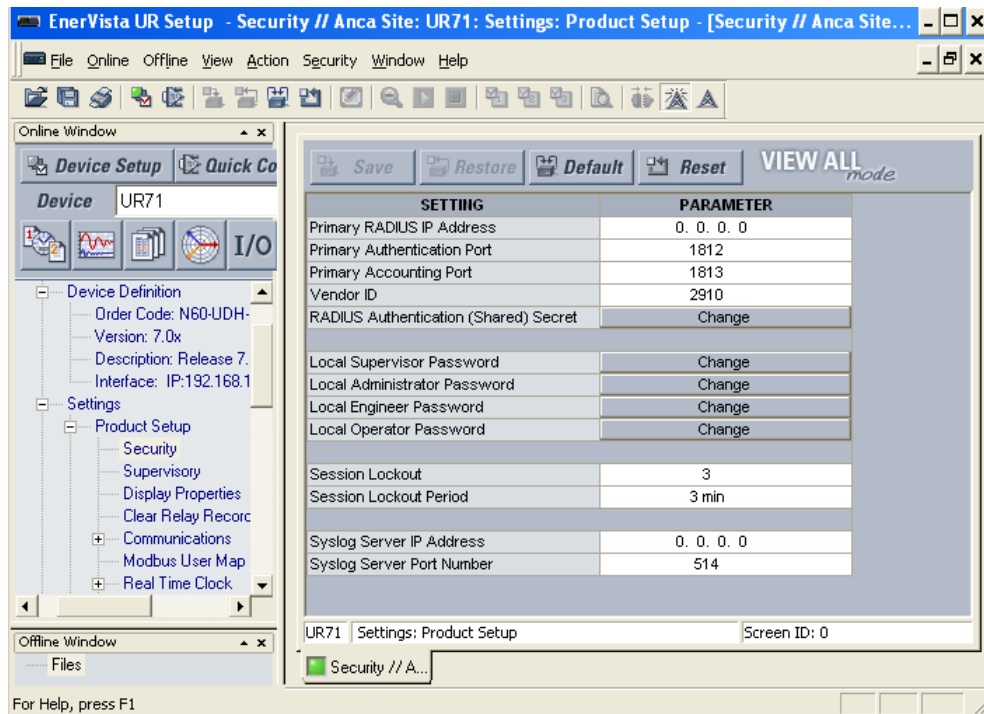

During the commissioning phase, you have the option to bypass the use of passwords. Do so by enabling the Bypass Access setting under **SETTINGS > PRODUCT SETUP > SECURITY > SUPERVISORY**. Be sure to disable this bypass setting after commissioning the device.

You can change the password for any role either from the front panel or through EnerVista.

If using EnerVista, navigate to **Settings > Product Setup > Security**. Change the **Local Administrator Password**, for example. It is strongly recommended that the password for the Administrator be changed from the default. Changing the passwords for the other three roles is optional.

Figure 1–11: CHANGING THE DEFAULT PASSWORD

1.4.1 MOUNTING AND WIRING

See Chapter 3: Hardware for mounting and wiring instructions.

1.4.2 COMMUNICATIONS

The EnerVista UR Setup software communicates to the relay via the faceplate RS232 port or the rear panel RS485 / Ethernet ports. To communicate via the faceplate RS232 port, a standard straight-through serial cable is used. The DB-9 male end is connected to the relay and the DB-9 or DB-25 female end is connected to the computer COM2 port as described in the *CPU communications ports* section of chapter 3.

Figure 1-12: RELAY COMMUNICATION OPTIONS

To communicate through the L90 rear RS485 port from a computer RS232 port, the GE Multilin RS232/RS485 converter box is required. This device (catalog number F485) connects to the computer using a straight-through serial cable. A shielded twisted-pair (20, 22, or 24 AWG) connects the F485 converter to the L90 rear communications port. The converter terminals (+, –, GND) are connected to the L90 communication module (+, –, COM) terminals. See the *CPU communications ports* section in chapter 3 for details. The line is terminated with an R-C network (that is, 120 Ω , 1 nF) as described in the chapter 3.

1.4.3 FACEPLATE DISPLAY

All messages are displayed on a backlit liquid crystal display (LCD) to make them visible under poor lighting conditions. While the keypad and display are not actively being used, the display defaults to user-defined messages. Any high-priority event-driven message automatically overrides the default message and appears on the display.

1.5.1 FACEPLATE KEYPAD

1

Display messages are organized into pages under the following headings: actual values, settings, commands, and targets. The MENU key navigates through these pages. Each heading page is divided further into logical subgroups.

The MESSAGE keys navigate through the subgroups. The VALUE keys increment or decrement numerical setting values when in programming mode. These keys also scroll through alphanumeric values in the text edit mode. Alternatively, values can be entered with the numeric keypad.

The decimal key initiates and advances to the next character in text edit mode or enters a decimal point.

The HELP key can be pressed at any time for context-sensitive help messages.

The ENTER key stores altered setting values.

1.5.2 MENU NAVIGATION

Press the MENU key to select a header display page (top-level menu). The header title appears momentarily followed by a header display page menu item. Each press of the MENU key advances through the following main heading pages:

- Actual values
- Settings
- Commands
- Targets
- User displays (when enabled)

1.5.3 MENU HIERARCHY

The setting and actual value messages are arranged hierarchically. The header display pages are indicated by double scroll bar characters (■■), while sub-header pages are indicated by single scroll bar characters (■). The header display pages represent the highest level of the hierarchy and the sub-header display pages fall below this level. The MESSAGE UP and DOWN keys move within a group of headers, sub-headers, setting values, or actual values. Continually pressing the MESSAGE RIGHT key from a header display displays specific information for the header category. Conversely, continually pressing the MESSAGE LEFT key from a setting value or actual value display returns to the header display.

HIGHEST LEVEL

LOWEST LEVEL (SETTING VALUE)

1.5.4 RELAY ACTIVATION

The relay is in the default “Not Programmed” state when it leaves the factory. When powered up successfully, the Trouble LED is on and the In Service LED off. The relay in the “Not Programmed” state blocks signaling of any output relay. These conditions remain until the relay is explicitly put in the “Programmed” state.

Select the menu message **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **INSTALLATION** ⇒ **RELAY SETTINGS**

RELAY SETTINGS:
Not Programmed

1. To put the relay in the “Programmed” state, press either of the VALUE keys once and then press ENTER. The faceplate Trouble LED turns off and the In Service LED turns on.

The settings for the relay can be programmed manually (see *Chapter 5*) via the faceplate keypad or remotely via the EnerVista UR Setup software (see the EnerVista UR Setup help file).

1.5.5 RELAY PASSWORDS

a) PASSWORD SECURITY

It is recommended that passwords be set for each security level and assigned to specific personnel. There are two user security access levels, COMMAND and SETTING.

1. COMMAND

The COMMAND access level restricts the user from making any settings changes, but allows the user to perform the following operations:

- Operate breakers via faceplate keypad
- Change state of virtual inputs
- Clear event records
- Clear oscillography records
- Operate user-programmable pushbuttons

2. SETTING

The SETTING access level allows the user to make any changes to any of the setting values.

See the Changing Settings section in Chapter 4 for complete instructions on setting security-level passwords.

NOTE

b) CYBERSENTRY

When the CyberSentry option is purchased, advanced security services are available, using either device authentication or server authentication using RADIUS. When this option is purchased, the basic password security is disabled automatically. For more information, see the CyberSentry content in the Security section of the next chapter.

1.5.6 FLEXLOGIC CUSTOMIZATION

FlexLogic equation editing is required for setting user-defined logic for customizing the relay operations. See the *FlexLogic* section in Chapter 5.

Commissioning tests are included in the *Commissioning* chapter.

The L90 requires minimal maintenance after it is commissioned into service. Since the L90 is a microprocessor-based relay, its characteristics do not change over time. As such, no further functional tests are required.

The L90 performs a number of continual self-tests and takes the necessary action in case of any major errors (see the *Relay Self-tests* section in chapter 7). However, it is recommended that L90 maintenance be scheduled with other system maintenance. This maintenance can involve in-service, out-of-service, or unscheduled maintenance.

In-service maintenance:

1. Visual verification of the analog values integrity, such as voltage and current (in comparison to other devices on the corresponding system).
2. Visual verification of active alarms, relay display messages, and LED indications.
3. LED test.
4. Visual inspection for any damage, corrosion, dust, or loose wires.
5. Event recorder file download with further events analysis.

Out-of-service maintenance:

1. Check wiring connections for firmness.
2. Analog values (currents, voltages, RTDs, analog inputs) injection test and metering accuracy verification. Calibrated test equipment is required.
3. Protection elements setting verification (analog values injection or visual verification of setting file entries against relay settings schedule).
4. Contact inputs and outputs verification. This test can be conducted by direct change of state forcing or as part of the system functional testing.
5. Visual inspection for any damage, corrosion, or dust.
6. Event recorder file download with further events analysis.
7. LED Test and pushbutton continuity check.

Unscheduled maintenance, such as a disturbance causing system interruption:

1. View the event recorder and oscillography or fault report for correct operation of inputs, outputs, and elements.

If it is concluded that the relay or one of its modules is of concern, contact GE Multilin for service.

2.1.1 OVERVIEW

The L90 Line Current Differential System is a digital current differential relay system with an integral communications channel interface. It is a complete line terminal protection and control system, able to deliver protection as either a line differential and/or distance device. Both distance and line differential elements can run simultaneously.

The L90 is intended to provide complete protection for transmission lines of any voltage level. Both three phase and single phase tripping schemes are available. Models of the L90 are available for application on both two and three terminal lines. The L90 uses per phase differential at 64 kbps transmitting two phaselets per cycle. The current differential scheme is based on innovative patented techniques developed by GE. The L90 algorithms are based on the Fourier transform–phaselet approach and an adaptive statistical restraint. The restraint is similar to a traditional percentage differential scheme, but is adaptive based on relay measurements. When used with a 64 kbps channel, the innovative phaselets approach yields an operating time of 1.0 to 1.5 cycles (typical). The adaptive statistical restraint approach provides both more sensitive and more accurate fault sensing. This allows the L90 to detect relatively higher impedance single line to ground faults that existing systems may not. The basic current differential element operates on current input only. Long lines with significant capacitance can benefit from charging current compensation if terminal voltage measurements are applied to the relay. The voltage input is also used for some protection and monitoring features such as directional elements, fault locator, metering, and distance backup. In addition, the L90 provides local restricted ground fault protection.

The L90 is designed to operate over different communications links with various degrees of noise encountered in power systems and communications environments. Since correct operation of the relay is completely dependent on data received from the remote end, special attention must be paid to information validation. The L90 incorporates a high degree of security by using a 32-bit CRC (cyclic redundancy code) inter-relay communications packet.

In addition to current differential protection, the relay provides multiple backup protection for phase and ground faults. For overcurrent protection, the time overcurrent curves may be selected from a selection of standard curve shapes or a custom FlexCurve™ for optimum co-ordination. Additionally, five zones of phase and ground distance protection with power swing blocking, out-of-step tripping, line pickup, load encroachment, and six pilot schemes are included.

The L90 incorporates charging current compensation for applications on very long transmission lines without loss of sensitivity. The line capacitive current is removed from the terminal phasors.

For breaker-and-a-half or ring applications, the L90 design provides secure operation during external faults with possible CT saturation.

Voltage, current, and power metering is built into the relay as a standard feature. Current parameters are available as total waveform RMS magnitude, or as fundamental frequency only RMS magnitude and angle (phasor).

Table 2–1: DEVICE NUMBERS AND FUNCTIONS

DEVICE NUMBER	FUNCTION	DEVICE NUMBER	FUNCTION
21G	Ground distance	52	AC circuit breaker
21P	Phase distance	59N	Neutral overvoltage
25	Synchrocheck	59P	Phase overvoltage
27P	Phase undervoltage	59X	Auxiliary overvoltage
27X	Auxiliary undervoltage	67N	Neutral directional overcurrent
32N	Wattmetric zero-sequence directional	67P	Phase directional overcurrent
50BF	Breaker failure	67_2	Negative-sequence directional overcurrent
50DD	Adaptive fault detector (sensitive current disturbance detector)	68	Power swing blocking
50G	Ground instantaneous overcurrent	78	Out-of-step tripping
50N	Neutral instantaneous overcurrent	79	Automatic recloser
50P	Phase instantaneous overcurrent	81O	Overfrequency
50_2	Negative-sequence instantaneous overcurrent	81ROCOF	Rate of change of frequency
51G	Ground time overcurrent	81U	Underfrequency
51N	Neutral time overcurrent	87G	Restricted ground fault
51P	Phase time overcurrent	87L	Segregated line current differential
51_2	Negative-sequence time overcurrent	87LG	Ground differential

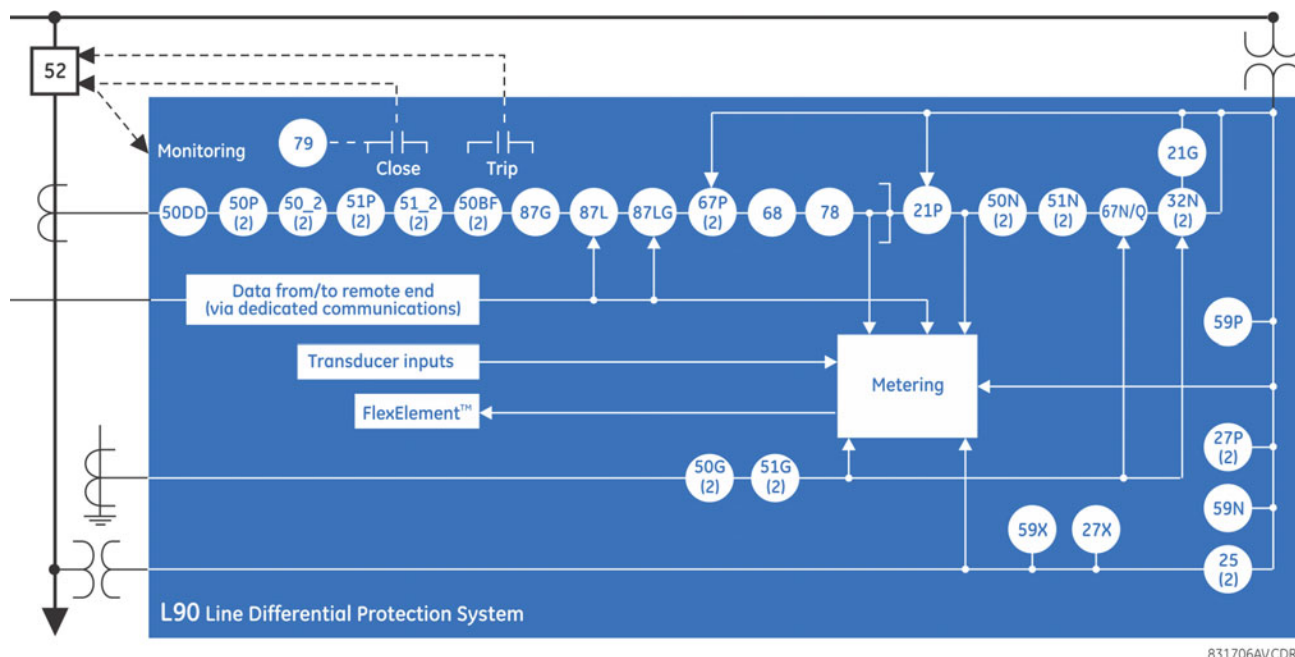

Figure 2-1: SINGLE LINE DIAGRAM

Table 2-2: OTHER DEVICE FUNCTIONS

FUNCTION	FUNCTION	FUNCTION
Breaker Arcing Current (I^2t)	Fault Reporting	Stub Bus
Breaker Control	FlexElements™ (8)	Synchrophasors
Broken Conductor Detection	FlexLogic™ Equations	Time synchronization over IRIG-B or IEEE 1588
Contact Inputs (up to 96)	IEC 61850 Communications (optional)	Time Synchronization over SNTP
Contact Outputs (up to 64)	L90 Channel Tests	Transducer Inputs/Outputs
Control Pushbuttons	Line Pickup	User Definable Displays
CT Failure Detector	Load Encroachment	User Programmable LEDs
CyberSentry™ security	Metering: Current, Voltage, Power, Energy, Frequency, Demand, Power Factor, 87L current, local and remote phasors	User Programmable Pushbuttons
Data Logger	Modbus Communications	User Programmable Self-Tests
Digital Counters (8)	Modbus User Map	Virtual Inputs (64)
Digital Elements (48)	Non-Volatile Latches	Virtual Outputs (96)
Direct Inputs (8 per L90 comms channel)	Non-Volatile Selector Switch	VT Fuse Failure
Disconnect Switches	Open Pole Detector	
DNP 3.0 or IEC 60870-5-104 protocol	Oscillography	
Event Recorder	Pilot Schemes	
Fault Locator	Setting Groups (6)	

LINE CURRENT DIFFERENTIAL:

- Phase segregated, high-speed digital current differential system
- Overhead and underground AC transmission lines, series compensated lines
- Two-terminal and three-terminal line applications
- Zero-sequence removal for application on lines with tapped transformers connected in a grounded wye on the line side
- GE phaselets approach based on the Discrete Fourier Transform with 64 samples per cycle and transmitting two time-stamped phaselets per cycle
- Adaptive restraint approach improving sensitivity and accuracy of fault sensing
- Increased security for trip decision using disturbance detector and trip output logic
- Accommodates in-zone transformer with a magnitude and phase compensation and second harmonic inhibit during transformer magnetizing inrush
- Continuous clock synchronization via the distributed synchronization technique
- Increased transient stability through DC decaying offset removal
- Accommodates up to five times CT ratio differences
- Peer-to-peer (master-master) architecture changing to master-slave via DTT (if channel fails) at 64 kbps
- Charging current compensation
- Interfaces direct fiber, multiplexed RS422, IEEE C37.94, and G.703 connections with relay ID check
- Per-phase line differential protection direct transfer trip plus eight user-assigned pilot signals via the communications channel
- Secure 32-bit CRC protection against communications errors
- Channel asymmetry (up to 10 ms) compensation using GPS satellite-controlled clock

BACKUP PROTECTION:

- DTT provision for pilot schemes
- Five zones of distance protection with six pilot schemes, power swing blocking and out-of-step tripping, line pickup, and load encroachment
- Two-element time overcurrent and two-element instantaneous overcurrent directional phase overcurrent protection
- Two-element time overcurrent and two-element instantaneous overcurrent directional zero-sequence protection
- Two-element time overcurrent and two-element instantaneous overcurrent negative-sequence overcurrent protection
- Undervoltage and overvoltage protection

ADDITIONAL PROTECTION:

- Breaker failure protection
- Stub bus protection
- VT and CT supervision
- GE Multilin *sources* approach allowing grouping of different CTs and VTs from multiple input channels
- Open pole detection
- Breaker trip coil supervision and *seal-in* of trip command
- FlexLogic allowing creation of user-defined distributed protection and control logic

CONTROL:

- One and two breaker configuration for breaker-and-a-half and ring bus schemes, pushbutton control from the relay
- Auto-reclosing and synchrochecking

- Breaker arcing current

MONITORING:

- Oscillography of current, voltage, FlexLogic operands, and digital signals (1 × 128 cycles to 31 × 8 cycles configurable)
- Events recorder: 1024 events
- Fault locator

METERING:

- Actual 87L remote phasors, differential current, channel delay, and channel asymmetry at all line terminals of line current differential protection
- Line current, voltage, real power, reactive power, apparent power, power factor, and frequency

COMMUNICATIONS:

- Front panel RS232 port: 19.2 kbps
- Rear RS485 port: up to 115 kbps
- Rear 100Base-FX Ethernet port supporting the IEC 61850 protocol

2.1.3 SECURITY

The following security features are available:

- Password security — Basic security present in the default offering of the product
- EnerVista security — Role-based access to various EnerVista software screens and configuration elements. The feature is available in the default offering of the product and only in the EnerVista software.
- CyberSentry security — Advanced security options available as a software option. When purchased, the options are automatically enabled, and the default Password security and EnerVista security are disabled.

a) ENERVISTA SECURITY

The EnerVista security management system is a role-based access control (RBAC) system that allows an administrator to manage the privileges of multiple users. This allows for access control of UR devices by multiple personnel within a substation and conforms to the principles of RBAC as defined in ANSI INCITS 359-2004. The EnerVista security management system is disabled by default to allow the administrator direct access to the EnerVista software after installation. It is recommended that security be enabled before placing the device in service.

Basic password or enhanced CyberSentry security applies, depending on purchase.

b) PASSWORD SECURITY

Password security is a basic security feature present in the default offering of the product.

Two levels of password security are provided: command and setting.

The following operations are under command password supervision:

- Operating the breakers via faceplate keypad
- Changing the state of virtual inputs
- Clearing the event records
- Clearing the oscillography records
- Clearing fault reports
- Changing the date and time
- Clearing the breaker arcing current
- Clearing energy records
- Clearing the data logger
- Clearing the user-programmable pushbutton states

The following operations are under setting password supervision:

- Changing any setting
- Test mode operation

The command and setting passwords are defaulted to “0” when the relay is shipped from the factory. When a password is set to “0”, the password security feature is disabled. As shown in the figures, the window indicates when the password is at the default and when the password has been set.

Figure 2–2: WINDOW INDICATES DEFAULT PASSWORD (LEFT) AND PASSWORD SET (RIGHT)

The L90 supports password entry from a local or remote connection. Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the through the faceplate RS232 port. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

When entering a settings or command password via EnerVista or any serial interface, the user must enter the corresponding connection password. If the connection is to the back of the L90, the remote password must be used. If the connection is to the RS232 port of the faceplate, the local password applies.

Events are logged in the Event Recorder. The FlexLogic operands and events are updated every five seconds.

c) CYBERSENTRY SECURITY

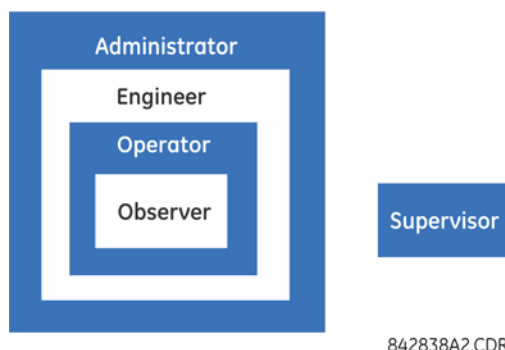

CyberSentry Embedded Security is a software option that provides advanced security services. When this option is purchased, the basic password security is disabled automatically.

CyberSentry provides security through the following features:

- An Authentication, Authorization, Accounting (AAA) Remote Authentication Dial-In User Service (RADIUS) client that is centrally managed, enables user attribution, provides accounting of all user activities, and uses secure standards-based strong cryptography for authentication and credential protection.
- A Role-Based Access Control (RBAC) system that provides a permission model that allows access to UR device operations and configurations based on specific roles and individual user accounts configured on the AAA server (that is, Administrator, Supervisor, Engineer, Operator, Observer).
- Security event reporting through the Syslog protocol for supporting Security Information Event Management (SIEM) systems for centralized cybersecurity monitoring.
- Strong encryption of all access and configuration network messages between the EnerVista software and UR devices using the Secure Shell (SSH) protocol, the Advanced Encryption Standard (AES), and 128-bit keys in Galois Counter Mode (GCM) as specified in the U.S. National Security Agency Suite B extension for SSH and approved by the National Institute of Standards and Technology (NIST) FIPS-140-2 standards for cryptographic systems.

Example: Administrative functions can be segmented away from common operator functions, or engineering type access, all of which are defined by separate roles, as shown in the following figure, so that access of UR devices by multiple personnel within a substation is allowed. Permission for each role are outlined in the next section.

Figure 2–3: CYBERSENTRY USER ROLES

There are two types of authentication supported by CyberSentry that can be used to access the UR device:

- Device Authentication (local UR device authenticates)
- Server Authentication (RADIUS server authenticates)

The EnerVista software allows access to functionality that is determined by the user role, which comes either from the local UR device or RADIUS server.

The EnerVista software has a device authentication option on the login screen for accessing the UR device. When the "Device" button is selected, the UR uses its local authentication database and not the RADIUS server to authenticate the user. In this case, it uses its built-in roles (Administrator, Engineer, Supervisor, Observer, Operator) as login names and the associated passwords are stored on the UR device. As such, when using the local accounts, access is not user-attributable.

In cases where user attributable access is required especially to facilitate auditable processes for compliance reasons, use RADIUS authentication only.

When the "Server" Authentication Type option is selected, the UR uses the RADIUS server and not its local authentication database to authenticate the user.

No password or security information are displayed in plain text by the EnerVista software or UR device, nor are they ever transmitted without cryptographic protection.

CYBERSENTRY USER ROLES

CyberSentry user roles (Administrator, Engineer, Operator, Supervisor, Observer) limit the levels of access to various UR device functions. This means that the EnerVista software allows for access to functionality based on the user's logged in role.

Example: Observer cannot write any settings.

The table lists the roles that are supported and their corresponding capabilities.

Table 2–3: PERMISSIONS BY USER ROLE FOR CYBERSENTRY

Roles	Administrator	Engineer	Operator	Supervisor	Observer
	Complete access	Complete access except for CyberSentry Security	Command menu	Authorizes writing	Default role

2. R = read access
3. Supervisor = RW (default), Administrator = R (default), Administrator = RW (only if Supervisor role is disabled)
4. NA = the permission is not enforced by CyberSentry Security

CYBERSENTRY SERVER AUTHENTICATION

The UR has been designed to automatically direct authentication requests based on user names. In this respect, local account names on the UR are considered as reserved, and not used on a RADIUS server.

The UR automatically detects whether an authentication request is to be handled remotely or locally. As there are only five local accounts possible on the UR, if the user ID credential does not match one of the five local accounts, the UR automatically forwards the request to a RADIUS server when one is provided.

If a RADIUS server is provided, but is unreachable over the network, server authentication requests are denied. In this situation, use local UR accounts to gain access to the UR system.

2.1.4 ORDERING**a) OVERVIEW**

The L90 is available as a 19-inch rack horizontal mount or reduced-size ($\frac{3}{4}$) vertical unit and consists of the following modules: power supply, CPU, CT/VT, digital input and output, transducer input and output, and inter-relay communications. Each of these modules can be supplied in a number of configurations specified at the time of ordering. The information required to completely specify the relay is provided in the following tables (see chapter 3 for full details of relay modules).

Order codes are subject to change without notice. See the ordering page at <http://www.gedigitalenergy.com/multilin/order.htm> for the latest options.

The order code structure is dependent on the mounting option (horizontal or vertical) and the type of CT/VT modules (enhanced diagnostic CT/VT modules or HardFiber™ process bus modules). The order code options are described in the following sub-sections.

b) ORDER CODES WITH ENHANCED CT/VT MODULES

The order codes for the horizontal mount units are shown below.

Table 2–4: L90 ORDER CODES (HORIZONTAL UNITS)

BASE UNIT CPU	L90	T	U	V	F	H	L	N	S	U	W/X	Full Size Horizontal Mount
SOFTWARE												Base Unit
	00											RS485 and Three Multi-mode fiber 100Base-FX (SFP with LC)
	03											RS485 and Two Multi-mode fiber 100Base-FX (SFP with LC), One 10/100Base-T (SFP with RJ45)
	05											RS485 and Three 10/100Base-T (SFP with RJ45)

c) ORDER CODES WITH PROCESS BUS MODULES

The order codes for the horizontal mount units with the process bus module are shown below.

Table 2–6: L90 ORDER CODES (HORIZONTAL UNITS WITH PROCESS BUS)

2-12

Table 2-6: L90 ORDER CODES (HORIZONTAL UNITS WITH PROCESS BUS)

[illegible]

Table 2–6: L90 ORDER CODES (HORIZONTAL UNITS WITH PROCESS BUS)

L90 - - - - - F - - H - - L - - N - - S - - W/X - -										Full Size Horizontal Mount		
Base Unit										Base Unit		
POWER SUPPLY (redundant supply must be same type as main supply)	L90	H	H	L						RH	125 / 250 V AC/DC power supply	
											125 / 250 V AC/DC with redundant 125 / 250 V AC/DC power supply	
											24 to 48 V (DC only) power supply	
PROCESS BUS MODULE										RL	24 to 48 V (DC only) with redundant 24 to 48 V DC power supply	
											Eight-port digital process bus module	
											No Module	
DIGITAL INPUTS/OUTPUTS										XX	4A	4 Solid-State (no monitoring) MOSFET outputs
											4B	4 Solid-State (voltage with optional current) MOSFET outputs
											4C	4 Solid-State (current with optional voltage) MOSFET outputs
											4D	16 digital inputs with Auto-Burnishing
											4L	14 Form-A (no monitoring) Latching outputs
											67	8 Form-A (no monitoring) outputs
											6A	2 Form-A (voltage with optional current) and 2 Form-C outputs, 8 digital inputs
											6B	2 Form-A (voltage with optional current) and 4 Form-C outputs, 4 digital inputs
											6C	8 Form-C outputs
											6D	16 digital inputs
											6E	4 Form-C outputs, 8 digital inputs
											6F	8 Fast Form-C outputs
											6G	4 Form-A (voltage with optional current) outputs, 8 digital inputs
											6H	6 Form-A (voltage with optional current) outputs, 4 digital inputs
											6K	4 Form-C and 4 Fast Form-C outputs
											6L	2 Form-A (current with optional voltage) and 2 Form-C outputs, 8 digital inputs
											6M	2 Form-A (current with optional voltage) and 4 Form-C outputs, 4 digital inputs
											6N	4 Form-A (current with optional voltage) outputs, 8 digital inputs
											6P	6 Form-A (current with optional voltage) outputs, 4 digital inputs
											6R	2 Form-A (no monitoring) and 2 Form-C outputs, 8 digital inputs
											6S	2 Form-A (no monitoring) and 4 Form-C outputs, 4 digital inputs
											6T	4 Form-A (no monitoring) outputs, 8 digital inputs
											6U	6 Form-A (no monitoring) outputs, 4 digital inputs
											6V	2 Form-A outputs, 1 Form-C output, 2 Form-A (no monitoring) latching outputs, 8 digital inputs
INTER-RELAY COMMUNICATIONS (select a maximum of 1 per unit)											2A	C37.94SM, 1300nm single-mode, ELED, 1 channel single-mode

7W	RS422, 2 Channels											

The order codes for the reduced size vertical mount units with the process bus module are shown below.

Table 2–7: L90 ORDER CODES (REDUCED SIZE VERTICAL UNITS WITH PROCESS BUS)

L90 - - - - - F - - H - - L - - N - - R - -											Reduced Size Vertical Mount
BASE UNIT CPU	L90										Base Unit
		T									RS485 and Three Multi-mode fiber 100Base-FX (SFP with LC)
		U									RS485 and Two Multi-mode fiber 100Base-FX (SFP with LC), One 10/100Base-T (SFP with RJ45)
SOFTWARE		V									RS485 and Three 10/100Base-T (SFP with RJ45)
	00										No software options
	02										Breaker-and-a-half software
	03										IEC 61850 communications
	05										Breaker-and-a-half software and IEC 61850 communications
	06										Phasor measurement unit (PMU)
	07										IEC 61850 communications and PMU
	08										Breaker-and-a-half and PMU
	09										Breaker-and-a-half, IEC 61850 communications, and PMU
	24										In-zone transformer protection
	25										In-zone transformer protection and IEC 61850
	26										In-zone transformer protection and PMU
	27										In-zone transformer protection, IEC 61850, and PMU
	80										In-zone transformer and Breaker-and-a-half
	81										In-zone transformer, IEC 61850, and Breaker-and-a-half
	82										In-zone transformer, Breaker-and-a-half, and PMU
	83										In-zone transformer, IEC 61850, Breaker-and-a-half, and PMU
	A0										CyberSentry Lvl 1
	A2										CyberSentry Lvl 1 and Breaker-and-a-half
	A3										CyberSentry Lvl 1 and IEC 61850
	A5										CyberSentry Lvl 1, IEC 61850, and Breaker-and-a-half
	A6										CyberSentry Lvl 1 and PMU
	A7										CyberSentry Lvl 1, IEC 61850, and PMU
	A8										CyberSentry Lvl 1, PMU, and Breaker-and-a-half
	A9										CyberSentry Lvl 1, IEC 61850, PMU, and Breaker-and-a-half
	AD										CyberSentry Lvl 1 and In-zone transformer protection
	AP										CyberSentry Lvl 1, IEC 61850, and In-zone transformer protection
	AQ										CyberSentry Lvl 1, PMU, and In-zone transformer protection
	AR										CyberSentry Lvl 1, IEC 61850, PMU, and In-zone transformer protection
	B0										IEEE 1588
B2										IEEE 1588 and Breaker-and-a-half	
B3										IEEE 1588 and IEC 61850	
B5										IEEE 1588, IEC 61850, and Breaker-and-a-half	
B6										IEEE 1588 and PMU	
B7										IEEE 1588, IEC 61850, and PMU	
B8										IEEE 1588, PMU, and Breaker-and-a-half	
B9										IEEE 1588, IEC 61850, PMU, and Breaker-and-a-half	
B0										IEEE 1588 and In-zone transformer protection	
BP										IEEE 1588, IEC 61850, and In-zone transformer protection	
BQ										IEEE 1588, PMU, and In-zone transformer protection	
BR										IEEE 1588, IEC 61850, PMU, and In-zone transformer protection	
C0										Parallel Redundancy Protocol (PRP)	
C2										PRP and Breaker-and-a-half	
C3										PRP and IEC 61850	
C5										PRP, IEC 61850, and Breaker-and-a-half	
C6										PRP and PMU	
C7										PRP, IEC 61850, and PMU	
C8										PRP, Breaker-and-a-half, and PMU	
C9										PRP, IEC 61850, Breaker-and-a-half, and PMU	
CO										PRP and In-zone transformer protection	
CP										PRP, In-zone transformer protection, and IEC 61850	
CQ										PRP, In-zone transformer protection, and PMU	
CR										PRP, In-zone transformer protection, IEC 61850, and PMU

2.1.5 REPLACEMENT MODULES

Replacement modules can be ordered separately. When ordering a replacement CPU module or faceplate, provide the serial number of your existing unit.

Not all replacement modules may be applicable to the L90 relay. Only the modules specified in the order codes are available as replacement modules.

Replacement module codes are subject to change without notice. See the ordering page at <http://www.gedigitalenergy.com/multilin/order.htm> for the latest L90 ordering options.

The replacement module order codes for the horizontal mount units are shown below.

Table 2–8: ORDER CODES FOR REPLACEMENT MODULES, HORIZONTAL UNITS

	UR	H	
POWER SUPPLY (redundant supply only available in horizontal units; must be same type as main supply)	RH	H	Redundant 125 / 250 V AC/DC
CPU	RL	H	Redundant 24 to 48 V (DC only)
	T		RS485 with 3 100Base-FX Ethernet, multimode, SFP with LC

2.2.1 INTER-RELAY COMMUNICATIONS

Dedicated inter-relay communications may operate over 64 kbps digital channels or dedicated fiber optic channels. Available interfaces include:

- RS422 at 64 kbps
- G.703 at 64 kbps
- Dedicated fiber optics at 64 kbps. The fiber optic options include:
 - 820 nm multi-mode fiber with an LED transmitter
 - 1300 nm multi-mode fiber with an LED transmitter
 - 1300 nm single-mode fiber with an ELED transmitter
 - 1300 nm single-mode fiber with a laser transmitter
 - 1550 nm single-mode fiber with a laser transmitter
 - IEEE C37.94 820 nm multi-mode fiber with an LED transmitter

All fiber optic options use an ST connector. L90 models are available for use on two or three terminal lines. A two terminal line application requires one bidirectional channel. However, in two terminal line applications, it is also possible to use an L90 relay with two bidirectional channels. The second bidirectional channel will provide a redundant backup channel with automatic switchover if the first channel fails.

The L90 current differential relay is designed to function in a peer-to-peer or master-to-master architecture. In the peer-to-peer architecture, all relays in the system are identical and perform identical functions in the current differential scheme. In order for every relay on the line to be a peer, each relay must be able to communicate with all of the other relays. If there is a failure in communications among the relays, the relays revert to a master-to-peer architecture on a three-terminal system, with the master as the relay that has current phasors from all terminals. Using two different operational modes increases the dependability of the current differential scheme on a three-terminal system by reducing reliance on communications.

The main difference between a master and a slave L90 is that only a master relay performs the actual current differential calculation, and only a master relay communicates with the relays at all other terminals of the protected line.

At least one master L90 relay must have live communications to all other terminals in the current differential scheme; the other L90 relays on that line may operate as slave relays. All master relays in the scheme will be equal, and each will perform all functions. Each L90 relay in the scheme will determine if it is a master by comparing the number of terminals on the line to the number of active communication channels.

The slave terminals only communicate with the master; there is no slave-to-slave communications path. As a result, a slave L90 relay cannot calculate the differential current. When a master L90 relay issues a local trip signal, it also sends a direct transfer trip (DTT) signal to all of the other L90 relays on the protected line.

If a slave L90 relay issues a trip from one of its backup functions, it can send a transfer trip signal to its master and other slave relays if such option is designated. Because a slave cannot communicate with all the relays in the differential scheme, the master will then “broadcast” the direct transfer trip (DTT) signal to all other terminals.

The slave L90 Relay performs the following functions:

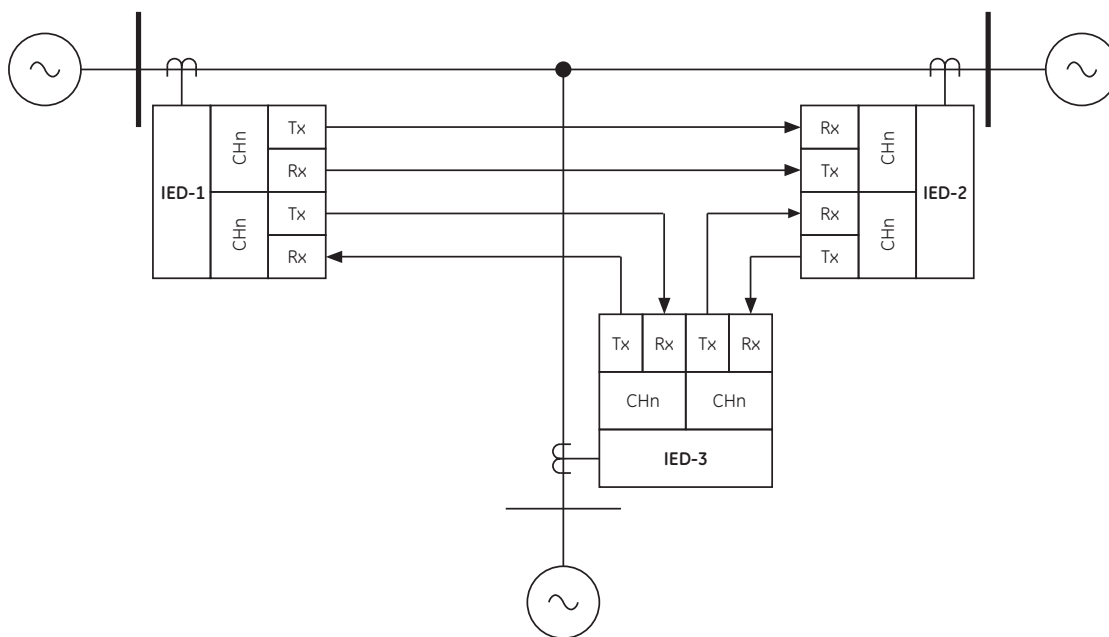

- Samples currents and voltages
- Removes DC offset from the current via the mimic algorithm
- Creates phaselets
- Calculates sum of squares data
- Transmits current data to all master L90 relays
- Performs all local relaying functions
- Receives current differential DTT and Direct Input signals from all other L90 relays
- Transmits direct output signals to all communicating relays
- Sends synchronization information of local clock to all other L90 clocks

The master L90 relay performs the following functions:

- Performs all functions of a slave L90
- Receives current phasor information from all relays
- Performs the current differential algorithm
- Sends a current differential DTT signal to all L90 relays on the protected line

In the peer-to-peer mode, all L90 relays act as masters.

2

831009A5.CDR

Figure 2-4: COMMUNICATIONS PATHS

2.2.2 CHANNEL MONITOR

The L90 has logic to detect that the communications channel is deteriorating or has failed completely. This can provide an alarm indication and disable the current differential protection. Note that a failure of the communications from the master to a slave does not prevent the master from performing the current differential algorithm; failure of the communications from a slave to the master will prevent the master from performing the correct current differential logic. Channel propagation delay is being continuously measured and adjusted according to changes in the communications path. Every relay on the protection system can assigned an unique ID to prevent advertent loopbacks at multiplexed channels.

2.2.3 LOOPBACK TEST

This option allows the user to test the relay at one terminal of the line by *looping* the transmitter output to the receiver input; at the same time, the signal sent to the remote will not change. A local loopback feature is included in the relay to simplify single ended testing.

2.2.4 DIRECT TRANSFER TRIPPING

The L90 includes provision for sending and receiving a single-pole direct transfer trip (DTT) signal from current differential protection between the L90 relays at the line terminals using the pilot communications channel. The user may also initiate an additional eight pilot signals with an L90 communications channel to create trip, block, or signaling logic. A FlexLogic operand, an external contact closure, or a signal over the LAN communication channels can be assigned for that logic.

2.3.1 PROTECTION AND CONTROL FUNCTIONS

- **Current differential protection:** The current differential algorithms used in the L90 Line Current Differential System are based on the Fourier transform *phaselet* approach and an adaptive statistical restraint. The L90 uses per-phase differential at 64 kbps with two phaselets per cycle. A detailed description of the current differential algorithms is found in chapter 8. The current differential protection can be set in a percentage differential scheme with a single or dual slope.
- **Backup protection:** In addition to the primary current differential protection, the L90 Line Current Differential System incorporates backup functions that operate on the local relay current only, such as directional phase overcurrent, directional neutral overcurrent, negative-sequence overcurrent, undervoltage, overvoltage, and distance protection.
- **Multiple setting groups:** The relay can store six groups of settings. They may be selected by user command, a configurable contact input or a FlexLogic equation to allow the relay to respond to changing conditions.
- **User-programmable logic:** In addition to the built-in protection logic, the relay may be programmed by the user via FlexLogic equations.
- **Configurable inputs and outputs:** All of the contact converter inputs (digital inputs) to the relay may be assigned by the user to directly block a protection element, operate an output relay or serve as an input to FlexLogic equations. All of the outputs, except for the self test critical alarm contacts, may also be assigned by the user.

2.3.2 METERING AND MONITORING FUNCTIONS

- **Metering:** The relay measures all input currents and calculates both phasors and symmetrical components. When AC potential is applied to the relay via the optional voltage inputs, metering data includes phase and neutral current, phase voltage, three phase and per phase W, VA, and var, and power factor. Frequency is measured on either current or voltage inputs. They may be called onto the local display or accessed via a computer. All terminal current phasors and differential currents are also displayed at all relays, allowing the user opportunity to analyze correct polarization of currents at all terminals.
- **Event records:** The relay has a sequence of events recorder which combines the recording of snapshot data and oscillography data. Events consist of a broad range of change of state occurrences, including input contact changes, measuring-element pickup and operation, FlexLogic equation changes, and self-test status. The relay stores up to 1024 events with the date and time stamped to the nearest microsecond. This provides the information needed to determine a sequence of events, which can reduce troubleshooting time and simplify report generation after system events.
- **Oscillography:** The relay stores oscillography data at a sampling rate of 64 times per cycle. The relay can store a maximum of 64 records. Each oscillography file includes a sampled data report consisting of:
 - Instantaneous sample of the selected currents and voltages (if AC potential is used),
 - The status of each selected contact input.
 - The status of each selected contact output.
 - The status of each selected measuring function.
 - The status of various selected logic signals, including virtual inputs and outputs.

The captured oscillography data files can be accessed via the remote communications ports on the relay.

- **CT failure and current unbalance alarm:** The relay has current unbalance alarm logic. The unbalance alarm may be supervised by a zero-sequence voltage detector. The user may block the relay from tripping when the current unbalance alarm operates.
- **Trip circuit monitor:** On those outputs designed for trip duty, a trip voltage monitor will continuously measure the DC voltage across output contacts to determine if the associated trip circuit is intact. If the voltage dips below the minimum voltage or the breaker fails to open or close after a trip command, an alarm can be activated.
- **Self-test:** The most comprehensive self testing of the relay is performed during a power-up. Because the system is not performing any protection activities at power-up, tests that would be disruptive to protection processing may be performed. The processors in the CPU and all CT/VT modules participate in startup self-testing. Self-testing checks approximately 85 to 90% of the hardware, and CRC/check-sum verification of all PROMs is performed. The proces-

sors communicate their results to each other so that if any failures are detected, they can be reported to the user. Each processor must successfully complete its self tests before the relay begins protection activities.

During both startup and normal operation, the CPU polls all plug-in modules and checks that every one answers the poll. The CPU compares the module types that identify themselves to the relay order code stored in memory and declares an alarm if a module is either non-responding or the wrong type for the specific slot. When running under normal power system conditions, the relay processors will have idle time. During this time, each processor performs background self-tests that are not disruptive to the foreground processing.

2.3.3 OTHER FUNCTIONS

a) ALARMS

The relay contains a dedicated alarm relay, the critical failure alarm, housed in the power supply module. This output relay is not user programmable. This relay has form-C contacts and is energized under normal operating conditions. The critical failure alarm will become de-energized if the relay self test algorithms detect a failure that would prevent the relay from properly protecting the transmission line.

b) LOCAL USER INTERFACE

The local user interface (on the faceplate) consists of a 2×20 liquid crystal display (LCD) and keypad. The keypad and display may be used to view data from the relay, to change settings in the relay, or to perform control actions. Also, the faceplate provides LED indications of status and events.

c) TIME SYNCHRONIZATION

The relay includes a clock which can run freely from the internal oscillator or be synchronized from an external IRIG-B signal. With the external signal, all relays wired to the same synchronizing signal will be synchronized to within 0.1 millisecond.

d) FUNCTION DIAGRAMS

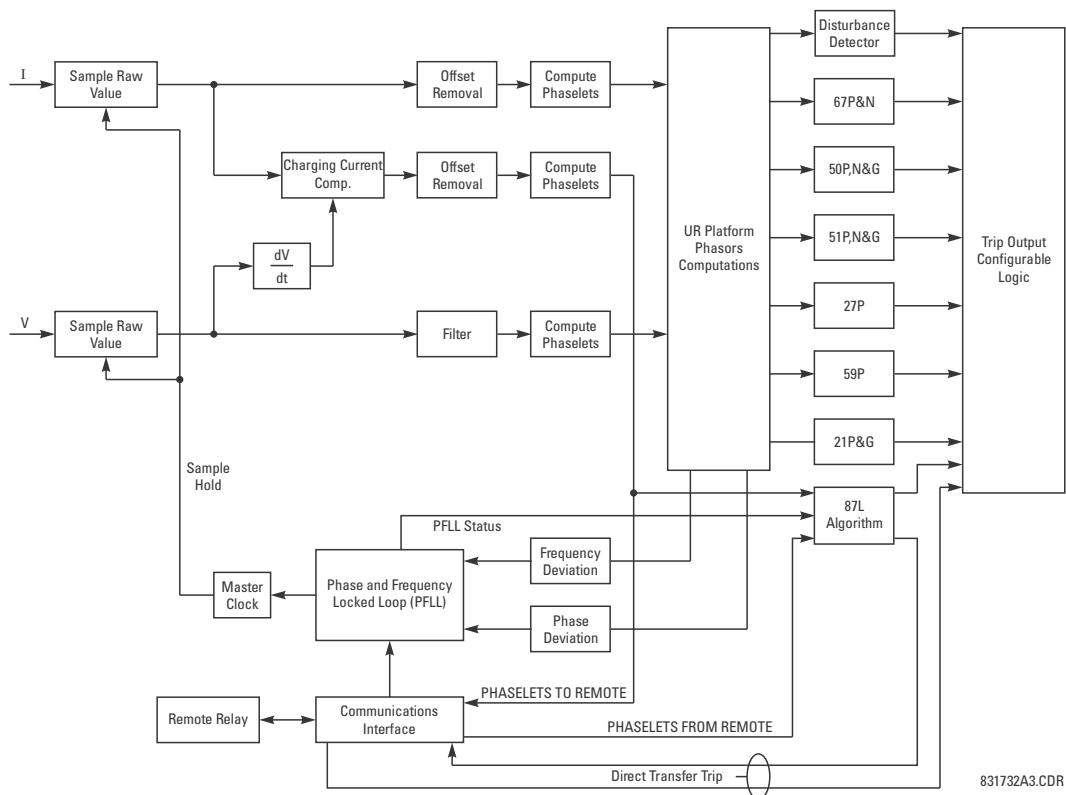

Figure 2-5: L90 BLOCK DIAGRAM

2.4.1 PROTECTION ELEMENTS

The operating times include the activation time of a trip rated form-A output contact unless otherwise indicated. FlexLogic operands of a given element are 4 ms faster. Take this into account when using FlexLogic to interconnect with other protection or control elements of the relay, building FlexLogic equations, or interfacing with other IEDs or power system devices via communications or different output contacts. If not specified, operate times are given here for a 60 Hz system at nominal system frequency. Operate times for a 50 Hz system are 1.2 times longer.

2

PHASE DISTANCE

Characteristic:	mho (memory polarized or offset) or quad (memory polarized or non-directional), selectable individually per zone
Number of zones:	5
Directionality:	forward, reverse, or non-directional
Reach (secondary Ω):	0.02 to 500.00 Ω in steps of 0.01
Reach accuracy:	$\pm 5\%$ including the effect of CVT transients up to an SIR of 30
Distance:	
Characteristic angle:	30 to 90° in steps of 1
Comparator limit angle:	30 to 90° in steps of 1
Directional supervision:	
Characteristic angle:	30 to 90° in steps of 1
Limit angle:	30 to 90° in steps of 1
Right blinder (Quad only):	
Reach:	0.02 to 500 Ω in steps of 0.01
Characteristic angle:	60 to 90° in steps of 1
Left Blinder (Quad only):	
Reach:	0.02 to 500 Ω in steps of 0.01
Characteristic angle:	60 to 90° in steps of 1
Time delay:	0.000 to 65.535 s in steps of 0.001
Timer accuracy:	$\pm 3\%$ of operate time or $\pm 1/4$ cycle (whichever is greater)
Current supervision:	
Level:	line-to-line current
Pickup:	0.050 to 30.000 pu in steps of 0.001
Dropout:	97 to 98%
Memory duration:	5 to 25 cycles in steps of 1
VT location:	all delta-wye and wye-delta transformers
CT location:	all delta-wye and wye-delta transformers
Voltage supervision pickup (series compensation applications):	0 to 5.000 pu in steps of 0.001
Operation time:	1 to 1.5 cycles (typical)
Reset time:	1 power cycle (typical)

GROUND DISTANCE

Characteristic:	Mho (memory polarized or offset) or Quad (memory polarized or non-directional)
Reactance polarization:	negative-sequence or zero-sequence current
Non-homogeneity angle:	-40 to 40° in steps of 1
Number of zones:	5
Directionality:	forward, reverse, or non-directional
Reach (secondary Ω):	0.02 to 500.00 Ω in steps of 0.01
Reach accuracy:	$\pm 5\%$ including the effect of CVT transients up to an SIR of 30
Distance characteristic angle:	30 to 90° in steps of 1
Distance comparator limit angle:	30 to 90° in steps of 1
Directional supervision:	
Characteristic angle:	30 to 90° in steps of 1
Limit angle:	30 to 90° in steps of 1
Zero-sequence compensation	
Z0/Z1 magnitude:	0.00 to 10.00 in steps of 0.01
Z0/Z1 angle:	-90 to 90° in steps of 1
Zero-sequence mutual compensation	
Z0M/Z1 magnitude:	0.00 to 7.00 in steps of 0.01
Z0M/Z1 angle:	-90 to 90° in steps of 1
Right blinder (Quad only):	
Reach:	0.02 to 500 Ω in steps of 0.01
Characteristic angle:	60 to 90° in steps of 1
Left blinder (Quad only):	
Reach:	0.02 to 500 Ω in steps of 0.01
Characteristic angle:	60 to 90° in steps of 1
Time delay:	0.000 to 65.535 s in steps of 0.001
Timer accuracy:	$\pm 3\%$ of operate time or $\pm 1/4$ cycle (whichever is greater)
Current supervision:	
Level:	neutral current (3I ₀)
Pickup:	0.050 to 30.000 pu in steps of 0.001
Dropout:	97 to 98%
Memory duration:	5 to 25 cycles in steps of 1
Voltage supervision pickup (series compensation applications):	0 to 5.000 pu in steps of 0.001
Operation time:	1 to 1.5 cycles (typical)
Reset time:	1 power cycle (typical)

LINE PICKUP

Phase instantaneous overcurrent:	0.000 to 30.000 pu
Undervoltage pickup:	0.000 to 3.000 pu
Overvoltage delay:	0.000 to 65.535 s

LINE CURRENT DIFFERENTIAL (87L)

Application:	2 or 3 terminal line, series compensated line, tapped line, with charging current compensation
Pickup current level:	0.20 to 4.00 pu in steps of 0.01
CT Tap (CT mismatch factor):	0.20 to 5.00 in steps of 0.01
Slope # 1:	1 to 50%
Slope # 2:	1 to 70%
Breakpoint between slopes:	0.0 to 20.0 pu in steps of 0.1
Zero-sequence current differential (87LG):	
87LG pickup level:	0.05 to 1.00 pu in steps of 0.01
87LG slope:	1 to 50%
87LG pickup delay:	0.00 to 5.00 s in steps of 0.01
DTT:	Direct Transfer Trip (1 and 3 pole) to remote L90
Operating Time:	1.0 to 1.5 power cycles duration
Asymmetrical channel delay compensation using GPS:	asymmetry up to 10 ms
In-zone transformer group compensation:	0 to 330° in steps of 30°
Inrush inhibit level:	1.0 to 40.0% f_0 in steps of 0.1

LINE CURRENT DIFFERENTIAL TRIP LOGIC

87L trip:	Adds security for trip decision; creates 1 and 3 pole trip logic
DTT:	Engaged Direct Transfer Trip (1 and 3 pole) from remote L90
DD:	Sensitive Disturbance Detector to detect fault occurrence
Stub bus protection:	Security for ring bus and 1½ breaker configurations
Open pole detector:	Security for sequential and evolving faults

RESTRICTED GROUND FAULT

Pickup:	0.005 to 30.000 pu in steps of 0.001
Dropout:	97 to 98% of pickup
Slope:	0 to 100% in steps of 1%
Pickup delay:	0 to 600.00 s in steps of 0.01
Dropout delay:	0 to 600.00 s in steps of 0.01
Operate time:	<1 power system cycle

PHASE/NEUTRAL/GROUND TOC

Current:	Phasor or RMS
Pickup level:	0.000 to 30.000 pu in steps of 0.001
Dropout level:	97% to 98% of pickup
Level accuracy:	
for 0.1 to 2.0 × CT:	±0.5% of reading or ±0.4% of rated (whichever is greater)
for > 2.0 × CT:	±1.5% of reading > 2.0 × CT rating
Curve shapes:	IEEE Moderately/Very/Extremely Inverse; IEC (and BS) A/B/C and Short Inverse; GE IAC Inverse, Short/Very/Extremely Inverse; I ² t; FlexCurves™ (programmable); Definite Time (0.01 s base curve)
Curve multiplier:	Time Dial = 0.00 to 600.00 in steps of 0.01
Reset type:	Instantaneous/Timed (per IEEE)
Curve timing accuracy	
at 1.03 to 20 × pickup:	±3.5% of operate time or ±½ cycle (whichever is greater) from pickup to operate

PHASE/NEUTRAL/GROUND IOC

Pickup level:	0.000 to 30.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	
0.1 to 2.0 × CT rating:	±0.5% of reading or ±0.4% of rated (whichever is greater)
> 2.0 × CT rating	±1.5% of reading
Overreach:	<2%
Pickup delay:	0.00 to 600.00 s in steps of 0.01
Reset delay:	0.00 to 600.00 s in steps of 0.01
Operate time:	<16 ms at 3 × pickup at 60 Hz (Phase/Ground IOC) <20 ms at 3 × pickup at 60 Hz (Neutral IOC)
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)

NEGATIVE SEQUENCE TOC

Current:	Phasor
Pickup level:	0.000 to 30.000 pu in steps of 0.001
Dropout level:	97% to 98% of pickup
Level accuracy:	±0.5% of reading or ±0.4% of rated (whichever is greater) from 0.1 to 2.0 × CT rating ±1.5% of reading > 2.0 × CT rating
Curve shapes:	IEEE Moderately/Very/Extremely Inverse; IEC (and BS) A/B/C and Short Inverse; GE IAC Inverse, Short/Very/Extremely Inverse; I ² t; FlexCurves™ (programmable); Definite Time (0.01 s base curve)
Curve multiplier (Time dial):	0.00 to 600.00 in steps of 0.01
Reset type:	Instantaneous/Timed (per IEEE) and Linear
Curve timing accuracy at 1.03 to 20 × pickup:	±3.5% of operate time or ±½ cycle (whichever is greater) from pickup to operate

NEGATIVE SEQUENCE IOC

Current:	Phasor
Pickup level:	0.000 to 30.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	0.1 to 2.0 × CT rating: ±0.5% of reading or ±0.4% of rated (whichever is greater); > 2.0 × CT rating: ±1.5% of reading
Overreach:	<2%
Pickup delay:	0.00 to 600.00 s in steps of 0.01
Reset delay:	0.00 to 600.00 s in steps of 0.01
Operate time:	<20 ms at 3 × pickup at 60 Hz
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)

PHASE DIRECTIONAL OVERCURRENT

Relay connection:	90° (quadrature)
Quadrature voltage:	ABC phase seq.: phase A (V _{BC}), phase B (V _{CA}), phase C (V _{AB}); ACB phase seq.: phase A (V _{CB}), phase B (V _{AC}), phase C (V _{BA})
Polarizing voltage threshold:	0.000 to 3.000 pu in steps of 0.001
Current sensitivity threshold:	0.05 pu
Characteristic angle:	0 to 359° in steps of 1
Angle accuracy:	±2°
Operation time (FlexLogic operands):	Tripping (reverse load, forward fault): < 12 ms, typically Blocking (forward load, reverse fault): < 8 ms, typically

NEUTRAL DIRECTIONAL OVERCURRENT

Directionality:	Co-existing forward and reverse
Polarizing:	Voltage, Current, Dual, Dual-V, Dual-I
Polarizing voltage:	V ₀ or V _X
Polarizing current:	I _G
Operating current:	I ₀
Level sensing:	$3 \times (I_{00} - K \times I_{01})$, I _G
Restraint, K:	0.000 to 0.500 in steps of 0.001
Characteristic angle:	–90 to 90° in steps of 1
Limit angle:	40 to 90° in steps of 1, independent for forward and reverse
Angle accuracy:	±2°
Offset impedance:	0.00 to 250.00 Ω in steps of 0.01
Pickup level:	0.002 to 30.000 pu in steps of 0.01
Dropout level:	97 to 98%
Operation time:	<16 ms at 3 × pickup at 60 Hz

NEGATIVE SEQUENCE DIRECTIONAL OC

Directionality:	Co-existing forward and reverse
Polarizing:	Voltage
Polarizing voltage:	V ₂
Operating current:	I ₂
Level sensing:	Zero-sequence: $ I_{00} - K \times I_{01} $ Negative-sequence: $ I_{20} - K \times I_{21} $
Restraint, K:	0.000 to 0.500 in steps of 0.001
Characteristic angle:	0 to 90° in steps of 1
Limit angle:	40 to 90° in steps of 1, independent for forward and reverse
Angle accuracy:	±2°
Offset impedance:	0.00 to 250.00 Ω in steps of 0.01
Pickup level:	0.015 to 30.000 pu in steps of 0.01
Dropout level:	97 to 98%
Operation time:	<16 ms at 3 × pickup at 60 Hz

WATTMETRIC ZERO-SEQUENCE DIRECTIONAL

Measured power:	zero-sequence
Number of elements:	2
Characteristic angle:	0 to 360° in steps of 1
Minimum power:	0.001 to 1.200 pu in steps of 0.001
Pickup level accuracy:	±1% or ±0.0025 pu, whichever is greater
Hysteresis:	3% or 0.001 pu, whichever is greater
Pickup delay:	definite time (0 to 600.00 s in steps of 0.01), inverse time, or FlexCurve
Inverse time multiplier:	0.01 to 2.00 s in steps of 0.01
Curve timing accuracy:	±3.5% of operate time or ±1 cycle (whichever is greater) from pickup to operate
Operate time:	<30 ms at 60 Hz

SENSITIVE DIRECTIONAL POWER

Measured power:	3-phase, true RMS
Number of stages:	2
Characteristic angle:	0 to 359° in steps of 1
Calibration angle:	0.00 to 0.95° in steps of 0.05
Minimum power:	-1.200 to 1.200 pu in steps of 0.001
Pickup level accuracy:	±1% or ±0.001 pu, whichever is greater
Hysteresis:	2% or 0.001 pu, whichever is greater
Pickup delay:	0 to 600.00 s in steps of 0.01
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
Operate time:	<50 ms

PHASE UNDERVOLTAGE

Voltage:	Phasor only
Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	102 to 103% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Curve shapes:	GE IAV Inverse; Definite Time (0.1s base curve)
Curve multiplier:	Time dial = 0.00 to 600.00 in steps of 0.01
Curve timing accuracy at <0.90 x pickup:	±3.5% of operate time or ±1/2 cycle (whichever is greater) from pickup to operate

AUXILIARY UNDERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	102 to 103% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Curve shapes:	GE IAV Inverse, Definite Time
Curve multiplier:	Time Dial = 0 to 600.00 in steps of 0.01
Curve timing accuracy at <0.90 x pickup:	±3.5% of operate time or ±1/2 cycle (whichever is greater) from pickup to operate

PHASE OVERVOLTAGE

Voltage:	Phasor only
Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Pickup delay:	0.00 to 600.00 in steps of 0.01 s
Operate time:	<30 ms at 1.10 × pickup at 60 Hz
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)

NEUTRAL OVERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Pickup delay:	0.00 to 600.00 s in steps of 0.01 (definite time) or user-defined curve
Reset delay:	0.00 to 600.00 s in steps of 0.01
Curve timing accuracy at >1.1 x pickup:	±3.5% of operate time or ±1 cycle (whichever is greater) from pickup to operate
Operate time:	<30 ms at 1.10 × pickup at 60 Hz

AUXILIARY OVERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Pickup delay:	0 to 600.00 s in steps of 0.01
Reset delay:	0 to 600.00 s in steps of 0.01
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
Operate time:	<30 ms at 1.10 × pickup at 60 Hz

UNDERFREQUENCY

Minimum signal:	0.10 to 1.25 pu in steps of 0.01
Pickup level:	20.00 to 65.00 Hz in steps of 0.01
Dropout level:	pickup + 0.03 Hz
Level accuracy:	±0.001 Hz
Time delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
Operate time:	typically 4 cycles at 0.1 Hz/s change typically 3.5 cycles at 0.3 Hz/s change typically 3 cycles at 0.5 Hz/s change

Typical times are average operate times including variables such as frequency change instance, test method, etc., and may vary by ±0.5 cycles.

OVERFREQUENCY

Pickup level:	20.00 to 65.00 Hz in steps of 0.01
Dropout level:	pickup - 0.03 Hz
Level accuracy:	±0.001 Hz
Time delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)
Operate time:	typically 4 cycles at 0.1 Hz/s change typically 3.5 cycles at 0.3 Hz/s change typically 3 cycles at 0.5 Hz/s change

Typical times are average operate times including variables such as frequency change instance, test method, etc., and may vary by ±0.5 cycles.

RATE OF CHANGE OF FREQUENCY

df/dt trend:	increasing, decreasing, bi-directional
df/dt pickup level:	0.10 to 15.00 Hz/s in steps of 0.01
df/dt dropout level:	96% of pickup
df/dt level accuracy:	80 mHz/s or 3.5%, whichever is greater
Overvoltage supv.:	0.100 to 3.000 pu in steps of 0.001
Overcurrent supv.:	0.000 to 30.000 pu in steps of 0.001
Pickup delay:	0 to 65.535 s in steps of 0.001
Reset delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)

95% settling time for df/dt: <24 cycles

Operate time:	typically 6.5 cycles at 2 × pickup
	typically 5.5 cycles at 3 × pickup
	typically 4.5 cycles at 5 × pickup

Typical times are average operate times including variables such as frequency change instance, test method, etc., and may vary by ±0.5 cycles.

BREAKER FAILURE

Mode:	1-pole, 3-pole
Current supervision:	phase, neutral current
Current supv. pickup:	0.001 to 30.000 pu in steps of 0.001
Current supv. dropout:	97 to 98% of pickup
Current supv. accuracy:	
0.1 to 2.0 × CT rating:	±0.75% of reading or ±2% of rated (whichever is greater)
above 2 × CT rating:	±2.5% of reading

BREAKER ARCING CURRENT

Principle:	accumulates breaker duty (I^2t) and measures fault duration
Initiation:	programmable per phase from any Flex-Logic operand
Compensation for auxiliary relays:	0 to 65.535 s in steps of 0.001
Alarm threshold:	0 to 50000 kA ² -cycle in steps of 1
Fault duration accuracy:	0.25 of a power cycle
Availability:	1 per CT bank with a minimum of 2

BREAKER FLASHOVER

Operating quantity:	phase current, voltage and voltage difference
Pickup level voltage:	0 to 1.500 pu in steps of 0.001
Dropout level voltage:	97 to 98% of pickup
Pickup level current:	0 to 1.500 pu in steps of 0.001
Dropout level current:	97 to 98% of pickup
Level accuracy:	±0.5% or ±0.1% of rated, whichever is greater
Pickup delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±42 ms, whichever is greater
Operate time:	<42 ms at 1.10 × pickup at 60 Hz

BREAKER RESTRIKE

Principle:	detection of high-frequency overcurrent condition ¼ cycle after breaker opens
Availability:	one per CT/VT module (not including 8Z modules)
Pickup level:	0.1 to 2.00 pu in steps of 0.01
Reset delay:	0.000 to 65.535 s in steps of 0.001

SYNCHROCHECK

Max voltage difference:	0 to 400000 V in steps of 1
Max angle difference:	0 to 100° in steps of 1
Max freq. difference:	0.00 to 2.00 Hz in steps of 0.01
Hysteresis for max. freq. diff.:	0.00 to 0.10 Hz in steps of 0.01
Dead source function:	None, LV1 & DV2, DV1 & LV2, DV1 or DV2, DV1 xor DV2, DV1 & DV2 (L = Live, D = Dead)

AUTORECLOSURE

Two breakers applications
Single- and three-pole tripping schemes
Up to 4 reclose attempts before lockout
Selectable reclosing mode and breaker sequence

PILOT-AIDED SCHEMES

Direct Underreaching Transfer Trip (DUTT)
Permissive Underreaching Transfer Trip (PUTT)
Permissive Overreaching Transfer Trip (POTT)
Hybrid POTT Scheme
Directional Comparison Blocking Scheme
Directional Comparison Unblocking Scheme (DCUB)

TRIP OUTPUT

Collects trip and reclose input requests and issues outputs to control tripping and reclosing.	
Communications timer delay:	0 to 65.535 s in steps of 0.001
Evolving fault timer:	0.000 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)

POWER SWING DETECT

Functions:	Power swing block, Out-of-step trip
Characteristic:	Mho or Quad
Measured impedance:	Positive-sequence
Blocking / tripping modes:	2-step or 3-step
Tripping mode:	Early or Delayed
Current supervision:	
Pickup level:	0.050 to 30.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Fwd / reverse reach (sec. Ω):	0.10 to 500.00 Ω in steps of 0.01
Left and right blinders (sec. Ω):	0.10 to 500.00 Ω in steps of 0.01
Impedance accuracy:	±5%
Fwd / reverse angle impedances:	40 to 90° in steps of 1
Angle accuracy:	±2°
Characteristic limit angles:	40 to 140° in steps of 1
Timers:	0.000 to 65.535 s in steps of 0.001
Timer accuracy:	±3% of operate time or ±1/4 cycle (whichever is greater)

LOAD ENCROACHMENT

Responds to:	Positive-sequence quantities
Minimum voltage:	0.000 to 3.000 pu in steps of 0.001
Reach (sec. Ω):	0.02 to 250.00 Ω in steps of 0.01
Impedance accuracy:	$\pm 5\%$
Angle:	5 to 50° in steps of 1
Angle accuracy:	$\pm 2^\circ$
Pickup delay:	0 to 65.535 s in steps of 0.001
Reset delay:	0 to 65.535 s in steps of 0.001
Timer accuracy:	$\pm 3\%$ of operate time or $\pm 1/4$ cycle (whichever is greater)
Operate time:	<30 ms at 60 Hz

OPEN POLE DETECTOR

Functionality:	Detects an open pole condition, monitoring breaker auxiliary contacts, the current in each phase and optional voltages on the line
Current pickup level:	0.000 to 30.000 pu in steps of 0.001
Line capacitive reactances (X_{C1} , X_{C0}):	300.0 to 9999.9 sec. Ω in steps of 0.1
Remote current pickup level:	0.000 to 30.000 pu in steps of 0.001
Current dropout level:	pickup + 3%, not less than 0.05 pu

THERMAL OVERLOAD PROTECTION

Thermal overload curves:	IEC 255-8 curve
Base current:	0.20 to 3.00 pu in steps of 0.01
Overload (k) factor:	1.00 to 1.20 pu in steps of 0.05
Trip time constant:	0 to 1000 min. in steps of 1
Reset time constant:	0 to 1000 min. in steps of 1
Minimum reset time:	0 to 1000 min. in steps of 1
Timer accuracy (cold curve):	± 100 ms or 2%, whichever is greater
Timer accuracy (hot curve):	± 500 ms or 2%, whichever is greater for $I_p < 0.9 \times k \times I_b$ and $I / (k \times I_b) > 1.1$

TRIP BUS (TRIP WITHOUT FLEXLOGIC)

Number of elements:	6
Number of inputs:	16
Operate time:	<2 ms at 60 Hz
Timer accuracy:	$\pm 3\%$ or 10 ms, whichever is greater

2.4.2 USER-PROGRAMMABLE ELEMENTS**FLEXLOGIC**

Programming language:	Reverse Polish Notation with graphical visualization (keypad programmable)
Lines of code:	512
Internal variables:	64
Supported operations:	NOT, XOR, OR (2 to 16 inputs), AND (2 to 16 inputs), NOR (2 to 16 inputs), NAND (2 to 16 inputs), latch (reset-dominant), edge detectors, timers
Inputs:	any logical variable, contact, or virtual input
Number of timers:	32
Pickup delay:	0 to 60000 (ms, sec., min.) in steps of 1
Dropout delay:	0 to 60000 (ms, sec., min.) in steps of 1

FLEXCURVES™

Number:	4 (A through D)
Reset points:	40 (0 through 1 of pickup)
Operate points:	80 (1 through 20 of pickup)
Time delay:	0 to 65535 ms in steps of 1

FLEX STATES

Number:	up to 256 logical variables grouped under 16 Modbus addresses
Programmability:	any logical variable, contact, or virtual input

FLEXELEMENTS™

Number of elements:	8
Operating signal:	any analog actual value, or two values in differential mode
Operating signal mode:	signed or absolute value
Operating mode:	level, delta
Comparator direction:	over, under
Pickup Level:	-90.000 to 90.000 pu in steps of 0.001
Hysteresis:	0.1 to 50.0% in steps of 0.1
Delta dt:	20 ms to 60 days
Pickup & dropout delay:	0.000 to 65.535 s in steps of 0.001

NON-VOLATILE LATCHES

Type:	set-dominant or reset-dominant
Number:	16 (individually programmed)
Output:	stored in non-volatile memory
Execution sequence:	as input prior to protection, control, and FlexLogic

USER-PROGRAMMABLE LEDs

Number:	48 plus trip and alarm
Programmability:	from any logical variable, contact, or virtual input
Reset mode:	self-reset or latched

LED TEST

Initiation:	from any digital input or user-programmable condition
Number of tests:	3, interruptible at any time
Duration of full test:	approximately 3 minutes
Test sequence 1:	all LEDs on
Test sequence 2:	all LEDs off, one LED at a time on for 1 s
Test sequence 3:	all LEDs on, one LED at a time off for 1 s

USER-DEFINABLE DISPLAYS

Number of displays:	16
Lines of display:	2 × 20 alphanumeric characters
Parameters:	up to 5, any Modbus register addresses
Invoking and scrolling:	keypad, or any user-programmable condition, including pushbuttons

CONTROL PUSHBUTTONS

Number of pushbuttons:	7
Operation:	drive FlexLogic operands

USER-PROGRAMMABLE PUSHBUTTONS (OPTIONAL)

Number of pushbuttons:	12 (standard faceplate); 16 (enhanced faceplate)
Mode:	self-reset, latched
Display message:	2 lines of 20 characters each
Drop-out timer:	0.00 to 60.00 s in steps of 0.05
Autoreset timer:	0.2 to 600.0 s in steps of 0.1
Hold timer:	0.0 to 10.0 s in steps of 0.1

SELECTOR SWITCH

Number of elements:	2
Upper position limit:	1 to 7 in steps of 1
Selecting mode:	time-out or acknowledge
Time-out timer:	3.0 to 60.0 s in steps of 0.1
Control inputs:	step-up and 3-bit
Power-up mode:	restore from non-volatile memory or synchronize to a 3-bit control input or synch/restore mode

DIGITAL ELEMENTS

Number of elements:	48
Operating signal:	any FlexLogic operand
Pickup delay:	0.000 to 999999.999 s in steps of 0.001
Dropout delay:	0.000 to 999999.999 s in steps of 0.001
Timing accuracy:	±3% or ±4 ms, whichever is greater

2.4.3 MONITORING**OSCILLOGRAPHY**

Maximum records:	64
Sampling rate:	64 samples per power cycle
Triggers:	any element pickup, dropout, or operate; digital input change of state; digital output change of state; FlexLogic equation
Data:	AC input channels; element state; digital input state; digital output state
Data storage:	in non-volatile memory

EVENT RECORDER

Capacity:	1024 events
Time-tag:	to 1 microsecond
Triggers:	any element pickup, dropout, or operate; digital input change of state; digital output change of state; self-test events
Data storage:	in non-volatile memory

DATA LOGGER

Number of channels:	1 to 16
Parameters:	any available analog actual value
Sampling rate:	15 to 3600000 ms in steps of 1
Trigger:	any FlexLogic operand
Mode:	continuous or triggered
Storage capacity:	(NN is dependent on memory) 1-second rate: 01 channel for NN days 16 channels for NN days ↓ 60-minute rate: 01 channel for NN days 16 channels for NN days

FAULT LOCATOR

Method:	multi-ended or single-ended during channel failure
Voltage source:	wye-connected VTs, delta-connected VTs and neutral voltage, delta-connected VTs and zero-sequence current (approximation)
Maximum accuracy if:	fault resistance is zero or fault currents from all line terminals are in phase
Relay accuracy:	±1.5% (V > 10 V, I > 0.1 pu)
Worst-case accuracy:	
VT _{%error} +	user data
CT _{%error} +	user data
Z _{Line} %error +	user data
METHOD _{%error} +	0.5% (multi-ended method), see chapter 8 (single-ended method)
RELAY ACCURACY _{%error} +	(1.5%)

PHASOR MEASUREMENT UNIT

Output format:	per IEEE C37.118 or IEC 61850-90-5 standard
Number of channels:	14 synchrophasors, 8 analogs, 16 digitals
TVE (total vector error)	<1%
Triggering:	frequency, voltage, current, power, rate of change of frequency, user-defined
Reporting rate:	1, 2, 5, 10, 12, 15, 20, 25, 30, 50, or 60 times per second for P and M class, and 100 or 120 times per second for P class only
Number of clients:	One over TCP/IP port and one over UDP/IP per aggregator
AC ranges:	As indicated in appropriate specifications sections
Network reporting format:	16-bit integer (for C37.118) or 32-bit IEEE floating point numbers
Network reporting style:	rectangular (real and imaginary for C37.188) or polar (magnitude and angle) coordinates
Post-filtering:	none, 3-point, 5-point, 7-point
Calibration:	$\pm 5^\circ$ (angle) and $\pm 5\%$ (magnitude)

2.4.4 METERING**RMS CURRENT: PHASE, NEUTRAL, AND GROUND**

Accuracy at	
0.1 to $2.0 \times$ CT rating:	$\pm 0.25\%$ of reading or $\pm 0.1\%$ of rated (whichever is greater)
> $2.0 \times$ CT rating:	$\pm 1.0\%$ of reading

RMS VOLTAGE

Accuracy:	$\pm 0.5\%$ of reading from 10 to 208 V
-----------	---

REAL POWER (WATTS)

Accuracy at 0.1 to $1.5 \times$	
CT rating and 0.8 to	
$1.2 \times$ VT rating:	$\pm 1.0\%$ of reading at $-1.0 \leq \text{PF} < -0.8$ and $0.8 < \text{PF} \leq 1.0$

REACTIVE POWER (VARs)

Accuracy at 0.1 to $1.5 \times$	
CT rating and 0.8 to	
$1.2 \times$ VT rating:	$\pm 1.0\%$ of reading at $-0.2 \leq \text{PF} \leq 0.2$

APPARENT POWER (VA)

Accuracy at 0.1 to $1.5 \times$	
CT rating and 0.8 to	
$1.2 \times$ VT rating:	$\pm 1.0\%$ of reading

WATT-HOURS (POSITIVE AND NEGATIVE)

Accuracy:	$\pm 2.0\%$ of reading
Range:	± 0 to 1×10^6 MWh
Parameters:	three-phase only
Update rate:	50 ms

VAR-HOURS (POSITIVE AND NEGATIVE)

Accuracy:	$\pm 2.0\%$ of reading
Range:	± 0 to 1×10^6 Mvarh
Parameters:	three-phase only
Update rate:	50 ms

FREQUENCY

Accuracy at	
$V = 0.8$ to 1.2 pu:	± 0.01 Hz (when voltage signal is used for frequency measurement)
$I = 0.1$ to 0.25 pu:	± 0.05 Hz
$I > 0.25$ pu:	± 0.02 Hz (when current signal is used for frequency measurement)

DEMAND

Measurements:	Phases A, B, and C present and maximum measured currents 3-Phase Power (P, Q, and S) present and maximum measured currents
Accuracy:	$\pm 2.0\%$

2.4.5 INPUTS

2

AC CURRENT

CT rated primary:	1 to 50000 A
CT rated secondary:	1 A or 5 A by connection
Relay burden:	< 0.2 VA at rated secondary
Conversion range:	
Standard CT:	0.02 to 46 × CT rating RMS symmetrical
Sensitive Ground CT module:	0.002 to 4.6 × CT rating RMS symmetrical
Current withstand:	20 ms at 250 times rated 1 sec. at 100 times rated continuous 4xInom; URs equipped with 24 CT inputs have a maximum operating temp. of 50°C
Short circuit rating:	150000 RMS symmetrical amperes, 250 V maximum (primary current to external CT)

AC VOLTAGE

VT rated secondary:	50.0 to 240.0 V
VT ratio:	1.00 to 24000.00
Relay burden:	< 0.25 VA at 120 V
Conversion range:	1 to 275 V
Voltage withstand:	continuous at 260 V to neutral 1 min./hr at 420 V to neutral

FREQUENCY

Nominal frequency setting:	25 to 60 Hz
Sampling frequency:	64 samples per power cycle
Tracking frequency range:	45 to 65 Hz

CONTACT INPUTS

Dry contacts:	1000 Ω maximum
Wet contacts:	300 V DC maximum
Selectable thresholds:	17 V, 33 V, 84 V, 166 V
Tolerance:	±10%
Contacts per common return:	4
Recognition time:	< 1 ms
Debounce time:	0.0 to 16.0 ms in steps of 0.5
Continuous current draw:	3 mA (when energized)

CONTACT INPUTS WITH AUTO-BURNISHING

Dry contacts:	1000 Ω maximum
Wet contacts:	300 V DC maximum
Selectable thresholds:	17 V, 33 V, 84 V, 166 V
Tolerance:	±10%
Contacts per common return:	2
Recognition time:	< 1 ms
Debounce time:	0.0 to 16.0 ms in steps of 0.5
Continuous current draw:	3 mA (when energized)
Auto-burnish impulse current:	50 to 70 mA
Duration of auto-burnish impulse:	25 to 50 ms

DCMA INPUTS

Current input (mA DC):	0 to -1, 0 to +1, -1 to +1, 0 to 5, 0 to 10, 0 to 20, 4 to 20 (programmable)
Input impedance:	379 Ω ±10%
Conversion range:	-1 to + 20 mA DC
Accuracy:	±0.2% of full scale
Type:	Passive

RTD INPUTS

Types (3-wire):	100 Ω Platinum, 100 & 120 Ω Nickel, 10 Ω Copper
Sensing current:	5 mA
Range:	-50 to +250°C
Accuracy:	±2°C
Isolation:	36 V pk-pk

IRIG-B INPUT

Amplitude modulation:	1 to 10 V pk-pk
DC shift:	TTL-Compatible
Input impedance:	50 kΩ
Isolation:	2 kV

REMOTE INPUTS (IEC 61850 GSSE/GOOSE)

Input points:	32, configured from 64 incoming bit pairs
Remote devices:	16
Default states on loss of comms.:	On, Off, Latest/Off, Latest/On
Remote DPS inputs:	5

2.4.6 POWER SUPPLY

LOW RANGE

Nominal DC voltage: 24 to 48 V
 Minimum DC voltage: 20 V
 Maximum DC voltage: 60 V
 Voltage loss hold-up: 20 ms duration at nominal
 NOTE: Low range is DC only.

HIGH RANGE

Nominal DC voltage: 125 to 250 V
 Minimum DC voltage: 88 V
 Maximum DC voltage: 300 V
 Nominal AC voltage: 100 to 240 V at 50/60 Hz
 Minimum AC voltage: 88 V at 25 to 100 Hz
 Maximum AC voltage: 265 V at 25 to 100 Hz
 Voltage loss hold-up: 200 ms duration at nominal

ALL RANGES

Volt withstand: $2 \times$ Highest Nominal Voltage for 10 ms
 Power consumption: typical = 15 to 20 W/VA
 maximum = 50 W/VA
 contact factory for exact order code consumption

INTERNAL FUSE RATINGS

Low range power supply: 8 A / 250 V
 High range power supply: 4 A / 250 V

INTERRUPTING CAPACITY

AC: 100 000 A RMS symmetrical
 DC: 10 000 A

2.4.7 OUTPUTS

FORM-A RELAY

Make and carry for 0.2 s: 30 A as per ANSI C37.90
 Carry continuous: 6 A
 Break (DC inductive, L/R = 40 ms):

VOLTAGE	CURRENT
24 V	1 A
48 V	0.5 A
125 V	0.3 A
250 V	0.2 A

Operate time: < 4 ms
 Contact material: silver alloy

LATCHING RELAY

Make and carry for 0.2 s: 30 A as per ANSI C37.90
 Carry continuous: 6 A as per IEEE C37.90
 Break (DC resistive as per IEC61810-1):

VOLTAGE	CURRENT
24 V	6 A
48 V	1.6 A
125 V	0.4 A
250 V	0.2 A

Operate time: < 4 ms
 Contact material: silver alloy
 Control: separate operate and reset inputs
 Control mode: operate-dominant or reset-dominant

FORM-A VOLTAGE MONITOR

Applicable voltage: approx. 15 to 250 V DC
 Trickle current: approx. 1 to 2.5 mA

FORM-A CURRENT MONITOR

Threshold current: approx. 80 to 100 mA

FORM-C AND CRITICAL FAILURE RELAY

Make and carry for 0.2 s: 30 A as per ANSI C37.90
 Carry continuous: 8 A
 Break (DC inductive, L/R = 40 ms):

VOLTAGE	CURRENT
24 V	1 A
48 V	0.5 A
125 V	0.3 A
250 V	0.2 A

Operate time: < 8 ms
 Contact material: silver alloy

FAST FORM-C RELAY

Make and carry: 0.1 A max. (resistive load)
 Minimum load impedance:

INPUT VOLTAGE	IMPEDANCE	
	2 W RESISTOR	1 W RESISTOR
250 V DC	20 K Ω	50 K Ω
120 V DC	5 K Ω	2 K Ω
48 V DC	2 K Ω	2 K Ω
24 V DC	2 K Ω	2 K Ω

Note: values for 24 V and 48 V are the same due to a required 95% voltage drop across the load impedance.

Operate time: < 0.6 ms
 Internal Limiting Resistor: 100 Ω , 2 W

SOLID-STATE OUTPUT RELAYOperate and release time: <100 μ s

Maximum voltage: 265 V DC

Maximum continuous current: 5 A at 45°C; 4 A at 65°C

Make and carry:

for 0.2 s: 30 A as per ANSI C37.90

for 0.03 s: 300 A

Breaking capacity:

	UL508	Utility application (autoreclose scheme)	Industrial application
Operations/ interval	5000 ops / 1 s-On, 9 s-Off	5 ops / 0.2 s-On, 0.2 s-Off within 1 minute	10000 ops / 0.2 s-On, 30 s-Off
	1000 ops / 0.5 s-On, 0.5 s-Off		
Break capability (0 to 250 V DC)	3.2 A L/R = 10 ms	10 A L/R = 40 ms	10 A L/R = 40 ms
	1.6 A L/R = 20 ms		
	0.8 A L/R = 40 ms

2.4.9 INTER-RELAY COMMUNICATIONS

SHIELDED TWISTED-PAIR INTERFACE OPTIONS

INTERFACE TYPE	TYPICAL DISTANCE
RS422	1200 m
G.703	100 m

RS422 distance is based on transmitter power and does not take into consideration the clock source provided by the user.

LINK POWER BUDGET

EMITTER, FIBER TYPE	TRANSMIT POWER	RECEIVED SENSITIVITY	POWER BUDGET
820 nm LED, Multimode	-20 dBm	-30 dBm	10 dB
1300 nm LED, Multimode	-21 dBm	-30 dBm	9 dB
1300 nm ELED, Singlemode	-23 dBm	-32 dBm	9 dB
1300 nm Laser, Singlemode	-1 dBm	-30 dBm	29 dB
1550 nm Laser, Singlemode	+5 dBm	-30 dBm	35 dB

These power budgets are calculated from the manufacturer's worst-case transmitter power and worst case receiver sensitivity.

The power budgets for the 1300 nm ELED are calculated from the manufacturer's transmitter power and receiver sensitivity at ambient temperature. At extreme temperatures these values deviate based on component tolerance. On average, the output power decreases as the temperature is increased by a factor 1dB / 5°C.

MAXIMUM OPTICAL INPUT POWER

EMITTER, FIBER TYPE	MAX. OPTICAL INPUT POWER
820 nm LED, Multimode	-7.6 dBm
1300 nm LED, Multimode	-11 dBm
1300 nm ELED, Singlemode	-14 dBm
1300 nm Laser, Singlemode	-14 dBm
1550 nm Laser, Singlemode	-14 dBm

TYPICAL LINK DISTANCE

EMITTER TYPE	CABLE TYPE	CONNECTOR TYPE	TYPICAL DISTANCE
820 nm LED, multimode	62.5/125 µm	ST	1.65 km
1300 nm LED, multimode	62.5/125 µm	ST	3.8 km
1300 nm ELED, single mode	9/125 µm	ST	11.4 km
1300 nm Laser, single mode	9/125 µm	ST	64 km
1550 nm Laser, single-mode	9/125 µm	ST	105 km

Typical distances listed are based on the following assumptions for system loss. As actual losses vary from one installation to another, the distance covered by your system may vary.

CONNECTOR LOSSES (TOTAL OF BOTH ENDS)

ST connector 2 dB

FIBER LOSSES

820 nm multimode 3 dB/km

1300 nm multimode 1 dB/km

1300 nm singlemode 0.35 dB/km

1550 nm singlemode 0.25 dB/km

Splice losses: One splice every 2 km, at 0.05 dB loss per splice.

SYSTEM MARGIN

3 dB additional loss added to calculations to compensate for all other losses.

Compensated difference in transmitting and receiving (channel asymmetry) channel delays using GPS satellite clock: 10 ms

2.4.10 ENVIRONMENTAL

AMBIENT TEMPERATURES

Storage temperature: -40 to 85°C

Operating temperature: -40 to 60°C; the LCD contrast can be impaired at temperatures less than -20°C

HUMIDITY

Humidity: operating up to 95% (non-condensing) at 55°C (as per IEC60068-2-30 variant 1, 6 days).

OTHER

Altitude: 2000 m (maximum)

Pollution degree: II

Overvoltage category: II

Ingress protection: IP20 front, IP10 back

2.4.14 MAINTENANCE

MOUNTING

Attach mounting brackets using 20 inch-pounds (± 2 inch-pounds) of torque.

CLEANING

Normally, cleaning is not required; but for situations where dust has accumulated on the faceplate display, a dry cloth can be used.

NOTICE

To avoid deterioration of electrolytic capacitors, power up units that are stored in a de-energized state once per year, for one hour continuously.

3.1.1 PANEL CUTOUT

a) HORIZONTAL UNITS

The L90 Line Current Differential System is available as a 19-inch rack horizontal mount unit with a removable faceplate. The faceplate can be specified as either standard or enhanced at the time of ordering. The enhanced faceplate contains additional user-programmable pushbuttons and LED indicators.

The modular design allows the relay to be easily upgraded or repaired by a qualified service person. The faceplate is hinged to allow easy access to the removable modules, and is itself removable to allow mounting on doors with limited rear depth.

The case dimensions are shown below, along with panel cutout details for panel mounting. When planning the location of your panel cutout, ensure that provision is made for the faceplate to swing open without interference to or from adjacent equipment.

The relay must be mounted such that the faceplate sits semi-flush with the panel or switchgear door, allowing the operator access to the keypad and the RS232 communications port. The relay is secured to the panel with the use of four screws supplied with the relay.

Figure 3-1: L90 HORIZONTAL DIMENSIONS (ENHANCED PANEL)

Figure 3-2: L90 HORIZONTAL MOUNTING (ENHANCED PANEL)

827704B4.DWG

Figure 3-3: L90 HORIZONTAL MOUNTING AND DIMENSIONS (STANDARD PANEL)

b) VERTICAL UNITS

The L90 Line Current Differential System is available as a reduced size ($\frac{3}{4}$) vertical mount unit, with a removable faceplate. The faceplate can be specified as either standard or enhanced at the time of ordering. The enhanced faceplate contains additional user-programmable pushbuttons and LED indicators.

The modular design allows the relay to be easily upgraded or repaired by a qualified service person. The faceplate is hinged to allow easy access to the removable modules, and is itself removable to allow mounting on doors with limited rear depth.

The case dimensions are shown below, along with panel cutout details for panel mounting. When planning the location of your panel cutout, ensure that provision is made for the faceplate to swing open without interference to or from adjacent equipment.

The relay must be mounted such that the faceplate sits semi-flush with the panel or switchgear door, allowing the operator access to the keypad and the RS232 communications port. The relay is secured to the panel with the use of four screws supplied with the relay.

Figure 3-4: L90 VERTICAL DIMENSIONS (ENHANCED PANEL)

Figure 3-5: L90 VERTICAL MOUNTING AND DIMENSIONS (STANDARD PANEL)

For details on side mounting L90 devices with the enhanced front panel, refer to the following documents available online from the GE Multilin website.

- GEK-113180: UR-series UR-V side-mounting front panel assembly instructions.
- GEK-113181: Connecting the side-mounted UR-V enhanced front panel to a vertical UR-series device.
- GEK-113182: Connecting the side-mounted UR-V enhanced front panel to a vertically-mounted horizontal UR-series device.

For details on side mounting L90 devices with the standard front panel, refer to the figures below.

Figure 3-6: L90 VERTICAL SIDE MOUNTING INSTALLATION (STANDARD PANEL)

Figure 3-7: L90 VERTICAL SIDE MOUNTING REAR DIMENSIONS (STANDARD PANEL)

3.1.2 REAR TERMINAL LAYOUT

Figure 3-8: REAR TERMINAL VIEW

Do not touch any rear terminals while the relay is energized.

The small form-factor pluggable ports (SFPs) are pluggable transceivers. Do not use non-validated transceivers or install validated transceivers in the wrong Ethernet slot, else damage can occur.

The relay follows a convention with respect to terminal number assignments which are three characters long assigned in order by module slot position, row number, and column letter. Two-slot wide modules take their slot designation from the first slot position (nearest to CPU module) which is indicated by an arrow marker on the terminal block. See the following figure for an example of rear terminal assignments.

Figure 3–9: EXAMPLE OF MODULES IN F AND H SLOTS

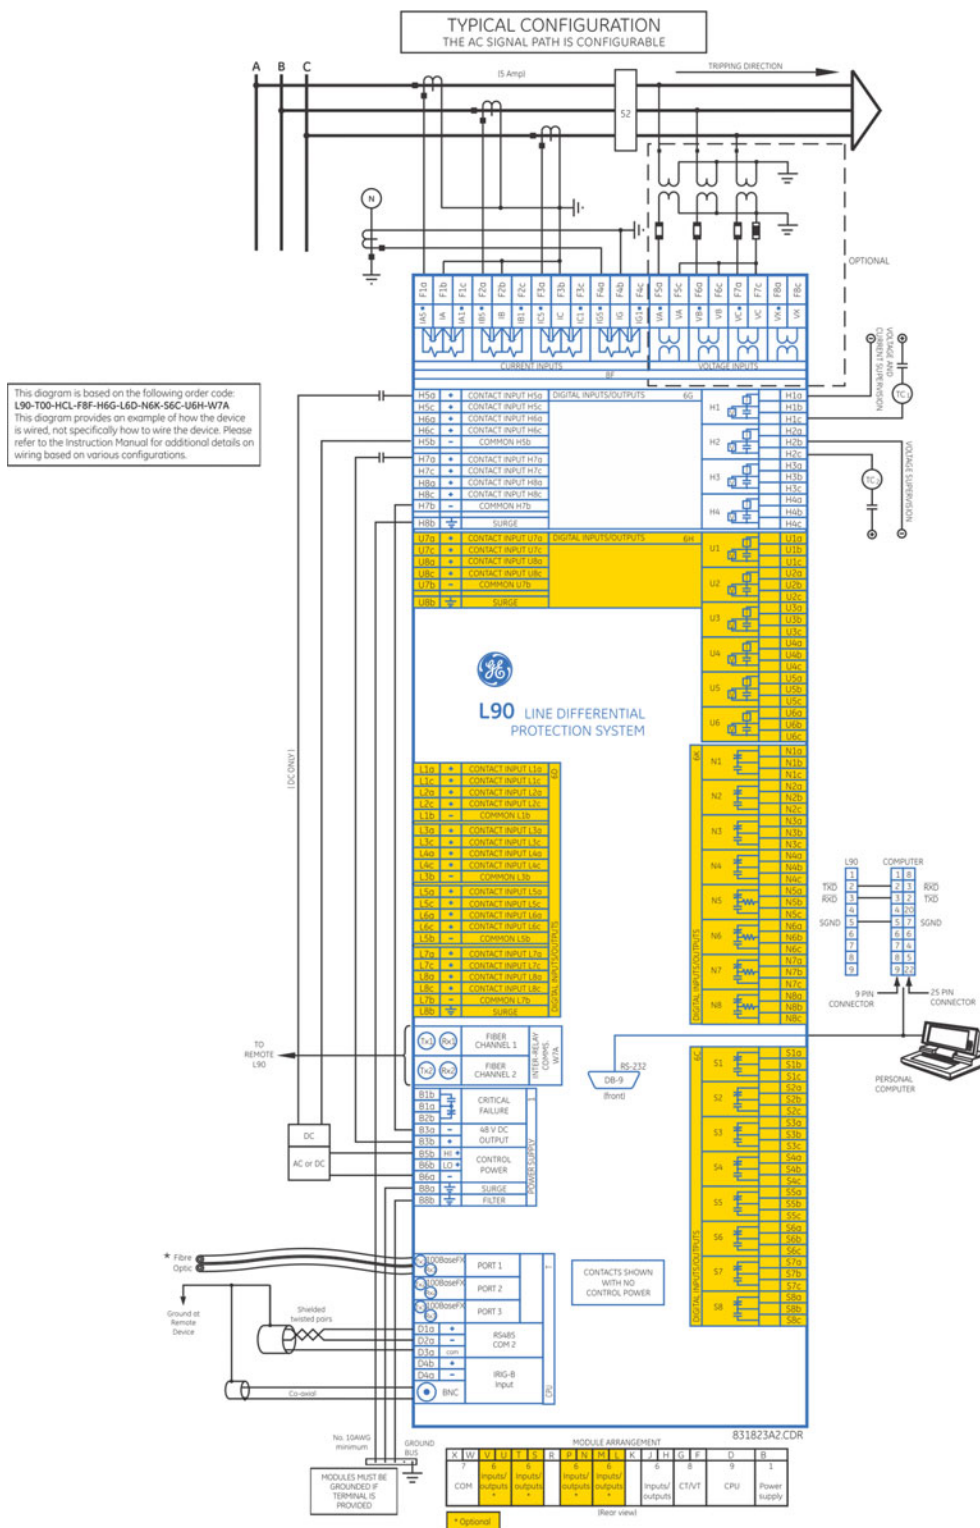

Figure 3–10: TYPICAL WIRING DIAGRAM (T MODULE SHOWN FOR CPU)

3.2.2 DIELECTRIC STRENGTH

The dielectric strength of the UR-series module hardware is shown in the following table:

Table 3–1: DIELECTRIC STRENGTH OF UR-SERIES MODULE HARDWARE

MODULE TYPE	MODULE FUNCTION	TERMINALS		DIELECTRIC STRENGTH (AC)
		FROM	TO	
1	Power supply	High (+); Low (+); (–)	Chassis	2000 V AC for 1 minute
1	Power supply	48 V DC (+) and (–)	Chassis	2000 V AC for 1 minute
1	Power supply	Relay terminals	Chassis	2000 V AC for 1 minute
2	Reserved	N/A	N/A	N/A
3	Reserved	N/A	N/A	N/A
4	Reserved	N/A	N/A	N/A
5	Analog inputs/outputs	All except 8b	Chassis	< 50 V DC
6	Digital inputs/outputs	All	Chassis	2000 V AC for 1 minute
7	G.703	All except 2b, 3a, 7b, 8a	Chassis	2000 V AC for 1 minute
	RS422	All except 6a, 7b, 8a	Chassis	< 50 V DC
8	CT/VT	All	Chassis	2000 V AC for 1 minute
9	CPU	All	Chassis	2000 V AC for 1 minute

NOTICE

Filter networks and transient protection clamps are used in the hardware to prevent damage caused by high peak voltage transients, radio frequency interference (RFI), and electromagnetic interference (EMI). These protective components can be damaged by application of the ANSI/IEEE C37.90 specified test voltage for a period longer than the specified one minute.

3.2.3 CONTROL POWER

NOTICE

Control power supplied to the relay must be connected to the matching power supply range of the relay. If the voltage is applied to the wrong terminals, damage can occur.

NOTICE

The L90 relay, like almost all electronic relays, contains electrolytic capacitors. These capacitors are well known to be subject to deterioration over time if voltage is not applied periodically. Deterioration can be avoided by powering the relays up once a year.

The power supply module can be ordered for two possible voltage ranges, with or without a redundant power option. Each range has a dedicated input connection for proper operation. The ranges are as shown below (see the *Technical specifications* section of chapter 2 for additional details):

- Low (LO) range: 24 to 48 V (DC only) nominal.
- High (HI) range: 125 to 250 V nominal.

The power supply module provides power to the relay and supplies power for dry contact input connections.

The power supply module provides 48 V DC power for dry contact input connections and a critical failure relay (see the *Typical wiring diagram* earlier). The critical failure relay is a form-C device that is energized once control power is applied and the relay has successfully booted up with no critical self-test failures. If on-going self-test diagnostic checks detect a critical failure (see the *Self-test errors* section in chapter 7) or control power is lost, the relay is de-energize.

For high reliability systems, the L90 has a redundant option in which two L90 power supplies are placed in parallel on the bus. If one of the power supplies become faulted, the second power supply assumes the full load of the relay without any interruptions. Each power supply has a green LED on the front of the module to indicate it is functional. The critical fail relay of the module also indicates a faulted power supply.

An LED on the front of the control power module shows the status of the power supply:

LED INDICATION	POWER SUPPLY
CONTINUOUS ON	OK
ON / OFF CYCLING	Failure
OFF	Failure

Figure 3-11: CONTROL POWER CONNECTION

3.2.4 CT/VT MODULES

A CT/VT module can have voltage inputs on channels 1 through 4 inclusive, or channels 5 through 8 inclusive. Channels 1 and 5 are intended for connection to phase A, and are labeled as such in the relay. Likewise, channels 2 and 6 are intended for connection to phase B, and channels 3 and 7 are intended for connection to phase C.

Channels 4 and 8 are intended for connection to a single-phase source. For voltage inputs, these channels are labeled as auxiliary voltage (VX). For current inputs, these channels are intended for connection to a CT between system neutral and ground, and are labeled as ground current (IG).

NOTICE

Verify that the connection made to the relay nominal current of 1 A or 5 A matches the secondary rating of the connected CTs. Unmatched CTs may result in equipment damage or inadequate protection.

CT/VT modules can be ordered with a standard ground current input that is the same as the phase current input. Each AC current input has an isolating transformer and an automatic shorting mechanism that shorts the input when the module is withdrawn from the chassis. There are no internal ground connections on the current inputs. Current transformers with 1 to 50000 A primaries and 1 A or 5 A secondaries may be used.

The above modules are available with enhanced diagnostics. These modules can automatically detect CT/VT hardware failure and take the relay out of service.

CT connections for both ABC and ACB phase rotations are identical as shown in the *Typical wiring diagram*.

The exact placement of a zero-sequence core balance CT to detect ground fault current is shown below. Twisted-pair cabling on the zero-sequence CT is recommended.

Figure 3-12: ZERO-SEQUENCE CORE BALANCE CT INSTALLATION

The phase voltage channels are used for most metering and protection purposes. The auxiliary voltage channel is used as input for the synchrocheck and volts-per-hertz features.

Substitute the tilde “~” symbol with the slot position of the module in the following figure.

3.2.5 PROCESS BUS MODULES

The L90 can be ordered with a process bus interface module. This module is designed to interface with the GE Multilin HardFiber system, allowing bidirectional IEC 61850 fiber optic communications with up to eight HardFiber merging units, known as Bricks. The HardFiber system has been designed to integrate seamlessly with the existing UR-series applications, including protection functions, FlexLogic, metering, and communications.

The IEC 61850 process bus system offers the following benefits:

- Reduces labor associated with design, installation, and testing of protection and control applications using the L90 by reducing the number of individual copper terminations
- Integrates seamlessly with existing L90 applications, since the IEC 61850 process bus interface module replaces the traditional CT/VT modules
- Communicates using open standard IEC 61850 messaging

For additional details on the HardFiber system, see GE publication GEK-113658: HardFiber Process Bus System Instruction Manual.

3.2.6 CONTACT INPUTS AND OUTPUTS

Every contact input/output module has 24 terminal connections. They are arranged as three terminals per row, with eight rows in total. A given row of three terminals can be used for the outputs of one relay. For example, for form-C relay outputs, the terminals connect to the normally open (NO), normally closed (NC), and common contacts of the relay. For a form-A output, there are options of using current or voltage detection for feature supervision, depending on the module ordered. The terminal configuration for contact inputs is different for the two applications.

The contact inputs are grouped with a common return. The L90 has two versions of grouping: four inputs per common return and two inputs per common return. When a contact input/output module is ordered, four inputs per common is used. The four inputs per common allows for high-density inputs in combination with outputs, with a compromise of four inputs sharing one common. If the inputs must be isolated per row, then two inputs per common return should be selected (4D module).

The tables and diagrams on the following pages illustrate the module types (6A, etc.) and contact arrangements that can be ordered for the relay. Since an entire row is used for a single contact output, the name is assigned using the module slot position and row number. However, since there are two contact inputs per row, these names are assigned by module slot position, row number, and column position.

Some form-A / solid-state relay outputs include circuits to monitor the DC voltage across the output contact when it is open, and the DC current through the output contact when it is closed. Each of the monitors contains a level detector whose output is set to logic “On = 1” when the current in the circuit is above the threshold setting. The voltage monitor is set to “On = 1” when the current is above about 1 to 2.5 mA, and the current monitor is set to “On = 1” when the current exceeds about 80 to 100 mA. The voltage monitor is intended to check the health of the overall trip circuit, and the current monitor can be used to seal-in the output contact until an external contact has interrupted current flow.

Block diagrams are shown as follows for form-A and solid-state relay outputs with optional voltage monitor, optional current monitor, and with no monitoring. The actual values shown for contact output 1 are the same for all contact outputs.

Figure 3-14: FORM-A AND SOLID-STATE CONTACT OUTPUTS WITH VOLTAGE AND CURRENT MONITORING

The operation of voltage and current monitors is reflected with the corresponding FlexLogic operands (CONT OP # VON, CONT OP # VOFF, and CONT OP # ION) which can be used in protection, control, and alarm logic. The typical application of the voltage monitor is breaker trip circuit integrity monitoring; a typical application of the current monitor is seal-in of the control command.

Refer to the *Digital elements* section of chapter 5 for an example of how form-A and solid-state relay contacts can be applied for breaker trip circuit integrity monitoring.

Consider relay contacts unsafe to touch when the unit is energized. If the relay contacts need to be used for low voltage accessible applications, ensure proper insulation levels.

USE OF FORM-A AND SOLID-STATE RELAY OUTPUTS IN HIGH IMPEDANCE CIRCUITS

For form-A and solid-state relay output contacts internally equipped with a voltage measuring circuit across the contact, the circuit has an impedance that can cause a problem when used in conjunction with external high input impedance monitoring equipment such as modern relay test set trigger circuits. These monitoring circuits may continue to read the form-A contact as being closed after it has closed and subsequently opened, when measured as an impedance.

The solution is to use the voltage measuring trigger input of the relay test set, and connect the form-A contact through a voltage-dropping resistor to a DC voltage source. If the 48 V DC output of the power supply is used as a source, a 500 Ω, 10 W resistor is appropriate. In this configuration, the voltage across either the form-A contact or the resistor can be used to monitor the state of the output.

Wherever a tilde “~” symbol appears, substitute with the slot position of the module; wherever a number sign “#” appears, substitute the contact number

NOTICE

When current monitoring is used to seal-in the form-A and solid-state relay contact outputs, the FlexLogic operand driving the contact output should be given a reset delay of 10 ms to prevent damage of the output contact (in situations when the element initiating the contact output is bouncing, at values in the region of the pickup value).

Figure 3-16: CONTACT INPUT AND OUTPUT MODULE WIRING (2 of 2)

NOTICE

For proper functionality, observe correct polarity for all contact input and solid state output connections.

CONTACT INPUTS

A dry contact has one side connected to terminal B3b. This is the positive 48 V DC voltage rail supplied by the power supply module. The other side of the dry contact is connected to the required contact input terminal. Each contact input group has its own common (negative) terminal which must be connected to the DC negative terminal (B3a) of the power supply module. When a dry contact closes, a current of 1 to 3 mA flows through the associated circuit.

A wet contact has one side connected to the positive terminal of an external DC power supply. The other side of this contact is connected to the required contact input terminal. If a wet contact is used, then the negative side of the external source must be connected to the relay common (negative) terminal of each contact group. The maximum external source voltage for this arrangement is 300 V DC.

The voltage threshold at which each group of four contact inputs detects a closed contact input is programmable as 17 V DC for 24 V sources, 33 V DC for 48 V sources, 84 V DC for 110 to 125 V sources, and 166 V DC for 250 V sources.

Figure 3-17: DRY AND WET CONTACT INPUT CONNECTIONS

Wherever a tilde “~” symbol appears, substitute with the slot position of the module.

Contact outputs can be ordered as form-A or form-C. The form-A contacts can be connected for external circuit supervision. These contacts are provided with voltage and current monitoring circuits used to detect the loss of DC voltage in the circuit, and the presence of DC current flowing through the contacts when the form-A contact closes. If enabled, the current monitoring can be used as a seal-in signal to ensure that the form-A contact does not attempt to break the energized inductive coil circuit and weld the output contacts.

There is no provision in the relay to detect a DC ground fault on 48 V DC control power external output. We recommend using an external DC supply.

USE OF CONTACT INPUTS WITH AUTO-BURNISHING

The contact inputs sense a change of the state of the external device contact based on the measured current. When external devices are located in a harsh industrial environment (either outdoor or indoor), their contacts can be exposed to various types of contamination. Normally, there is a thin film of insulating sulfidation, oxidation, or contaminants on the surface of the contacts, sometimes making it difficult or impossible to detect a change of the state. This film must be removed to establish circuit continuity – an impulse of higher than normal current can accomplish this.

The contact inputs with auto-burnish create a high current impulse when the threshold is reached to burn off this oxidation layer as a maintenance to the contacts. Afterwards the contact input current is reduced to a steady-state current. The impulse has a 5 second delay after a contact input changes state.

Figure 3–18: CURRENT THROUGH CONTACT INPUTS WITH AUTO-BURNISHING

Regular contact inputs limit current to less than 3 mA to reduce station battery burden. In contrast, contact inputs with auto-burnishing allow currents up to 50 to 70 mA at the first instance when the change of state was sensed. Then, within 25 to 50 ms, this current is slowly reduced to 3 mA as indicated above. The 50 to 70 mA peak current burns any film on the contacts, allowing for proper sensing of state changes. If the external device contact is bouncing, the auto-burnishing starts when external device contact bouncing is over.

Another important difference between the auto-burnishing input module and the regular input modules is that only two contact inputs have common ground, as opposed to four contact inputs sharing one common ground (refer to the *Contact Input and Output Module Wiring* diagrams). This is beneficial when connecting contact inputs to separate voltage sources. Consequently, the threshold voltage setting is also defined per group of two contact inputs.

The auto-burnish feature can be disabled or enabled using the DIP switches found on each daughter card. There is a DIP switch for each contact, for a total of 16 inputs.

Figure 3–19: AUTO-BURNISH DIP SWITCHES

The auto-burnish circuitry has an internal fuse for safety purposes. During regular maintenance, check the auto-burnish functionality using an oscilloscope.

3.2.7 TRANSDUCER INPUTS AND OUTPUTS

Transducer input modules can receive input signals from external dcmA output transducers (dcmA In) or resistance temperature detectors (RTD). Hardware and software is provided to receive signals from these external transducers and convert these signals into a digital format for use as required.

Transducer output modules provide DC current outputs in several standard dcmA ranges. Software is provided to configure virtually any analog quantity used in the relay to drive the analog outputs.

Every transducer input/output module has a total of 24 terminal connections. These connections are arranged as three terminals per row with a total of eight rows. A given row can be used for either inputs or outputs, with terminals in column "a" having positive polarity and terminals in column "c" having negative polarity. Since an entire row is used for a single input/output channel, the name of the channel is assigned using the module slot position and row number.

Each module also requires that a connection from an external ground bus be made to terminal 8b. The current outputs require a twisted-pair shielded cable, where the shield is grounded at one end only. The figure below illustrates the transducer module types (5A, 5C, 5D, 5E, and 5F) and channel arrangements that can be ordered for the relay.

Wherever a tilde "~" symbol appears, substitute with the slot position of the module.

3.2.8 RS232 FACEPLATE PORT

A 9-pin RS232C serial port is located on the L90 faceplate for programming with a computer. All that is required to use this interface is a computer running the EnerVista UR Setup software provided with the relay. Cabling for the RS232 port is shown in the following figure for both 9-pin and 25-pin connectors.

The baud rate for this port is fixed at **19200 bps**.

Figure 3–21: RS232 FACEPLATE PORT CONNECTION

3.2.9 CPU COMMUNICATION PORTS

a) OPTIONS

In addition to the faceplate RS232 port, the L90 provides a rear RS485 communication port.

The CPU modules do not require a surge ground connection.

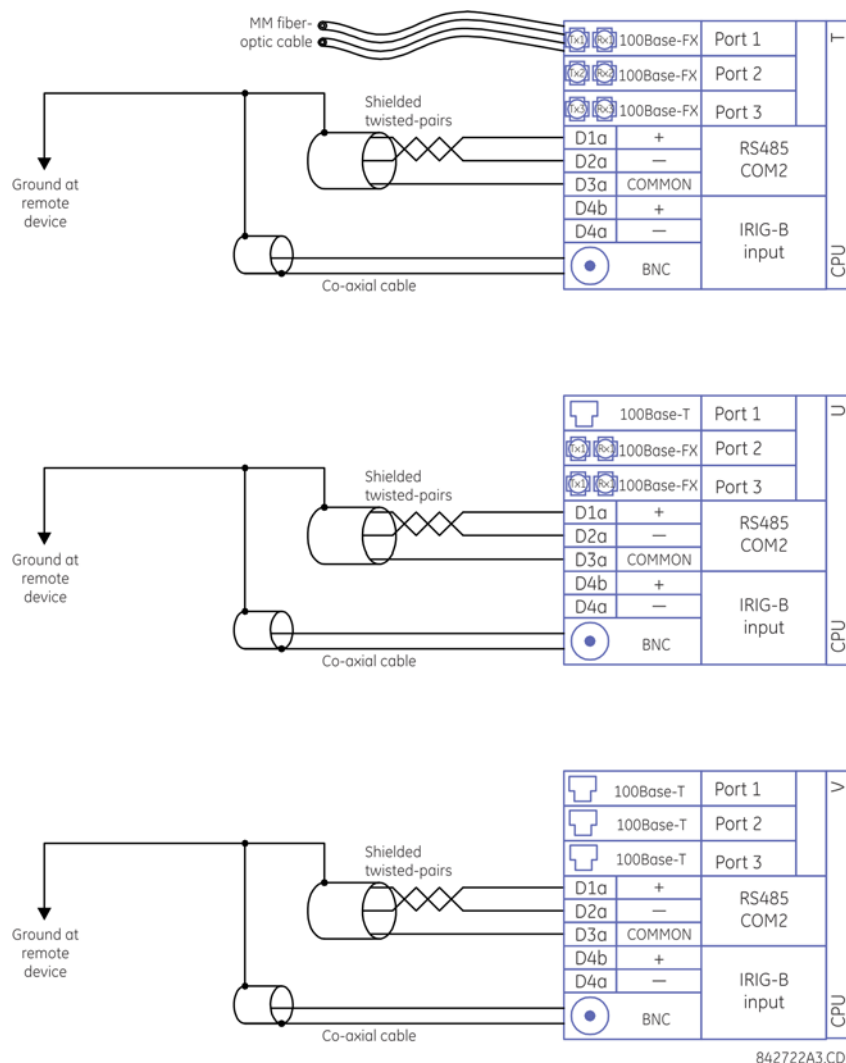

Figure 3-22: CPU MODULE COMMUNICATIONS WIRING

b) RS485 PORTS

RS485 data transmission and reception are accomplished over a single twisted pair with transmit and receive data alternating over the same two wires. Through the use of the port, continuous monitoring and control from a remote computer, SCADA system, or PLC is possible.

To minimize errors from noise, the use of shielded twisted pair wire is recommended. Correct polarity must also be observed. For instance, the relays must be connected with all RS485 “+” terminals connected together, and all RS485 “-” terminals connected together. Though data is transmitted over a two-wire twisted pair, all RS485 devices require a shared reference, or common voltage. This common voltage is implied to be a power supply common. Some systems allow the shield (drain wire) to be used as common wire and to connect directly to the L90 COM terminal (#3); others function correctly only if the common wire is connected to the L90 COM terminal, but insulated from the shield.

To avoid loop currents, ground the shield at only one point. If other system considerations require the shield to be grounded at more than one point, install resistors (typically 100 ohms) between the shield and ground at each grounding point. Each relay needs to be daisy-chained to the next one in the link. A maximum of 32 relays can be connected in this manner without exceeding driver capability. For larger systems, additional serial channels must be added. It is also possible to use commercially available repeaters to have more than 32 relays on a single channel. Avoid star or stub connections entirely.

Lightning strikes and ground surge currents can cause large momentary voltage differences between remote ends of the communication link. For this reason, surge protection devices are internally provided at both communication ports. An isolated power supply with an optocoupled data interface also acts to reduce noise coupling. To ensure maximum reliability, all equipment should have similar transient protection devices installed.

Terminate both ends of the RS485 circuit with an impedance as shown below.

Figure 3-23: RS485 SERIAL CONNECTION

c) 100BASE-FX FIBER OPTIC PORTS

Ensure that the dust covers are installed when the fiber is not in use. Dirty or scratched connectors can lead to high losses on a fiber link.

Observing any fiber transmitter output can injure the eye.

The fiber optic communication ports allow for fast and efficient communications between relays at 100 Mbps. Optical fiber can be connected to the relay supporting a wavelength of 1310 nm in multi-mode.

The fiber optic port is designed such that the response times do not vary for any core that is 100 μm or less in diameter, 62.5 μm for 100 Mbps. For optical power budgeting, splices are required every 1 km for the transmitter/receiver pair. When splicing optical fibers, the diameter and numerical aperture of each fiber must be the same.

3.2.10 IRIG-B

IRIG-B is a standard time code format that allows stamping of events to be synchronized among connected devices within 1 millisecond. The IRIG time code formats are serial, width-modulated codes that can be either DC level shifted or amplitude modulated (AM). Third party equipment is available for generating the IRIG-B signal; this equipment can use a GPS satellite system to obtain the time reference so that devices at different geographic locations can be synchronized.

Figure 3-24: OPTIONS FOR THE IRIG-B CONNECTION

Using an amplitude modulated receiver causes errors up to 1 ms in event time-stamping.

Using an amplitude modulated receiver also causes errors of up to 1 ms in metered synchrophasor values.

3.3.1 DESCRIPTION

A special inter-relay communications module is available for the L90. This module is plugged into slot “W” in horizontally mounted units and slot “R” in vertically mounted units. Inter-relay channel communications is not the same as 10/100Base-F interface communications (available as an option with the CPU module). Channel communication is used for sharing data among relays.

The inter-relay communications modules are available with several interfaces as shown in the table below.

Table 3–3: CHANNEL COMMUNICATION OPTIONS

MODULE	SPECIFICATION
2A	C37.94SM, 1300 nm, single-mode, ELED, 1 channel single-mode

7H	820 nm, multi-mode, LED, 2 channels
7I	1300 nm, multi-mode, LED, 2 channels
7J	1300 nm, single-mode, ELED, 2 channels
7K	1300 nm, single-mode, LASER, 2 channels
7L	Channel 1: RS422, channel: 820 nm, multi-mode, LED
7M	Channel 1: RS422, channel 2: 1300 nm, multi-mode, LED
7N	Channel 1: RS422, channel 2: 1300 nm, single-mode, ELED
7P	Channel 1: RS422, channel 2: 1300 nm, single-mode, laser
7Q	Channel 1: G.703, channel 2: 1300 nm, single-mode, laser
7R	G.703, 1 channel
7S	G.703, 2 channels
7T	RS422, 1 channel
7V	RS422, 2 channels, 2 clock inputs
7W	RS422, 2 channels

All of the fiber modules use ST type connectors. For two-terminal applications, each L90 relay requires at least one communications channel.

The current differential function must be “Enabled” for the communications module to properly operate. Refer to **SETTINGS** ⇒ **GROUPED ELEMENTS** ⇒ **LINE DIFFERENTIAL** ⇒ **CURRENT DIFFERENTIAL** menu.

The fiber optic modules (7A to 7W) are designed for back-to-back connections of UR-series relays only. For connections to higher-order systems, use the 72 to 77 modules or the 2A and 2B modules.

Observing any fiber transmitter output can injure the eye.

3.3.2 FIBER: LED AND ELED TRANSMITTERS

The following figure shows the configuration for the 7A, 7B, 7C, 7H, 7I, and 7J fiber-only modules.

Figure 3–25: LED AND ELED FIBER MODULES

3.3.3 FIBER-LASER TRANSMITTERS

The following figure shows the configuration for the 72, 73, 7D, and 7K fiber-laser module.

Figure 3–26: LASER FIBER MODULES

When using a laser Interface, attenuators can be necessary to ensure that you do not exceed the maximum optical input power to the receiver.

3.3.4 G.703 INTERFACE

a) DESCRIPTION

The following figure shows the 64K ITU G.703 co-directional interface configuration.

The G.703 module is fixed at 64 kbps. The SETTINGS > PRODUCT SETUP > DIRECT I/O > DIRECT I/O DATA RATE setting is not applicable to this module.

AWG 24 twisted shielded pair is recommended for external connections, with the shield grounded only at one end. Connecting the shield to pin X1a or X6a grounds the shield since these pins are internally connected to ground. Thus, if pin X1a or X6a is used, do not ground at the other end. This interface module is protected by surge suppression devices.

842773A3.CDR

Figure 3-27: G.703 INTERFACE CONFIGURATION

The following figure shows the typical pin interconnection between two G.703 interfaces. For the actual physical arrangement of these pins, see the *Rear terminal assignments* section earlier in this chapter. All pin interconnections are to be maintained for a connection to a multiplexer.

Figure 3-28: TYPICAL PIN INTERCONNECTION BETWEEN TWO G.703 INTERFACES

Pin nomenclature can differ from one manufacturer to another. Therefore, it is not uncommon to see pinouts numbered TxA, TxB, RxA and RxB. In such cases, it can be assumed that "A" is equivalent to "+" and "B" is equivalent to "-".

b) G.703 SELECTION SWITCH PROCEDURES

1. With the power to the relay off, remove the G.703 module (7R or 7S) as follows. Record the original location of the module to help ensure that the same or replacement module is inserted into the correct slot.
2. Simultaneously pull the ejector/inserters clips located at the top and at the bottom of each module in order to release the module for removal.
3. Remove the module cover screw.
4. Remove the top cover by sliding it towards the rear and then lift it upwards.
5. Set the timing selection switches (channel 1, channel 2) to the desired timing modes.
6. Replace the top cover and the cover screw.

7. Re-insert the G.703 module. Take care to ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/insertor clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module is fully inserted.

Figure 3–29: G.703 TIMING SELECTION SWITCH SETTING

Table 3–4: G.703 TIMING SELECTIONS

SWITCHES	FUNCTION
S1	OFF → octet timing disabled ON → octet timing 8 kHz
S5 and S6	S5 = OFF and S6 = OFF → loop timing mode S5 = ON and S6 = OFF → internal timing mode S5 = OFF and S6 = ON → minimum remote loopback mode S5 = ON and S6 = ON → dual loopback mode

c) G.703 OCTET TIMING

If octet timing is enabled (ON), this 8 kHz signal is asserted during the violation of bit 8 (LSB) necessary for connecting to higher order systems. When L90s are connected back-to-back, octet timing is disabled (OFF).

d) G.703 TIMING MODES

There are two timing modes for the G.703 module: internal timing mode and loop timing mode (default).

- **Internal Timing Mode:** The system clock is generated internally. Therefore, the G.703 timing selection should be in the internal timing mode for back-to-back (UR-to-UR) connections. For back-to-back connections, set for octet timing (S1 = OFF) and timing mode to internal timing (S5 = ON and S6 = OFF).
- **Loop Timing Mode:** The system clock is derived from the received line signal. Therefore, the G.703 timing selection should be in loop timing mode for connections to higher order systems. For connection to a higher order system (UR-to-multiplexer, factory defaults), set to octet timing (S1 = ON) and set timing mode to loop timing (S5 = OFF and S6 = OFF).

The switch settings for the internal and loop timing modes are shown below:

e) G.703 TEST MODES

In *minimum remote loopback mode*, the multiplexer is enabled to return the data from the external interface without any processing to assist in diagnosing G.703 line-side problems irrespective of clock rate. Data enters from the G.703 inputs, passes through the data stabilization latch which also restores the proper signal polarity, passes through the multiplexer and then returns to the transmitter. The differential received data is processed and passed to the G.703 transmitter module after which point the data is discarded. The G.703 receiver module is fully functional and continues to process data and passes it to the differential Manchester transmitter module. Since timing is returned as it is received, the timing source is expected to be from the G.703 line side of the interface.

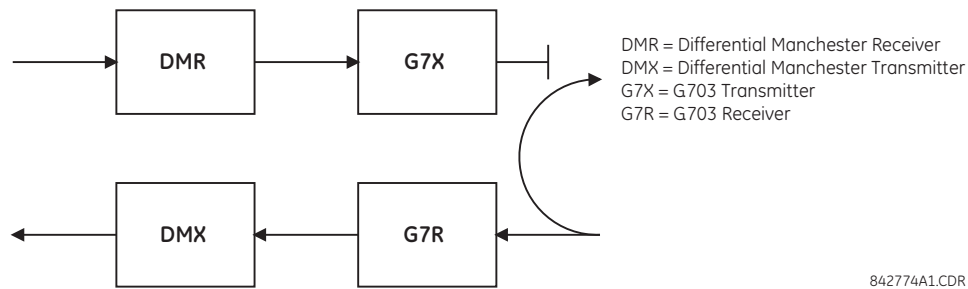

Figure 3–30: G.703 MINIMUM REMOTE LOOPBACK MODE

In *dual loopback mode*, the multiplexers are active and the functions of the circuit are divided into two with each receiver/transmitter pair linked together to deconstruct and then reconstruct their respective signals. Differential Manchester data enters the Differential Manchester receiver module and then is returned to the differential Manchester transmitter module. Likewise, G.703 data enters the G.703 receiver module and is passed through to the G.703 transmitter module to be returned as G.703 data. Because of the complete split in the communications path and because, in each case, the clocks are extracted and reconstructed with the outgoing data, in this mode there must be two independent sources of timing. One source lies on the G.703 line side of the interface while the other lies on the differential Manchester side of the interface.

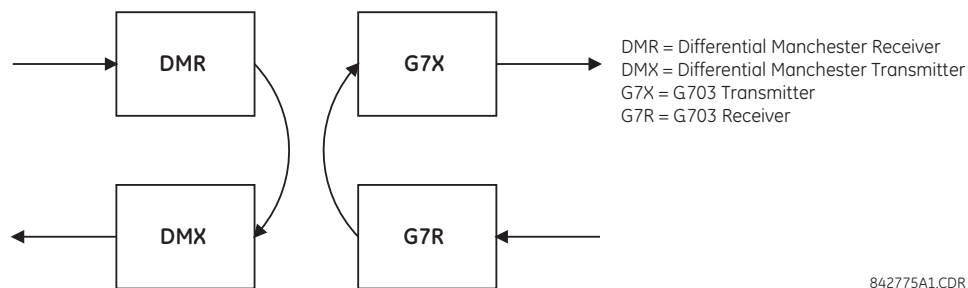

Figure 3–31: G.703 DUAL LOOPBACK MODE

3.3.5 RS422 INTERFACE

a) DESCRIPTION

There are three RS422 inter-relay communications modules available: single-channel RS422 (module 7T), dual-channel RS422 (module 7W), and dual-channel dual-clock RS422 (module 7V). The modules can be configured to run at 64 or 128 kbps. AWG 24 twisted shielded pair cable is recommended for external connections. These modules are protected by optically-isolated surge suppression devices.

The two-channel two-clock RS422 interface (module 7V) is intended for use with two independent channel banks with two independent clocks. It is intended for situations where a single clock for both channels is not acceptable.

The shield pins (6a and 7b) are internally connected to the ground pin (8a). Proper shield termination is as follows:

- Site 1: Terminate shield to pins 6a or 7b or both.
- Site 2: Terminate shield to COM pin 2b.

Match the clock terminating impedance with the impedance of the line.

Figure 3-32: RS422 INTERFACE CONNECTIONS

The following figure shows the typical pin interconnection between two single-channel RS422 interfaces installed in slot W. All pin interconnections are to be maintained for a connection to a multiplexer.

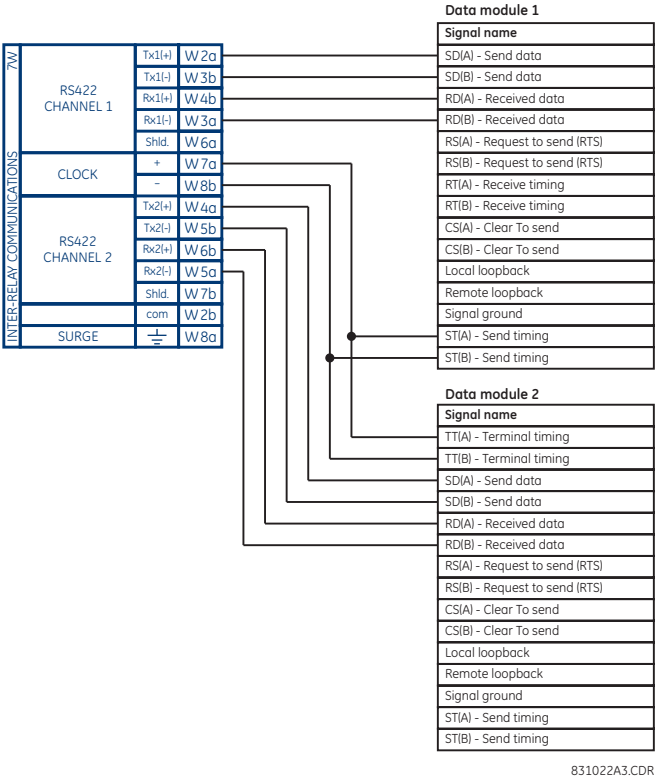

Figure 3-33: TYPICAL PIN INTERCONNECTION BETWEEN TWO RS422 INTERFACES

b) TWO-CHANNEL APPLICATION VIA MULTIPLEXERS

The RS422 interface can be used for single channel or two channel applications over SONET/SDH or multiplexed systems. When used in single-channel applications, the RS422 interface links to higher order systems in a typical fashion observing transmit (Tx), receive (Rx), and send timing (ST) connections. However, when used in two-channel applications, certain criteria must be followed since there is one clock input for the two RS422 channels. The system functions correctly when the following connections are observed and your data module has a terminal timing feature. Terminal timing is a common feature to most synchronous data units that allows the module to accept timing from an external source. Using the terminal timing feature, two channel applications can be achieved if these connections are followed: The send timing outputs from the multiplexer (data module 1), connects to the clock inputs of the UR-RS422 interface in the usual fashion. In addition,

the send timing outputs of data module 1 is also paralleled to the terminal timing inputs of data module 2. By using this configuration, the timing for both data modules and both UR-RS422 channels are derived from a single clock source. As a result, data sampling for both of the UR-RS422 channels is synchronized via the send timing leads on data module 1 as shown below. If the terminal timing feature is not available or this type of connection is not desired, the G.703 interface is a viable option that does not impose timing restrictions.

831022A3.CDR

Figure 3-34: TIMING CONFIGURATION FOR RS422 TWO-CHANNEL, THREE-TERMINAL APPLICATION

Data module 1 provides timing to the L90 RS422 interface via the ST(A) and ST(B) outputs. Data module 1 also provides timing to data module 2 TT(A) and TT(B) inputs via the ST(A) and AT(B) outputs. The data module pin numbers have been omitted in the figure above since they vary by manufacturer.

c) TRANSMIT TIMING

The RS422 interface accepts one clock input for transmit timing. It is important that the rising edge of the 64 kHz transmit timing clock of the multiplexer interface is sampling the data in the center of the transmit data window. Therefore, it is important to confirm clock and data transitions to ensure proper system operation. For example, the following figure shows the positive edge of the Tx clock in the center of the Tx data bit.

Figure 3–35: CLOCK AND DATA TRANSITIONS

d) RECEIVE TIMING

The RS422 interface utilizes NRZI-MARK modulation code and; therefore, does not rely on an Rx clock to recapture data. NRZI-MARK is an edge-type, invertible, self-clocking code.

To recover the Rx clock from the data-stream, an integrated DPLL (digital phase lock loop) circuit is utilized. The DPLL is driven by an internal clock, which is 16-times over-sampled, and uses this clock along with the data-stream to generate a data clock that can be used as the SCC (serial communication controller) receive clock.

3.3.6 TWO-CHANNEL TWO-CLOCK RS422 INTERFACE

The two-channel two-clock RS422 interface (module 7V) is intended for use with the synchrophasor feature. The module connections are illustrated below.

7V	RS422 channel 1	Tx -	~3b
		Rx -	~3a
		Tx +	~2a
		Rx +	~4b
		Shield	~6a
	RS422 channel 2	Tx -	~5b
		Rx -	~5a
		Tx +	~4a
		Rx +	~6b
		Shield	~7b
	Channel 1 clock	Tx -	~7a
		Rx -	~8b
	Channel 2 clock	Tx -	~1b
		Rx -	~1a

	Surge		~8a

842802A2.CDR

Figure 3–36: TWO-CHANNEL TWO-CLOCK RS422 INTERFACE CONNECTIONS

3.3.7 RS422 AND FIBER INTERFACE

The following figure shows the combined RS422 plus fiberoptic interface configuration at 64K baud. The 7L, 7M, 7N, 7P, and 74 modules are used in two-terminal with a redundant channel or three-terminal configurations where channel 1 is employed via the RS422 interface (possibly with a multiplexer) and channel 2 via direct fiber.

AWG 20-24 twisted shielded pair is recommended for external RS422 connections and ground the shield only at one end. For the direct fiber channel, address power budget issues properly.

NOTICE

When using a LASER Interface, attenuators can be necessary to ensure that you do not exceed maximum optical input power to the receiver.

7L, 7M, 7N, 7P, and 74 RS422 communications	Clock channel 1	+	~7a
		-	~8b
	Common	COM	~2b
	RS422 channel 1	Tx -	~3b
		Rx -	~3a
		Tx +	~2a
		Rx +	~4b
	Shield		~6a
	Fiber channel 2	Tx2 Rx2	
	Surge		~8a

842777A2.CDR

Figure 3–37: RS422 AND FIBER INTERFACE CONNECTION

Connections shown above are for multiplexers configured as DCE (data communications equipment) units.

3.3.8 G.703 AND FIBER INTERFACE

The figure below shows the combined G.703 plus fiberoptic interface configuration at 64 kbps. The 7E, 7F, 7G, 7Q, and 75 modules are used in configurations where channel 1 is employed via the G.703 interface (possibly with a multiplexer) and channel 2 via direct fiber. AWG 24 twisted shielded pair is recommended for external G.703 connections connecting the shield to pin 1a at one end only. For the direct fiber channel, address power budget issues properly. See previous sections for additional details on the G.703 and fiber interfaces.

NOTICE

When using a laser Interface, attenuators can be necessary to ensure that you do not exceed the maximum optical input power to the receiver.

75, 7E, 7F, 7G, and 7Q G.703 communications	G.703 channel 1	Shield	~1a
		Tx -	~1b
		Rx -	~2a
		Tx +	~2b
		Rx +	~3a
	Surge		~3b
	Fiber channel 2	Rx2 Tx2	

842778A2.CDR

Figure 3–38: G.703 AND FIBER INTERFACE CONNECTION

3.3.9 IEEE C37.94 INTERFACE

The UR-series IEEE C37.94 communication modules (modules types 76, and 77) are designed to interface with IEEE C37.94 compliant digital multiplexers or an IEEE C37.94 compliant interface converter for use with direct input and output applications. The IEEE C37.94 standard defines a point-to-point optical link for synchronous data between a multiplexer and a teleprotection device. This data is typically 64 kbps, but the standard provides for speeds up to $64n$ kbps, where $n = 1, 2, \dots, 12$. The UR-series C37.94 communication modules are either 64 kbps (with n fixed at 1) for 128 kbps (with n fixed at 2). The frame is a valid International Telecommunications Union (ITU-T) recommended G.704 pattern from the standpoint of framing and data rate. The frame is 256 bits and is repeated at a frame rate of 8000 Hz, with a resultant bit rate of 2048 kbps.

The specifications for the module are as follows:.

- IEEE standard: C37.94 for 2×64 kbps optical fiber interface (for 76 and 77 modules)
- Fiber optic cable type: 50 mm or 62.5 mm core diameter optical fiber
- Fiber optic mode: multi-mode
- Fiber optic cable length: up to 2 km
- Fiber optic connector: type ST
- Wavelength: 830 ± 40 nm
- Connection: as per all fiber optic connections, a Tx to Rx connection is required

The UR-series C37.94 communication module can be connected directly to any compliant digital multiplexer that supports the IEEE C37.94 standard as shown below.

The UR-series C37.94 communication module can be connected to the electrical interface (G.703, RS422, or X.21) of a non-compliant digital multiplexer via an optical-to-electrical interface converter that supports the IEEE C37.94 standard, as shown below.

The UR-series C37.94 communication module has six switches that are used to set the clock configuration. The functions of these control switches are shown below.

For the internal timing mode, the system clock is generated internally. Therefore, the timing switch selection should be internal timing for relay 1 and loop timed for relay 2. There must be only one timing source configured.

For the looped timing mode, the system clock is derived from the received line signal. Therefore, the timing selection should be in loop timing mode for connections to higher order systems.

The IEEE C37.94 communications module cover removal procedure is as follows:

1. With power to the relay off, remove the IEEE C37.94 module (type 76 or 77 module) as follows. Record the original location of the module to help ensure that the same or replacement module is inserted into the correct slot.
2. Simultaneously pull the ejector/insert clips located at the top and at the bottom of each module in order to release the module for removal.
3. Remove the module cover screw.

4. Remove the top cover by sliding it towards the rear and then lift it upwards.
5. Set the timing selection switches (channel 1, channel 2) to the desired timing modes (see description above).
6. Replace the top cover and the cover screw.
7. Re-insert the IEEE C37.94 module. Take care to ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module is fully inserted.

Figure 3-39: IEEE C37.94 TIMING SELECTION SWITCH SETTING

831774A3.CDR

Modules shipped since January 2012 have status LEDs that indicate the status of the DIP switches, as shown in the following figure.

Figure 3-40: STATUS LEDs

The clock configuration LED status is as follows:

- Flashing green — loop timing mode while receiving a valid data packet
- Flashing yellow — internal mode while receiving a valid data packet
- Solid red — (switch to) internal timing mode while not receiving a valid data packet

The link/activity LED status is as follows:

- Flashing green — FPGA is receiving a valid data packet
- Solid yellow — FPGA is receiving a "yellow bit" and remains yellow for each "yellow bit"
- Solid red — FPGA is not receiving a valid packet or the packet received is invalid

3.3.10 C37.94SM INTERFACE

The UR-series C37.94SM communication modules (2A and 2B) are designed to interface with modified IEEE C37.94 compliant digital multiplexers or IEEE C37.94 compliant interface converters that have been converted from 820 nm multi-mode fiber optics to 1300 nm ELED single-mode fiber optics. The IEEE C37.94 standard defines a point-to-point optical link for synchronous data between a multiplexer and a teleprotection device. This data is typically 64 kbps, but the standard provides for speeds up to $64n$ kbps, where $n = 1, 2, \dots, 12$. The UR-series C37.94SM communication module is 64 kbps only with n fixed at 1. The frame is a valid International Telecommunications Union (ITU-T) recommended G.704 pattern from the standpoint of framing and data rate. The frame is 256 bits and is repeated at a frame rate of 8000 Hz, with a resultant bit rate of 2048 kbps.

The specifications for the module are as follows:

- Emulated IEEE standard: emulates C37.94 for 1×64 kbps optical fiber interface (modules set to $n = 1$ or 64 kbps)
- Fiber optic cable type: 9/125 μm core diameter optical fiber
- Fiber optic mode: single-mode, ELED compatible with HP HFBR-1315T transmitter and HP HFBR-2316T receiver
- Fiber optic cable length: up to 11.4 km
- Fiber optic connector: type ST
- Wavelength: 1300 ± 40 nm
- Connection: as per all fiber optic connections, a Tx to Rx connection is required

The UR-series C37.94SM communication module can be connected *directly* to any compliant digital multiplexer that supports C37.94SM as shown below.

It can also be connected **directly** to any other UR-series relay with a C37.94SM module as shown below.

The UR-series C37.94SM communication module has six switches that are used to set the clock configuration. The functions of these control switches are shown below.

For the internal timing mode, the system clock is generated internally. Therefore, the timing switch selection should be internal timing for relay 1 and loop timed for relay 2. There must be only one timing source configured.

For the looped timing mode, the system clock is derived from the received line signal. Therefore, the timing selection should be in loop timing mode for connections to higher order systems.

The C37.94SM communications module cover removal procedure is as follows:

1. With power to the relay off, remove the C37.94SM module (modules 2A or 2B) as follows. Record the original location of the module to help ensure that the same or replacement module is inserted into the correct slot.
2. Simultaneously pull the ejector/inserter clips located at the top and at the bottom of each module in order to release the module for removal.
3. Remove the module cover screw.
4. Remove the top cover by sliding it towards the rear and then lift it upwards.
5. Set the timing selection switches (channel 1, channel 2) to the desired timing modes (see description above).
6. Replace the top cover and the cover screw.
7. Re-insert the C37.94SM module. Take care to ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/inserters located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module is fully inserted.

Figure 3-41: C37.94SM TIMING SELECTION SWITCH SETTING

Modules shipped since January 2012 have status LEDs that indicate the status of the DIP switches, as shown in the following figure.

Figure 3-42: STATUS LEDS

The clock configuration LED status is as follows:

- Flashing green — loop timing mode while receiving a valid data packet
- Flashing yellow — internal mode while receiving a valid data packet
- Solid red — (switch to) internal timing mode while not receiving a valid data packet

The link/activity LED status is as follows:

- Flashing green — FPGA is receiving a valid data packet
- Solid yellow — FPGA is receiving a "yellow bit" and remains yellow for each "yellow bit"
- Solid red — FPGA is not receiving a valid packet or the packet received is invalid

4.1.1 INTRODUCTION

The EnerVista UR Setup software provides a graphical user interface (GUI) as one of two human interfaces to a UR device. The alternate human interface is implemented via the device's faceplate keypad and display (see the *Faceplate interface* section in this chapter).

The EnerVista UR Setup software provides a single facility to configure, monitor, maintain, and troubleshoot the operation of relay functions, connected over local or wide area communication networks. It can be used while disconnected (offline) or connected (online) to a UR device. In offline mode, settings files can be created for eventual downloading to the device. In online mode, you can communicate with the device in real-time.

The EnerVista UR Setup software is provided with every L90 relay and runs on Microsoft Windows XP, 7, and Server 2008. This chapter provides a summary of the basic EnerVista UR Setup software interface features. The EnerVista UR Setup Help File provides details for getting started and using the EnerVista UR Setup software interface.

4.1.2 CREATING A SITE LIST

To start using the EnerVista UR Setup software, site and device definition are required. See the EnerVista UR Setup Help File or refer to the *Connecting EnerVista UR Setup with the L90* section in Chapter 1 for details.

4.1.3 ENERVISTA UR SETUP OVERVIEW

a) ENGAGING A DEVICE

The EnerVista UR Setup software can be used in online mode (relay connected) to directly communicate with the L90 relay. Communicating relays are organized and grouped by communication interfaces and into sites. Sites can contain any number of relays selected from the UR-series of relays.

b) USING SETTINGS FILES

The EnerVista UR Setup software interface supports three ways of handling changes to relay settings:

- In offline mode (relay disconnected) to create or edit relay settings files for later download to communicating relays
- While connected to a communicating relay to directly modify any relay settings via relay data view windows, and then save the settings to the relay
- You can create/edit settings files and then write them to the relay while the interface is connected to the relay

Settings files are organized on the basis of file names assigned by the user. A settings file contains data pertaining to the following types of relay settings:

- Device definition
- Product setup
- System setup
- FlexLogic
- Grouped elements
- Control elements
- Inputs/outputs
- Testing

Factory default values are supplied and can be restored after any changes.

The following communications settings are not transferred to the L90 with settings files.

- Modbus Slave Address
- Modbus IP Port Number
- RS485 COM2 Baud Rate
- RS485 COM2 Parity
- COM2 Minimum Response Time

COM2 Selection
 RRTD Slave Address
 RRTD Baud Rate
 IP Address
 IP Subnet Mask
 IEC61850 Config GOOSE ConfRev
 IP Routing

When a settings file is loaded to a L90 that is in-service, the following sequence occurs:

1. The L90 takes itself out of service.
2. The L90 issues a **UNIT NOT PROGRAMMED** major self-test error.
3. The L90 closes the critical fail contact.

c) CREATING AND EDITING FLEXLOGIC™

You create or edit a FlexLogic equation in order to customize the relay. You can subsequently view the automatically generated logic diagram.

d) VIEWING ACTUAL VALUES

You can view real-time relay data such as input/output status and measured parameters.

e) VIEWING TRIGGERED EVENTS

While the interface is in either online or offline mode, you can view and analyze data generated by triggered specified parameters, via one of the following:

- **Event recorder**

The event recorder captures contextual data associated with the last 1024 events, listed in chronological order from most recent to oldest.

- **Oscillography**

The oscillography waveform traces and digital states are used to provide a visual display of power system and relay operation data captured during specific triggered events.

f) FILE SUPPORT

- **Execution:** Any EnerVista UR Setup file that is opened launches the application or provides focus to the already opened application. If the file was a settings file (has a **URS** extension) that had been removed from the Settings List tree menu, it is added back to the Settings List tree menu.
- **Drag and Drop:** The Site List and Settings List control bar windows are each mutually a drag source and a drop target for device-order-code-compatible files or individual menu items. Also, the Settings List control bar window and any Windows Explorer directory folder are each mutually a file drag source and drop target.

New files that are dropped into the Settings List window are added to the tree, which is automatically sorted alphabetically with respect to settings file names. Files or individual menu items that are dropped in the selected device menu in the Site List window are automatically sent to the online communicating device.

g) FIRMWARE UPGRADES

The firmware of a L90 device can be upgraded, locally or remotely, via the EnerVista UR Setup software. The corresponding instructions are provided by the EnerVista UR Setup Help file under the topic “Upgrading Firmware”.

Modbus addresses assigned to firmware modules, features, settings, and corresponding data items (that is, default values, minimum/maximum values, data type, and item size) can change slightly from version to version of firmware. The addresses are rearranged when new features are added or existing features are enhanced or modified. The **EEPROM DATA ERROR** message displayed after upgrading/downgrading the firmware is a resettable, self-test message intended to inform users that the Modbus addresses have changed with the upgraded firmware. This message does not signal any problems when appearing after firmware upgrades.

4.1.4 ENERVISTA UR SETUP MAIN WINDOW

The EnerVista UR Setup software main window supports the following primary display components:

1. Title bar that shows the pathname of the active data view
2. Main window menu bar
3. Main window tool bar
4. Site list control bar window
5. Settings list control bar window
6. Device data view windows, with common tool bar
7. Settings file data view windows, with common tool bar
8. Workspace area with data view tabs
9. Status bar
10. Quick action hot links

Figure 4-1: ENERVISTA UR SETUP SOFTWARE MAIN WINDOW

4.2.1 SETTINGS TEMPLATES

Setting file templates simplify the configuration and commissioning of multiple relays that protect similar assets. An example of this is a substation that has ten similar feeders protected by ten UR-series F60 relays.

In these situations, typically 90% or greater of the settings are identical between all devices. The templates feature allows engineers to configure and test these common settings, then lock them so that they are not available to users. For example, these locked down settings can be hidden from view for field engineers, allowing them to quickly identify and concentrate on the specific settings.

The remaining settings (typically 10% or less) can be specified as editable and be made available to field engineers installing the devices. These are settings such as protection element pickup values and CT and VT ratios.

The settings template mode allows the user to define which settings are visible in EnerVista UR Setup. Settings templates can be applied to both settings files (settings file templates) and online devices (online settings templates). The functionality is identical for both purposes.

Settings files conversion from previous firmware versions is supported.

a) ENABLING THE SETTINGS TEMPLATE

The settings file template feature is disabled by default. The following procedure describes how to enable the settings template for UR-series settings files.

1. Select a settings file from the offline window of the EnerVista UR Setup main screen.
2. Right-click the selected device or settings file and select the **Template Mode > Create Template** option.

The settings file template is now enabled and the file tree displayed in light blue. The settings file is now in template editing mode.

Alternatively, the settings template can also be applied to online settings. The following procedure describes this process.

1. Select an installed device from the online window of the EnerVista UR Setup main screen.
2. Right-click the selected device and select the **Template Mode > Create Template** option.

The software prompts for a template password. This password is required to use the template feature and must be at least four characters in length.

3. Enter and re-enter the new password, then click **OK** to continue.

The online settings template is now enabled. The device is now in template editing mode.

b) EDITING THE SETTINGS TEMPLATE

The settings template editing feature allows the user to specify which settings are available for viewing and modification in EnerVista UR Setup. By default, all settings except the FlexLogic equation editor settings are locked.

1. Select an installed device or a settings file from the tree menu on the left of the EnerVista UR Setup main screen.
2. Select the **Template Mode > Edit Template** option to place the device in template editing mode.
3. Enter the template password then click **OK**.
4. Open the relevant settings windows that contain settings to be specified as viewable.

By default, all settings are specified as locked and displayed against a grey background. The icon on the upper right of the settings window also indicates that EnerVista UR Setup is in **EDIT mode**. The following example shows the phase time overcurrent settings window in edit mode.

Figure 4-2: SETTINGS TEMPLATE VIEW, ALL SETTINGS SPECIFIED AS LOCKED

- Specify the settings to make viewable by clicking them.

The setting available to view is displayed against a yellow background as shown below.

Figure 4-3: SETTINGS TEMPLATE VIEW, TWO SETTINGS SPECIFIED AS EDITABLE

- Click on **Save** to save changes to the settings template.
- Proceed through the settings tree to specify all viewable settings.

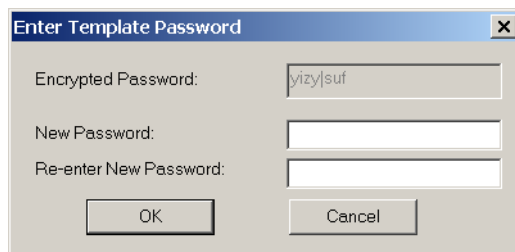

c) ADDING PASSWORD PROTECTION TO A TEMPLATE

It is highly recommended that templates be saved with password protection to maximize security.

The following procedure describes how to add password protection to a settings file template.

- Select a settings file from the offline window on the left of the EnerVista UR Setup main screen.
- Selecting the **Template Mode > Password Protect Template** option.

The software prompts for a template password. This password must be at least four characters in length.

Enter Template Password dialog box. It contains three input fields: 'Encrypted Password:' with the value 'yizy|suf', 'New Password:', and 'Re-enter New Password:'. Below the fields are 'OK' and 'Cancel' buttons.

3. Enter and re-enter the new password, then click **OK** to continue.

The settings file template is now secured with password protection.

When templates are created for online settings, the password is added during the initial template creation step. It does not need to be added after the template is created.

d) VIEWING THE SETTINGS TEMPLATE

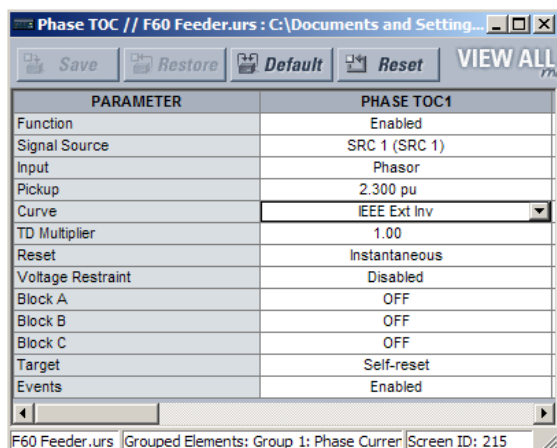

Once all necessary settings are specified for viewing, users are able to view the settings template on the online device or settings file. There are two ways to specify the settings view with the settings template feature:

- Display only those settings available for editing
- Display all settings, with settings not available for editing greyed-out

Use the following procedure to only display settings available for editing:

1. Select an installed device or a settings file from the tree menu on the left of the EnerVista UR Setup main screen.
2. Apply the template by selecting the **Template Mode > View In Template Mode** option.
3. Enter the template password then click **OK** to apply the template.

Once the template has been applied, users are limited to view and edit the settings specified by the template. The effect of applying the template to the phase time overcurrent settings is shown below.

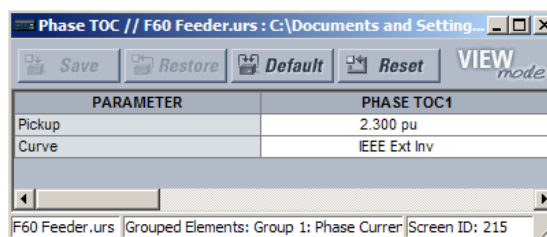

Phase TOC settings window without template applied. The window title is 'Phase TOC // F60 Feeder.urs : C:\Documents and Setting...'. It has buttons for 'Save', 'Restore', 'Default', and 'Reset', and a 'VIEW ALL' button. The table below shows the parameters and their values.

PARAMETER	PHASE TOC1
Function	Enabled
Signal Source	SRC 1 (SRC 1)
Input	Phasor
Pickup	2.300 pu
Curve	IEEE Ext Inv
TD Multiplier	1.00
Reset	Instantaneous
Voltage Restraint	Disabled
Block A	OFF
Block B	OFF
Block C	OFF
Target	Self-reset
Events	Enabled

At the bottom, it says 'F60 Feeder.urs | Grouped Elements: Group 1: Phase Currer | Screen ID: 215'.

Phase time overcurrent settings window without template applied.

Phase TOC settings window with template applied. The window title is 'Phase TOC // F60 Feeder.urs : C:\Documents and Setting...'. It has buttons for 'Save', 'Restore', 'Default', and 'Reset', and a 'VIEW mode' button. The table below shows the parameters and their values.

PARAMETER	PHASE TOC1
Pickup	2.300 pu
Curve	IEEE Ext Inv

At the bottom, it says 'F60 Feeder.urs | Grouped Elements: Group 1: Phase Currer | Screen ID: 215'.

Phase time overcurrent window with template applied via the **Template Mode > View In Template Mode** command. The template specifies that only the **Pickup** and **Curve** settings be available.

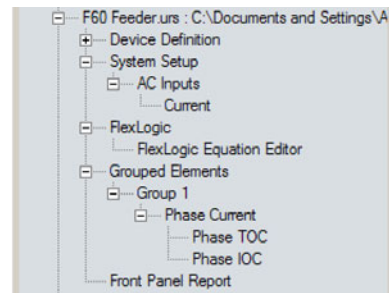

842858A1.CDR

Figure 4–4: APPLYING TEMPLATES VIA THE VIEW IN TEMPLATE MODE COMMAND

Viewing the settings in template mode also modifies the settings tree, showing only the settings categories that contain editable settings. The effect of applying the template to a typical settings tree view is shown below.

Typical settings tree view without template applied.

Typical settings tree view with template applied via the **Template Mode > View In Template Mode** command.

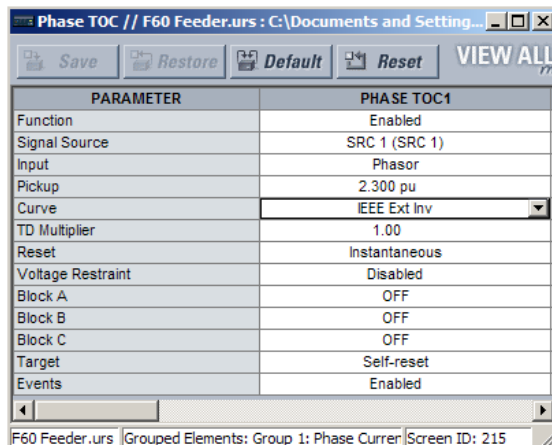

842860A1.CDR

Figure 4–5: APPLYING TEMPLATES VIA THE VIEW IN TEMPLATE MODE SETTINGS COMMAND

Use the following procedure to display settings available for editing and settings locked by the template.

1. Select an installed device or a settings file from the tree menu on the left of the EnerVista UR Setup main screen.
2. Apply the template by selecting the **Template Mode > View All Settings** option.
3. Enter the template password then click **OK** to apply the template.

Once the template has been applied, users are limited to edit the settings specified by the template, but all settings are shown. The effect of applying the template to the phase time overcurrent settings is shown below.

Phase time overcurrent settings window without template applied.

Phase time overcurrent window with template applied via the **Template Mode > View All Settings** command. The template specifies that only the **Pickup** and **Curve** settings be available.

842859A1.CDR

Figure 4–6: APPLYING TEMPLATES VIA THE VIEW ALL SETTINGS COMMAND

e) REMOVING THE SETTINGS TEMPLATE

It can be necessary at some point to remove a settings template. Once a template is removed, it cannot be reapplied and it is necessary to define a new settings template.

1. Select an installed device or settings file from the tree menu on the left of the EnerVista UR Setup main screen.
2. Select the **Template Mode > Remove Settings Template** option.
3. Enter the template password and click **OK** to continue.

- Verify one more time that you want to remove the template by clicking **Yes**.

The EnerVista software removes all template information and all settings are available.

4.2.2 SECURING AND LOCKING FLEXLOGIC EQUATIONS

The UR allows users to secure parts or all of a FlexLogic equation, preventing unauthorized viewing or modification of critical FlexLogic applications. This is accomplished using the settings template feature to lock individual entries within FlexLogic equations.

Secured FlexLogic equations remain secure when files are sent to and retrieved from any UR-series device.

a) LOCKING FLEXLOGIC EQUATION ENTRIES

The following procedure describes how to lock individual entries of a FlexLogic equation.

- Right-click the settings file or online device and select the **Template Mode > Create Template** item to enable the settings template feature.
- Select the **FlexLogic > FlexLogic Equation Editor** settings menu item.
By default, all FlexLogic entries are specified as viewable and displayed against a yellow background. The icon on the upper right of the window also indicates that EnerVista UR Setup is in **EDIT mode**.
- Specify which entries to lock by clicking on them.

The locked entries are displayed against a grey background as shown in the example below.

Figure 4-7: LOCKING FLEXLOGIC ENTRIES IN EDIT MODE

- Click on **Save** to save and apply changes to the settings template.
- Select the **Template Mode > View In Template Mode** option to view the template.
- Apply a password to the template then click **OK** to secure the FlexLogic equation.

Once the template has been applied, users are limited to view and edit the FlexLogic entries not locked by the template. The effect of applying the template to the FlexLogic entries in the above procedure is shown below.

FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Virtual Inputs On	Close HMI On (V11)
FlexLogic Entry 2	Virtual Inputs On	Close SCADA On (V12)
FlexLogic Entry 3	Contact Inputs On	Manual Close On(H5A)
FlexLogic Entry 4	OR	3 Input
FlexLogic Entry 5	Assign Virtual Output	= Close 52-1 (VO1)
FlexLogic Entry 6	Contact Inputs On	52-1 Closed On(H5C)
FlexLogic Entry 7	Contact Inputs On	52-1 Rack In On(H6A)
FlexLogic Entry 8	AND	2 Input
FlexLogic Entry 9	Protection Element	PHASE IOC1 OP
FlexLogic Entry 10	Protection Element	PHASE TOC1 OP
FlexLogic Entry 11	Protection Element	GROUND IOC1 OP
FlexLogic Entry 12	Protection Element	NEUTRAL IOC1 OP
FlexLogic Entry 13	OR	4 Input
FlexLogic Entry 14	AND	2 Input
FlexLogic Entry 15	Assign Virtual Output	= Trip 52-1 (VO2)
FlexLogic Entry 16	Protection Element	ANY MAJOR ERROR
FlexLogic Entry 17	POSITIVE ONE SHOT	1 Input

Typical FlexLogic™ entries without template applied.

FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Virtual Inputs On	Close HMI On (V11)
FlexLogic Entry 2	Virtual Inputs On	Close SCADA On (V12)
FlexLogic Entry 3	Contact Inputs On	Manual Close On(H5a)
FlexLogic Entry 4	OR	3 Input
FlexLogic Entry 5	Assign Virtual Output	= Close 52-1 (VO1)
FlexLogic Entry 6	Locked	Locked
FlexLogic Entry 7	Locked	Locked
FlexLogic Entry 8	Locked	Locked
FlexLogic Entry 9	Locked	Locked
FlexLogic Entry 10	Locked	Locked
FlexLogic Entry 11	Locked	Locked
FlexLogic Entry 12	Locked	Locked
FlexLogic Entry 13	Locked	Locked
FlexLogic Entry 14	Locked	Locked
FlexLogic Entry 15	Locked	Locked
FlexLogic Entry 16	Protection Element	ANY MAJOR ERROR
FlexLogic Entry 17	POSITIVE ONE SHOT	1 Input
FlexLogic Entry 18	Protection Element	ANY MAJOR ERROR

Typical FlexLogic™ entries locked with template via the **Template Mode > View In Template Mode** command.

842861A1.CDR

Figure 4–8: LOCKING FLEXLOGIC ENTRIES THROUGH SETTING TEMPLATES

The FlexLogic entries are also shown as locked in the graphical view (as shown below) and on the front panel display.

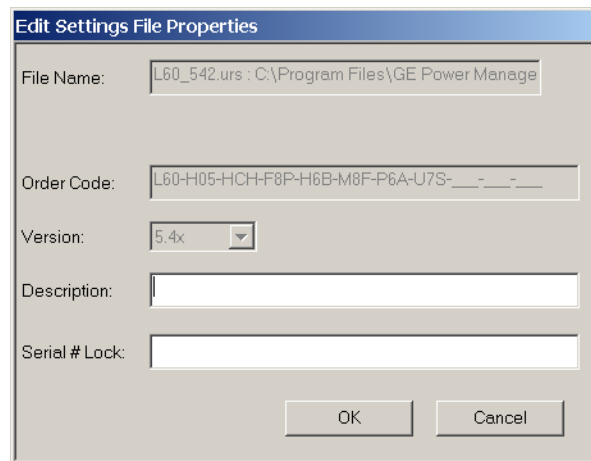

Figure 4–9: SECURED FLEXLOGIC IN GRAPHICAL VIEW

b) LOCKING FLEXLOGIC EQUATIONS TO A SERIAL NUMBER

A settings file and associated FlexLogic equations can also be locked to a specific UR serial number. Once the desired FlexLogic entries in a settings file have been secured, use the following procedure to lock the settings file to a specific serial number.

1. Select the settings file in the offline window.
2. Right-click on the file and select the **Edit Settings File Properties** item.

The following window is displayed.

The dialog box titled "Edit Settings File Properties" contains the following fields:

- File Name:** L60_542.urs : C:\Program Files\GE Power Manage
- Order Code:** L60-H05-HCH-F8P-H6B-M8F-P6A-U7S-__-__-__
- Version:** 5.4x (dropdown menu)
- Description:** (empty text field)
- Serial # Lock:** (empty text field)

At the bottom are "OK" and "Cancel" buttons.

Figure 4-10: TYPICAL SETTINGS FILE PROPERTIES WINDOW

4

3. Enter the serial number of the L90 device to lock to the settings file in the **Serial # Lock** field.

The settings file and corresponding secure FlexLogic equations are now locked to the L90 device specified by the serial number.

4.2.3 SETTINGS FILE TRACEABILITY

A traceability feature for settings files allows the user to quickly determine if the settings in a L90 device have been changed since the time of installation from a settings file. When a settings file is transferred to a L90 device, the date, time, and serial number of the L90 are sent back to EnerVista UR Setup and added to the settings file on the local PC. This information can be compared with the L90 actual values at any later date to determine if security has been compromised.

The traceability information is only included in the settings file if a complete settings file is either transferred to the L90 device or obtained from the L90 device. Any partial settings transfers by way of drag and drop do not add the traceability information to the settings file.

Figure 4-11: SETTINGS FILE TRACEABILITY MECHANISM

With respect to the above diagram, the traceability feature is used as follows.

1. The transfer date of a setting file written to a L90 is logged in the relay and can be viewed via EnerVista UR Setup or the front panel display. Likewise, the transfer date of a setting file saved to a local PC is logged in EnerVista UR Setup.
2. Comparing the dates stored in the relay and on the settings file at any time in the future indicates if any changes have been made to the relay configuration since the settings file was saved.

a) SETTINGS FILE TRACEABILITY INFORMATION

The serial number and file transfer date are saved in the settings files when they are sent to a L90 device.

The L90 serial number and file transfer date are included in the settings file device definition within the EnerVista UR Setup offline window as shown in the example below.

Figure 4-12: DEVICE DEFINITION SHOWING TRACEABILITY DATA

This information is also available in printed settings file reports as shown in the example below.

Figure 4-13: SETTINGS FILE REPORT SHOWING TRACEABILITY DATA

b) ONLINE DEVICE TRACEABILITY INFORMATION

The L90 serial number and file transfer date are available for an online device through the actual values. Select the **Actual Values > Product Info > Model Information** menu item within the EnerVista UR Setup online window as shown in the example below.

842865A1.CDR

Figure 4-14: TRACEABILITY DATA IN ACTUAL VALUES WINDOW

This information is also available from the front panel display through the following actual values:

ACTUAL VALUES ⇨ **PRODUCT INFO** ⇨ **MODEL INFORMATION** ⇨ **SERIAL NUMBER**
ACTUAL VALUES ⇨ **PRODUCT INFO** ⇨ **MODEL INFORMATION** ⇨ **LAST SETTING CHANGE**

c) ADDITIONAL TRACEABILITY RULES

The following additional rules apply for the traceability feature

- If the user changes any settings within the settings file in the offline window, then the traceability information is removed from the settings file.
- If the user creates a new settings file, then no traceability information is included in the settings file.
- If the user converts an existing settings file to another revision, then any existing traceability information is removed from the settings file.
- If the user duplicates an existing settings file, then any traceability information is transferred to the duplicate settings file.

4.3.1 FACEPLATE

a) ENHANCED FACEPLATE

The front panel interface is one of two supported interfaces, the other interface being EnerVista UR Setup software. The front panel interface consists of LED panels, an RS232 port, keypad, LCD display, control pushbuttons, and optional user-programmable pushbuttons.

The faceplate is hinged to allow easy access to the removable modules.

Figure 4-15: UR-SERIES ENHANCED FACEPLATE

b) STANDARD FACEPLATE

There are two interfaces: the front panel and the EnerVista UR Setup software. The front panel interface consists of LED panels, an RS232 port, keypad, LCD display, control pushbuttons, and optional user-programmable pushbuttons.

The faceplate is hinged to allow easy access to the removable modules. There is also a removable dust cover that fits over the faceplate that must be removed in order to access the keypad panel. The following figure shows the horizontal arrangement of the faceplate panels.

Figure 4-16: UR-SERIES STANDARD HORIZONTAL FACEPLATE PANELS

The following figure shows the vertical arrangement of the faceplate panels for relays ordered with the vertical option.

Figure 4-17: UR-SERIES STANDARD VERTICAL FACEPLATE PANELS

4.3.2 LED INDICATORS

a) ENHANCED FACEPLATE

The enhanced front panel display provides five columns of LED indicators. The first column contains 14 status and event cause LEDs, and the next four columns contain the 48 user-programmable LEDs.

The RESET key is used to reset any latched LED indicator or target message, once the condition has been cleared (these latched conditions can also be reset via the **SETTINGS** ⇒ **INPUT/OUTPUTS** ⇒ **RESETTING** menu). The RS232 port is intended for connection to a portable PC.

The USER keys are used by the breaker control feature.

Figure 4-18: TYPICAL LED INDICATOR PANEL FOR ENHANCED FACEPLATE

The status indicators in the first column are described below.

- **IN SERVICE:** This LED indicates that control power is applied, all monitored inputs, outputs, and internal systems are OK, and that the device has been programmed.

- **TROUBLE:** This LED indicates that the relay has detected an internal problem.
- **TEST MODE:** This LED indicates that the relay is in test mode.
- **TRIP:** This LED indicates that the FlexLogic operand serving as a trip switch has operated. This indicator always latches; as such, a reset command must be initiated to allow the latch to be reset.
- **ALARM:** This LED indicates that the FlexLogic operand serving as an alarm switch has operated. This indicator is never latched.
- **PICKUP:** This LED indicates that an element is picked up. This indicator is never latched.

The event cause indicators in the first column are described below.

Events cause LEDs are turned on or off by protection elements that have their respective target setting selected as either “Enabled” or “Latched”. If a protection element target setting is “Enabled”, then the corresponding event cause LEDs remain on as long as operate operand associated with the element remains asserted. If a protection element target setting is “Latched”, then the corresponding event cause LEDs turn on when the operate operand associated with the element is asserted and remain on until the RESET button on the front panel is pressed after the operand is reset.

All elements that are able to discriminate faulted phases can independently turn off or on the phase A, B or C LEDs. This includes phase instantaneous overcurrent, phase undervoltage, etc. This means that the phase A, B, and C operate operands for individual protection elements are ORed to turn on or off the phase A, B or C LEDs.

- **VOLTAGE:** This LED indicates voltage was involved.
- **CURRENT:** This LED indicates current was involved.
- **FREQUENCY:** This LED indicates frequency was involved.
- **OTHER:** This LED indicates a composite function was involved.
- **PHASE A:** This LED indicates phase A was involved.
- **PHASE B:** This LED indicates phase B was involved.
- **PHASE C:** This LED indicates phase C was involved.
- **NEUTRAL/GROUND:** This LED indicates that neutral or ground was involved.

The user-programmable LEDs consist of 48 amber LED indicators in four columns. The operation of these LEDs is user-defined. Support for applying a customized label beside every LED is provided. Default labels are shipped in the label package of every L90, together with custom templates. The default labels can be replaced by user-printed labels.

User customization of LED operation is of maximum benefit in installations where languages other than English are used to communicate with operators. Refer to the *User-programmable LEDs* section in chapter 5 for the settings used to program the operation of the LEDs on these panels.

b) STANDARD FACEPLATE

The standard faceplate consists of three panels with LED indicators, keys, and a communications port. The RESET key is used to reset any latched LED indicator or target message, once the condition has been cleared (these latched conditions can also be reset via the **SETTINGS** ⇒ **INPUT/OUTPUTS** ⇒ **RESETTING** menu). The RS232 port is for connection to a computer.

The USER keys are used by the breaker control feature.

Figure 4–19: LED PANEL 1

- **GROUP 1...6:** The illuminated GROUP is the active settings group.
- **BREAKER 1(2) OPEN:** The breaker is open.
- **BREAKER 1(2) CLOSED:** The breaker is closed.
- **BREAKER 1(2) TROUBLE:** A problem related to the breaker has been detected.
- **SYNCHROCHECK NO1(2) IN-SYNCH:** Voltages have satisfied the synchrocheck element.
- **RECLOSE ENABLED:** The recloser is operational.
- **RECLOSE DISABLED:** The recloser is not operational.
- **RECLOSE IN PROGRESS:** A reclose operation is in progress.
- **RECLOSE LOCKED OUT:** The recloser is not operational and requires a reset.

Firmware revisions 2.9x and earlier support eight user setting groups; revisions 3.0x and higher support six setting groups. For convenience of users using earlier firmware revisions, the relay panel shows eight setting groups. Please note that the LEDs, despite their default labels, are fully user-programmable.

The relay is shipped with the default label for the LED panel 2. The LEDs, however, are not pre-programmed. To match the pre-printed label, the LED settings must be entered as shown in the *User-programmable LEDs* section of chapter 5. The LEDs are fully user-programmable. The default labels can be replaced by user-printed labels for both panels as explained in the following section.

SETTINGS IN USE	BREAKER 1	SYNCHROCHECK
GROUP 1	OPEN	NO1 IN-SYNCH
GROUP 2	CLOSED	NO2 IN-SYNCH
GROUP 3	TROUBLE	
GROUP 4		RECLOSE
GROUP 5	BREAKER 2	ENABLED
GROUP 6	OPEN	DISABLED
GROUP 7	CLOSED	IN PROGRESS
GROUP 8	TROUBLE	LOCKED OUT

842784A1.CDR

Figure 4–21: LED PANEL 2 (DEFAULT LABELS)

4.3.3 CUSTOM LABELING OF LEDS

a) ENHANCED FACEPLATE

The following procedure requires these pre-requisites:

- EnerVista UR Setup software is installed and operational
- The L90 settings have been saved to a settings file
- The L90 front panel label cutout sheet (GE Multilin part number 1006-0047) has been downloaded from <http://www.gedigitalenergy.com/products/support/ur/URLEDenhanced.doc> and printed
- Small-bladed knife

To create custom LED labels for the enhanced front panel display:

1. Start the EnerVista UR Setup software.

2. Select the **Front Panel Report** item at the bottom of the menu tree for the settings file. The front panel report window displays.

Figure 4-22: FRONT PANEL REPORT WINDOW

3. Enter the text to appear next to each LED and above each user-programmable pushbuttons in the fields provided.
4. Feed the L90 front panel label cutout sheet into a printer and press the **Print** button in the front panel report window.
5. When printing is complete, fold the sheet along the perforated lines and punch out the labels.
6. Remove the L90 label insert tool from the package and bend the tabs as described in the following procedures. These tabs are used for removal of the default and custom LED labels.

It is important that the tool be used EXACTLY as shown below, with the printed side containing the GE part number facing the user.

The label package shipped with every L90 contains the three default labels shown below, the custom label template sheet, and the label removal tool.

If the default labels are suitable for your application, insert them in the appropriate slots and program the LEDs to match them. If you require custom labels, follow the procedures below to remove the original labels and insert the new ones.

The following procedure describes how to setup and use the label removal tool.

1. Bend the tabs at the left end of the tool upwards as shown below.

2. Bend the tab at the center of the tool tail as shown below.

The following procedure describes how to remove the LED labels from the L90 enhanced front panel and insert the custom labels.

1. Use the knife to lift the LED label and slide the label tool underneath. Make sure the bent tabs are pointing away from the relay.

2. Slide the label tool under the LED label until the tabs snap out as shown below. This attaches the label tool to the LED label.

3. Remove the tool and attached LED label as shown below.

4. Slide the new LED label inside the pocket until the text is properly aligned with the LEDs, as shown below.

The following procedure describes how to remove the user-programmable pushbutton labels from the L90 enhanced front panel and insert the custom labels.

1. Use the knife to lift the pushbutton label and slide the tail of the label tool underneath, as shown below. Make sure the bent tab is pointing away from the relay.

- Slide the label tool under the user-programmable pushbutton label until the tabs snap out as shown below. This attaches the label tool to the user-programmable pushbutton label.

- Remove the tool and attached user-programmable pushbutton label as shown below.

- Slide the new user-programmable pushbutton label inside the pocket until the text is properly aligned with the buttons, as shown below.

b) STANDARD FACEPLATE

Custom labeling of an LED-only panel is facilitated through a Microsoft Word file available from the following URL:

<http://www.gedigitalenergy.com/products/support/ur/GET-8494A.doc>

This file provides templates and instructions for creating appropriate labeling for the LED panel. The following procedures are contained in the downloadable file. The panel templates provide relative LED locations and located example text (x) edit boxes. The following procedure demonstrates how to install/uninstall the custom panel labeling.

- Remove the clear Lexan Front Cover (GE Multilin part number: 1501-0014).

- Pop out the LED module and/or the blank module with a screwdriver as shown below. Be careful not to damage the plastic covers.

- Place the left side of the customized module back to the front panel frame, then snap back the right side.
- Put the clear Lexan front cover back into place.

The following items are required to customize the L90 display module:

- Black and white or color printer (color preferred)
- Microsoft Word 97 or later software for editing the template
- 1 each of: 8.5" x 11" white paper, exacto knife, ruler, custom display module (GE Multilin Part Number: 1516-0069), and a custom module cover (GE Multilin Part Number: 1502-0015)

The following procedure describes how to customize the L90 display module:

1. Open the LED panel customization template with Microsoft Word. Add text in places of the **LED x** text placeholders on the template(s). Delete unused place holders as required.
2. When complete, save the Word file to your computer for future use.
3. Print the template(s) to a local printer.
4. From the printout, cut-out the Background Template from the three windows, using the cropmarks as a guide.
5. Put the Background Template on top of the custom display module (GE Multilin Part Number: 1513-0069) and snap the clear custom module cover (GE Multilin Part Number: 1502-0015) over it and the templates.

4.3.4 DISPLAY

All messages are displayed on a backlit liquid crystal display (LCD) to make them visible under poor lighting conditions. While the keypad and display are not actively being used, the display defaults to user-defined messages. Any high-priority event-driven message automatically overrides the default message and appears on the display.

4.3.5 KEYPAD

Display messages are organized into pages under the following headings: actual values, settings, commands, and targets. The MENU key navigates through these pages. Each heading page is divided further into logical subgroups.

The MESSAGE keys navigate through the subgroups. The VALUE keys increment or decrement numerical setting values when in programming mode. These keys also scroll through alphanumeric values in the text edit mode. Alternatively, values can be entered with the numeric keypad.

The decimal key initiates and advances to the next character in text edit mode or enters a decimal point.

The HELP key can be pressed at any time for context-sensitive help messages.

The ENTER key stores altered setting values.

4.3.6 BREAKER CONTROL

a) INTRODUCTION

The L90 can interface with associated circuit breakers. In many cases the application monitors the state of the breaker, that can be presented on faceplate LEDs, along with a breaker trouble indication. Breaker operations can be manually initiated from faceplate keypad or automatically initiated from a FlexLogic operand. A setting is provided to assign names to each breaker; this user-assigned name is used for the display of related flash messages. These features are provided for two breakers; the user can use only those portions of the design relevant to a single breaker, which must be breaker 1.

For the following discussion it is assumed the **SETTINGS** ⇒ **SYSTEM SETUP** ⇒ **BREAKERS** ⇒ **BREAKER 1(2)** ⇒ **BREAKER FUNCTION** setting is "Enabled" for each breaker.

b) CONTROL MODE SELECTION AND MONITORING

Installations can require that a breaker is operated in the three-pole only mode (3-pole), or in the one and three-pole (1-pole) mode, selected by setting. If the mode is selected as three-pole, a single input tracks the breaker open or closed position. If the mode is selected as one-pole, all three breaker pole states must be input to the relay. These inputs must be in agreement to indicate the position of the breaker.

For the following discussion it is assumed the **SETTINGS** ⇒ **SYSTEM SETUP** ⇒ **BREAKERS** ⇒ **BREAKER 1(2)** ⇒ **BREAKER 1(2) PUSH BUTTON CONTROL** setting is "Enabled" for each breaker.

c) FACEPLATE (USER KEY) CONTROL

After the 30 minute interval during which command functions are permitted after a correct command password, the user cannot open or close a breaker via the keypad. The following discussions begin from the not-permitted state.

d) CONTROL OF TWO BREAKERS

For the following example setup, the **(Name)** field represents the user-programmed variable name.

For this application (setup shown below), the relay is connected and programmed for both breaker 1 and breaker 2. The USER 1 key performs the selection of which breaker is to be operated by the USER 2 and USER 3 keys. The USER 2 key is used to manually close the breaker and the USER 3 key is used to manually open the breaker.

ENTER COMMAND PASSWORD	This message appears when the USER 1, USER 2, or USER 3 key is pressed and a COMMAND PASSWORD is required; i.e. if COMMAND PASSWORD is enabled and no commands have been issued within the last 30 minutes.
Press USER 1 To Select Breaker	This message appears if the correct password is entered or if none is required. This message displays for 30 seconds or until the USER 1 key is pressed again.
BKR1- (Name) SELECTED USER 2=CLS/USER 3=OP	This message is displayed after the USER 1 key is pressed for the second time. Three possible actions can be performed from this state within 30 seconds as per items (1) , (2) and (3) below:
(1)	
USER 2 OFF/ON To Close BKR1- (Name)	If the USER 2 key is pressed, this message appears for 20 seconds. If the USER 2 key is pressed again within that time, a signal is created that can be programmed to operate an output relay to close breaker 1.
(2)	
USER 3 OFF/ON To Open BKR1- (Name)	If the USER 3 key is pressed, this message appears for 20 seconds. If the USER 3 key is pressed again within that time, a signal is created that can be programmed to operate an output relay to open breaker 1.
(3)	
BKR2- (Name) SELECTED USER 2=CLS/USER 3=OP	If the USER 1 key is pressed at this step, this message appears showing that a different breaker is selected. Three possible actions can be performed from this state as per (1) , (2) and (3) . Repeatedly pressing the USER 1 key alternates between available breakers. Pressing keys other than USER 1, 2, or 3 at any time aborts the breaker control function.

e) CONTROL OF ONE BREAKER

For this application the relay is connected and programmed for breaker 1 only. Operation for this application is identical to that described above for two breakers.

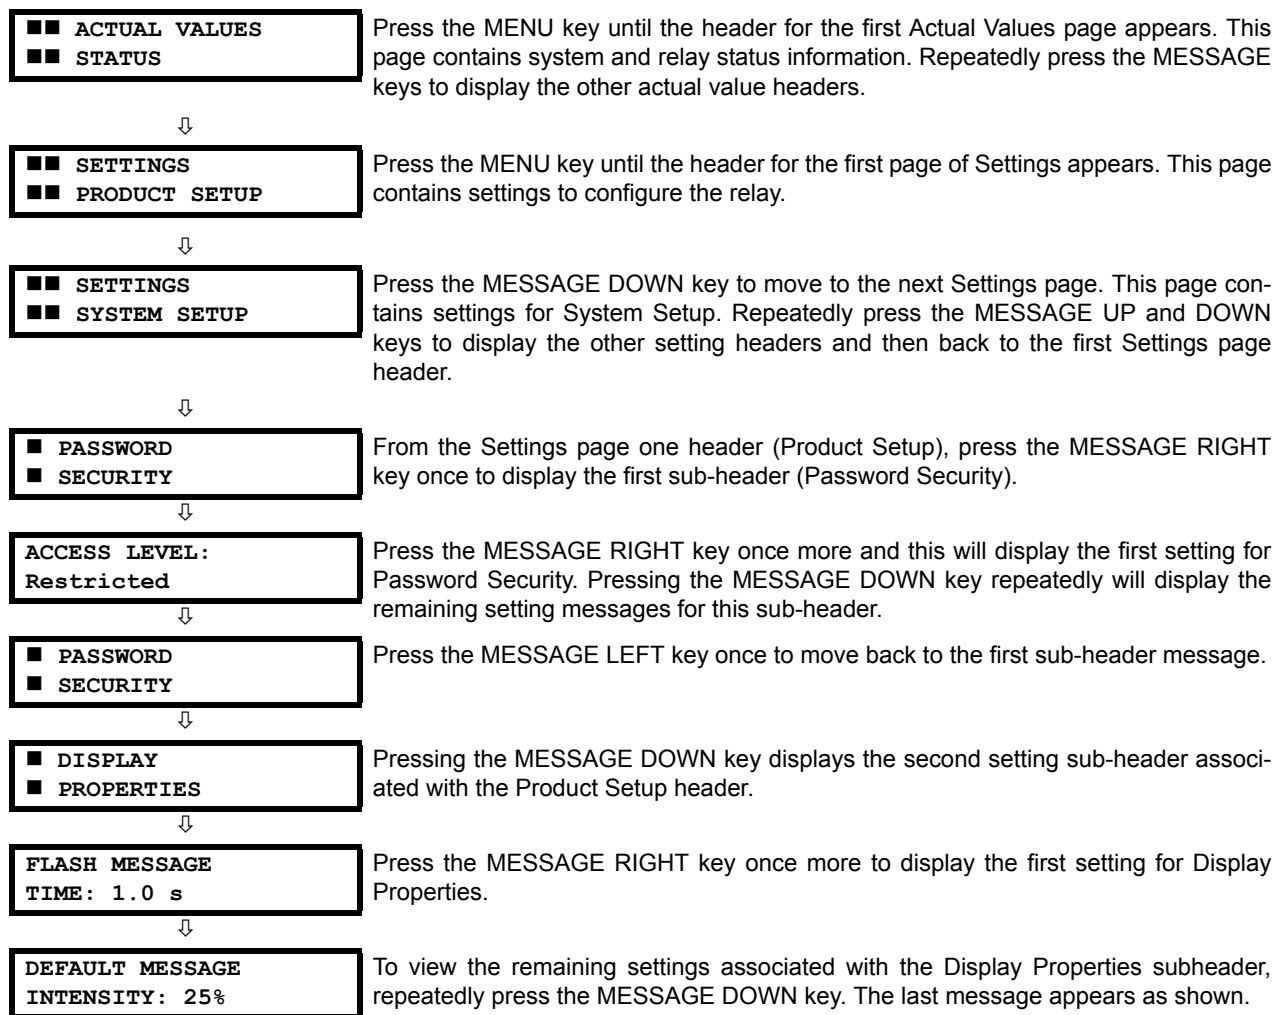

4.3.7 MENUS**a) NAVIGATION**

Press the MENU key to select a header display page (top-level menu). The header title appears momentarily followed by a header display page menu item. Each press of the MENU key advances through the following main heading pages:

- Actual values
- Settings
- Commands
- Targets
- User displays (when enabled)

b) HIERARCHY

The setting and actual value messages are arranged hierarchically. The header display pages are indicated by double scroll bar characters (■■), while sub-header pages are indicated by single scroll bar characters (■). The header display pages represent the highest level of the hierarchy and the sub-header display pages fall below this level. The MESSAGE UP and DOWN keys move within a group of headers, sub-headers, setting values, or actual values. Continually pressing the MESSAGE RIGHT key from a header display displays specific information for the header category. Conversely, continually pressing the MESSAGE LEFT key from a setting value or actual value display returns to the header display.

HIGHEST LEVEL**LOWEST LEVEL (SETTING VALUE)****c) EXAMPLE MENU NAVIGATION**

4.3.8 CHANGING SETTINGS

a) ENTERING NUMERICAL DATA

Each numerical setting has its own minimum, maximum, and increment value associated with it. These parameters define what values are acceptable for a setting.

FLASH MESSAGE
TIME: 1.0 s

For example, select the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **DISPLAY PROPERTIES** ⇒ **FLASH MESSAGE TIME** setting.

MINIMUM: 0.5
MAXIMUM: 10.0

Press the HELP key to view the minimum and maximum values. Press the HELP key again to view the next context sensitive help message.

Two methods of editing and storing a numerical setting value are available.

- **0 to 9 and decimal point:** The relay numeric keypad works the same as that of any electronic calculator. A number is entered one digit at a time. The leftmost digit is entered first and the rightmost digit is entered last. Pressing the MESSAGE LEFT key or pressing the ESCAPE key, returns the original value to the display.
- **VALUE keys:** The VALUE UP key increments the displayed value by the step value, up to the maximum value allowed. While at the maximum value, pressing the VALUE UP key again allows the setting selection to continue upward from the minimum value. The VALUE DOWN key decrements the displayed value by the step value, down to the minimum value. While at the minimum value, pressing the VALUE DOWN key again allows the setting selection to continue downward from the maximum value.

FLASH MESSAGE
TIME: 2.5 s

As an example, set the flash message time setting to 2.5 seconds. Press the appropriate numeric keys in the sequence "2 . 5". The display message changes as the digits are being entered.

NEW SETTING
HAS BEEN STORED

Until ENTER is pressed, editing changes are not registered by the relay. Therefore, press ENTER to store the new value in memory. This flash message momentarily appears as confirmation of the storing process. Numerical values which contain decimal places are rounded-off if more decimal place digits are entered than specified by the step value.

b) ENTERING ENUMERATION DATA

Enumeration settings have data values which are part of a set, whose members are explicitly defined by a name. A set is comprised of two or more members.

ACCESS LEVEL:
Restricted

For example, the selections available for **ACCESS LEVEL** are "Restricted", "Command", "Setting", and "Factory Service".

Enumeration type values are changed using the VALUE keys. The VALUE UP key displays the next selection while the VALUE DOWN key displays the previous selection.

ACCESS LEVEL:
Setting

If the **ACCESS LEVEL** needs to be "Setting", press the VALUE keys until the proper selection is displayed. Press HELP at any time for the context sensitive help messages.

NEW SETTING
HAS BEEN STORED

Changes are not registered by the relay until the ENTER key is pressed. Pressing ENTER stores the new value in memory. This flash message momentarily appears as confirmation of the storing process.

c) ENTERING ALPHANUMERIC TEXT

Text settings have data values which are fixed in length, but user-defined in character. They can be upper case letters, lower case letters, numerals, and a selection of special characters.

There are several places where text messages can be programmed to allow the relay to be customized for specific applications. One example is the Message Scratchpad. Use the following procedure to enter alphanumeric text messages.

For example: to enter the text, "Breaker #1".

1. Press the decimal point to enter text edit mode.
2. Press the VALUE keys until the character 'B' appears; press the decimal key to advance the cursor to the next position.
3. Repeat step 2 for the remaining characters: r,e,a,k,e,r, ,#,1.
4. Press ENTER to store the text.
5. If you have any problem, press HELP to view context sensitive help. Flash messages appear sequentially for several seconds each. For the case of a text setting message, pressing HELP displays how to edit and store new values.

d) ACTIVATING THE RELAY

RELAY SETTINGS:
Not Programmed

When the relay is powered up, the Trouble LED is on, the In Service LED off, and this message displayed, indicating the relay is in the "Not Programmed" state and is safeguarding (output relays blocked) against the installation of a relay whose settings have not been entered. This message remains until the relay is explicitly put in the "Programmed" state.

To change the **RELAY SETTINGS: "Not Programmed"** mode to "Programmed", proceed as follows:

1. Press the MENU key until the **SETTINGS** header flashes momentarily and the **PRODUCT SETUP** message appears on the display.
2. Press the MESSAGE RIGHT key until the **PASSWORD SECURITY** message appears on the display.
3. Press the MESSAGE DOWN key until the **INSTALLATION** message appears on the display.
4. Press the MESSAGE RIGHT key until the **RELAY SETTINGS: Not Programmed** message is displayed.

5. After the **RELAY SETTINGS: Not Programmed** message appears on the display, press the VALUE keys change the selection to "Programmed".
6. Press the ENTER key.

RELAY SETTINGS:
Not Programmed

RELAY SETTINGS:
Programmed

NEW SETTING
HAS BEEN STORED

7. When the "NEW SETTING HAS BEEN STORED" message appears, the relay is in "Programmed" state and the In Service LED turns on.

e) ENTERING INITIAL PASSWORDS

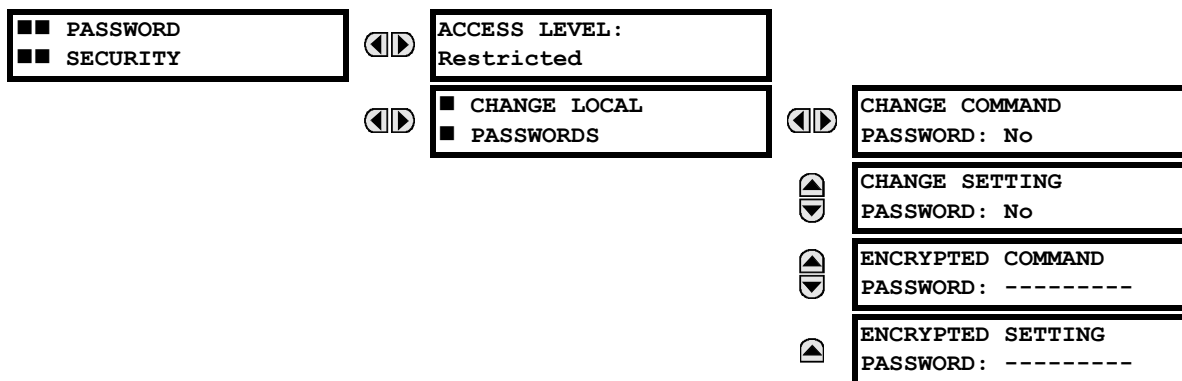

The information in this section refers to password security. For information on how to set or change CyberSentry passwords, see the Settings > Product Setup > Security > CyberSentry section in the next chapter.

The L90 supports password entry from a local or remote connection.

Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the faceplate RS232 connection. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

To enter the initial setting (or command) password, proceed as follows:

1. Press the MENU key until the **SETTINGS** header flashes momentarily and the **PRODUCT SETUP** message appears on the display.
2. Press the MESSAGE RIGHT key until the **ACCESS LEVEL** message appears on the display.
3. Press the MESSAGE DOWN key until the **CHANGE LOCAL PASSWORDS** message appears on the display.
4. Press the MESSAGE RIGHT key until the **CHANGE SETTING PASSWORD** or **CHANGE COMMAND PASSWORD** message appears on the display.

5. After the **CHANGE...PASSWORD** message appears on the display, press the VALUE UP or DOWN key to change the selection to "Yes".
6. Press the ENTER key and the display prompts you to **ENTER NEW PASSWORD**.
7. Type in a numerical password (up to 10 characters) and press the ENTER key.
8. When the **VERIFY NEW PASSWORD** is displayed, re-type in the same password and press ENTER.

9. When the **NEW PASSWORD HAS BEEN STORED** message appears, your new Setting (or Command) Password will be active.

f) CHANGING EXISTING PASSWORD

To change an existing password, follow the instructions in the previous section with the following exception. A message prompts you to type in the existing password (for each security level) before a new password can be entered.

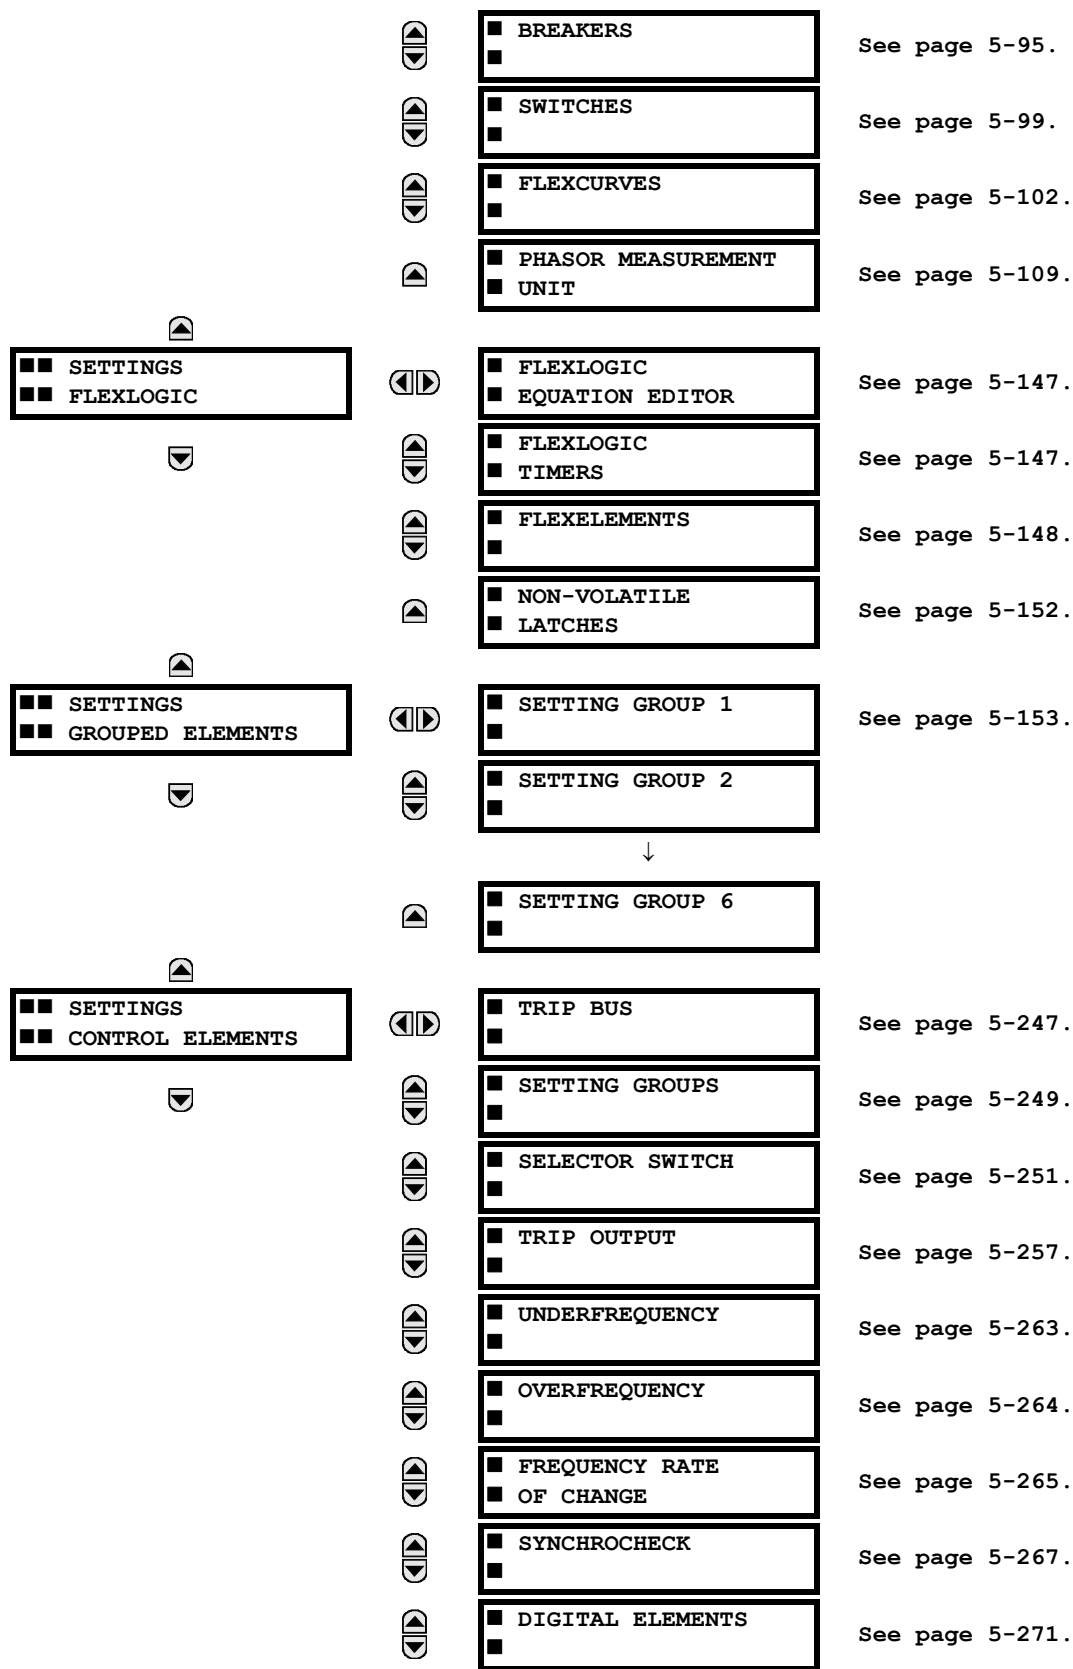

g) INVALID PASSWORD ENTRY

When an incorrect command or setting password has been entered via the faceplate interface three times within a 3-minute time span, the LOCAL ACCESS DENIED FlexLogic operand is set to "On" and the L90 does not allow settings or command level access via the faceplate interface for the next five minutes, or in the event that an incorrect Command Or Setting password has been entered via the any external communications interface three times within a 3-minute time span, the REMOTE ACCESS DENIED FlexLogic operand is set to "On" and the L90 does not allow settings or command access via the any external communications interface for the next five minutes.

In the event that an incorrect Command or Setting password has been entered via the any external communications interface three times within a three-minute time span, the REMOTE ACCESS DENIED FlexLogic operand is set to “On” and the L90 does not allow Settings or Command access via the any external communications interface for the next ten minutes. The REMOTE ACCESS DENIED FlexLogic operand is set to “Off” after the expiration of the ten-minute timeout.

5.1.2 INTRODUCTION TO ELEMENTS

In the design of UR relays, the term *element* is used to describe a feature that is based around a comparator. The comparator is provided with an input (or set of inputs) that is tested against a programmed setting (or group of settings) to determine if the input is within the defined range that will set the output to logic 1, also referred to as *setting the flag*. A single comparator may make multiple tests and provide multiple outputs; for example, the time overcurrent comparator sets a pickup flag when the current input is above the setting and sets an operate flag when the input current has been at a level above the pickup setting for the time specified by the time-current curve settings. All comparators use analog parameter actual values as the input.

The exception to the above rule are the digital elements, which use logic states as inputs.

5

Elements are arranged into two classes, *grouped* and *control*. Each element classed as a grouped element is provided with six alternate sets of settings, in setting groups numbered 1 through 6. The performance of a grouped element is defined by the setting group that is active at a given time. The performance of a control element is independent of the selected active setting group.

The main characteristics of an element are shown on the element logic diagram. This includes the inputs, settings, fixed logic, and the output operands generated (abbreviations used on scheme logic diagrams are defined in Appendix F).

Some settings for current and voltage elements are specified in per-unit (pu) calculated quantities:

$$\text{pu quantity} = (\text{actual quantity}) / (\text{base quantity})$$

For current elements, the *base quantity* is the nominal secondary or primary current of the CT.

Where the current source is the sum of two CTs with different ratios, the base quantity will be the common secondary or primary current to which the sum is scaled (that is, normalized to the larger of the two rated CT inputs). For example, if CT1 = 300 / 5 A and CT2 = 100 / 5 A, then in order to sum these, CT2 is scaled to the CT1 ratio. In this case, the base quantity will be 5 A secondary or 300 A primary.

For voltage elements the base quantity is the nominal primary voltage of the protected system which corresponds (based on VT ratio and connection) to secondary VT voltage applied to the relay.

For example, on a system with a 13.8 kV nominal primary voltage and with 14400:120 V delta-connected VTs, the secondary nominal voltage (1 pu) would be:

$$\frac{13800}{14400} \times 120 = 115 \text{ V} \quad (\text{EQ 5.1})$$

For wye-connected VTs, the secondary nominal voltage (1 pu) would be:

$$\frac{13800}{14400} \times \frac{120}{\sqrt{3}} = 66.4 \text{ V} \quad (\text{EQ 5.2})$$

Many settings are common to most elements and are discussed below:

- **FUNCTION setting:** This setting programs the element to be operational when selected as “Enabled”. The factory default is “Disabled”. Once programmed to “Enabled”, any element associated with the function becomes active and all options become available.
- **NAME setting:** This setting is used to uniquely identify the element.
- **SOURCE setting:** This setting is used to select the parameter or set of parameters to be monitored.
- **PICKUP setting:** For simple elements, this setting is used to program the level of the measured parameter above or below which the pickup state is established. In more complex elements, a set of settings may be provided to define the range of the measured parameters which will cause the element to pickup.
- **PICKUP DELAY setting:** This setting sets a time-delay-on-pickup, or on-delay, for the duration between the pickup and operate output states.
- **RESET DELAY setting:** This setting is used to set a time-delay-on-dropout, or off-delay, for the duration between the Operate output state and the return to logic 0 after the input transits outside the defined pickup range.
- **BLOCK setting:** The default output operand state of all comparators is a logic 0 or “flag not set”. The comparator remains in this default state until a logic 1 is asserted at the RUN input, allowing the test to be performed. If the RUN input changes to logic 0 at any time, the comparator returns to the default state. The RUN input is used to supervise the comparator. The BLOCK input is used as one of the inputs to RUN control.
- **TARGET setting:** This setting is used to define the operation of an element target message. When set to “Disabled”, no target message or illumination of a faceplate LED indicator is issued upon operation of the element. When set to “Self-Reset”, the target message and LED indication follow the operate state of the element, and self-resets once the operate element condition clears. When set to “Latched”, the target message and LED indication will remain visible after the element output returns to logic 0 until a RESET command is received by the relay.
- **EVENTS setting:** This setting is used to control whether the pickup, dropout or operate states are recorded by the event recorder. When set to “Disabled”, element pickup, dropout or operate are not recorded as events. When set to “Enabled”, events are created for:
 - (Element) PKP (pickup)
 - (Element) DPO (dropout)
 - (Element) OP (operate)

The DPO event is created when the measure and decide comparator output transits from the pickup state (logic 1) to the dropout state (logic 0). This could happen when the element is in the operate state if the reset delay time is not 0.

5.1.3 INTRODUCTION TO AC SOURCES

a) BACKGROUND

The L90 may be used on systems with breaker-and-a-half or ring bus configurations.

In these applications, each of the two three-phase sets of individual phase currents (one associated with each breaker) can be used as an input to a breaker failure element. The sum of both breaker phase currents and 3I₀ residual currents may be required for the circuit relaying and metering functions. Two separate synchrocheck elements can be programmed to check synchronization between two different buses VT and the line VT. These requirements can be satisfied with a single L90, equipped with sufficient CT and VT input channels, by selecting proper parameter to measure. A mechanism is provided to specify the AC parameter (or group of parameters) used as the input to protection/control comparators and some metering elements. Selection of the measured parameters is partially performed by the design of a measuring element or protection/control comparator by identifying the measured parameter type (fundamental frequency phasor, harmonic phasor, symmetrical component, total waveform RMS magnitude, phase-phase or phase-ground voltage, etc.). The user completes the process by selecting the instrument transformer input channels to use and some parameters calculated from these channels. The input parameters available include the summation of currents from multiple input channels. For the summed currents of phase, 3I₀, and ground current, current from CTs with different ratios are adjusted to a single ratio before summation. A mechanism called a *source* configures the routing of CT and VT input channels to measurement sub-systems.

Sources, in the context of L90 series relays, refer to the logical grouping of current and voltage signals such that one source contains all the signals required to measure the load or fault in a particular power apparatus. A given source may contain all or some of the following signals: three-phase currents, single-phase ground current, three-phase voltages and an auxiliary voltages from a single-phase VT for checking for synchronism.

To illustrate the concept of Sources, as applied to current inputs only, consider the breaker-and-a-half scheme below. Some protection elements, like breaker failure, require individual CT current as an input. Other elements, like distance, require the sum of both current as an input. The line differential function requires the CT currents to be processed individually to cope with a possible CT saturation of one CT during an external fault on the upper bus. The current into protected line is the phasor sum (or difference) of the currents in CT1 and CT2, depending on the current distribution on the upper bus.

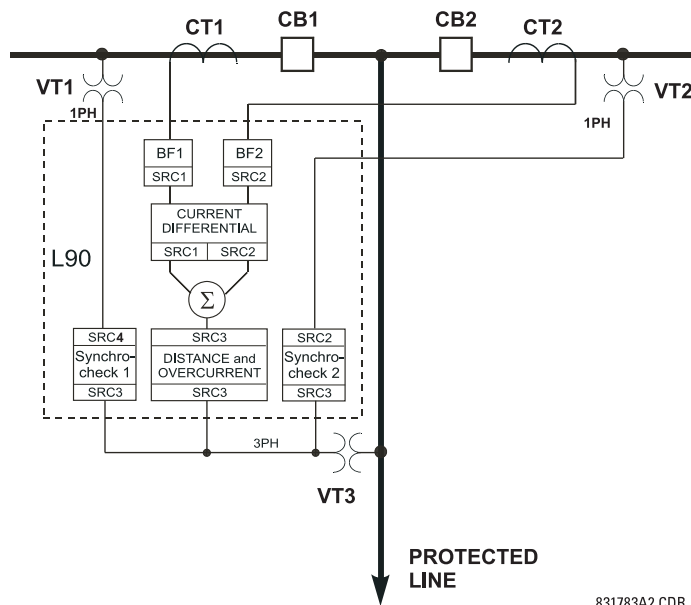

Figure 5-1: BREAKER-AND-A-HALF SCHEME

In conventional analog or electronic relays, the sum of the currents is obtained from an appropriate external connection of all CTs through which any portion of the current for the element being protected could flow. Auxiliary CTs are required to perform ratio matching if the ratios of the primary CTs to be summed are not identical. In the L90 relay, provisions have been included for all the current signals to be brought to the device where grouping, CT ratio correction, and summation are applied internally via configuration settings. Up to four currents can be brought into L90 relay; current summation and CT ratio matching is performed internally. A major advantage of internal summation is that individual currents are available to the protection device (for example, as additional information to apply a restraint current properly, or to allow the provision of additional features that operate on the individual currents, such as breaker failure). Given the flexibility of this approach, it becomes necessary to add configuration settings to the platform to allow the user to select which sets of CT inputs will be added to form the net current into the protected device. The internal grouping of current and voltage signals forms an internal source. This source can be assigned a specific name and becomes available to protection and metering elements in the relay. Individual names can be given to each source to identify them for later use. For example, in the scheme shown above, three different sources are configured as inputs for separate elements:

- Source 1: CT1 current, for the breaker failure 1 element and first current source for the line differential element.
- Source 2: CT2 current, for breaker failure 2 element and second current source for the line differential element.
- Source 3: the sum of the CT1 and CT2 currents for the distance function.

In addition, two separate synchrocheck elements can be programmed to check synchronization between line voltage and two different bus voltages (SRC3–SRC1 and SRC3–SRC2).

b) CT/VT MODULE CONFIGURATION

CT and VT input channels are contained in CT/VT modules. The type of input channel can be phase/neutral/other voltage, phase/ground current, or sensitive ground current. The CT/VT modules calculate total waveform RMS levels, fundamental frequency phasors, symmetrical components and harmonics for voltage or current, as allowed by the hardware in each channel. These modules may calculate other parameters as directed by the CPU module.

A CT/VT module contains up to eight input channels, numbered 1 through 8. The channel numbering corresponds to the module terminal numbering 1 through 8 and is arranged as follows: Channels 1, 2, 3 and 4 are always provided as a group, hereafter called a “bank,” and all four are either current or voltage, as are channels 5, 6, 7 and 8. Channels 1, 2, 3 and 5, 6, 7 are arranged as phase A, B and C respectively. Channels 4 and 8 are either another current or voltage.

Banks are ordered sequentially from the block of lower-numbered channels to the block of higher-numbered channels, and from the CT/VT module with the lowest slot position letter to the module with the highest slot position letter, as follows:

INCREASING SLOT POSITION LETTER -->		
CT/VT MODULE 1	CT/VT MODULE 2	CT/VT MODULE 3
< bank 1 >	< bank 3 >	< bank 5 >
< bank 2 >	< bank 4 >	< bank 6 >

The UR platform allows for a maximum of three sets of three-phase voltages and six sets of three-phase currents. The result of these restrictions leads to the maximum number of CT/VT modules in a chassis to three. The maximum number of sources is six. A summary of CT/VT module configurations is shown below.

ITEM	MAXIMUM NUMBER
CT/VT Module	2
CT Bank (3 phase channels, 1 ground channel)	8
VT Bank (3 phase channels, 1 auxiliary channel)	4

c) CT/VT INPUT CHANNEL CONFIGURATION

Upon relay startup, configuration settings for every bank of current or voltage input channels in the relay are automatically generated from the order code. Within each bank, a channel identification label is automatically assigned to each bank of channels in a given product. The *bank* naming convention is based on the physical location of the channels, required by the user to know how to connect the relay to external circuits. Bank identification consists of the letter designation of the slot in which the CT/VT module is mounted as the first character, followed by numbers indicating the channel, either 1 or 5.

For three-phase channel sets, the number of the lowest numbered channel identifies the set. For example, F1 represents the three-phase channel set of F1/F2/F3, where F is the slot letter and 1 is the first channel of the set of three channels.

Upon startup, the CPU configures the settings required to characterize the current and voltage inputs, and will display them in the appropriate section in the sequence of the banks (as described above) as follows for a maximum configuration: F1, F5, L1, L5, S1, and S5.

The above section explains how the input channels are identified and configured to the specific application instrument transformers and the connections of these transformers. The specific parameters to be used by each measuring element and comparator, and some actual values are controlled by selecting a specific source. The source is a group of current and voltage input channels selected by the user to facilitate this selection. With this mechanism, a user does not have to make multiple selections of voltage and current for those elements that need both parameters, such as a distance element or a watt calculation. It also gathers associated parameters for display purposes.

The basic idea of arranging a source is to select a point on the power system where information is of interest. An application example of the grouping of parameters in a source is a transformer winding, on which a three phase voltage is measured, and the sum of the currents from CTs on each of two breakers is required to measure the winding current flow.

5.2.1 SECURITY

a) SECURITY OVERVIEW

The following security features are available:

- Password security — Basic security present in the default offering of the product
- EnerVista security — Role-based access to various EnerVista software screens and configuration elements. The feature is available in the default offering of the product and only in the EnerVista software.
- CyberSentry security — Advanced security options available as a software option. When purchased, the options are automatically enabled, and the default Password security and EnerVista security are disabled.

b) LOST PASSWORD

If all passwords are lost, recovery is possible by resetting the unit to default values.

To reset the unit after a lost password:

1. Email GE customer service at multilin.tech@ge.com with the serial number and using a recognizable corporate email account. Customer service provides a code to reset the relay to the factory defaults.
2. Enter the reset code on the front panel, under **Commands > Commands Relay Maintenance > Service Command**.
3. Change the default password of ChangeMe1# as outlined in the Set Up CyberSentry and Change Default Password section in the first chapter.

c) PASSWORD REQUIREMENTS

For password security and CyberSentry security, a user account requires an alpha-numeric password that meets the following requirements:

- Password is case-sensitive
- Password cannot contain the user account name or parts of the user account that exceed two consecutive characters
- Password must be 6 to 20 characters in length
- Password must contain characters from three of the following four categories:
 - English uppercase characters (A through Z)
 - English lowercase characters (a through z)
 - Base 10 digits (0 through 9)
 - Non-alphabetic characters (for example, ~, !, @, #, \$, %, &)

d) PASSWORD SECURITY

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY

<div>■ SECURITY</div>	◀▶	<div>ACCESS LEVEL: Restricted</div>	Range: Restricted, Command, Setting, Factory Service (for factory use only)
MESSAGE	▲▼	<div>■ CHANGE LOCAL ■ PASSWORDS</div>	See page 5–9.
MESSAGE	▲▼	<div>■ ACCESS ■ SUPERVISION</div>	See page 5–10.
MESSAGE	▲▼	<div>■ DUAL PERMISSION ■ SECURITY ACCESS</div>	See page 5–11.
MESSAGE	▲	<div>PASSWORD ACCESS EVENTS: Disabled</div>	Range: Disabled, Enabled

The L90 supports password entry from a local or remote connection.

Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the through the faceplate RS232 port. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

When entering a settings or command password via EnerVista or any serial interface, the user must enter the corresponding connection password. If the connection is to the back of the L90, the remote password must be used. If the connection is to the RS232 port of the faceplate, the local password must be used.

The **PASSWORD ACCESS EVENTS** settings allows recording of password access events in the event recorder.

The local setting and command sessions are initiated by the user through the front panel display and are disabled either by the user or by timeout (via the setting and command level access timeout settings). The remote setting and command sessions are initiated by the user through the EnerVista UR Setup software and are disabled either by the user or by timeout.

The state of the session (local or remote, setting or command) determines the state of the following FlexLogic operands.

- ACCESS LOC SETG OFF: Asserted when local setting access is disabled
- ACCESS LOC SETG ON: Asserted when local setting access is enabled
- ACCESS LOC CMND OFF: Asserted when local command access is disabled
- ACCESS LOC CMND ON: Asserted when local command access is enabled
- ACCESS REM SETG OFF: Asserted when remote setting access is disabled
- ACCESS REM SETG ON: Asserted when remote setting access is enabled
- ACCESS REM CMND OFF: Asserted when remote command access is disabled
- ACCESS REM CMND ON: Asserted when remote command access is enabled

A command or setting write operation is required to update the state of all the remote and local security operands shown above.

LOCAL PASSWORDS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ CHANGE LOCAL PASSWORDS

<div> <div>■ CHANGE LOCAL</div> <div>■ PASSWORDS</div> </div>	<div> <div>◀▶</div> <div>CHANGE COMMAND</div> <div>PASSWORD: No</div> </div>	Range: No, Yes
	<div> <div>MESSAGE</div> <div>▲▼</div> <div>CHANGE SETTING</div> <div>PASSWORD: No</div> </div>	Range: No, Yes
	<div> <div>MESSAGE</div> <div>▲▼</div> <div>ENCRYPTED COMMAND</div> <div>PASSWORD: -----</div> </div>	Range: 0 to 999999999 Note: ----- indicates no password
	<div> <div>MESSAGE</div> <div>▲▼</div> <div>ENCRYPTED SETTING</div> <div>PASSWORD: -----</div> </div>	Range: 0 to 999999999 Note: ----- indicates no password

Proper password codes are required to enable each access level. When a **CHANGE COMMAND PASSWORD** or **CHANGE SETTING PASSWORD** setting is programmed to “Yes” via the front panel interface, the following message sequence is invoked:

1. ENTER NEW PASSWORD: _____.
2. VERIFY NEW PASSWORD: _____.
3. NEW PASSWORD HAS BEEN STORED.

To gain write access to a “Restricted” setting, program the **ACCESS LEVEL** setting in the main security menu to “Setting” and then change the setting, or attempt to change the setting and follow the prompt to enter the programmed password. If the password is correctly entered, access will be allowed. Accessibility automatically reverts to the “Restricted” level according to the access level timeout setting values.

If the setting and command passwords are identical, then this one password allows access to both commands and settings.

If a remote connection is established, local passcodes are not visible.

NOTE

REMOTE PASSWORDS

The remote password settings are visible only from a remote connection via the EnerVista UR Setup software.

Proper passwords are required to enable each command or setting level access.

To set the command or setting password:

1. In the EnerVista software, navigate to **Settings > Product Setup > Security** menu item to open the remote password settings window.
2. Click the command or setting password **Change** button.
3. Enter the new password in the **New Password** field. Requirements are outlined in the *Password Requirements* section at the beginning of the chapter. When an original password has already been used, enter it in the **Enter Password** field and click the **Send Password to Device** button.
4. Re-enter the password in the **Confirm Password** field.
5. Click the **OK** button. The password is checked to ensure that it meets requirements.

If you establish a local connection to the relay (serial), you cannot view remote passcodes.

NOTE

ACCESS SUPERVISION

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ ACCESS SUPERVISION

<div> <div>■ ACCESS</div> <div>■ SUPERVISION</div> </div>	<div> <div>◀ ▶</div> <div>▲ ▼</div> <div>▲</div> </div>	<div> <div>■ ACCESS LEVEL</div> <div>■ TIMEOUTS</div> </div>	
MESSAGE		INVALID ATTEMPTS BEFORE LOCKOUT: 3	Range: 2 to 5 in steps of 1
MESSAGE		PASSWORD LOCKOUT DURATION: 5 min	Range: 5 to 60 minutes in steps of 1

The following access supervision settings are available.

- **INVALID ATTEMPTS BEFORE LOCKOUT:** This setting specifies the number of times an incorrect password can be entered within a three-minute time span before lockout occurs. When lockout occurs, the LOCAL ACCESS DENIED or REMOTE ACCESS DENIED FlexLogic operands are set to “On”. These operands are returned to the “Off” state upon expiration of the lockout.
- **PASSWORD LOCKOUT DURATION:** This setting specifies the time that the L90 will lockout password access after the number of invalid password entries specified by the INVALID ATTEMPTS BEFORE LOCKOUT setting has occurred.

The L90 provides a means to raise an alarm upon failed password entry. Should password verification fail while accessing a password-protected level of the relay (either settings or commands), the UNAUTHORIZED ACCESS FlexLogic operand is asserted. The operand can be programmed to raise an alarm via contact outputs or communications. This feature can be used to protect against both unauthorized and accidental access attempts.

The UNAUTHORIZED ACCESS operand is reset with the **COMMANDS** ⇒ **CLEAR RECORDS** ⇒ **RESET UNAUTHORIZED ALARMS** command. Therefore, to apply this feature with security, the command level should be password-protected. The operand does not generate events or targets.

If events or targets are required, the UNAUTHORIZED ACCESS operand can be assigned to a digital element programmed with event logs or targets enabled.

The access level timeout settings are shown below.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ ACCESS SUPERVISION ⇒ ACCESS LEVEL TIMEOUTS

These settings allow the user to specify the length of inactivity required before returning to the restricted access level. Note that the access level will set as restricted if control power is cycled.

- **COMMAND LEVEL ACCESS TIMEOUT:** This setting specifies the length of inactivity (no local or remote access) required to return to restricted access from the command password level.
- **SETTING LEVEL ACCESS TIMEOUT:** This setting specifies the length of inactivity (no local or remote access) required to return to restricted access from the command password level.

DUAL PERMISSION SECURITY ACCESS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ DUAL PERMISSION SECURITY ACCESS

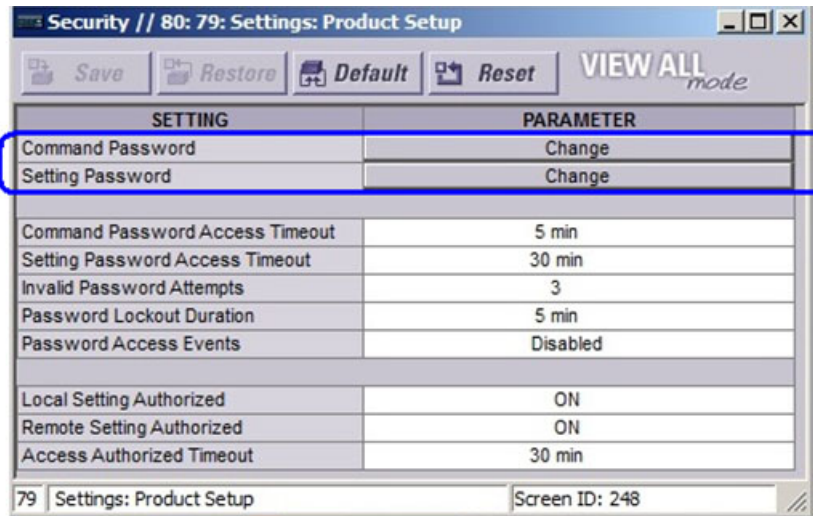

The dual permission security access feature provides a mechanism for customers to prevent unauthorized or unintended upload of settings to a relay through the local or remote interfaces interface.

The following settings are available through the local (front panel) interface only.

- **LOCAL SETTING AUTH:** This setting is used for local (front panel or RS232 interface) setting access supervision. Valid values for the FlexLogic operands are either “On” (default) or any physical “Contact Input ~~ On” value.
If this setting is “On”, then local setting access functions as normal; that is, a local setting password is required. If this setting is any contact input on FlexLogic operand, then the operand must be asserted (set as on) prior to providing the local setting password to gain setting access.
If setting access is *not* authorized for local operation (front panel or RS232 interface) and the user attempts to obtain setting access, then the **UNAUTHORIZED ACCESS** message is displayed on the front panel.
- **REMOTE SETTING AUTH:** This setting is used for remote (Ethernet or RS485 interfaces) setting access supervision.
If this setting is “On” (the default setting), then remote setting access functions as normal; that is, a remote password is required. If this setting is “Off”, then remote setting access is blocked even if the correct remote setting password is provided. If this setting is any other FlexLogic operand, then the operand must be asserted (set as on) prior to providing the remote setting password to gain setting access.
- **ACCESS AUTH TIMEOUT:** This setting represents the timeout delay for local setting access. This setting is applicable when the **LOCAL SETTING AUTH** setting is programmed to any operand except “On”. The state of the FlexLogic operand is continuously monitored for an off-to-on transition. When this occurs, local access is permitted and the timer programmed with the **ACCESS AUTH TIMEOUT** setting value is started. When this timer expires, local setting access is immediately denied. If access is permitted and an off-to-on transition of the FlexLogic operand is detected, the timeout is restarted. The status of this timer is updated every 5 seconds.

The following settings are available through the remote (EnerVista UR Setup) interface only. Select the **Settings > Product Setup** menu item to display the security settings window.

The **Remote Settings Authorized** setting is used for remote (Ethernet or RS485 interfaces) setting access supervision. If this setting is “On” (the default setting), then remote setting access functions as normal; that is, a remote password is required). If this setting is “Off”, then remote setting access is blocked even if the correct remote setting password is provided. If this setting is any other FlexLogic operand, then the operand must be asserted (set as on) prior to providing the remote setting password to gain setting access.

The **Access Authorized Timeout** setting represents the timeout delay remote setting access. This setting is applicable when the **Remote Settings Authorized** setting is programmed to any operand except “On” or “Off”. The state of the FlexLogic operand is continuously monitored for an off-to-on transition. When this occurs, remote setting access is permitted and the timer programmed with the **Access Authorized Timeout** setting value is started. When this timer expires, remote setting access is immediately denied. If access is permitted and an off-to-on transition of the FlexLogic operand is detected, the timeout is restarted. The status of this timer is updated every 5 seconds.

e) ENERVISTA SECURITY

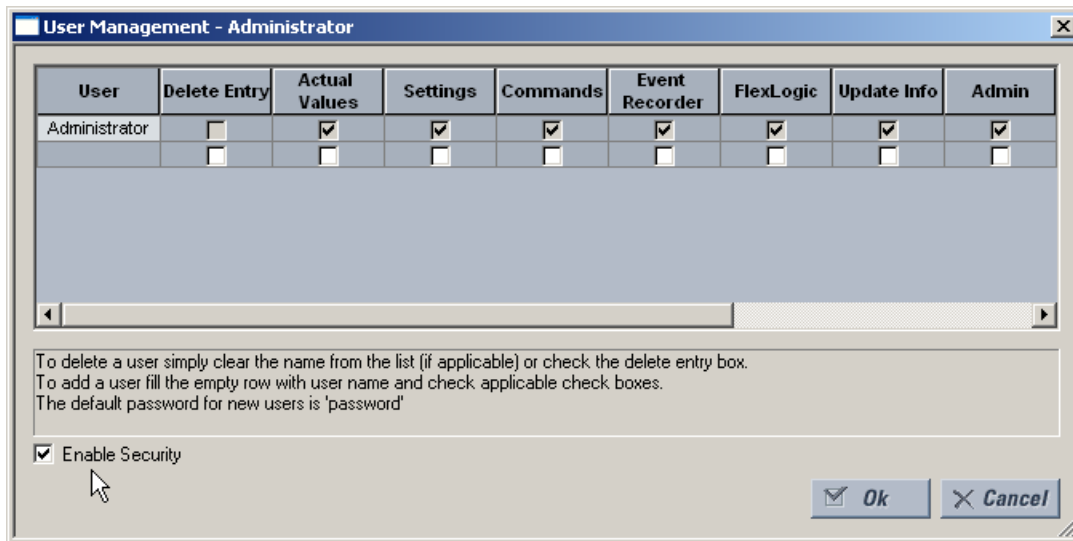

ENABLING THE SECURITY MANAGEMENT SYSTEM

The EnerVista security system allows an administrator to manage access privileges of multiple users to the EnerVista application.

It is disabled by default to allow the administrator direct access to the EnerVista software immediately after installation. When security is disabled, all users have administrator access. GE recommends enabling the EnerVista security before placing the device in service.

To enable the security system and require password use:

1. Select the **Security > User Management** menu item to open the user management window.

2. Check the **Enable Security** box in the lower-left corner to enable the security management system.

Security is now enabled for the EnerVista UR Setup software. Upon starting the software, users are now required to enter a username and password.

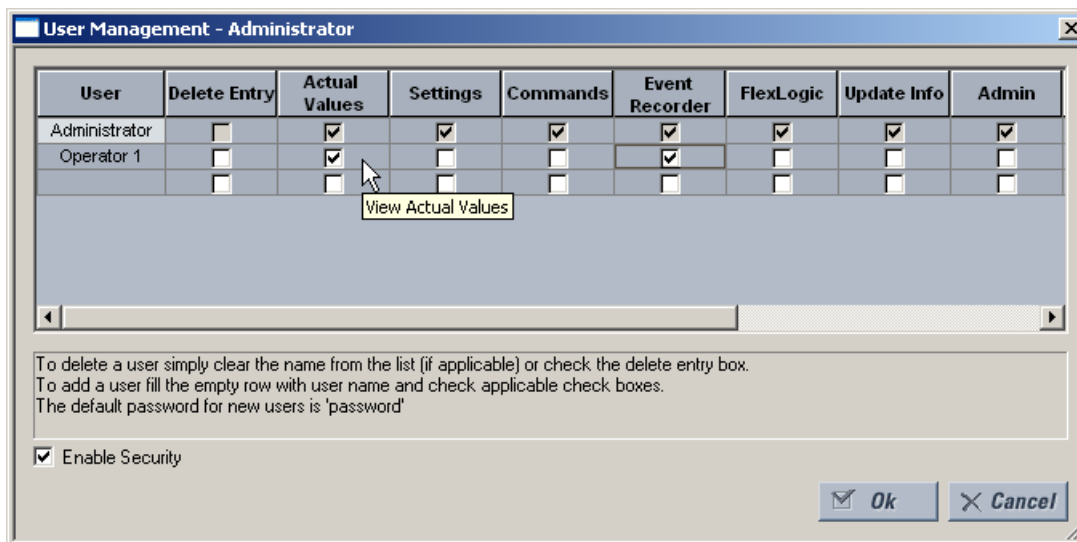

ADDING A NEW USER

The following pre-requisites are required to add user accounts to the EnerVista security management system:

- The user adding the account must have administrator rights
- The EnerVista security management system must be enabled (previous section)

To add user accounts:

1. Select the **Security > User Management** menu item to open the user management window.
2. Enter a username in the **User** field. The username must be 4 to 20 characters in length.
3. Select the user access rights by enabling the check box of one or more of the fields.

The table outlines access rights.

Table 5–1: ACCESS RIGHTS SUMMARY

FIELD	DESCRIPTION
Delete Entry	Deletes the user account when exiting the user management window
Actual Values	Allows the user to read actual values
Settings	Allows the user to read setting values
Commands	Allows the user to execute commands
Event Recorder	Allows the user to use the digital fault recorder
FlexLogic	Allows the user to read FlexLogic values
Update Info	Allows the user to write to any function to which they have read privileges. When any of the Settings, Event Recorder, and FlexLogic check boxes are enabled by themselves, the user is granted read access. When any of them are enabled in conjunction with the Update Info box, they are granted read and write access. The user is not granted write access to functions that are not checked, even if the Update Info field is checked.
Admin	The user is an EnerVista UR Setup administrator, therefore receiving all of the administrative rights. Exercise caution when granting administrator rights.

- Click **OK** to add the user account to the security management system.

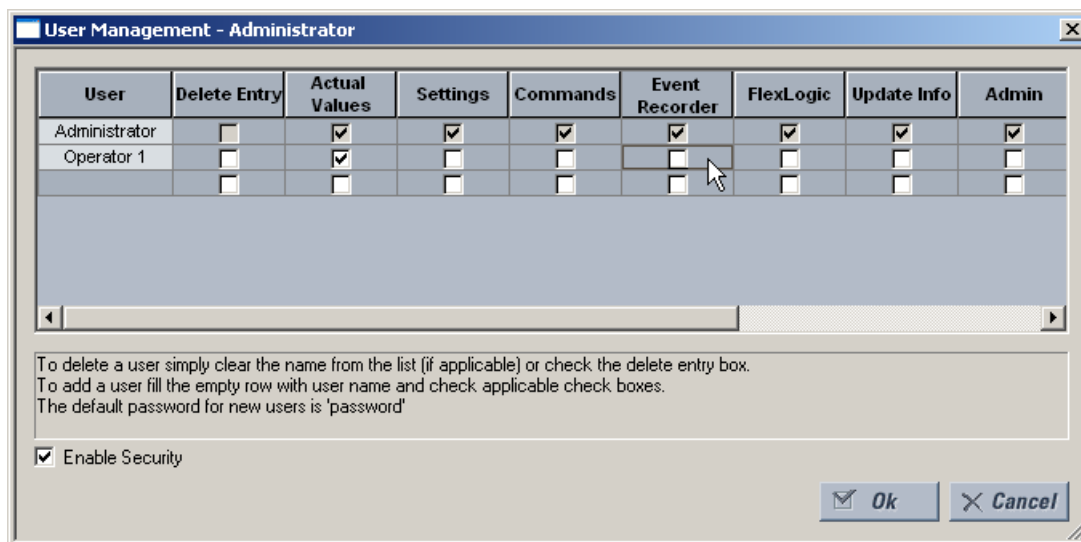

MODIFYING USER PRIVILEGES

The following pre-requisites are required to modify user privileges in the EnerVista security management system:

- The user modifying the privileges must have administrator rights
- The EnerVista security management system must be enabled

To modify user privileges:

- Select the **Security > User Management** menu item to open the user management window.
- Locate the username in the **User** field.
- Modify the user access rights by enabling or disabling one or more of the check boxes.

The table outlines access rights.

Table 5–2: ACCESS RIGHTS SUMMARY

FIELD	DESCRIPTION
Delete Entry	Deletes the user account when exiting the user management window
Actual Values	Allows the user to read actual values
Settings	Allows the user to read setting values
Commands	Allows the user to execute commands

Table 5–2: ACCESS RIGHTS SUMMARY

FIELD	DESCRIPTION
Event Recorder	Allows the user to use the digital fault recorder
FlexLogic	Allows the user to read FlexLogic values
Update Info	Allows the user to write to any function to which they have read privileges. When any of the Settings, Event Recorder, and FlexLogic check boxes are enabled by themselves, the user is granted read access. When any of them are enabled in conjunction with the Update Info box, they are granted read and write access. The user is not granted write access to functions that are not checked, even if the Update Info field is checked.
Admin	The user is an EnerVista UR Setup administrator, therefore receiving all of the administrative rights. Exercise caution when granting administrator rights.

4. Click **OK** to save the changes.

f) CYBERSENTRY SECURITY

The EnerVista software provides the means to configure and authenticate UR using either device or server authentication. The access to various pieces of functionality depends on user role.

The login screen of EnerVista has two options for access to the UR, server and device authentication.

When the "Device" button is selected, the UR uses its local authentication database and not the RADIUS server to authenticate the user. In this case, it uses built-in roles (Administrator, Engineer, Supervisor, Observer, Operator) as login accounts and the associated passwords are stored on the UR device. In this case, access is not user-attributable. In cases where user-attributable access is required, especially for auditable processes for compliance reasons, use server authentication (RADIUS) only.

When the "Server" Authentication Type option is selected, the UR uses the RADIUS server and not its local authentication database to authenticate the user.

No password or security information is displayed in plain text by the EnerVista software or UR device, nor are they ever transmitted without cryptographic protection.

CYBERSENTRY SETTINGS THROUGH ENERVISTA

CyberSentry security settings are configured under **Device > Settings > Product Setup > Security**.

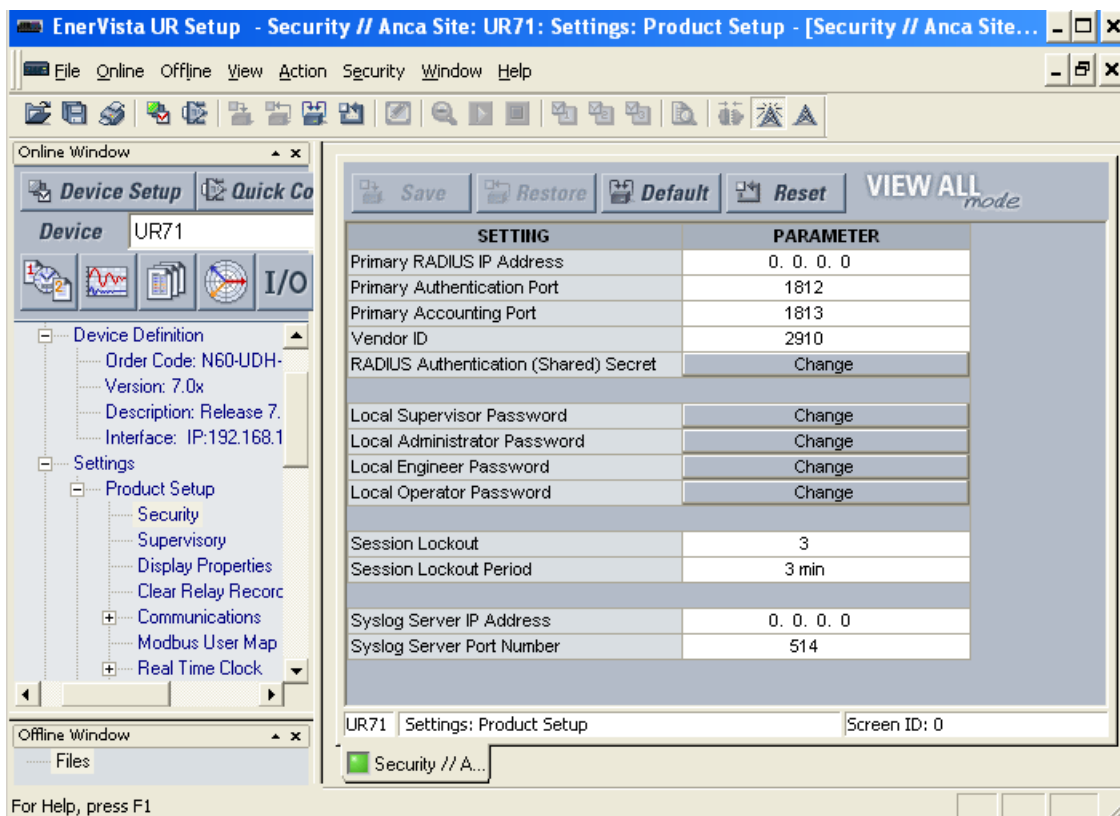

Figure 5-2: CYBERSENTRY SECURITY PANEL

For the **Device > Settings > Product Setup > Supervisory** option, the panel looks like the following.

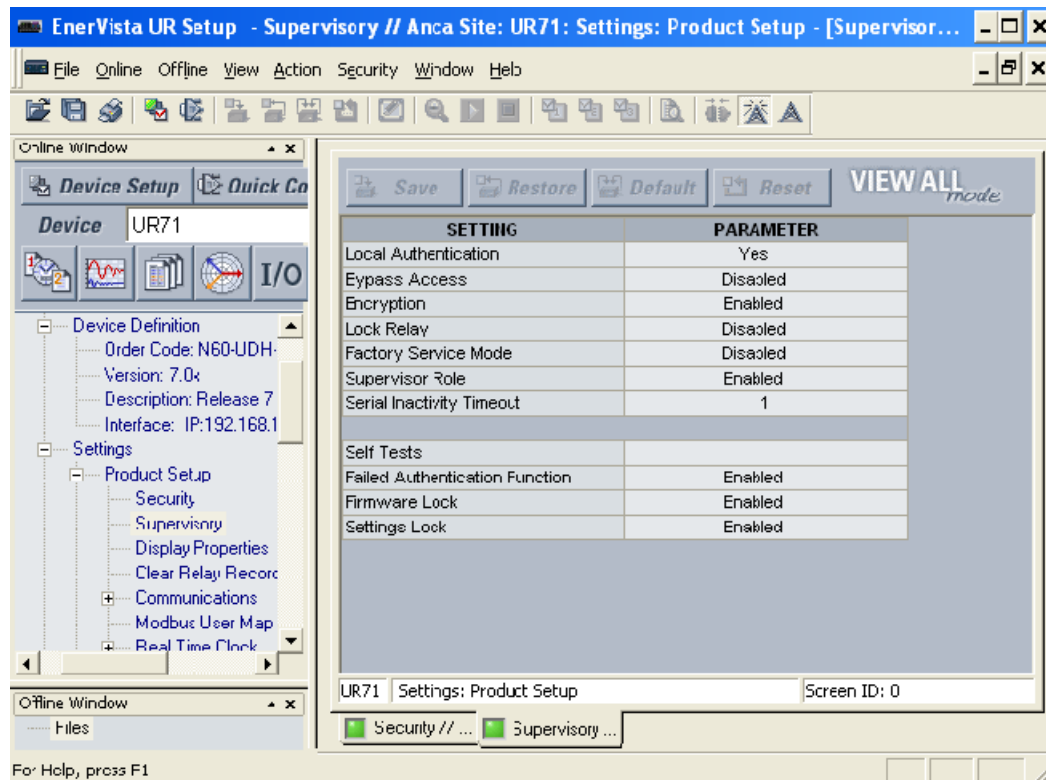

Figure 5–3: SUPERVISORY PANEL

For the Security panel, the following settings are available.

RADIUS Server Settings

SETTING NAME	DESCRIPTION	MIN	MAX	DEFAULT	UNITS	MINIMUM PERMISSION
Primary RADIUS IP Address	IP address of the main RADIUS server. Default value indicates no Primary RADIUS server is configured, and hence RADIUS is disabled.	0.0.0.0	223.255.255.254	0.0.0.0	-	Administrator
Primary Authentication Port	RADIUS authentication port	1	65535	1812	-	Administrator
Primary Accounting Port	RADIUS accounting port	1	65535	1813	-	Administrator
Vendor ID	An identifier that specifies RADIUS vendor-specific attributes used with the protocol			Value that represents General Electric		Administrator
RADIUS Authentication (Shared) Secret	Shared secret used in authentication. It displays as asterisks. This setting must meet the CyberSentry password requirements.	See the following password section for requirements	See the following password section for requirements	N/A	-	Administrator
RADIUS Authentication Method	Authentication method used by RADIUS server. Currently fixed to EAP-TTLS.	EAP-TTLS	EAP-TTLS	EAP-TTLS	-	Administrator
Timeout	Timeout in seconds between re-transmission requests	0	9999	10	sec	Administrator
Retries	Number of retries before giving up	0	9999	3	-	Administrator

Confirm RADIUS Authentication (Shared) Secret	Confirmation of the shared secret. The entry displays as asterisks.	See the following password section for requirements	245 characters	N/A	-	Administrator
---	---	---	----------------	-----	---	---------------

General Security Settings

SETTING NAME	DESCRIPTION	MIN	MAX	DEFAULT	UNITS	MINIMUM PERMISSION
Session Lockout	Number of failed authentications before the device blocks subsequent authentication attempts for the lockout period	0 (lockout disabled)	99	3	-	Administrator
Session Lockout Period	The period in minutes that a user is prevented from logging in after being locked out	0 (no period)	9999	3	min	Administrator
Syslog Server IP Address	The IP address of the target Syslog server to which all security events are transmitted	0.0.0.0	223.255.255.254	0.0.0.0	-	Administrator
Syslog Server Port Number	The UDP port number of the target syslog server to which all security events are transmitted	1	65535	514	-	Administrator
Device Authentication	When enabled, local device authentication with roles is allowed. When disabled, the UR only authenticates to the AAA server (RADIUS). NOTE: Administrator and Supervisor (if still enabled) remain active even after device authentication is disabled. The only permission for local Administrator is to re-enable device authentication when device authentication is disabled. To re-enable device authentication, the Supervisor unlocks the device for setting changes, and then the Administrator can re-enable device authentication.	Disabled	Enabled	Enabled	-	Administrator
Firmware Locked	Indicates if the device receives firmware upgrades. If Yes and the firmware upgrade attempt is made, the device denies the upgrade and displays an error message that the lock is set. On each firmware upgrade, this setting goes back to the default.	No	Yes	Yes	-	Administrator
Factory Service Mode	When enabled (checkbox selected), the device can go into factory service mode. To enable, Supervisor authentication is necessary.	Disabled	Enabled	Disabled	-	Supervisor (Administrator when Supervisor is disabled)
Restore to Defaults	Sets the device to factory defaults	No	Yes	No	-	Administrator
Supervisor role	When enabled (checkbox selected), the Supervisor role is active. To enable, Administrator authentication is necessary. When disabled, the Supervisor role is inactive. To disable, Supervisor authentication is necessary.	Disabled	Enabled	Enabled	-	Administrator to enable and Supervisor to disable
RADIUS user names	Ensure that RADIUS user names are not the same as local/device role names	See RADIUS server documents	See RADIUS server documents		-	Administrator
Password	Local/device roles except for Observer are password-protected. All RADIUS users are password-protected.	See the following password section for requirements	See the following password section for requirements	Change Me1#	Text	The specified role and Administrator, except for Supervisor, where it is only itself

Security Alarm Settings

SETTING NAME	DESCRIPTION / DETAILS	MIN	MAX	DEFAULT	UNITS	MINIMUM PERMISSIONS
Failed Authentications	A threshold number indicating when an alarm is set off to indicate too many failed authentication attempts	0 (disabled)	99	3	-	Administrator
Firmware lock	A Boolean value indicating if the device can receive a firmware upgrade. If Yes and a firmware upgrade attempt is made, the device alarm activates. If No the device alarm does not activate. On each firmware upgrade this setting goes back to the default.	No	Yes	Yes	-	Administrator
Settings lock	A Boolean value indicating if the device can accept any settings changes. If Yes and a settings change attempt is made, the device alarm activates. If No, the device alarm does not activate.	No	Yes	Yes	-	Supervisor (Administrator if Supervisor has been disabled)

CYBERSENTRY SETTINGS THROUGH THE FRONT PANEL

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY

<div style="border: 1px solid black; padding: 2px; margin-bottom: 10px;"> SECURITY </div>	<div style="border: 1px solid black; padding: 2px; margin-bottom: 10px;"> LOGIN: None </div> <div style="border: 1px solid black; padding: 2px; margin-bottom: 10px;"> CHANGE LOCAL PASSWORDS </div> <div style="border: 1px solid black; padding: 2px; margin-bottom: 10px;"> SESSION SETTINGS </div> <div style="border: 1px solid black; padding: 2px; margin-bottom: 10px;"> RESTORE DEFAULTS </div> <div style="border: 1px solid black; padding: 2px; margin-bottom: 10px;"> SUPERVISORY </div> <div style="border: 1px solid black; padding: 2px; margin-bottom: 10px;"> SYSLOG IP ADDRESS: 0.0.0.0 </div> <div style="border: 1px solid black; padding: 2px;"> SYSLOG PORT NUMBER: 514 </div>	<p>Range: Administrator, Engineer, Supervisor, Operator, Factory (for factory use only), None</p> <p>See page 5-20.</p> <p>See page 5-20.</p> <p>See page 5-20.</p> <p>See page 5-21.</p> <p>Range: 0.0.0.0, 255.255.255.255</p> <p>Range: 1 to 65535</p>
--	--	---

Login: This setting is applicable for *Device Authentication* only. This setting allows a user to login with a specific role, see descriptions below. For the Supervisor role, the “Supervisor Role” setting should be enabled.

Whenever a new role is logged in, the user is prompted with a display to enter a password. Passwords must obey the requirements specified the Password Requirements section in chapter 8. The UR device supports five roles. All roles have their corresponding passwords. The Observer role is the only role that does not require a password.

The roles are defined as follows:

- Administrator: Complete read and write access to all settings and commands. This role does not allow concurrent access. This role has an operand to indicate when it is logged on.
- Engineer: Complete read and write access to all settings and commands with the exception of configuring Security settings and Firmware upgrades. This role does not allow concurrent access.
- Operator: The Operator has read/write access to all settings under the command menu/section. This role does not exist offline.
- Supervisor: This is only an approving role. This role’s authentication commits setting changes submitted by Administrator or Engineer. The Supervisor role authenticates to unlock the UR relay for setting changes and not approve changes after the fact. Only Supervisor can set the Settings and Firmware Lock in the Security Settings. This role also has the ability to forcefully logoff any other role and clear the security event log. This role can also be disabled, but only through a Supervisor authentication. When this role is disabled its permissions are assigned to the Administrator role.

- **Observer:** This role has read only access to all UR settings. This role allows unlimited concurrent access but it has no download access to any files on the device. Observer is the default role if no authentication has been done to the device. This role displays as "None" on the front panel.

The Factory service role is not available and is intended for factory use only.

Local Passwords

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ CHANGE LOCAL PASSWORDS

<input type="checkbox"/> CHANGE LOCAL <input type="checkbox"/> PASSWORDS	MESSAGE	LOGIN:	None	Range: 20 Alphanumeric Characters
		NEW PASSWORD:		Range: 20 Alphanumeric Characters
		CONFIRM PASSWORD:		Range: 20 Alphanumeric Characters

The Change Local Passwords menu is shown on the front panel and Enervista on a successful login of Administrator role.

The "login setting" in this menu is similar to the login setting described in **PATH: SETTINGS > PRODUCT SETUP > SECURITY** except for the factory role.

Passwords are stored in text format. No encryption is applied.

Notes:

- In Device Authentication mode, the Observer role does not have a password associated with it. In Server Authentication mode the Observer role requires a password.
- The default password is "ChangeMe1#".
- Once the passwords are set, the Administrator with Supervisor approval can change the role associated password.
- In CyberSentry, password encryption is not supported.

Session Settings

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ SESSION SETTINGS

<input type="checkbox"/> SESSION <input type="checkbox"/> SETTINGS	MESSAGE	SESSION LOCKOUT:	3	Range: 0 to 99
		SESSION LOCKOUT PERIOD:	3 min	Range: 0 to 9999 minutes

The following session settings are available.

- **SESSION LOCKOUT:** This setting specifies the number of failed authentications (the default is three and the maximum is 99) before the device blocks subsequent authentication attempts for the lockout period. A value of zero means lockout is disabled.
- **SESSION LOCKOUT PERIOD:** This setting specifies the period of time in minutes of a lockout period (the default is three and the maximum is 9999). A value of 0 means that there is no lockout period.

Restore Defaults

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ RESTORE DEFAULTS

<input type="checkbox"/> RESTORE DEFAULTS		LOAD FACTORY DEFAULTS:	No	Range: Yes, No
---	--	------------------------	----	----------------

- **LOAD FACTORY DEFAULTS:** This setting is used to reset all the settings, communication and security passwords. An Administrator role is used to change this setting and a Supervisor role (if not disabled) approves it.

Supervisory

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ SUPERVISORY

<input checked="" type="checkbox"/> SUPERVISORY		DEVICE AUTHENTICATION: Yes	Range: Yes, No
MESSAGE		BYPASS ACCESS: Disabled	Range: Local, Remote, Local and Remote, Disabled
MESSAGE		LOCK RELAY: Disabled	Range: Enabled, Disabled
MESSAGE		FACTORY SERVICE: MODE: Disabled	Range: Enabled, Disabled
MESSAGE		<input checked="" type="checkbox"/> SELF TESTS	See below
MESSAGE		SUPERVISOR ROLE: Disabled	Range: Enabled, Disabled
MESSAGE		SERIAL INACTIVITY TIMEOUT: 1 min	Range: 1 to 9999 minutes

The Supervisory menu settings are available for Supervisor role only or if the Supervisor role is disabled then for the Administrator role only.

Device Authentication: This setting is enabled by default, meaning "Yes" is selected. When enabled, Device Authentication with roles is enabled. When this setting is disabled, the UR only authenticates to the AAA server (Radius). However, the Administrator and Supervisor (when enabled) remain active even after device authentication is disabled and their only permission is to re-enable device authentication. To re-enable device authentication, the Supervisor unlocks the device for setting changes, then the Administrator re-enables device authentication.

Bypass Access: The bypass security feature provides an easier access, with no authentication and encryption for those special situations when this is considered safe. Only the Supervisor, or the Administrator when the Supervisor role is disabled, can enable this feature.

MODE	FRONT PANEL OR SERIAL (RS232, RS485)	ETHERNET
Normal mode	Authentication — Role Based Access Control (RBAC) and passwords in clear	Authentication — RBAC and passwords encrypted SSH tunneling
Bypass access mode	No passwords for allowed RBAC levels	No passwords for allowed RBAC levels No SSH tunneling

The bypass options are as follows:

- Local — Bypasses authentication for push buttons, keypad, RS232, and RS485
- Remote — Bypasses authentication for Ethernet
- Local and Remote — Bypasses authentication for push buttons, keypad, RS232, RS485, and Ethernet

Lock Relay: This setting uses a Boolean value (Enable/Disable) to indicate if the device accepts setting changes and whether the device can receive a firmware upgrade. This setting can be changed only by the Supervisor role, if it is enabled or by the Administrator if the Supervisor role is disabled. The Supervisor role enables this setting for the relay to start accepting setting changes or command changes or firmware upgrade. After all the setting changes are applied or commands executed, the Supervisor disables to lock setting changes.

Example: If this setting is "Yes" and an attempt is made to change settings or upgrade the firmware, the UR device denies the setting changes and denies upgrading the firmware. If this setting is "No", the UR device accepts setting changes and firmware upgrade.

This role is disabled by default.

Factory Service Mode: When enabled (i.e., "Yes" is selected) the device can go into factory service mode. For this setting to become enabled a Supervisor authentication is necessary. The default value is Disabled.

Supervisor Role: When enabled (i.e., "Yes" is selected) the Supervisor role is active. When "No" is selected this role is disabled. To disabled this setting a Supervisor authentication is necessary. If disabled, the Supervisor role is not allowed to log on. In this case the Administrator can change the settings under the Supervisory menu.

If enabled, Supervisor authentication is required to change the settings in the Supervisory menu. If the Supervisor disables his role after authentication, the Supervisor session remains valid until he switches to another role using MMI or until he ends the current Supervisor session if using communications.

This role is disabled by default.

Serial Inactivity Timeout: The role logged via a serial port is auto logged off after the Serial Inactivity timer times out. A separate timer is maintained for RS232 and RS485 connections. The default value is 1 minute.

a) SELF TESTS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ ↓SUPERVISORY ⇒ SELF TESTS

<input type="checkbox"/> SELF TESTS <input type="checkbox"/>	◀▶	<input type="checkbox"/> FAILED <input type="checkbox"/> AUTHENTICATE	See below
MESSAGE	▲▼	FIRMWARE LOCK: Enabled	Range: Enabled, Disabled
MESSAGE	▲▼	SETTINGS LOCK: Enabled	Range: Enabled, Disabled

Failed Authentications: If this setting is Enabled then the number of failed authentications is compared with the Session lockout threshold. When the Session lockout threshold is exceeded, this minor alarm indication comes up.

Firmware Lock: If this setting is Enabled then any firmware upgrade operation attempt when the "LOCK FIRMWARE UPGRADE" setting is set to "Yes" brings up this self test alarm.

Settings Lock: If this setting is Enabled then an unauthorized write attempt to a setting for a given role activates this self test.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ SECURITY ⇒ ↓SUPERVISORY ⇒ SELF TESTS ⇒ FAILED AUTHENTICATE

<input type="checkbox"/> FAILED <input type="checkbox"/> AUTHENTICATE	◀▶	FAILED AUTHENTICATE: Enabled	Range: Enabled, Disabled
--	----	---------------------------------	--------------------------

CYBERSENTRY SETUP

When first using CyberSentry security, use the following procedure for set up.

1. Log in to the relay as Administrator by using the Value keys on the front panel to enter the default password "ChangeMe1#". Note that the "Lock relay" setting needs to be disabled in the **Security > Supervisory** menu. When this setting is disabled, configuration and firmware upgrade are possible. By default, this setting is disabled.
2. Enable the Supervisor role if you have a need for it.
3. Make any required changes in configuration, such as setting a valid IP address for communication over Ethernet.
4. Log out of the Administrator account by choosing None.

Next, device or server authentication can be chosen on the login screen, but the choice is available only in EnerVista. Use device authentication to log in using the five pre-configured roles (Administrator, Supervisor, Engineer, Operator, Observer). When using a serial connection, only device authentication is supported. When server authentication is required, characteristics for communication with a RADIUS server must be configured. This is possible only in the EnerVista software. The RADIUS server itself also must be configured. The appendix called RADIUS Server gives an example of how to setup a simple RADIUS server. Once both the RADIUS server and the parameters for connecting UR to the server have been configured, you can choose server authentication on the login screen of EnerVista.

NOTICE

The use of CyberSentry for devices communicating through an Ethernet-to-RS485 gateway is not supported. Because these gateways do not support the secure protocols necessary to communicate with such devices, the connection cannot be established. Use the device as a non-CyberSentry device.

NOTICE

Users logged in through the front panel are not timed out and cannot be forcefully logged out by a supervisor. Roles logged in through the front panel that do not allow multiple instances (Administrator, Supervisor, Engineer, Operator) must switch to None (equivalent to a logout) when they are done in order to log out.

NOTICE

For all user roles except Observer, only one instance can be logged in at one time, for both login by front panel and software.

To configure server authentication:

1. In the EnerVista software, choose device authentication and log in as Administrator.
2. Configure the following RADIUS server parameters: IP address, authentication port, shared secret, and vendor ID.
3. On the RADIUS server, configure the user accounts. Do not use the five pre-defined roles as user names (Administrator, Supervisor, Engineer, Operator, Observer) in the RADIUS server. If you do, the UR relay automatically provides the authentication from the device.
4. In the EnerVista software, choose server authentication and log in using the user name and password configured on the RADIUS server for server authentication login.
5. After making any required changes, log out.

NOTICE

When changing settings offline, ensure that only settings permitted by the role that performs the settings download are changed because only those changes are applied.

Pushbuttons (both user-control buttons and user-programmable buttons) located on the front panel can be pressed by an Administrator or Engineer role. This also applies to the reset button, which resets targets, where targets are errors displayed on the front panel or the Targets panel of the EnerVista software. The reset button has special behavior in that it allows these two roles to press it even when they are logged in through the RS232 port and not through the front panel.

To reset the security event log and self-test operands:

1. Log in as Supervisor (if the role is enabled) or Administrator (if the Supervisor role is disabled) and execute a clear security command under **Commands > Security > Clear Security**.

5.2.2 DISPLAY PROPERTIES

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ DISPLAY PROPERTIES

<div> <div>■ DISPLAY</div> <div>■ PROPERTIES</div> </div>		<div> <div>◀▶</div> <div>LANGUAGE:</div> <div>English</div> </div>	Range: English; English, French; English, Russian; English, Chinese (range dependent on order code)
	MESSAGE	<div> <div>▲▼</div> <div>FLASH MESSAGE</div> <div>TIME: 1.0 s</div> </div>	Range: 0.5 to 10.0 s in steps of 0.1
	MESSAGE	<div> <div>▲▼</div> <div>DEFAULT MESSAGE</div> <div>TIMEOUT: 300 s</div> </div>	Range: 10 to 900 s in steps of 1
	MESSAGE	<div> <div>▲▼</div> <div>DEFAULT MESSAGE</div> <div>INTENSITY: 25 %</div> </div>	Range: 25%, 50%, 75%, 100% Visible only if a VFD is installed
	MESSAGE	<div> <div>▲▼</div> <div>SCREEN SAVER</div> <div>FEATURE: Disabled</div> </div>	Range: Disabled, Enabled Visible only if an LCD is installed
	MESSAGE	<div> <div>▲▼</div> <div>SCREEN SAVER WAIT</div> <div>TIME: 30 min</div> </div>	Range: 1 to 65535 min. in steps of 1 Visible only if an LCD is installed
	MESSAGE	<div> <div>▲▼</div> <div>CURRENT CUT-OFF</div> <div>LEVEL: 0.020 pu</div> </div>	Range: 0.002 to 0.020 pu in steps of 0.001
	MESSAGE	<div> <div>▲</div> <div>VOLTAGE CUT-OFF</div> <div>LEVEL: 1.0 V</div> </div>	Range: 0.1 to 1.0 V secondary in steps of 0.1

Some relay messaging characteristics can be modified to suit different situations using the display properties settings.

- **LANGUAGE:** This setting selects the language used to display settings, actual values, and targets. The range is dependent on the order code of the relay.
- **FLASH MESSAGE TIME:** Flash messages are status, warning, error, or information messages displayed for several seconds in response to certain key presses during setting programming. These messages override any normal messages. The duration of a flash message on the display can be changed to accommodate different reading rates.
- **DEFAULT MESSAGE TIMEOUT:** If the keypad is inactive for a period of time, the relay automatically reverts to a default message. The inactivity time is modified via this setting to ensure messages remain on the screen long enough during programming or reading of actual values.
- **DEFAULT MESSAGE INTENSITY:** To extend phosphor life in the vacuum fluorescent display, the brightness can be attenuated during default message display. During keypad interrogation, the display always operates at full brightness.
- **SCREEN SAVER FEATURE and SCREEN SAVER WAIT TIME:** These settings are only visible if the L90 has a liquid crystal display (LCD) and control its backlighting. When the **SCREEN SAVER FEATURE** is "Enabled", the LCD backlighting is turned off after the **DEFAULT MESSAGE TIMEOUT** followed by the **SCREEN SAVER WAIT TIME**, providing that no keys have been pressed and no target messages are active. When a keypress occurs or a target becomes active, the LCD backlighting is turned on.
- **CURRENT CUT-OFF LEVEL:** This setting modifies the current cut-off threshold. Very low currents (1 to 2% of the rated value) are very susceptible to noise. Some customers prefer very low currents to display as zero, while others prefer the current be displayed even when the value reflects noise rather than the actual signal. The L90 applies a cut-off value to the magnitudes and angles of the measured currents. If the magnitude is below the cut-off level, it is substituted with zero. This applies to phase and ground current phasors as well as true RMS values and symmetrical components. The cut-off operation applies to quantities used for metering, protection, and control, as well as those used by communications protocols. Note that the cut-off level for the sensitive ground input is 10 times lower than the **CURRENT CUT-OFF LEVEL** setting value. Raw current samples available via oscillography are not subject to cut-off.

This setting does not affect the 87L metering cutoff, which is constantly at 0.02 pu.

- **VOLTAGE CUT-OFF LEVEL:** This setting modifies the voltage cut-off threshold. Very low secondary voltage measurements (at the fractional volt level) can be affected by noise. Some customers prefer these low voltages to be displayed as zero, while others prefer the voltage to be displayed even when the value reflects noise rather than the actual signal. The L90 applies a cut-off value to the magnitudes and angles of the measured voltages. If the magnitude is below the cut-off level, it is substituted with zero. This operation applies to phase and auxiliary voltages, and symmetrical components. The cut-off operation applies to quantities used for metering, protection, and control, as well as those used by communications protocols. Raw samples of the voltages available via oscillography are not subject cut-off.

The **CURRENT CUT-OFF LEVEL** and the **VOLTAGE CUT-OFF LEVEL** are used to determine the metered power cut-off levels. The power cut-off level is calculated as shown below. For Delta connections:

$$\text{3-phase power cut-off} = \frac{\sqrt{3} \times \text{CURRENT CUT-OFF LEVEL} \times \text{VOLTAGE CUT-OFF LEVEL} \times \text{VT primary} \times \text{CT primary}}{\text{VT secondary}} \quad (\text{EQ 5.3})$$

For Wye connections:

$$\text{3-phase power cut-off} = \frac{3 \times \text{CURRENT CUT-OFF LEVEL} \times \text{VOLTAGE CUT-OFF LEVEL} \times \text{VT primary} \times \text{CT primary}}{\text{VT secondary}} \quad (\text{EQ 5.4})$$

$$\text{per-phase power cut-off} = \frac{\text{CURRENT CUT-OFF LEVEL} \times \text{VOLTAGE CUT-OFF LEVEL} \times \text{VT primary} \times \text{CT primary}}{\text{VT secondary}} \quad (\text{EQ 5.5})$$

where VT primary = VT secondary × VT ratio and CT primary = CT secondary × CT ratio.

For example, given the following settings:

CURRENT CUT-OFF LEVEL: "0.02 pu"

VOLTAGE CUT-OFF LEVEL: "1.0 V"

PHASE CT PRIMARY: "100 A"

PHASE VT SECONDARY: "66.4 V"

PHASE VT RATIO: "208.00 : 1"

PHASE VT CONNECTION: "Delta".

We have:

CT primary = “100 A”, and

VT primary = **PHASE VT SECONDARY** × **PHASE VT RATIO** = 66.4 V × 208 = 13811.2 V

The power cut-off is therefore:

$$\begin{aligned} \text{power cut-off} &= (\text{CURRENT CUT-OFF LEVEL} \times \text{VOLTAGE CUT-OFF LEVEL} \times \text{CT primary} \times \text{VT primary}) / \text{VT secondary} \\ &= (\sqrt{3} \times 0.02 \text{ pu} \times 1.0 \text{ V} \times 100 \text{ A} \times 13811.2 \text{ V}) / 66.4 \text{ V} \\ &= 720.5 \text{ watts} \end{aligned}$$

Any calculated power value below this cut-off will not be displayed. As well, the three-phase energy data will not accumulate if the total power from all three phases does not exceed the power cut-off.

Lower the VOLTAGE CUT-OFF LEVEL and CURRENT CUT-OFF LEVEL with care as the relay accepts lower signals as valid measurements. Unless dictated otherwise by a specific application, the default settings of “0.02 pu” for CURRENT CUT-OFF LEVEL and “1.0 V” for VOLTAGE CUT-OFF LEVEL are recommended.

5.2.3 CLEAR RELAY RECORDS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ CLEAR RELAY RECORDS

<div> <div>■ CLEAR RELAY RECORDS</div> <div>◀▶</div> </div>		CLEAR FAULT REPORTS: Off	Range: FlexLogic operand
MESSAGE	▲▼	CLEAR EVENT RECORDS: Off	Range: FlexLogic operand
MESSAGE	▲▼	CLEAR OSCILLOGRAPHY? No	Range: FlexLogic operand
MESSAGE	▲▼	CLEAR DATA LOGGER: Off	Range: FlexLogic operand
MESSAGE	▲▼	CLEAR ARC AMPS 1: Off	Range: FlexLogic operand
MESSAGE	▲▼	CLEAR ARC AMPS 2: Off	Range: FlexLogic operand
MESSAGE	▲▼	CLEAR DEMAND: Off	Range: FlexLogic operand
MESSAGE	▲▼	CLEAR CHNL STATUS: Off	Range: FlexLogic operand
MESSAGE	▲▼	CLEAR ENERGY: Off	Range: FlexLogic operand
MESSAGE	▲	RESET UNAUTH ACCESS: Off	Range: FlexLogic operand

Selected records can be cleared from user-programmable conditions with FlexLogic operands. Assigning user-programmable pushbuttons to clear specific records are typical applications for these commands. Since the L90 responds to rising edges of the configured FlexLogic operands, they must be asserted for at least 50 ms to take effect.

Clearing records with user-programmable operands is not protected by the command password. However, user-programmable pushbuttons are protected by the command password. Thus, if they are used to clear records, the user-programmable pushbuttons can provide extra security if required.

For example, to assign user-programmable pushbutton 1 to clear demand records, the following settings should be applied.

1. Assign the clear demand function to pushbutton 1 by making the following change in the **SETTINGS ⇒ PRODUCT SETUP ⇒ CLEAR RELAY RECORDS** menu:

CLEAR DEMAND: “PUSHBUTTON 1 ON”

2. Set the properties for user-programmable pushbutton 1 by making the following changes in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **USER-PROGRAMMABLE PUSHBUTTONS** ⇒ **USER PUSHBUTTON 1** menu:

PUSHBUTTON 1 FUNCTION: "Self-reset"

PUSHBTN 1 DROP-OUT TIME: "0.20 s"

5.2.4 COMMUNICATIONS

a) MAIN MENU

PATH: **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS**

■ COMMUNICATIONS	◀▶	■ SERIAL PORTS	See below.
MESSAGE	▲▼	■ NETWORK	See page 5-29.
MESSAGE	▲▼	■ ROUTING	See page 5-31.

MESSAGE	▲▼	■ IEC 60870-5-104 ■ PROTOCOL	See page 5-54.

b) SERIAL PORTS

PATH: **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **SERIAL PORTS**

■ SERIAL PORTS	◀▶	RS485 COM2 BAUD RATE: 19200	Range: 300, 1200, 2400, 4800, 9600, 14400, 19200, 28800, 33600, 38400, 57600, 115200
MESSAGE	▲▼	RS485 COM2 PARITY: None	Range: None, Odd, Even
MESSAGE	▲	RS485 COM2 RESPONSE MIN TIME: 0 ms	Range: 0 to 1000 ms in steps of 10

The L90 is equipped with up to two independent serial communication ports. The faceplate RS232 port is intended for local use and is fixed at 19200 baud and no parity. The rear COM2 port is RS485. The RS485 port has settings for baud rate and parity. It is important that these parameters agree with the settings used on the computer or other equipment that is connected to these ports. Any of these ports can be connected to a computer running EnerVista UR Setup. This software can download and upload setting files, view measured parameters, and upgrade the relay firmware. A maximum of 32 relays can be daisy-chained and connected to a DCS, PLC, or computer using the RS485 ports.

For the RS485 port, the minimum time before the port transmits after receiving data from a host can be set. This feature allows operation with hosts which hold the RS485 transmitter active for some time after each transmission.

c) ETHERNET NETWORK TOPOLOGY

When using more than one Ethernet port, configure each to belong to a different network or subnet using the IP addresses and mask, else communication becomes unpredictable when more than one port is configured to the same subnet.

Example 1

IP1/Mask1: 10.1.1.2/255.255.255.0 (where LAN 1 is 10.1.1.x/255.255.255.0)

IP2/Mask2: 10.2.1.2/255.255.255.0 (where LAN2 is 10.2.1.x/255.255.255.0)

IP3/Mask3: 10.3.1.2/255.255.255.0 (where LAN3 is 10.3.1.x/255.255.255.0)

Example 2

IP1/Mask1: 10.1.1.2/255.0.0.0 (where LAN1 is 10.x.x.x/255.0.0.0)

IP2/Mask2: 11.1.1.2/255.0.0.0 (where LAN2 is 11.x.x.x/255.0.0.0)

IP3/Mask3: 12.1.1.2/255.0.0.0 (where LAN3 is 12.x.x.x/255.0.0.0)

Example 3 — Incorrect

IP1/Mask1: 10.1.1.2/255.0.0.0

IP2/Mask2: 10.2.1.2/255.0.0.0

IP3/Mask3: 10.3.1.2/255.0.0.0

This example is incorrect because the mask of 255.0.0.0 used for the three IP addresses makes them belong to the same network of 10.x.x.x.

Single LAN, No Redundancy

The topology shown in the following figure allows communications to SCADA, local configuration/monitoring through EnerVista, and access to the public network shared on the same LAN. No redundancy is provided.

Figure 5–4: NETWORK CONFIGURATION FOR SINGLE LAN

Multiple LANS, with Redundancy

The topology in the following figure provides local configuration/monitoring through EnerVista software and access to the public network shared on LAN1, to which port 1 (P1) is connected. There is no redundancy provided on LAN1. Communications to SCADA is provided through LAN2 and LAN3, to which P2 and respectively P3 are connected and configured to work in redundant mode. In this configuration, P3 uses the IP and MAC address of P2.

Figure 5-5: MULTIPLE LANS, WITH REDUNDANCY

Multiple LANS, No Redundancy

The following topology provides local configuration/monitoring through EnerVista software on LAN1, to which port 1 (P1) is connected, access to the public network on LAN2, to which port 2 (P2) is connected and communications with SCADA on LAN3, to which port 3 (P3) is connected. There is no redundancy.

Figure 5-6: MULTIPLE LANS, NO REDUNDANCY

d) NETWORK

As outlined in the previous section, when using more than one Ethernet port, configure each to belong to a different network or subnet using the IP addresses and mask. Configure the network IP and subnet settings before configuring the routing settings.

	<div> <div>MESSAGE</div> <div>▲</div> <div>PRT3 GOOSE ENABLED:</div> <div>Enabled</div> </div>	Range: Enabled, Disabled

The IP addresses are used with the DNP, Modbus/TCP, IEC 61580, IEC 60870-5-104, TFTP, HTTP, and PRP protocols. The next section explains PRP.

Do not set more than one protocol to the same TCP/UDP port number, as this results in unreliable operation of those protocols.

PRT1 (2 OR 3) IP ADDRESS: This setting sets the ports IPv4 address in standard IPV4 format. This setting is valid on port 3 if port 2 **REDUNDANCY** is set to None.

PRT1 (2 OR 3) SUBNET MASK: This setting sets the ports IPv4 subnet mask in standard IPV4 format. This setting is valid on port 3 if port 2 **REDUNDANCY** is set to None.

PRT2 REDUNDANCY is available when the hardware has multiple ports (modules T, U, and V). It determines if ports 2 and 3 operate in redundant or independent mode. If a license for PRP was purchased, the options are None, Failover, and PRP. If a license for PRP was not purchased, the available options are None and Failover. In non-redundant mode (**REDUNDANCY** set to None), ports 2 and 3 operate independently with their own MAC, IP, and mask addresses. If **REDUNDANCY** is set to Failover, the operation of ports 2 and 3 is as follows:

- Ports 2 and 3 use the port 2 MAC address, IP address, and mask
- The configuration fields for IP address and mask on port 3 are hidden

- Port 3 is in standby mode and does not actively communicate on the Ethernet network but monitors its link to the Multilink switch. If port 2 detects a problem with the link, communications is switched to Port 3. Port 3 is, in effect, acting as a redundant or backup link to the network for port 2. Once Port 2 detects that the link between port 2 and the switch is good, communications automatically switch back to port 2 and port 3 goes back into standby mode.

If **REDUNDANCY** is set to PRP, the operation of ports 2 and 3 is as follows:

- Ports 2 and 3 use the port 2 MAC address, IP address, and mask
- The configuration fields for IP address and mask on port 3 are overwritten with those from port 2. This is visible on the front panel but not displayed in the EnerVista software.
- Port 2 **MCST ADDRESS** field is visible
- The port 2 PTP function still uses only port 2 and the port 3 PTP function still uses only port 3. The relay still synchronizes to whichever port has the best master. When ports 2 and 3 see the same master, as is typically the case for PRP networks, the port with the better connectivity is used.

The two ports must be connected to completely independent LANS with no single point of failure, such as common power supplies that feed switches on both LANS.

For this setting change to take effect, restart the unit.

PRT2 PRP MCST ADDR: This setting allows the user to change the multicast address used by the PRP supervision frames. The setting applies to UR CPUs that support multiple ports (T, U, and V). This setting is available if the hardware has multiple ports and **REDUNDANCY** is set to PRP.

e) PARALLEL REDUNDANCY PROTOCOL (PRP)

The Parallel Redundancy Protocol (PRP) defines a redundancy protocol for high availability in substation automation networks. It applies to networks based on Ethernet technology (ISO/IEC 8802-3) and is based on the second edition (July 2012) of the IEC 62439-3, clause 4.

PRP is designed to provide seamless recovery in case of a single failure in the network, by using a combination of LAN duplication and frame duplication technique. Identical frames are sent on two completely independent networks that connect source and destination. Under normal circumstances both frames reach the destination and one of them is sent up the OSI stack to the destination application, while the second one is discarded. If an error occurs in one of the networks and traffic is prevented from flowing on that path, connectivity is still provided through the other network to ensure continuous communication. Take care when designing the two LANs, so that no single point of failure (such as a common power supply) is encountered, as such scenarios can bring down both LANs simultaneously.

Figure 5–7: EXAMPLE OF PARALLEL REDUNDANT NETWORK

PRP uses specialized nodes called doubly attached nodes (DANPs) for handling the duplicated frames. DANPs devices have an additional module, called Link Redundancy Entity (LRE). LRE is responsible for duplicating frames and adding the specific PRP trailer when sending the frames out on the LAN, as well as making decisions on received frames as to which one is sent up the OSI stack to the application layer and which one is discarded. LRE is responsible for making PRP transparent to the higher layers of the stack. There is a second type of specialized device used in PRP networks, called RedBox, with the role of connecting Single Attached Nodes (SANs) to a redundant network.

UR relays implement only the DANP functionality. The RedBox functionality is not implemented.

The original standard IEC 62439-3 (2010) was amended to align PRP with the High-availability Seamless Redundancy (HSR) protocol. To achieve this, the original PRP was modified at the cost of losing compatibility with the PRP 2010 version. The revised standard IEC 62439-3 (2012) is commonly referred to as PRP-1, while the original standard is PRP-0. The UR relays support only PRP-1.

The relay implements PRP on two of its Ethernet ports, specifically Port 2 and 3 of the CPU module. Use the previous section (network port configuration) to configure PRP.

PRP is purchased as a separate option. If purchased (valid order code), PRP can be enabled in configuration through a setting available on the network configuration menu, REDUNDANCY, which already has the capability of enabling failover redundancy. The options on this setting must be changed to accommodate two types of redundancy: failover and PRP. When REDUNDANCY is set to either failover or PRP, the ports dedicated for PRP (Port 2 and 3) operate in redundant mode. In this mode, Port 3 uses the Mac, IP address, and mask of Port 2.

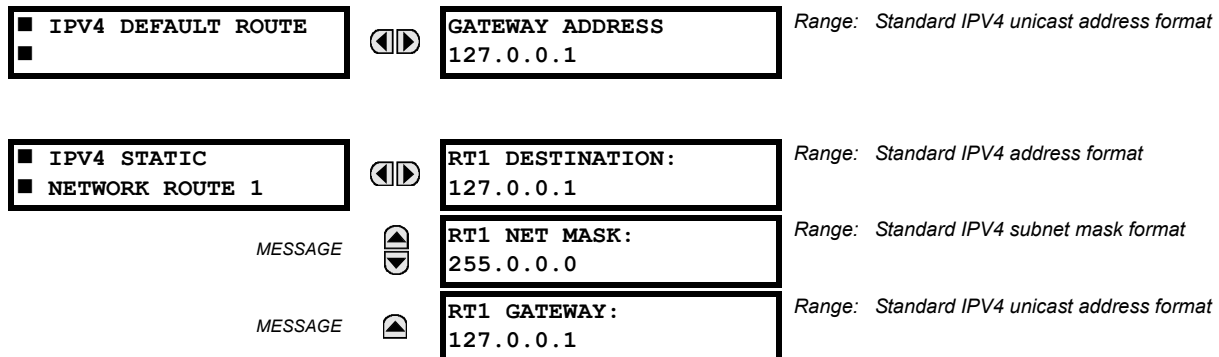

f) ROUTING

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ ROUTING 1(6)

A default route and a maximum number of six static routes can be configured.

The default route is used as the last choice when no other route towards a given destination is found.

Configure the network IP and subnet settings before configuring the routing settings.

ADDING AND DELETING STATIC ROUTES

Host routes are not supported at present.

The routing table configuration is available on the serial port and front panel. This is a deliberate decision, to avoid loss of connectivity when remotely configuring the UR.

By default the value of the destination field is 127.0.0.1 for all static routes (1 to 6). This is equivalent to saying that the static routes are not configured. When the destination address is 127.0.0.1, the mask and gateway must be also kept on default values.

By default, the value of the route gateway address is 127.0.0.1. This means the default route is not configured.

To add a route:

1. Use any of the static network route entries numbered 1 to 6 to configure a static network route. Once a route destination is configured for any of the entries 1 to 6, that entry becomes a static route and it must meet all the rules listed in the next section, General Conditions to be Satisfied by Static Routes.

- To configure the default route, enter a default gateway address. Once a default gateway address is configured, it must be validated against condition 2 of the General Conditions to be Satisfied by Static Routes.

To delete a route:

- Replace the route destination with the default loopback address (127.0.0.1). When deleting a route, the mask and gateway must be also brought back to default values.
- Delete the default route by replacing the default gateway with the default value 127.0.0.1.

GENERAL CONDITIONS TO BE SATISFIED BY STATIC ROUTES

The following rules are validated internally:

- The route mask has IP mask format. In binary this needs to be a set of contiguous bits of 1 from left to right, followed by one or more contiguous bits of 0.
- The route destination and mask must match. This can be verified by checking that $RtDestination \text{ and } RtMask = RtDestination$
Example of good configuration: $RtDestination = 10.1.1.0$; $RtMask = 255.255.255.0$
Example of bad configuration: $RtDestination = 10.1.1.1$; $RtMask = 255.255.255.0$

The following rules must be observed when you configure static routes:

- The route destination must not be a connected network
- The route gateway must be on a connected network. This rule applies to the gateway address of the default route as well. This can be verified by checking that:
 $RtGwy \text{ and } Prt1Mask = Prt1IP \text{ and } Prt1Mask \parallel RtGwy \text{ and } Prt2Mask = Prt2IP \text{ and } Prt2Mask \parallel RtGwy \text{ and } Prt3Mask = Prt3IP \text{ and } Prt3Mask$

ROUTING BEHAVIOR COMPARED TO PREVIOUS RELEASES

Prior to release 7.10, the UR did not have an explicit manner of configuring routes. The only available route was the default route configured as part of the network settings (port gateway IP address). This limited the ability to route to specific destinations, particularly if these destinations were reachable through a different interface than the one on which the default gateway was.

Starting with UR 7.10, up to six static network routes can be configured in addition to a default route. The default route configuration was also moved from the network settings into the routing section.

The figure shows an example of topology that benefits from the addition of static routes.

Figure 5–8: USING STATIC ROUTES

In the figure, the UR connects through the following two Ethernet ports:

- Port 1 (IP address 10.1.1.2) connects the UR to LAN 10.1.1.0/24 and to the Internet through Router1. Router 1 has an interface on 10.1.1.0/24 and the IP address of this interface is 10.1.1.1.

- Port 2 (IP address 10.1.2.2) connects the UR to LAN 10.1.2.0/24 and to the EnerVista software through Router 2. Router 2 has an interface on 10.1.2.0/24 and the IP address of this interface is 10.1.2.1.

The configuration before release 7.10 was as follows:

- PRT1 IP ADDRESS = 10.1.1.2
PRT1 SUBNET IP MASK = 255.255.255.0
PRT1 GWY IP ADDRESS = 10.1.1.1
PRT2 IP ADDRESS = 10.1.2.2
PRT2 SUBNET IP MASK = 255.255.255.0

The behavior before release 7.10 was as follows. When sending packets to EnerVista, the UR noticed that the destination was not on a connected network and it tried to find a route to destination. Since the default route was the only route it knew, it used it. Yet EnerVista was on a private network, which was not reachable through Router 1. Hence a destination unreachable message was received from the router.

The configuration starting release 7.10 is as follows:

- PRT1 IP ADDRESS = 10.1.1.2
PRT1 SUBNET IP MASK = 255.255.255.0
PRT2 IP ADDRESS = 10.1.2.2
PRT2 SUBNET IP MASK = 255.255.255.0
IPV4 DEFAULT ROUTE: GATEWAY ADDRESS = 10.1.1.1
STATIC NETWORK ROUTE 1: RT1 DESTINATION = 10.1.3.0/24; RT1 NET MASK = 255.255.255.0; and RT1 GATEWAY = 10.1.2.1

The behavior since release 7.10 is as follows. There is one added static network route to the destination 10.1.3.0/24, where a laptop running EnerVista is located. This static route uses a different gateway (10.1.2.1) than the default route. This gateway is the address of Router 2, which has knowledge about 10.1.3.0 and is able to route packets coming from UR and destined to EnerVista.

SHOW ROUTES AND ARP TABLES

This feature is available on the Web interface, where the main menu contains an additional Communications menu and two submenus:

- Routing Table
- ARP Table

The tables outline the information displayed when the two submenus are selected.

Table 5–3: ROUTING TABLE INFORMATION

FIELD	DESCRIPTION
Destination	The IP address of the remote network to which this route points
Mask	The network mask for the destination
Gateway	The IP address of the next router to the remote network
Interface	Interface through which the specified network can be reached

Table 5–4: IP ARP INFORMATION

FIELD	DESCRIPTION
IP Address	The network address that corresponds to Hardware Address
Age (min)	Age, in minutes, of the cache entry. A hyphen (-) means the address is local.
Hardware Address	LAN hardware address, a MAC address that corresponds to network address
Type	Dynamic or Static
Interface	Interface to which this address mapping has been assigned

g) MODBUS PROTOCOL

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ MODBUS PROTOCOL

<input checked="" type="checkbox"/> MODBUS PROTOCOL <input type="checkbox"/>	 	MODBUS SLAVE ADDRESS: 254	Range: 0 to 254 in steps of 1
		MODBUS TCP PORT NUMBER: 502	Range: 0 to 65535 in steps of 1

The serial communication ports utilize the Modbus protocol, unless configured for DNP operation (see descriptions below). This allows the EnerVista UR Setup software to be used. The UR operates as a Modbus slave device only. When using Modbus protocol on the RS232 port, the L90 responds regardless of the **MODBUS SLAVE ADDRESS** programmed. For the RS485 port, each L90 must have a unique address from 1 to 254. Address 0 is the broadcast address which all Modbus slave devices listen to. Addresses do not have to be sequential, but no two devices can have the same address or conflicts resulting in errors will occur. Generally, each device added to the link should use the next higher address starting at 1. See Appendix B for more information on the Modbus protocol.

A value of 0 closes the port. When the Modbus port is set to 0, communicate with the relay using the front panel or serial port.

When a 0 value is involved in a change, the changes to the MODBUS TCP PORT NUMBER setting take effect when the L90 is restarted.

h) DNP PROTOCOL

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ DNP PROTOCOL

The L90 supports the Distributed Network Protocol (DNP) version 3.0. The L90 can be used as a DNP slave device connected to multiple DNP masters (usually an RTU or a SCADA master station). Since the L90 maintains two sets of DNP data change buffers and connection information, two DNP masters can actively communicate with the L90 at one time.

The IEC 60870-5-104 and DNP protocols cannot be used simultaneously. When the IEC 60870-5-104 FUNCTION setting is set to "Enabled", the DNP protocol is not operational. When this setting is changed it does not become active until power to the relay has been cycled (off-to-on).

The DNP Channels sub-menu is shown below.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ DNP PROTOCOL ⇒ DNP CHANNELS

<input checked="" type="checkbox"/> DNP CHANNELS <input type="checkbox"/> MESSAGE	<input type="button" value="◀"/> <input type="button" value="▶"/>	DNP CHANNEL 1 PORT: NETWORK	Range: NONE, COM2 - RS485, FRONT PANEL - RS232, NETWORK - TCP, NETWORK - UDP
	<input type="button" value="▲"/>	DNP CHANNEL 2 PORT: COM2 - RS485	Range: NONE, COM2 - RS485, FRONT PANEL - RS232, NETWORK - TCP, NETWORK - UDP

The **DNP CHANNEL 1 PORT** and **DNP CHANNEL 2 PORT** settings select the communications port assigned to the DNP protocol for each channel. Once DNP is assigned to a serial port, the Modbus protocol is disabled on that port. When this setting is set to “Network - TCP”, the DNP protocol can be used over TCP/IP on channels 1 or 2. When this value is set to “Network - UDP”, the DNP protocol can be used over UDP/IP on channel 1 only. Refer to *Appendix E* for additional information on the DNP protocol.

Changes to the **DNP CHANNEL 1 PORT** and **DNP CHANNEL 2 PORT** settings take effect only after power has been cycled to the relay.

NOTE

The **DNP NETWORK CLIENT ADDRESS** settings can force the L90 to respond to a maximum of five specific DNP masters. The settings in this sub-menu are shown below.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ DNP PROTOCOL ⇒ DNP NETWORK CLIENT ADDRESSES

<input checked="" type="checkbox"/> DNP NETWORK <input checked="" type="checkbox"/> CLIENT ADDRESSES MESSAGE MESSAGE MESSAGE MESSAGE	<input type="button" value="◀"/> <input type="button" value="▶"/>	CLIENT ADDRESS 1: 0.0.0.0	Range: standard IP address
	<input type="button" value="▲"/>	CLIENT ADDRESS 2: 0.0.0.0	Range: standard IP address
	<input type="button" value="▲"/>	CLIENT ADDRESS 3: 0.0.0.0	Range: standard IP address
	<input type="button" value="▲"/>	CLIENT ADDRESS 4: 0.0.0.0	Range: standard IP address
	<input type="button" value="▲"/>	CLIENT ADDRESS 5: 0.0.0.0	Range: standard IP address

The **DNP UNSOL RESPONSE FUNCTION** should be “Disabled” for RS485 applications since there is no collision avoidance mechanism. The **DNP UNSOL RESPONSE TIMEOUT** sets the time the L90 waits for a DNP master to confirm an unsolicited response. The **DNP UNSOL RESPONSE MAX RETRIES** setting determines the number of times the L90 retransmits an unsolicited response without receiving confirmation from the master; a value of “255” allows infinite re-tries. The **DNP UNSOL RESPONSE DEST ADDRESS** is the DNP address to which all unsolicited responses are sent. The IP address to which unsolicited responses are sent is determined by the L90 from the current TCP connection or the most recent UDP message.

The DNP scale factor settings are numbers used to scale analog input point values. These settings group the L90 analog input data into the following types: current, voltage, power, energy, power factor, and other. Each setting represents the scale factor for all analog input points of that type. For example, if the **DNP VOLTAGE SCALE FACTOR** setting is set to “1000”, all DNP analog input points that are voltages will be returned with values 1000 times smaller (for example, a value of 72000 V on the L90 will be returned as 72). These settings are useful when analog input values must be adjusted to fit within certain ranges in DNP masters. Note that a scale factor of 0.1 is equivalent to a multiplier of 10 (that is, the value will be 10 times larger).

The **DNP DEFAULT DEADBAND** settings determine when to trigger unsolicited responses containing analog input data. These settings group the L90 analog input data into the following types: current, voltage, power, energy, power factor, and other. Each setting represents the default deadband value for all analog input points of that type. For example, to trigger unsolicited responses from the L90 when any current values change by 15 A, the **DNP CURRENT DEFAULT DEADBAND** setting should be set to “15”. Note that these settings are the deadband default values. DNP object 34 points can be used to change deadband values, from the default, for each individual DNP analog input point. Whenever power is removed and re-applied to the L90, the default deadbands will be in effect.

The **DNP TIME SYNC IIN PERIOD** setting determines how often the Need Time Internal Indication (IIN) bit is set by the L90. Changing this time allows the DNP master to send time synchronization commands more or less often, as required.

The **DNP MESSAGE FRAGMENT SIZE** setting determines the size, in bytes, at which message fragmentation occurs. Large fragment sizes allow for more efficient throughput; smaller fragment sizes cause more application layer confirmations to be necessary which can provide for more robust data transfer over noisy communication channels.

When the DNP data points (analog inputs and/or binary inputs) are configured for Ethernet-enabled relays, check the “DNP Points Lists” L90 web page to view the points lists. This page can be viewed with a web browser by entering the L90 IP address to access the L90 “Main Menu”, then by selecting the “Device Information Menu” > “DNP Points Lists” menu item.

The **DNP OBJECT 1 DEFAULT VARIATION** to **DNP OBJECT 32 DEFAULT VARIATION** settings allow the user to select the DNP default variation number for object types 1, 2, 20, 21, 22, 23, 30, and 32. The default variation refers to the variation response when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. Refer to the *DNP implementation* section in appendix E for additional details.

The DNP binary outputs typically map one-to-one to IED data points. That is, each DNP binary output controls a single physical or virtual control point in an IED. In the L90 relay, DNP binary outputs are mapped to virtual inputs. However, some legacy DNP implementations use a mapping of one DNP binary output to two physical or virtual control points to support the concept of trip/close (for circuit breakers) or raise/lower (for tap changers) using a single control point. That is, the DNP master can operate a single point for both trip and close, or raise and lower, operations. The L90 can be configured to support paired control points, with each paired control point operating two virtual inputs. The **DNP NUMBER OF PAIRED CONTROL POINTS** setting allows configuration of from 0 to 32 binary output paired controls. Points not configured as paired operate on a one-to-one basis.

The **DNP ADDRESS** setting is the DNP slave address. This number identifies the L90 on a DNP communications link. Each DNP slave should be assigned a unique address.

The **DNP TCP CONNECTION TIMEOUT** setting specifies a time delay for the detection of dead network TCP connections. If there is no data traffic on a DNP TCP connection for greater than the time specified by this setting, the connection will be aborted by the L90. This frees up the connection to be re-used by a client.

Relay power must be re-cycled after changing the **DNP TCP CONNECTION TIMEOUT** setting for the changes to take effect.

i) DNP / IEC 60870-5-104 POINT LISTS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ DNP / IEC104 POINT LISTS

<input checked="" type="checkbox"/> DNP / IEC104 <input checked="" type="checkbox"/> POINT LISTS	◀▶	<input checked="" type="checkbox"/> BINARY INPUT / MSP <input checked="" type="checkbox"/> POINTS	Range: see sub-menu below
MESSAGE ▲		<input checked="" type="checkbox"/> ANALOG INPUT / MME <input checked="" type="checkbox"/> POINTS	Range: see sub-menu below

The binary and analog inputs points for the DNP protocol, or the MSP and MME points for IEC 60870-5-104 protocol, can be configured to a maximum of 256 points. The value for each point is user-programmable and can be configured by assigning FlexLogic operands for binary inputs / MSP points or FlexAnalog parameters for analog inputs / MME points.

The menu for the binary input points (DNP) or MSP points (IEC 60870-5-104) is shown below.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ DNP / IEC104 POINT LISTS ⇒ BINARY INPUT / MSP POINTS

<input checked="" type="checkbox"/> BINARY INPUT / MSP <input checked="" type="checkbox"/> POINTS	◀▶	Point: 0 Off	Range: FlexLogic operand
MESSAGE ▲		Point: 1 Off	Range: FlexLogic operand
		↓	
MESSAGE ▲		Point: 255 Off	Range: FlexLogic operand

Up to 256 binary input points can be configured for the DNP or IEC 60870-5-104 protocols. The points are configured by assigning an appropriate FlexLogic operand. Refer to the *Introduction to FlexLogic* section in this chapter for the full range of assignable operands.

The menu for the analog input points (DNP) or MME points (IEC 60870-5-104) is shown below.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ DNP / IEC104 POINT LISTS ⇒ ANALOG INPUT / MME POINTS

<input checked="" type="checkbox"/> ANALOG INPUT / MME <input checked="" type="checkbox"/> POINTS	<div>Point: 0</div> <div>Off</div>	Range: any FlexAnalog parameter
	<div>Point: 1</div> <div>Off</div>	Range: any FlexAnalog parameter
	↓	
<div>Point: 255</div> <div>Off</div>	Range: any FlexAnalog parameter	

Up to 256 analog input points can be configured for the DNP or IEC 60870-5-104 protocols. The analog point list is configured by assigning an appropriate FlexAnalog parameter to each point. Refer to Appendix A: *FlexAnalog Parameters* for the full range of assignable parameters.

The DNP / IEC 60870-5-104 point lists always begin with point 0 and end at the first “Off” value. Since DNP / IEC 60870-5-104 point lists must be in one continuous block, any points assigned after the first “Off” point are ignored.

Changes to the DNP / IEC 60870-5-104 point lists will not take effect until the L90 is restarted.

j) IEC 61850 PROTOCOL

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL

<input checked="" type="checkbox"/> IEC 61850 PROTOCOL	<div>GSSE / GOOSE</div> <div>CONFIGURATION</div>
	<div>SERVER</div> <div>CONFIGURATION</div>
	<div>IEC 61850 LOGICAL</div> <div>NODE NAME PREFIXES</div>

	<div>GGIO1 STATUS</div> <div>CONFIGURATION</div>
	<div>GGIO2 CONTROL</div> <div>CONFIGURATION</div>
	<div>GGIO4 ANALOG</div> <div>CONFIGURATION</div>
	<div>GGIO5 UINTEGER</div> <div>CONFIGURATION</div>
	<div>REPORT CONTROL</div> <div>CONFIGURATION</div>
	<div>XCBR</div> <div>CONFIGURATION</div>
<div>XSWI</div> <div>CONFIGURATION</div>	

The L90 Line Current Differential System is provided with optional IEC 61850 communications capability. This feature is specified as a software option at the time of ordering. Refer to the *Ordering* section of chapter 2 for additional details.

NOTICE

Use independent ports for IEC 61850 communication and take care when configuring the settings, else loss of protection or misoperation of the relay can result.

The L90 supports the Manufacturing Message Specification (MMS) protocol as specified by IEC 61850. MMS is supported over two protocol stacks: TCP/IP over Ethernet. The L90 operates as an IEC 61850 server. The *Remote inputs and outputs* section in this chapter describe the peer-to-peer GSSE/GOOSE message scheme.

The GSSE/GOOSE configuration main menu is divided into two areas: transmission and reception.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GSSE/GOOSE CONFIGURATION

■ GSSE / GOOSE ■ CONFIGURATION	◀▶	■ TRANSMISSION ■
MESSAGE ▲		■ RECEPTION ■

The main transmission menu is shown below:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GSSE/GOOSE CONFIGURATION ⇒ TRANSMISSION

■ TRANSMISSION ■	◀▶	■ GENERAL ■
MESSAGE ▲		■ GSSE ■
MESSAGE ▲		■ FIXED GOOSE ■
MESSAGE ▲		■ CONFIGURABLE ■ GOOSE

The general transmission settings are shown below:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GSSE/GOOSE CONFIGURATION ⇒ TRANSMISSION ⇒ GENERAL

■ GENERAL ■	◀▶	DEFAULT GSSE/GOOSE UPDATE TIME: 60 s	Range: 1 to 60 s in steps of 1
----------------	----	---	--------------------------------

The **DEFAULT GSSE/GOOSE UPDATE TIME** sets the time between GSSE or GOOSE messages when there are no remote output state changes to be sent. When remote output data changes, GSSE or GOOSE messages are sent immediately. This setting controls the steady-state *heartbeat* time interval.

The **DEFAULT GSSE/GOOSE UPDATE TIME** setting is applicable to GSSE, fixed L90 GOOSE, and configurable GOOSE.

The GSSE settings are shown below:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GSSE/GOOSE CONFIGURATION ⇒ TRANSMISSION ⇒ GSSE

■ GSSE ■	◀▶	GSSE FUNCTION: Enabled	Range: Enabled, Disabled
MESSAGE ▲		GSSE ID: GSSEOut	Range: 65-character ASCII string
MESSAGE ▲		DESTINATION MAC: 000000000000	Range: standard MAC address

These settings are applicable to GSSE only. If the fixed GOOSE function is enabled, GSSE messages are not transmitted.

The **GSSE ID** setting represents the IEC 61850 GSSE application ID name string sent as part of each GSSE message. This string identifies the GSSE message to the receiving device. In L90 releases previous to 5.0x, this name string was represented by the **RELAY NAME** setting.

The fixed GOOSE settings are shown below:

PATH: **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION**
⇒ **TRANSMISSION** ⇒ **FIXED GOOSE**

■ FIXED GOOSE

◀▶

GOOSE FUNCTION:

Disabled

Range: Enabled, Disabled

MESSAGE

▲▼

GOOSE ID:

GOOSEOut

Range: 65-character ASCII string

MESSAGE

▲▼

DESTINATION MAC:

000000000000

Range: standard MAC address

MESSAGE

▲▼

GOOSE VLAN PRIORITY:

4

Range: 0 to 7 in steps of 1

MESSAGE

▲▼

GOOSE VLAN ID:

0

Range: 0 to 4095 in steps of 1

MESSAGE

▲▼

GOOSE ETYPE APPID:

0

Range: 0 to 16383 in steps of 1

These settings are applicable to fixed (DNA/UserSt) GOOSE only.

The **GOOSE ID** setting represents the IEC 61850 GOOSE application ID (GoID) name string sent as part of each GOOSE message. This string identifies the GOOSE message to the receiving device. In revisions previous to 5.0x, this name string was represented by the **RELAY NAME** setting.

The **DESTINATION MAC** setting allows the destination Ethernet MAC address to be set. This address must be a multicast address; the least significant bit of the first byte must be set. In L90 releases previous to 5.0x, the destination Ethernet MAC address was determined automatically by taking the sending MAC address (that is, the unique, local MAC address of the L90) and setting the multicast bit.

The **GOOSE VLAN PRIORITY** setting indicates the Ethernet priority of GOOSE messages. This allows GOOSE messages to have higher priority than other Ethernet data. The **GOOSE ETYPE APPID** setting allows the selection of a specific application ID for each GOOSE sending device. This value can be left at its default if the feature is not required. Both the **GOOSE VLAN PRIORITY** and **GOOSE ETYPE APPID** settings are required by IEC 61850.

The configurable GOOSE settings are shown below.

**PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GSSE/GOOSE CONFIGURATION
⇒ TRANSMISSION ⇒ CONFIGURABLE GOOSE ⇒ CONFIGURABLE GOOSE 1(8)**

■ CONFIGURABLE	◀▶	CONFIG GSE 1	Range: Enabled, Disabled
■ GOOSE 1		FUNCTION: Enabled

MESSAGE	▲▼	CONFIG GSE 1 DST MAC: 000000000000	Range: standard MAC address
MESSAGE	▲▼	CONFIG GSE 1 VLAN PRIORITY: 4	Range: 0 to 7 in steps of 1
MESSAGE	▲▼	CONFIG GSE 1 VLAN ID: 0	Range: 0 to 4095 in steps of 1
MESSAGE	▲▼	CONFIG GSE 1 ETYPE APID: 0	Range: 0 to 16383 in steps of 1
MESSAGE	▲▼	CONFIG GSE 1 CONFREV: 1	Range: 0 to 4294967295 in steps of 1
MESSAGE	▲▼	CONFIG GSE 1 RESTRANS CURVE: Relaxed	Range: Aggressive, Medium, Relaxed, Heartbeat
MESSAGE	▲	■ CONFIG GSE 1 ■ DATASET ITEMS	Range: 64 data items; each can be set to all valid MMS data item references for transmitted data

The configurable GOOSE settings allow the L90 to be configured to transmit a number of different datasets within IEC 61850 GOOSE messages. Up to eight different configurable datasets can be configured and transmitted. This is useful for intercommunication between L90 IEDs and devices from other manufacturers that support IEC 61850.

The configurable GOOSE feature allows for the configuration of the datasets to be transmitted or received from the L90. The L90 supports the configuration of eight (8) transmission and reception datasets, allowing for the optimization of data transfer between devices.

Items programmed for dataset 1 and 2 will have changes in their status transmitted as soon as the change is detected. Datasets 1 and 2 should be used for high-speed transmission of data that is required for applications such as transfer tripping, blocking, and breaker fail initiate. At least one digital status value needs to be configured in the required dataset to enable transmission of configured data. Configuring analog data only to dataset 1 or 2 will not activate transmission.

Items programmed for datasets 3 through 8 will have changes in their status transmitted at a maximum rate of every 100 ms. Datasets 3 through 8 will regularly analyze each data item configured within them every 100 ms to identify if any changes have been made. If any changes in the data items are detected, these changes will be transmitted through a GOOSE message. If there are no changes detected during this 100 ms period, no GOOSE message will be sent.

For all datasets 1 through 8, the integrity GOOSE message will still continue to be sent at the pre-configured rate even if no changes in the data items are detected.

The GOOSE functionality was enhanced to prevent the relay from flooding a communications network with GOOSE messages due to an oscillation being created that is triggering a message.

The L90 has the ability of detecting if a data item in one of the GOOSE datasets is erroneously oscillating. This can be caused by events such as errors in logic programming, inputs improperly being asserted and de-asserted, or failed station components. If erroneously oscillation is detected, the L90 will stop sending GOOSE messages from the dataset for a minimum period of one second. Should the oscillation persist after the one second time-out period, the L90 will continue to block transmission of the dataset. The L90 will assert the **MAINTENANCE ALERT: GGIO Ind XXX oscill** self-test error message on the front panel display, where **XXX** denotes the data item detected as oscillating.

For versions 5.70 and higher, the L90 supports four retransmission schemes: aggressive, medium, relaxed, and heartbeat. The aggressive scheme is only supported in fast type 1A GOOSE messages (GOOSEOut 1 and GOOSEOut 2). For slow GOOSE messages (GOOSEOut 3 to GOOSEOut 8) the aggressive scheme is the same as the medium scheme.

The details about each scheme are shown in the following table.

Table 5–5: GOOSE RETRANSMISSION SCHEMES

SCHEME	SQ NUM	TIME FROM THE EVENT	TIME BETWEEN MESSAGES	COMMENT	TIME ALLOWED TO LIVE IN MESSAGE
Aggressive	0	0 ms	0 ms	Event	2000 ms
	1	4 ms	4 ms	T1	2000 ms
	2	8 ms	4 ms	T1	2000 ms
	3	16 ms	8 ms	T2	Heartbeat * 4.5
	4	Heartbeat	Heartbeat	T0	Heartbeat * 4.5
	5	Heartbeat	Heartbeat	T0	Heartbeat * 4.5
Medium	0	0 ms	0 ms	Event	2000 ms
	1	16 ms	16 ms	T1	2000 ms
	2	32 ms	16 ms	T1	2000 ms
	3	64 ms	32 ms	T2	Heartbeat * 4.5
	4	Heartbeat	Heartbeat	T0	Heartbeat * 4.5
	5	Heartbeat	Heartbeat	T0	Heartbeat * 4.5
Relaxed	0	0 ms	0 ms	Event	2000 ms
	1	100 ms	100 ms	T1	2000 ms
	2	200 ms	100 ms	T1	2000 ms
	3	700 ms	500 ms	T2	Heartbeat * 4.5
	4	Heartbeat	Heartbeat	T0	Heartbeat * 4.5

	1	Heartbeat	Heartbeat	T1	2000 ms
	2	Heartbeat	Heartbeat	T1	2000 ms
	3	Heartbeat	Heartbeat	T2	Heartbeat * 4.5
	4	Heartbeat	Heartbeat	T0	Heartbeat * 4.5
	5	Heartbeat	Heartbeat	T0	Heartbeat * 4.5

The configurable GOOSE feature is recommended for applications that require GOOSE data transfer between UR-series IEDs and devices from other manufacturers. Fixed GOOSE is recommended for applications that require GOOSE data transfer between UR-series IEDs.

IEC 61850 GOOSE messaging contains a number of configurable parameters, all of which must be correct to achieve the successful transfer of data. It is critical that the configured datasets at the transmission and reception devices are an exact match in terms of data structure, and that the GOOSE addresses and name strings match exactly. Manual configuration is possible, but third-party substation configuration software may be used to automate the process. The EnerVista UR Setup software can produce IEC 61850 ICD files and import IEC 61850 SCD files produced by a substation configurator (refer to the *IEC 61850 IED configuration* section later in this appendix).

The following example illustrates the configuration required to transfer IEC 61850 data items between two devices. The general steps required for transmission configuration are:

1. Configure the transmission dataset.
2. Configure the GOOSE service settings.
3. Configure the data.

The general steps required for reception configuration are:

1. Configure the reception dataset.
2. Configure the GOOSE service settings.
3. Configure the data.

This example shows how to configure the transmission and reception of three IEC 61850 data items: a single point status value, its associated quality flags, and a floating point analog value.

The following procedure illustrates the transmission configuration.

- Configure the transmission dataset by making the following changes in the **PRODUCT SETUP** ⇒ **COMMUNICATION** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION** ⇒ **TRANSMISSION** ⇒ **CONFIGURABLE GOOSE** ⇒ **CONFIGURABLE GOOSE 1** ⇒ **CONFIG GSE 1 DATASET ITEMS** settings menu:
 - Set **ITEM 1** to “GGIO1.ST.Ind1.q” to indicate quality flags for GGIO1 status indication 1.
 - Set **ITEM 2** to “GGIO1.ST.Ind1.stVal” to indicate the status value for GGIO1 status indication 1.
 - Set **ITEM 3** to “MMXU1.MX.Hz.mag.f” to indicate the analog frequency magnitude for MMXU1 (the metered frequency for SRC1).

The transmission dataset now contains a quality flag, a single point status Boolean value, and a floating point analog value. The reception dataset on the receiving device must exactly match this structure.
- Configure the GOOSE service settings by making the following changes in the **PRODUCT SETUP** ⇒ **COMMUNICATION** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION** ⇒ **TRANSMISSION** ⇒ **CONFIGURABLE GOOSE** ⇒ **CONFIGURABLE GOOSE 1** settings menu:
 - Set **CONFIG GSE 1 FUNCTION** to “Enabled”.
 - Set **CONFIG GSE 1 ID** to an appropriate descriptive string (the default value is “GOOSEOut_1”).
 - Set **CONFIG GSE 1 DST MAC** to a multicast address (for example, 01 00 00 12 34 56).
 - Set the **CONFIG GSE 1 VLAN PRIORITY**; the default value of “4” is OK for this example.
 - Set the **CONFIG GSE 1 VLAN ID** value; the default value is “0”, but some switches may require this value to be “1”.
 - Set the **CONFIG GSE 1 ETYPE APPID** value. This setting represents the ETHERTYPE application ID and must match the configuration on the receiver (the default value is “0”).
 - Set the **CONFIG GSE 1 CONFREV** value. This value changes automatically as described in IEC 61850 part 7-2. For this example it can be left at its default value.
- Configure the data by making the following changes in the **PRODUCT SETUP** ⇒ **COMMUNICATION** ⇒ **IEC 61850 PROTOCOL** ⇒ **GGIO1 STATUS CONFIGURATION** settings menu:
 - Set **GGIO1 INDICATION 1** to a FlexLogic operand used to provide the status of GGIO1.ST.Ind1.stVal (for example, a contact input, virtual input, a protection element status, etc.).
- Configure the MMXU1 Hz Deadband by making the following changes in the **PRODUCT SETUP** ⇒ **COMMUNICATION** ⇒ **IEC 61850 PROTOCOL** ⇒ **MMXU DEADBANDS** ⇒ **MMXU1 DEADBANDS** settings menu:
 - Set **MMXU1 HZ DEADBAND** to “0.050%”. This will result in an update to the MMXU1.MX.mag.f analog value with a change greater than 45 mHz, from the previous MMXU1.MX.mag.f value, in the source frequency.

The L90 must be rebooted (control power removed and re-applied) before these settings take effect.

The following procedure illustrates the reception configuration.

- Configure the reception dataset by making the following changes in the **PRODUCT SETUP** ⇒ **COMMUNICATION** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION** ⇒ **RECEPTION** ⇒ **CONFIGURABLE GOOSE** ⇒ **CONFIGURABLE GOOSE 1** ⇒ **CONFIG GSE 1 DATASET ITEMS** settings menu:
 - Set **ITEM 1** to “GGIO3.ST.Ind1.q” to indicate quality flags for GGIO3 status indication 1.
 - Set **ITEM 2** to “GGIO3.ST.Ind1.stVal” to indicate the status value for GGIO3 status indication 1.
 - Set **ITEM 3** to “GGIO3.MX.AnIn1.mag.f” to indicate the analog magnitude for GGIO3 analog input 1.

The reception dataset now contains a quality flag, a single point status Boolean value, and a floating point analog value. This matches the transmission dataset configuration above.
- Configure the GOOSE service settings by making the following changes in the **INPUTS/OUTPUTS** ⇒ **REMOTE DEVICES** ⇒ **REMOTE DEVICE 1** settings menu:
 - Set **REMOTE DEVICE 1 ID** to match the GOOSE ID string for the transmitting device. Enter “GOOSEOut_1”.

- Set **REMOTE DEVICE 1 ETYPE APPID** to match the ETHERTYPE application ID from the transmitting device. This is “0” in the example above.
 - Set the **REMOTE DEVICE 1 DATASET** value. This value represents the dataset number in use. Since we are using configurable GOOSE 1 in this example, program this value as “GOOSEIn 1”.
3. Configure the Boolean data by making the following changes in the **INPUTS/OUTPUTS** ⇒ **REMOTE INPUTS** ⇒ **REMOTE INPUT 1** settings menu:
- Set **REMOTE IN 1 DEVICE** to “GOOSEOut_1”.
 - Set **REMOTE IN 1 ITEM** to “Dataset Item 2”. This assigns the value of the GGIO3.ST.Ind1.stVal single point status item to remote input 1.
4. Configure the analog data by making the following changes in the **INPUTS/OUTPUTS** ⇒ **IEC 61850 GOOSE ANALOG INPUTS** settings menu:
- Set the **IEC61850 GOOSE ANALOG INPUT 1 DEFAULT VALUE** to “60.000”.
 - Enter “Hz” for the **IEC61850 GOOSE ANALOG INPUT 1 UNITS** setting.

The GOOSE analog input 1 can now be used as a FlexAnalog value in a FlexElement or in other settings. The L90 must be rebooted (control power removed and re-applied) before these settings take effect.

The value of GOOSE analog input 1 in the receiving device will be determined by the MMXU1.MX.Hz.mag.f value in the sending device. This MMXU value is determined by the source 1 frequency value and the MMXU Hz deadband setting of the sending device.

Remote input 1 can now be used in FlexLogic equations or other settings. The L90 must be rebooted (control power removed and re-applied) before these settings take effect.

The value of remote input 1 (Boolean on or off) in the receiving device will be determined by the GGIO1.ST.Ind1.stVal value in the sending device. The above settings will be automatically populated by the EnerVista UR Setup software when a complete SCD file is created by third party substation configurator software.

For intercommunication between L90 IEDs, the fixed (DNA/UserSt) dataset can be used. The DNA/UserSt dataset contains the same DNA and UserSt bit pairs that are included in GSSE messages. All GOOSE messages transmitted by the L90 (DNA/UserSt dataset and configurable datasets) use the IEC 61850 GOOSE messaging services (for example, VLAN support).

Set the **CONFIG GSE 1 FUNCTION** function to “Disabled” when configuration changes are required. Once changes are entered, return the **CONFIG GSE 1 FUNCTION** to “Enabled” and restart the unit for changes to take effect.

PATH: SETTINGS ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION** ⇒ **TRANSMISSION** ⇒ **CONFIGURABLE GOOSE** ⇒ **CONFIGURABLE GOOSE 1(8)** ⇒ **CONFIG GSE 1(64) DATA ITEMS**

<div> <div>■ CONFIG GSE 1</div> <div>■ DATASET ITEMS</div> </div>	<div> <div>◀▶</div> <div>ITEM 1:</div> <div>GGIO1.ST.Ind1.stVal</div> </div>	Range: all valid MMS data item references for transmitted data
	<div> <div>MESSAGE</div> <div>▲▼</div> <div>ITEM 2:</div> <div>GGIO1.ST.IndPos1.stV</div> </div>	Range: all valid MMS data item references for transmitted data
	<div> <div>MESSAGE</div> <div>▲▼</div> <div>ITEM 3:</div> <div>None</div> </div>	Range: all valid MMS data item references for transmitted data
	↓	
<div> <div>MESSAGE</div> <div>▲</div> <div>ITEM 64:</div> <div>None</div> </div>	Range: all valid MMS data item references for transmitted data	

To create a configurable GOOSE dataset that contains an IEC 61850 Single Point Status indication and its associated quality flags, the following dataset items can be selected: “GGIO1.ST.Ind1.stVal” and “GGIO1.ST.Ind1.q”. The L90 will then create a dataset containing these two data items. The status value for GGIO1.ST.Ind1.stVal is determined by the FlexLogic operand assigned to GGIO1 indication 1. Changes to this operand will result in the transmission of GOOSE messages containing the defined dataset.

The main reception menu is applicable to configurable GOOSE only and contains the configurable GOOSE dataset items for reception:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GSSE/GOOSE CONFIGURATION ⇒ RECEPTION ⇒ CONFIGURABLE GOOSE ⇒ CONFIGURABLE GOOSE 1(16) ⇒ CONFIG GSE 1(32) DATA ITEMS

<div> <div>■ CONFIG GSE 1</div> <div>■ DATASET ITEMS</div> </div>	◀▶	<div>ITEM 1:</div> <div>GGIO3.ST.Ind1.stVal</div>	Range: all valid MMS data item references for transmitted data
	MESSAGE ▲▼	<div>ITEM 2:</div> <div>GGIO3.ST.IndPos1.stV</div>	Range: all valid MMS data item references for transmitted data
	MESSAGE ▲▼	<div>ITEM 3:</div> <div>None</div>	Range: all valid MMS data item references for transmitted data
	MESSAGE ▲	<div>ITEM 32:</div> <div>None</div>	Range: all valid MMS data item references for transmitted data

↓

The configurable GOOSE settings allow the L90 to be configured to receive a number of different datasets within IEC 61850 GOOSE messages. Up to sixteen different configurable datasets can be configured for reception. This is useful for intercommunication between L90 IEDs and devices from other manufacturers that support IEC 61850.

For intercommunication between L90 IEDs, the fixed (DNA/UserSt) dataset can be used. The DNA/UserSt dataset contains the same DNA and UserSt bit pairs that are included in GSSE messages.

To set up a L90 to receive a configurable GOOSE dataset that contains two IEC 61850 single point status indications, the following dataset items can be selected (for example, for configurable GOOSE dataset 1): “GGIO3.ST.Ind1.stVal” and “GGIO3.ST.Ind2.stVal”. The L90 will then create a dataset containing these two data items. The Boolean status values from these data items can be utilized as remote input FlexLogic operands. First, the **REMOTE DEVICE 1(16) DATASET** setting must be set to contain dataset “GOOSEIn 1” (that is, the first configurable dataset). Then **REMOTE IN 1(16) ITEM** settings must be set to “Dataset Item 1” and “Dataset Item 2”. These remote input FlexLogic operands will then change state in accordance with the status values of the data items in the configured dataset.

Double-point status values may be included in the GOOSE dataset. Received values are populated in the GGIO3.ST.IndPos1.stVal and higher items.

Floating point analog values originating from MMXU logical nodes may be included in GOOSE datasets. Deadband (non-instantaneous) values can be transmitted. Received values are used to populate the GGIO3.MX.AnIn1 and higher items. Received values are also available as FlexAnalog parameters (GOOSE analog In1 and up).

NOTE

GGIO3.MX.AnIn1 to GGIO3.MX.AnIn32 can only be used once for all sixteen reception datasets.

The main menu for the IEC 61850 server configuration is shown below.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ SERVER CONFIGURATION

<div> <div>SERVER</div> <div>CONFIGURATION</div> </div>		<div> <div>IED NAME: IECDevice</div> <div>Range: up to 32 alphanumeric characters</div> </div>
	MESSAGE	<div> <div>LD INST: LDInst</div> <div>Range: up to 32 alphanumeric characters</div> </div>
	MESSAGE	<div> <div>IEC/MMS TCP PORT NUMBER: 102</div> <div>Range: 0 to 65535 in steps of 1</div> </div>
	MESSAGE	<div> <div>INCLUDE NON-IEC DATA: Enabled</div> <div>Range: Disabled, Enabled</div> </div>
	MESSAGE	<div> <div>SERVER SCANNING: Disabled</div> <div>Range: Disabled, Enabled</div> </div>
	MESSAGE	<div> <div>LOCATION: LPHD DC PHV- Nam Location</div> <div>Range: up to 80 alphanumeric characters</div> </div>
	MESSAGE	<div> <div>LATITUDE:</div> <div>Range: -90.000 to 90.000 deg in steps of 0.001 deg</div> </div>
	MESSAGE	<div> <div>LONGITUDE:</div> <div>Range: -180.000 to 180.000 deg in steps of 0.001 deg</div> </div>
MESSAGE	<div> <div>ALTITUDE:</div> <div>Range: 0 to 10,0000 m in steps of 1 m</div> </div>	

The **IED NAME** and **LD INST** settings represent the MMS domain name (IEC 61850 logical device) where all IEC/MMS logical nodes are located. Valid characters for these values are upper and lowercase letters, numbers, and the underscore (_) character, and the first character in the string must be a letter. This conforms to the IEC 61850 standard. The **LOCATION** is a variable string and can be composed of ASCII characters. This string appears within the PhyName of the LPHD node.

The **IEC/MMS TCP PORT NUMBER** setting allows the user to change the TCP port number for MMS connections. The **INCLUDE NON-IEC DATA** setting determines whether or not the “UR” MMS domain will be available. This domain contains a large number of UR-series specific data items that are not available in the IEC 61850 logical nodes. This data does not follow the IEC 61850 naming conventions. For communications schemes that strictly follow the IEC 61850 standard, this setting should be “Disabled”.

When a 0 value is involved in a change, the changes to the **IEC/MMS TCP PORT NUMBER** setting take effect when the L90 is restarted.

The **SERVER SCANNING** feature should be set to “Disabled” when IEC 61850 client/server functionality is not required. IEC 61850 has two modes of functionality: GOOSE/GSSE inter-device communication and client/server communication. If the GOOSE/GSSE functionality is required without the IEC 61850 client server feature, then server scanning can be disabled to increase CPU resources. When server scanning is disabled, there is no updating of the IEC 61850 logical node status values in the L90. Clients are still able to connect to the server (L90 relay), but most data values are not updated. This setting does not affect GOOSE/GSSE operation.

Changes to the **IED NAME** setting, **LD INST** setting, and GOOSE dataset take effect when the L90 is restarted.

The main menu for the IEC 61850 logical node name prefixes is shown below.

**PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ IEC 61850 PROTOCOL
⇒ IEC 61850 LOGICAL NODE NAME PREFIXES**

The IEC 61850 logical node name prefix settings are used to create name prefixes to uniquely identify each logical node. For example, the logical node “PTOC1” may have the name prefix “abc”. The full logical node name will then be “abcMMXU1”. Valid characters for the logical node name prefixes are upper and lowercase letters, numbers, and the underscore (_) character, and the first character in the prefix must be a letter. This conforms to the IEC 61850 standard.

Changes to the logical node prefixes will not take effect until the L90 is restarted.

The main menu for the IEC 61850 MMXU deadbands is shown below.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ IEC 61850 PROTOCOL ⇒ MMXU DEADBANDS

The MMXU deadband settings represent the deadband values used to determine when the update the MMXU “mag” and “cVal” values from the associated “instmag” and “instcVal” values. The “mag” and “cVal” values are used for the IEC 61850 buffered and unbuffered reports. These settings correspond to the associated “db” data items in the CF functional constraint of the MMXU logical node, as per the IEC 61850 standard. According to IEC 61850-7-3, the db value “shall represent the percentage of difference between the maximum and minimum in units of 0.001%”. Thus, it is important to know the maximum value for each MMXU measured quantity, since this represents the 100.00% value for the deadband.

The minimum value for all quantities is 0; the maximum values are as follows:

- phase current: $46 \times$ phase CT primary setting
- neutral current: $46 \times$ ground CT primary setting
- voltage: $275 \times$ VT ratio setting
- power (real, reactive, and apparent): $46 \times$ phase CT primary setting \times $275 \times$ VT ratio setting
- frequency: 90 Hz
- power factor: 2

The GGIO1 status configuration points are shown below:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GGIO1 STATUS CONFIGURATION

<input checked="" type="checkbox"/> GGIO1 STATUS <input checked="" type="checkbox"/> CONFIGURATION		NUMBER OF STATUS POINTS IN GGIO1: 8	Range: 8 to 128 in steps of 8
	MESSAGE	GGIO1 INDICATION 1 Off	Range: FlexLogic operand
	MESSAGE	GGIO1 INDICATION 2 Off	Range: FlexLogic operand
	MESSAGE	GGIO1 INDICATION 3 Off	Range: FlexLogic operand
	MESSAGE	GGIO1 INDICATION 128 Off	Range: FlexLogic operand

The **NUMBER OF STATUS POINTS IN GGIO1** setting specifies the number of “Ind” (single point status indications) that are instantiated in the GGIO1 logical node. Changes to the **NUMBER OF STATUS POINTS IN GGIO1** setting will not take effect until the L90 is restarted.

The GGIO2 control configuration points are shown below:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GGIO2 CONTROL CONFIGURATION ⇒ GGIO2 CF SPCSO 1(64)

<input checked="" type="checkbox"/> GGIO2 CF SPCSO 1	GGIO2 CF SPCSO 1 CTLMODEL: 1	Range: 0, 1, or 2
--	---------------------------------	-------------------

The GGIO2 control configuration settings are used to set the control model for each input. The available choices are “0” (status only), “1” (direct control), and “2” (SBO with normal security). The GGIO2 control points are used to control the L90 virtual inputs.

The GGIO4 analog configuration points are shown below:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GGIO4 ANALOG CONFIGURATION

<input checked="" type="checkbox"/> GGIO4 ANALOG <input checked="" type="checkbox"/> CONFIGURATION		NUMBER OF ANALOG POINTS IN GGIO4: 8	Range: 4 to 32 in steps of 4
	MESSAGE	<input checked="" type="checkbox"/> GGIO4 ANALOG 1 <input checked="" type="checkbox"/> MEASURED VALUE	
	MESSAGE	<input checked="" type="checkbox"/> GGIO4 ANALOG 2 <input checked="" type="checkbox"/> MEASURED VALUE	
	MESSAGE	<input checked="" type="checkbox"/> GGIO4 ANALOG 3 <input checked="" type="checkbox"/> MEASURED VALUE	
	MESSAGE	<input checked="" type="checkbox"/> GGIO4 ANALOG 32 <input checked="" type="checkbox"/> MEASURED VALUE	

The **NUMBER OF ANALOG POINTS** setting determines how many analog data points will exist in GGIO4. When this value is changed, the L90 must be rebooted in order to allow the GGIO4 logical node to be re-instantiated and contain the newly configured number of analog points.

The measured value settings for each of the 32 analog values are shown below.

PATH: SETTINGS ⇒ PRODUCT... ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GGIO4 ANALOG CONFIGURATION ⇒ GGIO4 ANALOG 1(32) MEASURED VALUE

<input checked="" type="checkbox"/> GGIO4 ANALOG 1		ANALOG IN 1 VALUE:	Off	Range: any FlexAnalog value
<input checked="" type="checkbox"/> MEASURED VALUE				
MESSAGE		ANALOG IN 1 DB:	0.000	Range: 0.000 to 100.000 in steps of 0.001
MESSAGE		ANALOG IN 1 MIN:	0.000	Range: -1000000000.000 to 1000000000.000 in steps of 0.001
MESSAGE		ANALOG IN 1 MAX:	0.000	Range: -1000000000.000 to 1000000000.000 in steps of 0.001

These settings are configured as follows.

- **ANALOG IN 1 VALUE:** This setting selects the FlexAnalog value to drive the instantaneous value of each GGIO4 analog status value (GGIO4.MX.AnIn1.instMag.f).
- **ANALOG IN 1 DB:** This setting specifies the deadband for each analog value. Refer to IEC 61850-7-1 and 61850-7-3 for details. The deadband is used to determine when to update the deadbanded magnitude from the instantaneous magnitude. The deadband is a percentage of the difference between the maximum and minimum values.
- **ANALOG IN 1 MIN:** This setting specifies the minimum value for each analog value. Refer to IEC 61850-7-1 and 61850-7-3 for details. This minimum value is used to determine the deadband. The deadband is used in the determination of the deadbanded magnitude from the instantaneous magnitude.
- **ANALOG IN 1 MAX:** This setting defines the maximum value for each analog value. Refer to IEC 61850-7-1 and 61850-7-3 for details. This maximum value is used to determine the deadband. The deadband is used in the determination of the deadbanded magnitude from the instantaneous magnitude.

Note that the **ANALOG IN 1 MIN** and **ANALOG IN 1 MAX** settings are stored as IEEE 754 / IEC 60559 floating point numbers. Because of the large range of these settings, not all values can be stored. Some values may be rounded to the closest possible floating point number.

The GGIO5 integer configuration points are shown below:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ GGIO5 ANALOG CONFIGURATION

<input checked="" type="checkbox"/> GGIO5 UINTEGER		GGIO5 UINT In 1:	Off	Range: Off, any FlexInteger™ parameter
<input checked="" type="checkbox"/> CONFIGURATION				
MESSAGE		GGIO5 UINT In 2:	Off	Range: Off, any FlexInteger parameter
MESSAGE		GGIO5 UINT In 3:	Off	Range: Off, any FlexInteger parameter
MESSAGE		GGIO5 UINT In 16:	Off	Range: Off, any FlexInteger parameter

The GGIO5 logical node allows IEC 61850 client access to integer data values. This allows access to as many as 16 unsigned integer value points, associated timestamps, and quality flags. The method of configuration is similar to that of GGIO1 (binary status values). The settings allow the selection of FlexInteger values for each GGIO5 integer value point.

It is intended that clients use GGIO5 to access generic integer values from the L90. Additional settings are provided to allow the selection of the number of integer values available in GGIO5 (1 to 16), and to assign FlexInteger values to the GGIO5 integer inputs. The following setting is available for all GGIO5 configuration points.

- **GGIO5 UINT IN 1 VALUE:** This setting selects the FlexInteger value to drive each GGIO5 integer status value (GGIO5.ST.UIntIn1). This setting is stored as an 32-bit unsigned integer value.

The report control configuration settings are shown below:

**PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ REPORT CONTROL CONFIGURATION
⇒ CONFIGURABLE REPORT 1 ⇒ REPORT 1 DATASET ITEMS**

<div> <div>REPORT 1</div> <div>DATASET ITEMS</div> </div>		ITEM 1 :	Range: all valid MMS data item references
	MESSAGE	ITEM 2 :	Range: as shown above
	MESSAGE	ITEM 3 :	Range: as shown above
	MESSAGE	ITEM 64 :	Range: as shown above

To create the dataset for logical node LN, program the **ITEM 1** to **ITEM 64** settings to a value from the list of IEC 61850 data attributes supported by the L90. Changes to the dataset will only take effect when the L90 is restarted. It is recommended to use reporting service from logical node LLN0 if a user needs some (but not all) data from already existing GGIO1, GGIO4, and MMXU4 points and their quantity is not greater than 64 minus the number items in this dataset.

The breaker configuration settings are shown below. Changes to these values take effect when the UR is restarted:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 61850 PROTOCOL ⇒ XCBR CONFIGURATION

<input checked="" type="checkbox"/> XCBR <input checked="" type="checkbox"/> CONFIGURATION		<div> <div> <div></div> <div></div> </div> <div> <div></div> <div></div> </div> </div>	<div> <div>XCBR1 ST.LOC OPERAND</div> <div>Off</div> </div>	Range: FlexLogic operand

The XCBR1 ST.LOC OPERAND setting is used to inhibit 61850 control commands to close or open breaker through UR Breaker Control element. See the Breaker Control element logic diagram for more information.

The CLEAR XCBR1 OpCnt setting allows clearing the breaker operating counter. As breakers operate by opening and closing, the XCBR operating counter status attribute (OpCnt) increments with every operation. Frequent breaker operation can result in very large OpCnt values over time. This setting allows the OpCnt to be reset to "0" for XCBR1.

The XCBR1 SYNCHECK CLS setting is used to supervise a close command with a synchrocheck condition within XCBR logical node. If a Close with SynchroCheck is requested (through a SelectWithValue service) and the SynchroCheck condition is not satisfied, a Negative Response (-Rsp) is issued with the REASON CODE of Blocked-by-synchrocheck.

The XCBR1 INTERLOCK OPN/CLS settings are used to assign an operand, which is linked into the EnaOpn or EnaCls INTERLOCKED inputs respectively of the XCBR. When this operand is asserted, XCBR logical node inhibits execution of the open and close commands respectively. If select before operate (SBO) with Extended Security is requested and Interlock condition exists, the UR responds with a Negative response (-Rsp) with the Reason Code Blocked-by-interlocking.

The XCBR1 Pos ctlModel setting is used to select control model per IEC 61850-7-3. The following control models are supported by URs:

- 0 — Status only
- 1 — Direct control with normal security (direct-operate)
- 2 — SBO control with normal security (operate-once)
- 3 — Direct control with enhanced security (direct-operate)
- 4 — SBO control with enhanced security (operate-once)

See IEC 61850-7-2 for complete details on these control models.

The XCBR1 Pos sboTimeout setting is used to select SBO timeout value. To be successful, the IEC 61850 "operate" command must be executed after the "select" command within the XCBR1 Pos sboTimeout setting value.

The disconnect switch configuration settings are shown below. Changes to these values will not take effect until the UR is restarted:

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ ⚙ COMMUNICATIONS ⇒ ⚙ IEC 61850 PROTOCOL ⇒ ⚙ XSWI CONFIGURATION

XSWI

CONFIGURATION

XSWI1 ST.LOC OPERAND
Off

Range: FlexLogic operand

MESSAGE

XSWI2 ST.LOC OPERAND

Range: No, Yes

↓

MESSAGE

CLEAR XSWI24 OpCnt:
No

Range: No, Yes

The CLEAR XSWI1 OpCnt setting represents the disconnect switch operating counter. As disconnect switches operate by opening and closing, the XSWI operating counter status attribute (OpCnt) increments with every operation. Frequent switch operation may result in very large OpCnt values over time. This setting allows the OpCnt to be reset to "0" for XSWI1.

Since GSSE/GOOSE messages are multicast Ethernet by specification, they are not usually be forwarded by network routers. However, GOOSE messages may be forwarded by routers if the router has been configured for VLAN functionality.

k) WEB SERVER HTTP PROTOCOL

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ WEB SERVER HTTP PROTOCOL

<input checked="" type="checkbox"/> WEB SERVER <input checked="" type="checkbox"/> HTTP PROTOCOL	 	HTTP TCP PORT NUMBER: 80	Range: 0 to 65535 in steps of 1
---	---	-----------------------------	---------------------------------

The L90 contains an embedded web server and is capable of transferring web pages to a web browser such as Internet Explorer or Firefox. The web pages are organized as a series of menus that can be accessed starting at the L90 “Main Menu”. Web pages are available showing DNP and IEC 60870-5-104 points lists, Modbus registers, event records, fault reports, and so on. First connect the UR and a computer to an Ethernet network, then enter the IP address of the L90 into the “Address” box of the web browser.

When the port is set to 0, the change takes effect when the L90 is restarted.

l) TFTP PROTOCOL

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ TFTP PROTOCOL

<input checked="" type="checkbox"/> TFTP PROTOCOL <input type="checkbox"/>	 	TFTP MAIN UDP PORT NUMBER: 69	Range: 0 to 65535 in steps of 1
MESSAGE	 	TFTP DATA UDP PORT 1 NUMBER: 0	Range: 0 to 65535 in steps of 1
MESSAGE		TFTP DATA UDP PORT 2 NUMBER: 0	Range: 0 to 65535 in steps of 1

The Trivial File Transfer Protocol (TFTP) can be used to transfer files from the L90 over a network. The L90 operates as a TFTP server. TFTP client software is available from various sources, including Microsoft Windows NT. The `dir.txt` file obtained from the L90 contains a list and description of all available files (event records, oscillography, etc.).

When the TFTP MAIN UDP PORT NUMBER is set to 0, the change takes effect when the L90 is restarted.

m) IEC 60870-5-104 PROTOCOL

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 60870-5-104 PROTOCOL

<input checked="" type="checkbox"/> IEC 60870-5-104 <input checked="" type="checkbox"/> PROTOCOL			IEC 60870-5-104 FUNCTION: Disabled	Range: Enabled, Disabled
	MESSAGE		IEC TCP PORT NUMBER: 2404	Range: 0 to 65535 in steps of 1
	MESSAGE		<input checked="" type="checkbox"/> IEC NETWORK <input checked="" type="checkbox"/> CLIENT ADDRESSES	Range: see sub-menu below
	MESSAGE		IEC COMMON ADDRESS OF ASDU: 0	Range: 0 to 65535 in steps of 1
	MESSAGE		IEC CYCLIC DATA PERIOD: 60 s	Range: 1 to 65535 s in steps of 1
	MESSAGE		IEC CURRENT DEFAULT THRESHOLD: 30000	Range: 0 to 65535 in steps of 1
	MESSAGE		IEC VOLTAGE DEFAULT THRESHOLD: 30000	Range: 0 to 65535 in steps of 1
	MESSAGE		IEC POWER DEFAULT THRESHOLD: 30000	Range: 0 to 65535 in steps of 1
	MESSAGE		IEC ENERGY DEFAULT THRESHOLD: 30000	Range: 0 to 65535 in steps of 1
	MESSAGE		IEC PF DEFAULT THRESHOLD: 1.00	Range: 0.00 to 1.00
	MESSAGE		IEC OTHER DEFAULT THRESHOLD: 30000	Range: 0 to 65535 in steps of 1
	MESSAGE		IEC REDUNDANCY ENABLED: No	Range: No, Yes

The L90 supports the IEC 60870-5-104 protocol. The L90 can be used as an IEC 60870-5-104 slave device connected to a maximum of two masters (usually either an RTU or a SCADA master station). Since the L90 maintains two sets of IEC 60870-5-104 data change buffers, no more than two masters should actively communicate with the L90 at one time.

The IEC ----- **DEFAULT THRESHOLD** settings are used to determine when to trigger spontaneous responses containing M_ME_NC_1 analog data. These settings group the L90 analog data into types: current, voltage, power, energy, and other. Each setting represents the default threshold value for all M_ME_NC_1 analog points of that type. For example, to trigger spontaneous responses from the L90 when any current values change by 15 A, the IEC **CURRENT DEFAULT THRESHOLD** setting should be set to 15. Note that these settings are the default values of the deadbands. P_ME_NC_1 (parameter of measured value, short floating point value) points can be used to change threshold values, from the default, for each individual M_ME_NC_1 analog point. Whenever power is removed and re-applied to the L90, the default thresholds are in effect.

The IEC **REDUNDANCY** setting decides whether multiple client connections are accepted or not. If redundancy is set to Yes, two simultaneous connections can be active at any given time.

When the IEC port number is set to 0, the change takes effect when the L90 is restarted.

The IEC 60870-5-104 and DNP protocols cannot be used simultaneously. When the IEC 60870-5-104 FUNCTION setting is set to "Enabled", the DNP protocol does not operate. When this setting is changed, it takes effect when power to the relay is cycled (off-to-on).

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ COMMUNICATIONS ⇒ IEC 60870-5-104 PROTOCOL ⇒ IEC NETWORK CLIENT ADDRESSES

<input checked="" type="checkbox"/> IEC NETWORK <input checked="" type="checkbox"/> CLIENT ADDRESSES		<div>◀▶</div> <div>CLIENT ADDRESS 1: 0.0.0.0</div>	Range: Standard IPV4 address format
	MESSAGE	<div>▲▼</div> <div>CLIENT ADDRESS 2: 0.0.0.0</div>	Range: Standard IPV4 address format
	MESSAGE	<div>▲▼</div> <div>CLIENT ADDRESS 3: 0.0.0.0</div>	Range: Standard IPV4 address format
	MESSAGE	<div>▲▼</div> <div>CLIENT ADDRESS 4: 0.0.0.0</div>	Range: Standard IPV4 address format
	MESSAGE	<div>▲</div> <div>CLIENT ADDRESS 5: 0.0.0.0</div>	Range: Standard IPV4 address format

The UR can specify a maximum of five clients for its IEC 104 connections. These are IP addresses for the controllers to which the UR can connect.

A maximum of two simultaneous connections are supported at any given time.

5.2.5 MODBUS USER MAP

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ MODBUS USER MAP

<input checked="" type="checkbox"/> MODBUS USER MAP <input type="checkbox"/>		<div>◀▶</div> <div>ADDRESS 1: 0 VALUE: 0</div>	Range: 0 to 65535 in steps of 1
	MESSAGE	<div>▲▼</div> <div>ADDRESS 2: 0 VALUE: 0</div>	Range: 0 to 65535 in steps of 1
	MESSAGE	<div>▲▼</div> <div>ADDRESS 3: 0 VALUE: 0</div>	Range: 0 to 65535 in steps of 1
	MESSAGE	<div>▲</div> <div>ADDRESS 256: 0 VALUE: 0</div>	Range: 0 to 65535 in steps of 1

↓

The Modbus user map provides read-only access for up to 256 registers. To obtain a memory map value, enter the desired address in the **ADDRESS** line (converted from hex to decimal format). The corresponding value displays in the **VALUE** line. A value of "0" in subsequent register **ADDRESS** lines automatically returns values for the previous **ADDRESS** lines incremented by "1". An address value of "0" in the initial register means "none" and values of "0" display for all registers. Different **ADDRESS** values can be entered as required in any of the register positions.

5.2.6 REAL TIME CLOCK

a) MAIN MENU

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ ↓ REAL TIME CLOCK

<div> <div>■ REAL TIME</div> <div>■ CLOCK</div> </div>	<div> <div>◀▶</div> </div>	<div> <div>SYNCHRONIZING SOURCE:</div> <div>None</div> </div>	<div>Range: None, PP/IRIG-B/PTP/SNTP, IRIG-B/PP/PTP/SNTP, PP/PTP/IRIG-B/SNTP</div>

MESSAGE	<div> <div>▲▼</div> </div>	<div> <div>■ PRECISION TIME</div> <div>■ PROTOCOL (1588)</div> </div>	See below
MESSAGE	<div> <div>▲▼</div> </div>	<div> <div>■ SNTP PROTOCOL</div> <div>■</div> </div>	See below
MESSAGE	<div> <div>▲</div> </div>	<div> <div>■ LOCAL TIME</div> <div>■</div> </div>	See below

The relay contains a real time clock (RTC) to create timestamps for communications protocols as well as for historical data, such as event records and oscillography. When the relay restarts, the RTC initializes from an onboard battery-backed clock, which has the same accuracy as an electronic watch, approximately ± 1 minute per month (~ 23 ppm). Once the RTC is synchronized with the Precision Time Protocol (PTP), IRIG-B, or SNTP, its accuracy approaches that of the synchronizing time delivered to the relay. When the L30/L90 channel asymmetry function is used, the relay's real time clock must be synchronized to an external time source using PTP or IRIG-B, typically from a global positioning system (GPS) receiver.

The **SYNCHRONIZING SOURCE** setting configures the priority sequence that the relay uses to determine which of the available external time sources synchronizes the RTC and the synchrophasor clock. A setting of None causes the RTC and the synchrophasor clock to free-run. A setting of PP/IRIG-B/PTP/SNTP, IRIG-B/PP/PTP/SNTP, or PP/PTP/IRIG-B/SNTP causes the relay to track the first source named that is enabled and operational, or free-run if none of these are available. Here, PP means a time source that is strictly compliant with PP, PTP means a time source that is not strictly compliant with PP. When a time source fails or recovers, the relay automatically transfers synchronization as required by this setting.

See the **COMMANDS ⇒ SET DATE AND TIME** menu section of this manual to manually set the RTC.

The **REAL TIME CLOCK EVENTS** setting allows changes to the date and/or time to be captured in the event record. The event records the RTC time before the adjustment.

To enable IRIG-B synchronization, the input **IRIG-B SIGNAL TYPE** must be set to DC Shift or Amplitude Modulated. IRIG-B synchronization can be disabled by making this setting None.

To configure and enable PTP and/or SNTP, or to set local time parameters (for example time zone, daylight savings), use the following sections.

b) PRECISION TIME PROTOCOL (1588)

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ REAL TIME CLOCK ⇒ PRECISION TIME PROTOCOL (1588)

The UR supports the Precision Time Protocol (PTP) specified in IEEE Std 1588 2008 using the Power Profile (PP) specified in IEEE Std C37.238 2011. This enables the relay to synchronize to the international time standard over an Ethernet network that implements PP.

The relay can be configured to operate on some PTP networks that are not strictly PP. Time accuracy can be less than specified for a PP network. Tolerated deviations from strict PP include 1) missing declaration of PP compliance in the messages, 2) connection to a network device that does not support the PTP peer delay mechanism, 3) jitter substantially greater than 1 μ s in received event messages, and 4) certain non-compliant announce and sync message update rates.

The relay implements PTP according to IEEE Std 1588 2008 and the equivalent IEC 61588:2009(E), sometimes referred to as version 2 PTP. It does not support the previous version of the standard (version 1).

PTP is a protocol that allows multiple clocks in a network to synchronize with one another. It permits synchronization accuracies better than 1 ns, but this requires each and every component in the network achieve very high levels of accuracy and a very high baud rate, faster than normally used for relay communications. When operating over a generic Ethernet network, time error may amount to 1 ms or more. PP is a profile of PTP which specifies a limited subset of PTP suitable for use in power system protection, control, automation and data communication applications, and thereby facilitates interoperability between different vendor's clocks and switches. PP specifies a worst-case delivered time error of less than 1 μ s over a 16-hop network.

In a PTP system and in a PP system, the clocks automatically organize themselves into a master-slave synchronization hierarchy with the "best" clock available making itself the "grandmaster" at the top of the hierarchy; all others make themselves "slaves" and track the grandmaster. Typically the grandmaster clock receives its time from GPS satellites or some other link to the international time standard. If the grandmaster fails, the next "best" clock available in the domain assumes the grandmaster role. Should a clock on starting up discover it is "better" than the present grandmaster, it assumes the grandmaster role and the previous grandmaster reverts to slave.

Time messages issued by the grandmaster are delayed as they pass through the network both due to the finite speed of the signal in the interconnecting fiber or wire. Each clock and switch implementing PP measures the propagation delay to each of its PP neighbors, and compensates for these delays in the time received. Each network device implementing PP measures the processing delay it introduces in each time message and compensates for this delay in the time it transmits. As a result, the time delivered to end-devices such as the UR are virtually identical to the grandmaster time. Should one of the network devices in the hierarchy not fully implement PP, the associated propagation delay and/or latency may not be compensated for, and the time received at the end-device could be in error by more than 100 μ s.

See the **Settings > Product Setup > Real Time Clock** section of this manual for a description of when time values received via PTP are used to update the relay's real time clock.

The following settings are available for configuring the relay for PTP.

STRICT POWER PROFILE

- Power profile (IEEE Std C37.238 2011) requires that the relay only select as a grandmaster power profile compliant clocks, that the delivered time have worst-case error of $\pm 1 \mu\text{s}$, and that the peer delay mechanism be implemented. With the strict power profile setting enabled, the relay will only select as master clocks displaying the IEEE_C37_238 identification codes. It will use a port only when the peer delay mechanism is operational. With the strict power profile setting disabled, the relay will use clocks without the power profile identification when no power profile clocks are present, and will use ports even if the peer delay mechanism is non-operational.
- This setting applies to all of the relay's PTP capable ports.

PTP DOMAIN NUMBER

- This setting should be set to the domain number of the grandmaster-capable clock(s) to be synchronized to. A network may support multiple time distribution domains, each distinguished with a unique domain number. More commonly, there is a single domain using the default domain number zero.
- This setting applies to all of the relay's PTP capable ports.

PTP VLAN PRIORITY

- This setting selects the value of the priority field in the 802.1Q VLAN tag in request messages issued by the relay's peer delay mechanism. In compliance with PP the default VLAN priority is 4, but it is recommended that in accordance with PTP it be set to 7.
- Depending on the characteristics of the device to which the relay is directly linked, VLAN Priority may have no effect.
- This setting applies to all of the relay's PTP capable ports.

PTP VLAN ID

- This setting selects the value of the ID field in the 802.1Q VLAN tag in request messages issued by the relay's peer delay mechanism. It is provided in compliance with PP. As these messages have a destination address that indicates they are not to be bridged, their VLAN ID serves no function, and so may be left at its default value.
- Depending on the characteristics of the device to which the relay is directly linked, VLAN ID may have no effect.
- This setting applies to all of the relay's PTP capable ports.

PORT 1 ... 3 FUNCTION

- While this port setting is selected to disabled, PTP is disabled on this port. The relay does not generate or listen to PTP messages on this port.

PORT 1 ... 3 PATH DELAY ADDER

- The time delivered by PTP is advanced by the time value in this setting prior to the time being used to synchronize the relay's real time clock. This is to compensate to the extent practical for time delivery delays not compensated for in the network. In a fully compliant PP network, the peer delay and the processing delay mechanisms compensate for all the delays between the grandmaster and the relay. In such networks, this setting should be zero.
- In networks containing one or more switches and/or clocks that do not implement both of these mechanisms, not all delays are compensated, so the time of message arrival at the relay will be later than the time indicated in the message. This setting can be used to approximately compensate for this delay. However, as the relay is not aware of network switching that dynamically changes the amount of uncompensated delay, there is no setting that will always completely correct for uncompensated delay. A setting can be chosen that will reduce worst-case error to half of the range between minimum and maximum uncompensated delay, if these values are known.

PORT 1 ... 3 PATH DELAY ASYMMETRY

- This setting corresponds to "delayAsymmetry" in PTP, which is used by the peer delay mechanism to compensate for any difference in the propagation delay between the two directions of a link. Except in unusual cases, the two fibers are of essentially identical length and composition, so this setting should be set to zero.
- In unusual cases where the length of the link is different in different directions, this setting should be set to the number of nanoseconds the Ethernet propagation delay to the relay is longer than the mean of path propagation delays to and

from the relay. For instance, if it is known say from the physical length of the fibers and the propagation speed in the fibers that the delay from the relay to the Ethernet switch it is connected to is 9 000 ns and the that the delay from the switch to the relay is 11 000 ns, then the mean delay is 10 000 ns, and the path delay asymmetry is $11000 - 10000 = +1000$ ns.

c) SNTP PROTOCOL

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ REAL TIME CLOCK ⇒ SNTP PROTOCOL

<div>■ SNTP PROTOCOL</div> <div>MESSAGE</div> <div>MESSAGE</div>	<div>◀▶</div>	<div>SNTP FUNCTION:</div> <div>Disabled</div>	Range: Enabled, Disabled
	<div>▲▼</div>	<div>SNTP SERVER IP ADDR:</div> <div>0.0.0.0</div>	Range: Standard IP address format
	<div>▲</div>	<div>SNTP UDP PORT</div> <div>NUMBER: 123</div>	Range: 0 to 65535 in steps of 1

The L90 supports the Simple Network Time Protocol specified in RFC-2030. With SNTP, the L90 can obtain clock time over an Ethernet network. The L90 acts as an SNTP client to receive time values from an SNTP/NTP server, usually a dedicated product using a GPS receiver to provide an accurate time. Unicast SNTP is supported. The UR-series relays do not support the broadcast, multicast or anycast SNTP functionality.

The **SNTP FUNCTION** setting enables or disabled the SNTP feature on the L90.

To use SNTP, **SNTP SERVER IP ADDR** must be set to the SNTP/NTP server IP address. Once this address is set and **SNTP FUNCTION** is “Enabled”, the L90 attempts to obtain time values from the SNTP/NTP server. Since many time values are obtained and averaged, it generally takes three to four minutes until the L90 clock is closely synchronized with the SNTP/NTP server. It takes up to two minutes for the L90 to signal an SNTP self-test error if the server is offline.

The **SNTP UDP PORT NUMBER** is 123 for normal SNTP operation. If SNTP is not required, close the port by setting it to 0.

When the **SNTP UDP PORT NUMBER** is set to 0, the change takes effect when the L90 is restarted.

d) LOCAL TIME

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ ⚙ REAL TIME CLOCK ⇒ ⚙ LOCAL TIME

MESSAGE	⏮ ⏭ ⏭ ⏮	DST STOP HOUR: 2	Range: 0 to 23

The UR device maintains two times: local time and Universal Coordinated Time (UTC). Local time can be provided by IRIG-B signals. UTC time is provided by SNTP servers.

The real-time clock (RTC) and communication protocol times are not correct unless Local Time is configured for the current location. When the RTC is synchronized with IRIG-B, Local Time must be configured for the current location or else the timestamps may not be accurate. Furthermore, times reported in historical records and communication protocols may be incorrect if the Local Time setting is not configured properly.

The **LOCAL TIME OFFSET FROM UTC** setting is used to specify the local time zone offset from UTC (Greenwich Mean Time) in hours. Time zones in the eastern hemisphere have positive values; time zones in the western hemisphere have negative values. A value of zero causes the relay to use UTC for local time. This setting has two uses. When the system RTC is synchronized with a communications protocol providing only local time or it is free-running, the offset setting is used to calculate UTC from the local time these provide. When the RTC is synchronized with a communications protocol providing only UTC (such as PTP or SNTP), the time offset setting is used to determine local time from the UTC provided. PTP ALTERNATE_TIME_OFFSET_INDICATOR TLVs are not used to calculate local time. When a communications protocol other than PTP provides UTC to local time offset (meaning IRIG-B), that offset is used instead of the local time and daylight time settings.

The **DAYLIGHT SAVINGS TIME (DST)** settings can be used to allow the relay to follow the DST rules of the local time zone. Note that when IRIG-B time synchronization is active, the local time in the IRIG-B signal contains any daylight savings time offset and so the DST settings are ignored.

5.2.7 FAULT REPORTS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ ⚡ FAULT REPORTS ⇒ FAULT REPORT 1

The L90 incorporates a multi-ended fault locator method based on the synchronized voltage and current measurements at all ends of the transmission line. This makes it possible to compute the fault location without assumptions or approximations. This fault locator method is applicable on both two-terminal and three-terminal applications, with results computed independently at each terminal. For three-terminal line applications, the fault locator reports the exact line segment at which the fault occurred and the distance to the fault from the terminal adjacent to the fault.

if charging current compensation is configured and enabled, the line charging current is removed at each terminal for improved accuracy.

During communication channel failures, the L90 uses the single-ended algorithm to calculate and report fault location. When the single-ended algorithm is used for three-terminal line applications, the faulted segment of the line is not determined and reported.

The L90 relay supports one fault report and an associated fault locator. The signal source and trigger condition, as well as the characteristics of the line or feeder, are entered in this menu.

The fault report stores data, in non-volatile memory, pertinent to an event when triggered. The captured data contained in the `FaultReport.txt` file includes:

- Fault report number.
- Name of the relay, programmed by the user.
- Firmware revision of the relay.
- Date and time of trigger.
- Name of trigger (specific operand).
- Line or feeder ID via the name of a configured signal source.
- Active setting group at the time of trigger.
- Pre-fault current and voltage phasors (two cycles before either a 50DD disturbance associated with fault report source or the trigger operate). Once a disturbance is detected, pre-fault phasors hold for 3 seconds waiting for the fault report trigger. If trigger does not occur within this time, the values are cleared to prepare for the next disturbance.
- Fault current and voltage phasors (one cycle after the trigger).
- Elements operated at the time of triggering.
- Events: 9 before trigger and 7 after trigger (only available via the relay webpage).
- Fault duration times for each breaker (created by the breaker arcing current feature).

The captured data also includes the fault type and the distance to the fault location, as well as the reclose shot number (when applicable). To include fault duration times in the fault report, the user must enable and configure breaker arcing current feature for each of the breakers. Fault duration is reported on a per-phase basis.

The relay allows locating faults, including ground faults, from delta-connected VTs. In this case, the missing zero-sequence voltage is substituted either by the externally provided neutral voltage (broken delta VT) connected to the auxiliary voltage channel of a VT bank, or by the zero-sequence voltage approximated as a voltage drop developed by the zero-sequence current, and user-provided zero-sequence equivalent impedance of the system behind the relay.

The trigger can be any FlexLogic operand, but in most applications it is expected to be the same operand, usually a virtual output, that is used to drive an output relay to trip a breaker. To prevent the overwriting of fault events, the disturbance detector should not be used to trigger a fault report. A **FAULT RPT TRIG** event is automatically created when the report is triggered.

If a number of protection elements are ORed to create a fault report trigger, the first operation of any element causing the OR gate output to become high triggers a fault report. However, if other elements operate during the fault and the first operated element has not been reset (the OR gate output is still high), the fault report is not triggered again. Considering the reset time of protection elements, there is very little chance that fault report can be triggered twice in this manner. As the fault report must capture a usable amount of pre and post-fault data, it can not be triggered faster than every 20 ms.

Each fault report is stored as a file; the relay capacity is fifteen (15) files. An sixteenth (16th) trigger overwrites the oldest file.

The EnerVista UR Setup software is required to view all captured data. The relay faceplate display can be used to view the date and time of trigger, the fault type, the distance location of the fault, and the reclose shot number.

The **FAULT REPORT 1 SOURCE** setting selects the source for input currents and voltages and disturbance detection. For dual-breaker applications where the line current is supplied individually from two breaker CTs, the fault locator source should include the sum of currents from both CTs as well as the line voltage.

The **FAULT 1 REPORT TRIG** setting assigns the FlexLogic operand representing the protection element/elements requiring operational fault location calculations. The distance to fault calculations are initiated by this signal. The **FAULT REPORT 1 Z1 MAG** and **FAULT REPORT 1 Z0 MAG** impedances are entered in secondary ohms.

For a two-terminal line application, the **FAULT REPORT 1 Z1 MAG**, **FAULT REPORT 1 Z1 ANG**, **FAULT REPORT 1 Z0 MAG**, **FAULT REPORT 1 Z0 ANG** and **FAULT REPORT 1 LENGTH** settings for the entire line must to be entered for fault location calculations. For a three-terminal application, these settings are used to enter the line segment impedance and length from the local terminal to the tap point only.

The **FAULT REP 1 REM1-TAP Z1 MAG** and **FAULT REP 1 REM1-TAP Z1 ANG** settings are used for three-terminal applications to enter positive sequence section impedances (in secondary ohms) for the line segment from remote terminal 1 to the tap point. The length of the line section from remote terminal 1 to the tap point is entered in the **FAULT REP 1 REM1-TAP LENGTH** setting.

The **FAULT REP 1 REM2-TAP Z1 MAG**, **FAULT REP 1 REM2-TAP Z1 ANG**, and **FAULT REP 1 REM2-TAP LENGTH** settings are used as above, but for the line segment from remote terminal 2 to the tap point.

The **FAULT REPORT 1 VT SUBSTITUTION** setting shall be set to "None" if the relay is fed from wye-connected VTs. If delta-connected VTs are used, and the relay is supplied with the neutral (3V0) voltage, this setting shall be set to "V0". The method is still exact, as the fault locator would combine the line-to-line voltage measurements with the neutral voltage measurement to re-create the line-to-ground voltages. See the **ACTUAL VALUES** ⇒ **RECORDS** ⇒ **FAULT REPORTS** menu for additional details. It required to configure the delta and neutral voltages under the source indicated as input for the fault report. Also, the relay will check if the auxiliary signal configured is marked as "Vn" by the user (under VT setup), and inhibit the fault location if the auxiliary signal is labeled differently.

If the broken-delta neutral voltage is not available to the relay, an approximation is possible by assuming the missing zero-sequence voltage to be an inverted voltage drop produced by the zero-sequence current and the user-specified equivalent zero-sequence system impedance behind the relay: $V_0 = -Z_0 \times I_0$. In order to enable this mode of operation, the **FAULT REPORT 1 VT SUBSTITUTION** setting shall be set to "I0".

The **FAULT REP 1 SYSTEM Z0 MAG** and **FAULT REP 1 SYSTEM Z0 ANGLE** settings are used only when the **VT SUBSTITUTION** setting value is "I0". The magnitude is to be entered in secondary ohms. This impedance is an average system equivalent behind the relay. It can be calculated as zero-sequence Thevenin impedance at the local bus with the protected line/feeder disconnected. The method is accurate only if this setting matches perfectly the actual system impedance during the fault. If the system exhibits too much variability, this approach is questionable and the fault location results for single-line-to-ground faults shall be trusted with accordingly. It should be kept in mind that grounding points in vicinity of the installation impact the system zero-sequence impedance (grounded loads, reactors, zig-zag transformers, shunt capacitor banks, etc.).

For proper operation of the multi-ended fault locator, the nominal primary voltage is expected to appear identical at all line terminals as seen from the nominal secondary voltage, VT ratio, and VT connection settings of the first 87L source.

5.2.8 OSCILLOGRAPHY

a) MAIN MENU

PATH: **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **OSCILLOGRAPHY**

<input checked="" type="checkbox"/> OSCILLOGRAPHY		NUMBER OF RECORDS: 5	Range: 1 to 64 in steps of 1
MESSAGE		TRIGGER MODE: Automatic Overwrite	Range: Automatic Overwrite, Protected
MESSAGE		TRIGGER POSITION: 50%	Range: 0 to 100% in steps of 1
MESSAGE		TRIGGER SOURCE: Off	Range: FlexLogic operand
MESSAGE		AC INPUT WAVEFORMS: 16 samples/cycle	Range: Off, 8, 16, 32, 64 samples/cycle
MESSAGE		<input checked="" type="checkbox"/> DIGITAL CHANNELS	
MESSAGE		<input checked="" type="checkbox"/> ANALOG CHANNELS	

Oscillography records contain waveforms captured at the sampling rate as well as other relay data at the point of trigger. Oscillography records are triggered by a programmable FlexLogic operand. Multiple oscillography records may be captured simultaneously.

The **NUMBER OF RECORDS** is selectable, but the number of cycles captured in a single record varies considerably based on other factors such as sample rate and the number of operational modules. There is a fixed amount of data storage for oscillography; the more data captured, the less the number of cycles captured per record. See the **ACTUAL VALUES** ⇄ **RECORDS** ⇄ **OSCILLOGRAPHY** menu to view the number of cycles captured per record. The following table provides sample configurations with corresponding cycles/record. The minimum number of oscillographic records is three.

Table 5–6: OSCILLOGRAPHY CYCLES/RECORD EXAMPLE

RECORDS	CT/VTS	SAMPLE RATE	DIGITALS	ANALOGS	CYCLES/RECORD
3	1	8	0	0	14663
3	1	16	16	0	6945
8	1	16	16	0	3472
8	1	16	16	4	2868
8	2	16	16	4	1691
8	2	16	63	16	1221
8	2	32	63	16	749
8	2	64	63	16	422
32	2	64	63	16	124

A new record may automatically overwrite an older record if **TRIGGER MODE** is set to “Automatic Overwrite”.

Set the **TRIGGER POSITION** to a percentage of the total buffer size (for example, 10%, 50%, 75%, etc.). A trigger position of 25% consists of 25% pre- and 75% post-trigger data. The **TRIGGER SOURCE** is always captured in oscillography and may be any FlexLogic parameter (element state, contact input, virtual output, etc.). The relay sampling rate is 64 samples per cycle.

The **AC INPUT WAVEFORMS** setting determines the sampling rate at which AC input signals (that is, current and voltage) are stored. Reducing the sampling rate allows longer records to be stored. This setting has no effect on the internal sampling rate of the relay which is always 64 samples per cycle; that is, it has no effect on the fundamental calculations of the device.

When changes are made to the oscillography settings, all existing oscillography records will be CLEARED.

b) DIGITAL CHANNELS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ ⬇ OSCILLOGRAPHY ⇒ ⬇ DIGITAL CHANNELS

The diagram illustrates the Digital Channels configuration. It features a header 'DIGITAL CHANNELS' with a minus sign. Below it, three channels are expanded: 'DIGITAL CHANNEL 1: Off' (Range: FlexLogic operand), 'DIGITAL CHANNEL 2: Off' (Range: FlexLogic operand), and 'DIGITAL CHANNEL 3: Off' (Range: FlexLogic operand). A downward arrow indicates that channels 4 through 62 are collapsed into a single 'MESSAGE' block. Channel 63 is also expanded, showing 'DIGITAL CHANNEL 63: Off' (Range: FlexLogic operand).

A **DIGITAL 1(63) CHANNEL** setting selects the FlexLogic operand state recorded in an oscillography trace. The length of each oscillography trace depends in part on the number of parameters selected here. Parameters set to “Off” are ignored. Upon startup, the relay will automatically prepare the parameter list.

c) ANALOG CHANNELS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ OSCILLOGRAPHY ⇒ ANALOG CHANNELS

<div>■ ANALOG CHANNELS</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div>	<div>◀▶</div>	<div>ANALOG CHANNEL 1:</div> <div>Off</div>	<div>Range: Off, any FlexAnalog parameter</div> <div>See Appendix A for complete list.</div>
	<div>▲▼</div>	<div>ANALOG CHANNEL 2:</div> <div>Off</div>	<div>Range: Off, any FlexAnalog parameter</div> <div>See Appendix A for complete list.</div>
	<div>▲▼</div>	<div>ANALOG CHANNEL 3:</div> <div>Off</div>	<div>Range: Off, any FlexAnalog parameter</div> <div>See Appendix A for complete list.</div>
	<div>↓</div>	<div>ANALOG CHANNEL 16:</div> <div>Off</div>	<div>Range: Off, any FlexAnalog parameter</div> <div>See Appendix A for complete list.</div>

These settings select the metering actual value recorded in an oscillography trace. The length of each oscillography trace depends in part on the number of parameters selected here. Parameters set to “Off” are ignored. The parameters available in a given relay are dependent on:

- The type of relay,
- The type and number of CT/VT hardware modules installed, and
- The type and number of analog input hardware modules installed.

Upon startup, the relay will automatically prepare the parameter list. A list of all possible analog metering actual value parameters is presented in Appendix A: *FlexAnalog parameters*. The parameter index number shown in any of the tables is used to expedite the selection of the parameter on the relay display. It can be quite time-consuming to scan through the list of parameters via the relay keypad and display - entering this number via the relay keypad will cause the corresponding parameter to be displayed.

All eight CT/VT module channels are stored in the oscillography file. The CT/VT module channels are named as follows:

<slot_letter><terminal_number>—<I or V><phase A, B, or C, or 4th input>

The fourth current input in a bank is called IG, and the fourth voltage input in a bank is called VX. For example, F2-IB designates the IB signal on terminal 2 of the CT/VT module in slot F.

If there are no CT/VT modules and analog input modules, no analog traces will appear in the file; only the digital traces will appear.

5.2.9 DATA LOGGER

PATH: SETTINGS ⇒ DATA LOGGER ⇒ DATA LOGGING

DATA LOGGER		DATA LOGGER MODE: Continuous	Range: Continuous, Trigger
MESSAGE	DATA LOGGER TRIGGER: Off		Range: FlexLogic operand
MESSAGE	DATA LOGGER RATE: 60000 ms		Range: 15 to 3600000 ms in steps of 1
MESSAGE	DATA LOGGER CHNL 1: Off		Range: Off, any FlexAnalog parameter. See Appendix A: FlexAnalog Parameters for complete list.
MESSAGE	DATA LOGGER CHNL 2: Off		Range: Off, any FlexAnalog parameter. See Appendix A: FlexAnalog Parameters for complete list.
MESSAGE	DATA LOGGER CHNL 3: Off		Range: Off, any FlexAnalog parameter. See Appendix A: FlexAnalog Parameters for complete list.
↓			
MESSAGE	DATA LOGGER CHNL 16: Off		Range: Off, any FlexAnalog parameter. See Appendix A: FlexAnalog Parameters for complete list.
MESSAGE	DATA LOGGER CONFIG: 0 CHNL x 0.0 DAYS		Range: Not applicable - shows computed data only

The data logger samples and records up to 16 analog parameters at a user-defined sampling rate. This recorded data may be downloaded to EnerVista UR Setup and displayed with *parameters* on the vertical axis and *time* on the horizontal axis. All data is stored in non-volatile memory, meaning that the information is retained when power to the relay is lost.

For a fixed sampling rate, the data logger can be configured with a few channels over a long period or a larger number of channels for a shorter period. The relay automatically partitions the available memory between the channels in use. Example storage capacities for a system frequency of 60 Hz are shown in the following table.

Table 5-7: DATA LOGGER STORAGE CAPACITY EXAMPLE

SAMPLING RATE	CHANNELS	DAYS	STORAGE CAPACITY
15 ms	1	0.1	954 s
	8	0.1	120 s
	9	0.1	107 s
	16	0.1	60 s
1000 ms	1	0.7	65457 s
	8	0.1	8182 s
	9	0.1	7273 s
	16	0.1	4091 s
60000 ms	1	45.4	3927420 s
	8	5.6	490920 s
	9	5	436380 s
	16	2.8	254460 s
3600000 ms	1	2727.5	235645200 s
	8	340.9	29455200 s
	9	303	26182800 s

Changing any setting affecting data logger operation will clear any data that is currently in the log.

NOTE

- **DATA LOGGER MODE:** This setting configures the mode in which the data logger will operate. When set to “Continuous”, the data logger will actively record any configured channels at the rate as defined by the **DATA LOGGER RATE**. The data logger will be idle in this mode if no channels are configured. When set to “Trigger”, the data logger will begin to record any configured channels at the instance of the rising edge of the **DATA LOGGER TRIGGER** source FlexLogic operand. *The data logger will ignore all subsequent triggers* and will continue to record data until the active record is full. Once the data logger is full a **CLEAR DATA LOGGER** command is required to clear the data logger record before a new record can be started. Performing the **CLEAR DATA LOGGER** command will also stop the current record and reset the data logger to be ready for the next trigger.
- **DATA LOGGER TRIGGER:** This setting selects the signal used to trigger the start of a new data logger record. Any FlexLogic operand can be used as the trigger source. The **DATA LOGGER TRIGGER** setting only applies when the mode is set to “Trigger”.
- **DATA LOGGER RATE:** This setting selects the time interval at which the actual value data will be recorded.
- **DATA LOGGER CHNL 1(16):** This setting selects the metering actual value that is to be recorded in Channel 1(16) of the data log. The parameters available in a given relay are dependent on: the type of relay, the type and number of CT/VT hardware modules installed, and the type and number of Analog Input hardware modules installed. Upon startup, the relay will automatically prepare the parameter list. A list of all possible analog metering actual value parameters is shown in Appendix A: *FlexAnalog Parameters*. The parameter index number shown in any of the tables is used to expedite the selection of the parameter on the relay display. It can be quite time-consuming to scan through the list of parameters via the relay keypad/display – entering this number via the relay keypad will cause the corresponding parameter to be displayed.
- **DATA LOGGER CONFIG:** This display presents the total amount of time the Data Logger can record the channels not selected to “Off” without over-writing old data.

5.2.10 DEMAND

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ DEMAND

■ DEMAND	◀▶	CRNT DEMAND METHOD: Thermal Exponential	Range: Thermal Exponential, Block Interval, Rolling Demand
MESSAGE	▲▼	POWER DEMAND METHOD: Thermal Exponential	Range: Thermal Exponential, Block Interval, Rolling Demand
MESSAGE	▲▼	DEMAND INTERVAL: 15 MIN	Range: 5, 10, 15, 20, 30, 60 minutes
MESSAGE	▲▼	DEMAND TRIGGER: Off	Range: FlexLogic operand Note: for calculation using Method 2a

The relay measures current demand on each phase, and three-phase demand for real, reactive, and apparent power. Current and Power methods can be chosen separately for the convenience of the user. Settings are provided to allow the user to emulate some common electrical utility demand measuring techniques, for statistical or control purposes. If the **CRNT DEMAND METHOD** is set to "Block Interval" and the **DEMAND TRIGGER** is set to "Off", Method 2 is used (see below). If **DEMAND TRIGGER** is assigned to any other FlexLogic™ operand, Method 2a is used (see below).

The relay can be set to calculate demand by any of three methods as described below:

CALCULATION METHOD 1: THERMAL EXPONENTIAL

This method emulates the action of an analog peak recording thermal demand meter. The relay measures the quantity (RMS current, real power, reactive power, or apparent power) on each phase every second, and assumes the circuit quantity remains at this value until updated by the next measurement. It calculates the 'thermal demand equivalent' based on the following equation:

$$d(t) = D(1 - e^{-kt}) \quad (\text{EQ 5.6})$$

where: d = demand value after applying input quantity for time t (in minutes)
 D = input quantity (constant), and $k = 2.3 / \text{thermal 90\% response time}$.

The 90% thermal response time characteristic of 15 minutes is illustrated below. A setpoint establishes the time to reach 90% of a steady-state value, just as the response time of an analog instrument. A steady state value applied for twice the response time will indicate 99% of the value.

Figure 5-9: THERMAL DEMAND CHARACTERISTIC

CALCULATION METHOD 2: BLOCK INTERVAL

This method calculates a linear average of the quantity (RMS current, real power, reactive power, or apparent power) over the programmed demand time interval, starting daily at 00:00:00 (i.e. 12:00 am). The 1440 minutes per day is divided into the number of blocks as set by the programmed time interval. Each new value of demand becomes available at the end of each time interval.

CALCULATION METHOD 2a: BLOCK INTERVAL (with Start Demand Interval Logic Trigger)

This method calculates a linear average of the quantity (RMS current, real power, reactive power, or apparent power) over the interval between successive Start Demand Interval logic input pulses. Each new value of demand becomes available at the end of each pulse. Assign a FlexLogic operand to the **DEMAND TRIGGER** setting to program the input for the new demand interval pulses.

If no trigger is assigned in the **DEMAND TRIGGER** setting and the **CRNT DEMAND METHOD** is "Block Interval", use calculating method #2. If a trigger is assigned, the maximum allowed time between 2 trigger signals is 60 minutes. If no trigger signal appears within 60 minutes, demand calculations are performed and available and the algorithm resets and starts the new cycle of calculations. The minimum required time for trigger contact closure is 20 μ s.

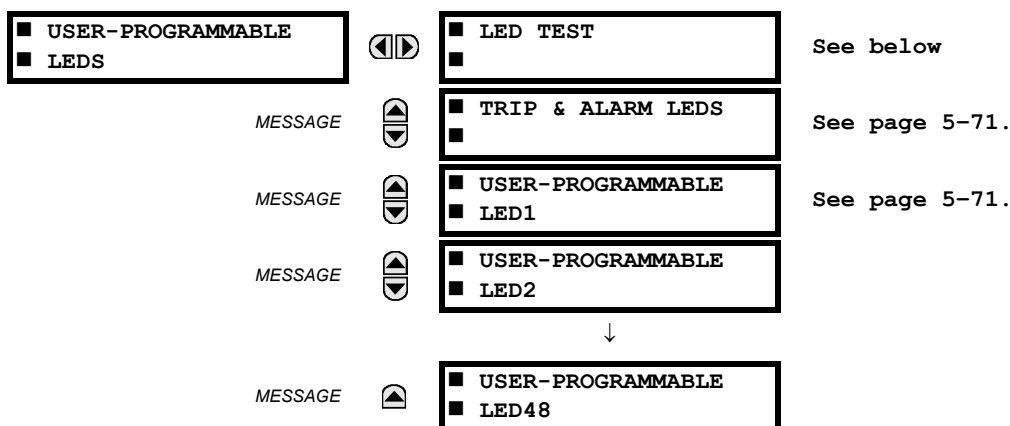

CALCULATION METHOD 3: ROLLING DEMAND

This method calculates a linear average of the quantity (RMS current, real power, reactive power, or apparent power) over the programmed demand time interval, in the same way as Block Interval. The value is updated every minute and indicates the demand over the time interval just preceding the time of update.

5.2.11 USER-PROGRAMMABLE LEDS

a) MAIN MENU

PATH: SETTINGS \Rightarrow PRODUCT SETUP \Rightarrow USER-PROGRAMMABLE LEDS

The 48 amber LEDs on relay panels 2 and 3 can be customized to illuminate when a selected FlexLogic operand is in the logic 1 state. The trip and alarm LEDs on panel 1 can also be customized in a similar manner. To ensure correct functionality of all LEDs, an LED test feature is also provided.

b) LED TEST

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ USER-PROGRAMMABLE LEDs ⇒ LED TEST

<div> <div>■ LED TEST</div> <div>MESSAGE</div> </div>	<div>◀▶</div>	<div>LED TEST FUNCTION:</div> <div>Disabled</div>	Range: Disabled, Enabled.
	<div>▲</div>	<div>LED TEST CONTROL:</div> <div>Off</div>	Range: FlexLogic operand

When enabled, the LED test can be initiated from any digital input or user-programmable condition such as user-programmable pushbutton. The control operand is configured under the **LED TEST CONTROL** setting. The test covers all LEDs, including the LEDs of the optional user-programmable pushbuttons.

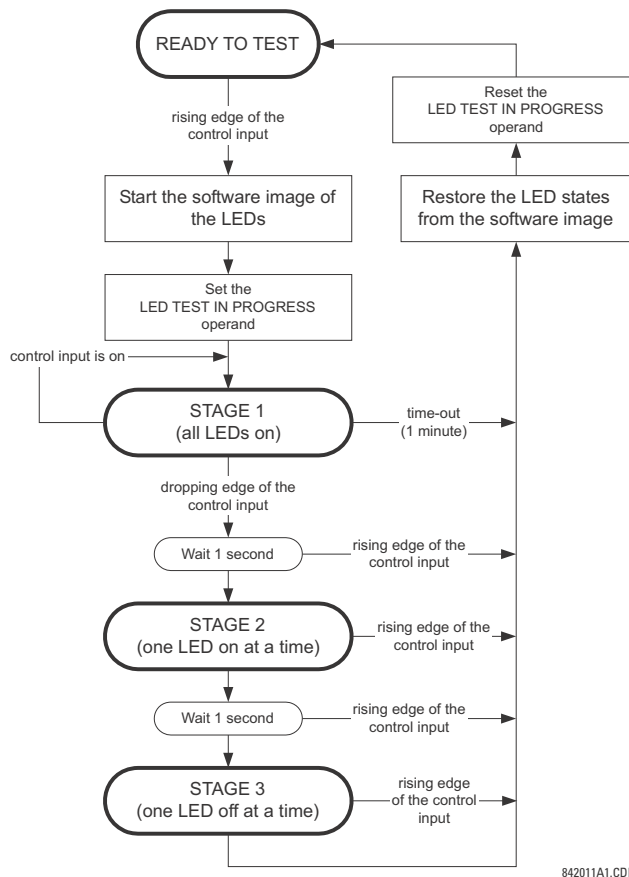

The test consists of three stages.

1. All 62 LEDs on the relay are illuminated. This is a quick test to verify if any of the LEDs is “burned”. This stage lasts as long as the control input is on, up to a maximum of 1 minute. After 1 minute, the test will end.
2. All the LEDs are turned off, and then one LED at a time turns on for 1 second, then back off. The test routine starts at the top left panel, moving from the top to bottom of each LED column. This test checks for hardware failures that lead to more than one LED being turned on from a single logic point. This stage can be interrupted at any time.
3. All the LEDs are turned on. One LED at a time turns off for 1 second, then back on. The test routine starts at the top left panel moving from top to bottom of each column of the LEDs. This test checks for hardware failures that lead to more than one LED being turned off from a single logic point. This stage can be interrupted at any time.

When testing is in progress, the LEDs are controlled by the test sequence, rather than the protection, control, and monitoring features. However, the LED control mechanism accepts all the changes to LED states generated by the relay and stores the actual LED states (on or off) in memory. When the test completes, the LEDs reflect the actual state resulting from relay response during testing. The reset pushbutton will not clear any targets when the LED Test is in progress.

A dedicated FlexLogic operand, LED TEST IN PROGRESS, is set for the duration of the test. When the test sequence is initiated, the LED TEST INITIATED event is stored in the event recorder.

The entire test procedure is user-controlled. In particular, stage 1 can last as long as necessary, and stages 2 and 3 can be interrupted. The test responds to the position and rising edges of the control input defined by the **LED TEST CONTROL** setting. The control pulses must last at least 250 ms to take effect. The following diagram explains how the test is executed.

842011A1.CDR

Figure 5–10: LED TEST SEQUENCE

APPLICATION EXAMPLE 1:

Assume one needs to check if any of the LEDs is “burned” through user-programmable pushbutton 1. The following settings should be applied. Configure user-programmable pushbutton 1 by making the following entries in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **USER-PROGRAMMABLE PUSHBUTTONS** ⇒ **USER PUSHBUTTON 1** menu:

PUSHBUTTON 1 FUNCTION: “Self-reset”

PUSHBTN 1 DROP-OUT TIME: “0.10 s”

Configure the LED test to recognize user-programmable pushbutton 1 by making the following entries in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **USER-PROGRAMMABLE LEDES** ⇒ **LED TEST** menu:

LED TEST FUNCTION: “Enabled”

LED TEST CONTROL: “PUSHBUTTON 1 ON”

The test will be initiated when the user-programmable pushbutton 1 is pressed. The pushbutton should remain pressed for as long as the LEDs are being visually inspected. When finished, the pushbutton should be released. The relay will then automatically start stage 2. At this point forward, test may be aborted by pressing the pushbutton.

APPLICATION EXAMPLE 2:

Assume one needs to check if any LEDs are “burned” as well as exercise one LED at a time to check for other failures. This is to be performed via user-programmable pushbutton 1.

After applying the settings in application example 1, hold down the pushbutton as long as necessary to test all LEDs. Next, release the pushbutton to automatically start stage 2. Once stage 2 has started, the pushbutton can be released. When stage 2 is completed, stage 3 will automatically start. The test may be aborted at any time by pressing the pushbutton.

c) TRIP AND ALARM LEDS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ USER-PROGRAMMABLE LEDS ⇒ TRIP & ALARM LEDS

<div> <div>TRIP & ALARM LEDS</div> <div>MESSAGE</div> </div>	<div> <div>TRIP LED INPUT:</div> <div>Off</div> </div>	Range: FlexLogic operand
	<div> <div>ALARM LED INPUT:</div> <div>Off</div> </div>	Range: FlexLogic operand

The trip and alarm LEDs are in the first LED column (enhanced faceplate) and on LED panel 1 (standard faceplate). Each indicator can be programmed to become illuminated when the selected FlexLogic operand is in the logic 1 state.

d) USER-PROGRAMMABLE LED 1(48)

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ USER-PROGRAMMABLE LEDS ⇒ USER-PROGRAMMABLE LED 1(48)

<div> <div>USER-PROGRAMMABLE</div> <div>LED 1</div> </div>	<div> <div>LED 1 OPERAND:</div> <div>Off</div> </div>	Range: FlexLogic operand
	<div> <div>LED 1 TYPE:</div> <div>Self-Reset</div> </div>	Range: Self-Reset, Latched

There are 48 amber LEDs across the relay faceplate LED panels. Each of these indicators can be programmed to illuminate when the selected FlexLogic operand is in the logic 1 state.

For the standard faceplate, the LEDs are located as follows.

- LED Panel 2: user-programmable LEDs 1 through 24
- LED Panel 3: user programmable LEDs 25 through 48

For the enhanced faceplate, the LEDs are located as follows.

- LED column 2: user-programmable LEDs 1 through 12
- LED column 3: user-programmable LEDs 13 through 24
- LED column 4: user-programmable LEDs 25 through 36
- LED column 5: user-programmable LEDs 37 through 48

Refer to the *LED indicators* section in chapter 4 for additional information on the location of these indexed LEDs.

The user-programmable LED settings select the FlexLogic operands that control the LEDs. If the **LED 1 TYPE** setting is “Self-Reset” (the default setting), the LED illumination will track the state of the selected LED operand. If the **LED 1 TYPE** setting is “Latched”, the LED, once lit, remains so until reset by the faceplate RESET button, from a remote device via a communications channel, or from any programmed operand, even if the LED operand state de-asserts.

Table 5–8: RECOMMENDED SETTINGS FOR USER-PROGRAMMABLE LEDS

SETTING	PARAMETER	SETTING	PARAMETER
LED 1 operand	SETTING GROUP ACT 1	LED 13 operand	Off
LED 2 operand	SETTING GROUP ACT 2	LED 14 operand	BREAKER 2 OPEN
LED 3 operand	SETTING GROUP ACT 3	LED 15 operand	BREAKER 2 CLOSED
LED 4 operand	SETTING GROUP ACT 4	LED 16 operand	BREAKER 2 TROUBLE
LED 5 operand	SETTING GROUP ACT 5	LED 17 operand	SYNC 1 SYNC OP
LED 6 operand	SETTING GROUP ACT 6	LED 18 operand	SYNC 2 SYNC OP
LED 7 operand	Off	LED 19 operand	Off
LED 8 operand	Off	LED 20 operand	Off
LED 9 operand	BREAKER 1 OPEN	LED 21 operand	AR ENABLED
LED 10 operand	BREAKER 1 CLOSED	LED 22 operand	AR DISABLED
LED 11 operand	BREAKER 1 TROUBLE	LED 23 operand	AR RIP
LED 12 operand	Off	LED 24 operand	AR LO

Refer to the *Control of setting groups* example in the *Control elements* section of this chapter for group activation.

5.2.12 USER-PROGRAMMABLE SELF-TESTS

For user-programmable self-tests for CyberSentry, use the **Setup > Security > Supervisory** menu instead.

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ USER-PROGRAMMABLE SELF TESTS

<div> <div>■ USER-PROGRAMMABLE</div> <div>■ SELF TESTS</div> </div>			REMOTE DEVICE OFF FUNCTION: Enabled	Range: Disabled, Enabled.
	MESSAGE		FIRST ETHERNET FAIL FUNCTION: Disabled	Range: Disabled, Enabled.
	MESSAGE		SEC. ETHERNET FAIL FUNCTION: Disabled	Range: Disabled, Enabled.
	MESSAGE		THIRD ETHERNET FAIL FUNCTION: Disabled	Range: Disabled, Enabled.
	MESSAGE		BATTERY FAIL FUNCTION: Enabled	Range: Disabled, Enabled.
	MESSAGE		SNTP FAIL FUNCTION: Enabled	Range: Disabled, Enabled.
	MESSAGE		IRIG-B FAIL FUNCTION: Enabled	Range: Disabled, Enabled.
	MESSAGE		PTP FAIL FUNCTION: Enabled	Range: Disabled, Enabled.
	MESSAGE		SFP MODULE FAIL FUNCTION: Disabled	Range: Disabled, Enabled.

All major self-test alarms are reported automatically with their corresponding FlexLogic operands, events, and targets. Most of the minor alarms can be disabled if desired.

When in the “Disabled” mode, minor alarms will not assert a FlexLogic operand, write to the event recorder, or display target messages. Moreover, they will not trigger the **ANY MINOR ALARM** or **ANY SELF-TEST** messages. When in the “Enabled” mode, minor alarms continue to function along with other major and minor alarms. Refer to the *Relay self-tests* section in chapter 7 for additional information on major and minor self-test alarms.

5.2.13 CONTROL PUSHBUTTONS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ CONTROL PUSHBUTTONS ⇒ CONTROL PUSHBUTTON 1(7)

<div> <div>■ CONTROL</div> <div>■ PUSHBUTTON 1</div> </div>			CONTROL PUSHBUTTON 1 FUNCTION: Disabled	Range: Disabled, Enabled
	MESSAGE		CONTROL PUSHBUTTON 1 EVENTS: Disabled	Range: Disabled, Enabled

There are three standard control pushbuttons, labeled USER 1, USER 2, and USER 3, on the standard and enhanced front panels. These are user-programmable and can be used for various applications such as performing an LED test, switching setting groups, and invoking and scrolling through user-programmable displays.

Firmware revisions 3.2x and older use these three pushbuttons for manual breaker control. This functionality has been retained – if the breaker control feature is configured to use the three pushbuttons, they cannot be used as user-programmable control pushbuttons.

The location of the control pushbuttons are shown in the following figures.

Figure 5-11: CONTROL PUSHBUTTONS (ENHANCED FACEPLATE)

An additional four control pushbuttons are included on the standard faceplate when the L90 is ordered with the twelve user-programmable pushbutton option.

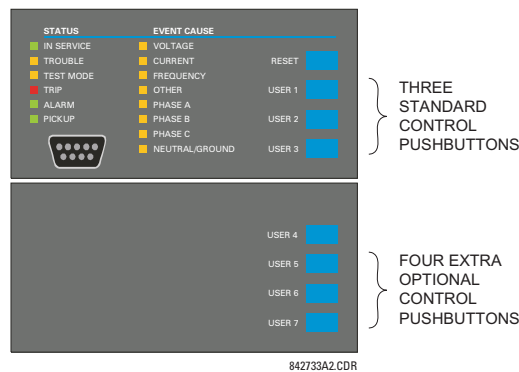

Figure 5-12: CONTROL PUSHBUTTONS (STANDARD FACEPLATE)

Control pushbuttons are not typically used for critical operations and are not protected by the control password. However, by supervising their output operands, the user can dynamically enable or disable control pushbuttons for security reasons.

Each control pushbutton asserts its own FlexLogic operand. These operands should be configured appropriately to perform the desired function. The operand remains asserted as long as the pushbutton is pressed and resets when the pushbutton is released. A dropout delay of 100 ms is incorporated to ensure fast pushbutton manipulation will be recognized by various features that may use control pushbuttons as inputs.

An event is logged in the event record (as per user setting) when a control pushbutton is pressed. No event is logged when the pushbutton is released. The faceplate keys (including control keys) cannot be operated simultaneously – a given key must be released before the next one can be pressed.

The control pushbuttons become user-programmable only if the breaker control feature is not configured for manual control via the USER 1 through 3 pushbuttons as shown below. If configured for manual control, breaker control typically uses the larger, optional user-programmable pushbuttons, making the control pushbuttons available for other user applications.

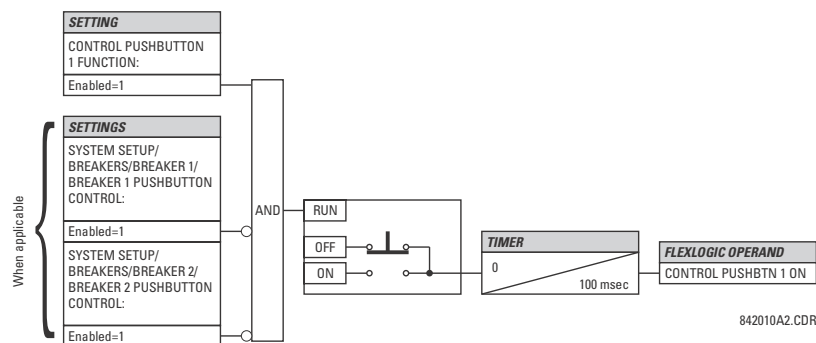

Figure 5-13: CONTROL PUSHBUTTON LOGIC

5.2.14 USER-PROGRAMMABLE PUSHBUTTONS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ USER-PROGRAMMABLE PUSHBUTTONS ⇒ USER PUSHBUTTON 1(16)

■ USER PUSHBUTTON 1		<div> <div></div> <div></div> </div>	PUSHBUTTON 1 FUNCTION: Disabled	Range: Self-Reset, Latched, Disabled
MESSAGE	<div> <div></div> <div></div> </div>	PUSHBTN 1 ID TEXT:	Range: Up to 20 alphanumeric characters	
MESSAGE	<div> <div></div> <div></div> </div>	PUSHBTN 1 ON TEXT:	Range: Up to 20 alphanumeric characters	
MESSAGE	<div> <div></div> <div></div> </div>	PUSHBTN 1 OFF TEXT:	Range: Up to 20 alphanumeric characters	
MESSAGE	<div> <div></div> <div></div> </div>	PUSHBTN 1 HOLD: 0.0 s	Range: 0.0 to 10.0 s in steps of 0.1	
MESSAGE	<div> <div></div> <div></div> </div>	PUSHBTN 1 SET: Off	Range: FlexLogic operand	
MESSAGE	<div> <div></div> <div></div> </div>	PUSHBTN 1 RESET: Off	Range: FlexLogic operand	
MESSAGE	<div> <div></div> <div></div> </div>	PUSHBTN 1 AUTORST: Disabled	Range: Disabled, Enabled

MESSAGE	<div> <div></div> <div></div> </div>	PUSHBTN 1 LED CTL: Off	Range: FlexLogic operand	
MESSAGE	<div> <div></div> <div></div> </div>	PUSHBTN 1 MESSAGE: Disabled	Range: Disabled, Normal, High Priority	
MESSAGE	<div> <div></div> <div></div> </div>	PUSHBUTTON 1 EVENTS: Disabled	Range: Disabled, Enabled	

The optional user-programmable pushbuttons (specified in the order code) provide an easy and error-free method of entering digital state (on, off) information. The number of available pushbuttons is dependent on the faceplate module ordered with the relay.

- Type P faceplate: standard horizontal faceplate with 12 user-programmable pushbuttons.
- Type Q faceplate: enhanced horizontal faceplate with 16 user-programmable pushbuttons.

The digital state can be entered locally (by directly pressing the front panel pushbutton) or remotely (via FlexLogic operands) into FlexLogic equations, protection elements, and control elements. Typical applications include breaker control, autorecloser blocking, and setting groups changes. The user-programmable pushbuttons are under the control level of password protection.

The user-configurable pushbuttons for the enhanced faceplate are shown below.

Figure 5-14: USER-PROGRAMMABLE PUSHBUTTONS (ENHANCED FACEPLATE)

The user-configurable pushbuttons for the standard faceplate are shown below.

Figure 5-15: USER-PROGRAMMABLE PUSHBUTTONS (STANDARD FACEPLATE)

Both the standard and enhanced faceplate pushbuttons can be custom labeled with a factory-provided template, available online at <http://www.gedigitalenergy.com/multilin>. The EnerVista UR Setup software can also be used to create labels for the enhanced faceplate.

Each pushbutton asserts its own “On” and “Off” FlexLogic operands (for example, PUSHBUTTON 1 ON and PUSHBUTTON 1 OFF). These operands are available for each pushbutton and are used to program specific actions. If any pushbutton is active, the ANY PB ON operand will be asserted.

Each pushbutton has an associated LED indicator. By default, this indicator displays the present status of the corresponding pushbutton (on or off). However, each LED indicator can be assigned to any FlexLogic operand through the **PUSHBTN 1 LED CTL** setting.

The pushbuttons can be automatically controlled by activating the operands assigned to the **PUSHBTN 1 SET** (for latched and self-reset mode) and **PUSHBTN 1 RESET** (for latched mode only) settings. The pushbutton reset status is declared when the PUSHBUTTON 1 OFF operand is asserted. The activation and deactivation of user-programmable pushbuttons is dependent on whether latched or self-reset mode is programmed.

- **Latched mode:** In latched mode, a pushbutton can be set (activated) by asserting the operand assigned to the **PUSHBTN 1 SET** setting or by directly pressing the associated front panel pushbutton. The pushbutton maintains the set state until deactivated by the reset command or after a user-specified time delay. The state of each pushbutton is stored in non-volatile memory and maintained through a loss of control power.

The pushbutton is reset (deactivated) in latched mode by asserting the operand assigned to the **PUSHBTN 1 RESET** setting or by directly pressing the associated active front panel pushbutton.

It can also be programmed to reset automatically through the **PUSHBTN 1 AUTORST** and **PUSHBTN 1 AUTORST DELAY** settings. These settings enable the autoreset timer and specify the associated time delay. The autoreset timer can be used in select-before-operate (SBO) breaker control applications, where the command type (close/open) or breaker location (feeder number) must be selected prior to command execution. The selection must reset automatically if control is not executed within a specified time period.

- **Self-reset mode:** In self-reset mode, a pushbutton will remain active for the time it is pressed (the *pulse duration*) plus the dropout time specified in the **PUSHBTN 1 DROP-OUT TIME** setting. If the pushbutton is activated via FlexLogic, the pulse duration is specified by the **PUSHBTN 1 DROP-OUT TIME** only. The time the operand remains assigned to the **PUSHBTN 1 SET** setting has no effect on the pulse duration.

The pushbutton is reset (deactivated) in self-reset mode when the dropout delay specified in the **PUSHBTN 1 DROP-OUT TIME** setting expires.

The pulse duration of the remote set, remote reset, or local pushbutton must be at least 50 ms to operate the pushbutton. This allows the user-programmable pushbuttons to properly operate during power cycling events and various system disturbances that may cause transient assertion of the operating signals.

The local and remote operation of each user-programmable pushbutton can be inhibited through the **PUSHBTN 1 LOCAL** and **PUSHBTN 1 REMOTE** settings, respectively. If local locking is applied, the pushbutton will ignore set and reset commands executed through the front panel pushbuttons. If remote locking is applied, the pushbutton will ignore set and reset commands executed through FlexLogic operands.

The locking functions are not applied to the autorestart feature. In this case, the inhibit function can be used in SBO control operations to prevent the pushbutton function from being activated and ensuring “one-at-a-time” select operation.

The locking functions can also be used to prevent the accidental pressing of the front panel pushbuttons. The separate inhibit of the local and remote operation simplifies the implementation of local/remote control supervision.

Pushbutton states can be logged by the event recorder and displayed as target messages. In latched mode, user-defined messages can also be associated with each pushbutton and displayed when the pushbutton is on or changing to off.

- **PUSHBUTTON 1 FUNCTION:** This setting selects the characteristic of the pushbutton. If set to “Disabled”, the pushbutton is not active and the corresponding FlexLogic operands (both “On” and “Off”) are de-asserted. If set to “Self-Reset”, the control logic is activated by the pulse (longer than 100 ms) issued when the pushbutton is being physically pressed or virtually pressed via a FlexLogic operand assigned to the **PUSHBTN 1 SET** setting.

When in “Self-Reset” mode and activated locally, the pushbutton control logic asserts the “On” corresponding FlexLogic operand as long as the pushbutton is being physically pressed, and after being released the deactivation of the operand is delayed by the drop out timer. The “Off” operand is asserted when the pushbutton element is deactivated. If the pushbutton is activated remotely, the control logic of the pushbutton asserts the corresponding “On” FlexLogic operand only for the time period specified by the **PUSHBTN 1 DROP-OUT TIME** setting.

If set to “Latched”, the control logic alternates the state of the corresponding FlexLogic operand between “On” and “Off” on each button press or by virtually activating the pushbutton (assigning set and reset operands). When in the “Latched” mode, the states of the FlexLogic operands are stored in a non-volatile memory. Should the power supply be lost, the correct state of the pushbutton is retained upon subsequent power up of the relay.

- **PUSHBTN 1 ID TEXT:** This setting specifies the top 20-character line of the user-programmable message and is intended to provide ID information of the pushbutton. Refer to the *User-definable displays* section for instructions on how to enter alphanumeric characters from the keypad.
- **PUSHBTN 1 ON TEXT:** This setting specifies the bottom 20-character line of the user-programmable message and is displayed when the pushbutton is in the “on” position. Refer to the *User-definable displays* section for instructions on entering alphanumeric characters from the keypad.
- **PUSHBTN 1 OFF TEXT:** This setting specifies the bottom 20-character line of the user-programmable message and is displayed when the pushbutton is activated from the on to the off position and the **PUSHBUTTON 1 FUNCTION** is “Latched”. This message is not displayed when the **PUSHBUTTON 1 FUNCTION** is “Self-reset” as the pushbutton operand status is implied to be “Off” upon its release. The length of the “Off” message is configured with the **PRODUCT SETUP** ⇒ **DISPLAY PROPERTIES** ⇒ **FLASH MESSAGE TIME** setting.
- **PUSHBTN 1 HOLD:** This setting specifies the time required for a pushbutton to be pressed before it is deemed active. This timer is reset upon release of the pushbutton. Note that any pushbutton operation will require the pushbutton to be pressed a minimum of 50 ms. This minimum time is required prior to activating the pushbutton hold timer.
- **PUSHBTN 1 SET:** This setting assigns the FlexLogic operand serving to operate the pushbutton element and to assert PUSHBUTTON 1 ON operand. The duration of the incoming set signal must be at least 100 ms.
- **PUSHBTN 1 RESET:** This setting assigns the FlexLogic operand serving to reset pushbutton element and to assert PUSHBUTTON 1 OFF operand. This setting is applicable only if pushbutton is in latched mode. The duration of the incoming reset signal must be at least 50 ms.
- **PUSHBTN 1 AUTORST:** This setting enables the user-programmable pushbutton autoreset feature. This setting is applicable only if the pushbutton is in the “Latched” mode.
- **PUSHBTN 1 AUTORST DELAY:** This setting specifies the time delay for automatic reset of the pushbutton when in the latched mode.
- **PUSHBTN 1 REMOTE:** This setting assigns the FlexLogic operand serving to inhibit pushbutton operation from the operand assigned to the **PUSHBTN 1 SET** or **PUSHBTN 1 RESET** settings.
- **PUSHBTN 1 LOCAL:** This setting assigns the FlexLogic operand serving to inhibit pushbutton operation from the front panel pushbuttons. This locking functionality is not applicable to pushbutton autoreset.

- **PUSHBTN 1 DROP-OUT TIME:** This setting applies only to “Self-Reset” mode and specifies the duration of the pushbutton active status after the pushbutton has been released. When activated remotely, this setting specifies the entire activation time of the pushbutton status; the length of time the operand remains on has no effect on the pulse duration. This setting is required to set the duration of the pushbutton operating pulse.
- **PUSHBTN 1 LED CTL:** This setting assigns the FlexLogic operand serving to drive pushbutton LED. If this setting is “Off”, then LED operation is directly linked to PUSHBUTTON 1 ON operand.
- **PUSHBTN 1 MESSAGE:** If pushbutton message is set to “High Priority”, the message programmed in the **PUSHBTN 1 ID** and **PUSHBTN 1 ON TEXT** settings will be displayed undisturbed as long as PUSHBUTTON 1 ON operand is asserted. The high priority option is not applicable to the **PUSHBTN 1 OFF TEXT** setting.

This message can be temporary removed if any front panel keypad button is pressed. However, ten seconds of keypad inactivity will restore the message if the PUSHBUTTON 1 ON operand is still active.

If the **PUSHBTN 1 MESSAGE** is set to “Normal”, the message programmed in the **PUSHBTN 1 ID** and **PUSHBTN 1 ON TEXT** settings will be displayed as long as PUSHBUTTON 1 ON operand is asserted, but not longer than time period specified by **FLASH MESSAGE TIME** setting. After the flash time is expired, the default message or other active target message is displayed. The instantaneous reset of the flash message will be executed if any relay front panel button is pressed or any new target or message becomes active.

The **PUSHBTN 1 OFF TEXT** setting is linked to PUSHBUTTON 1 OFF operand and will be displayed in conjunction with **PUSHBTN 1 ID** only if pushbutton element is in the “Latched” mode. The **PUSHBTN 1 OFF TEXT** message will be displayed as “Normal” if the **PUSHBTN 1 MESSAGE** setting is “High Priority” or “Normal”.

- **PUSHBUTTON 1 EVENTS:** If this setting is enabled, each pushbutton state change will be logged as an event into event recorder.

The user-programmable pushbutton logic is shown below.

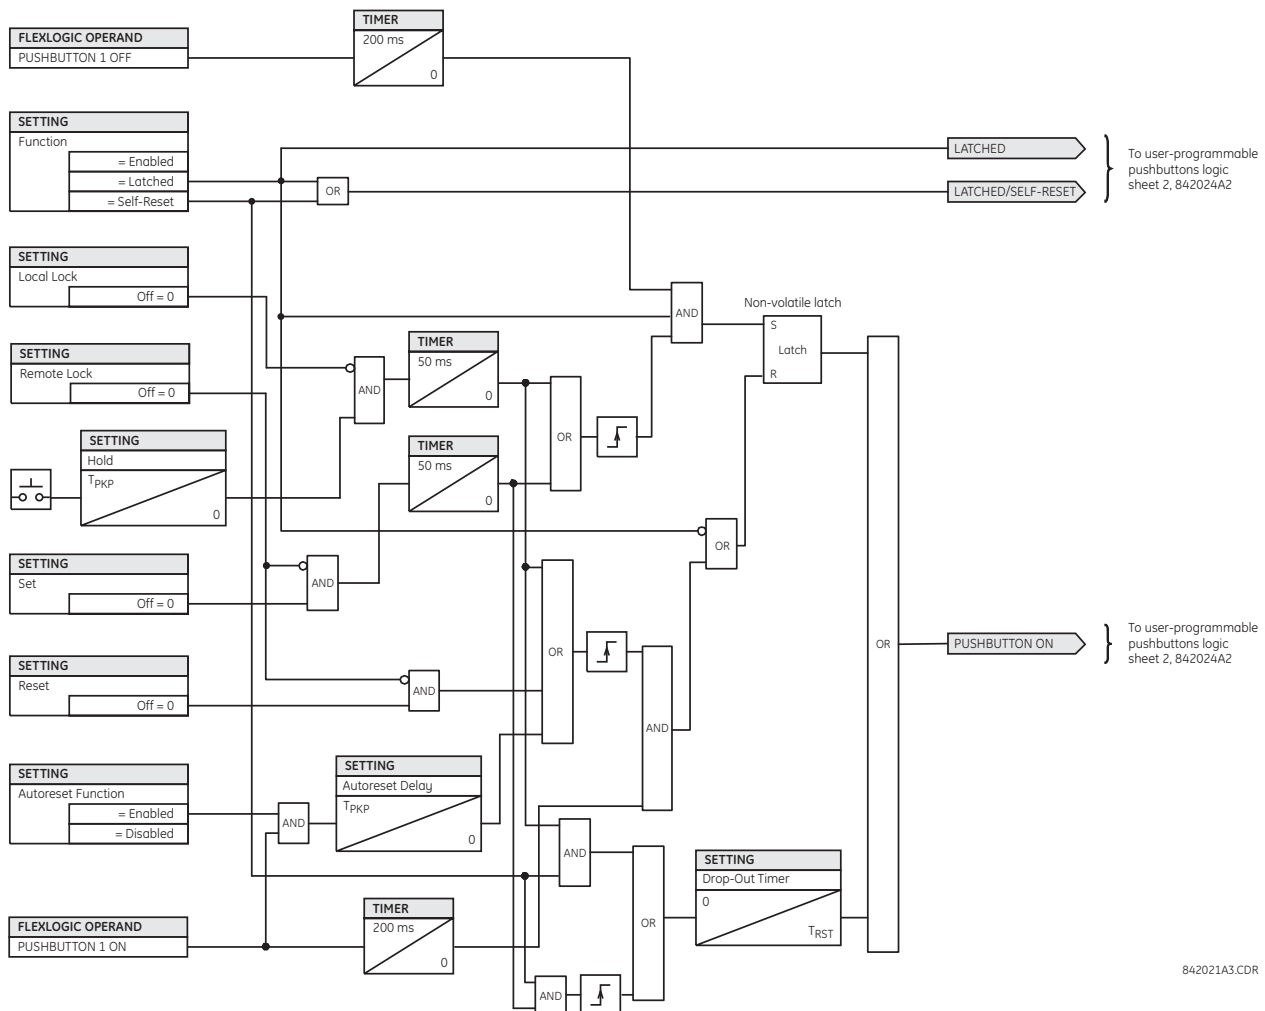

Figure 5-16: USER-PROGRAMMABLE PUSHBUTTON LOGIC (Sheet 1 of 2)

842021A3.CDR

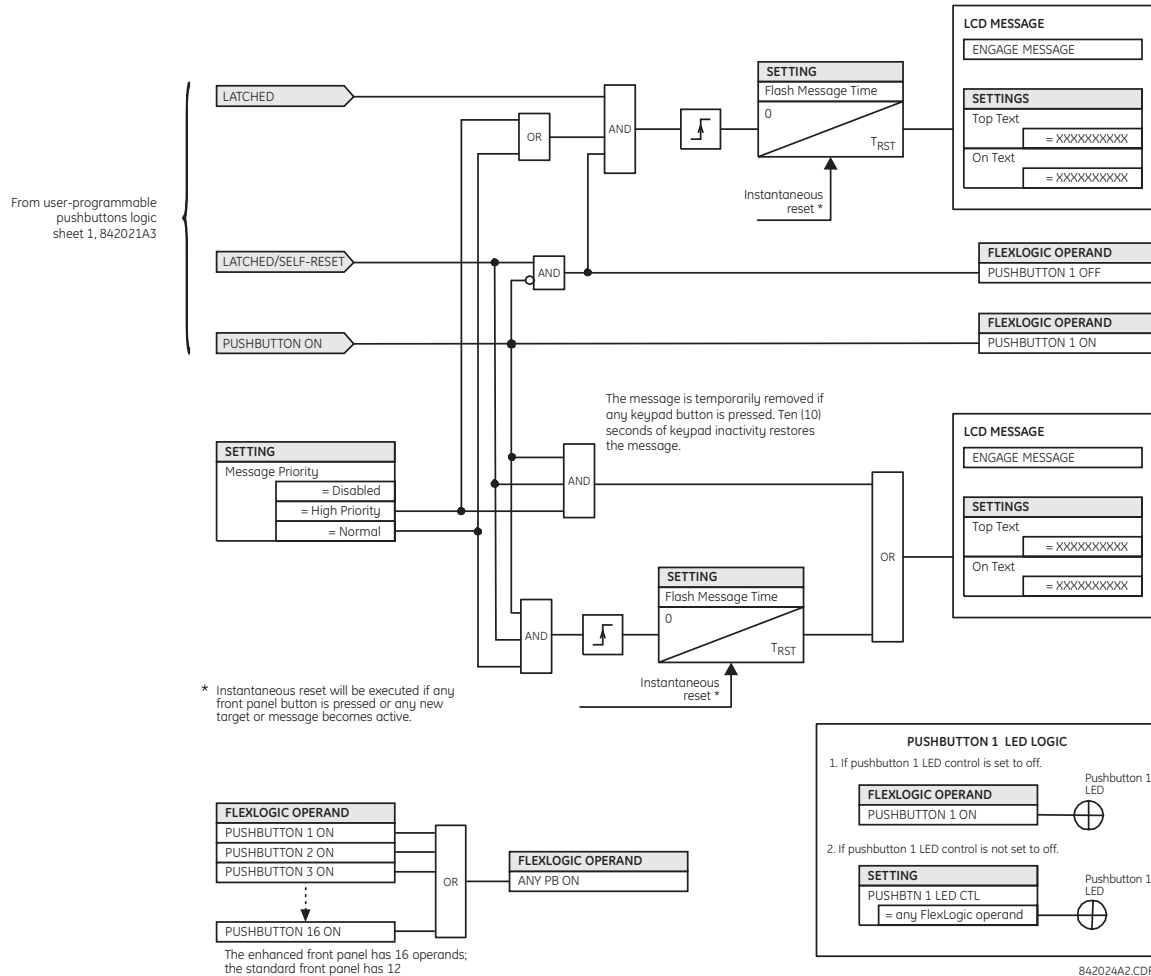

Figure 5-17: USER-PROGRAMMABLE PUSHBUTTON LOGIC (Sheet 2 of 2)

User-programmable pushbuttons require a type HP or HQ faceplate. If an HP or HQ type faceplate was ordered separately, the relay order code must be changed to indicate the correct faceplate option. This can be done via EnerVista UR Setup with the **Maintenance > Enable Pushbutton** command.

5.2.15 FLEX STATE PARAMETERS

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ FLEX STATE PARAMETERS

<div> <div>■ FLEX STATE</div> <div>■ PARAMETERS</div> </div>	MESSAGE	<div> <div>PARAMETER 1:</div> <div>Off</div> </div>	Range: FlexLogic operand
	MESSAGE	<div> <div>PARAMETER 2:</div> <div>Off</div> </div>	Range: FlexLogic operand
	MESSAGE	<div> <div>PARAMETER 3:</div> <div>Off</div> </div>	Range: FlexLogic operand
		↓	
	MESSAGE	<div> <div>PARAMETER 256:</div> <div>Off</div> </div>	Range: FlexLogic operand

This feature provides a mechanism where any of 256 selected FlexLogic operand states can be used for efficient monitoring. The feature allows user-customized access to the FlexLogic operand states in the relay. The state bits are packed so that 16 states may be read out in a single Modbus register. The state bits can be configured so that all of the states which are of interest to the user are available in a minimum number of Modbus registers.

The state bits may be read out in the “Flex States” register array beginning at Modbus address 0900h. Sixteen states are packed into each register, with the lowest-numbered state in the lowest-order bit. There are sixteen registers to accommodate the 256 state bits.

5.2.16 USER-DEFINABLE DISPLAYS

a) MAIN MENU

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ USER-DEFINABLE DISPLAYS

This menu provides a mechanism for manually creating up to 16 user-defined information displays in a convenient viewing sequence in the **USER DISPLAYS** menu (between the **TARGETS** and **ACTUAL VALUES** top-level menus). The sub-menus facilitate text entry and Modbus register data pointer options for defining the user display content.

Once programmed, the user-definable displays can be viewed in two ways.

- **KEYPAD:** Use the MENU key to select the **USER DISPLAYS** menu item to access the first user-definable display (note that only the programmed screens are displayed). The screens can be scrolled using the UP and DOWN keys. The display disappears after the default message time-out period specified by the **PRODUCT SETUP ⇒ DISPLAY PROPERTIES ⇒ DEFAULT MESSAGE TIMEOUT** setting.
- **USER-PROGRAMMABLE CONTROL INPUT:** The user-definable displays also respond to the **INVOKE AND SCROLL** setting. Any FlexLogic operand (in particular, the user-programmable pushbutton operands), can be used to navigate the programmed displays.

On the rising edge of the configured operand (such as when the pushbutton is pressed), the displays are invoked by showing the last user-definable display shown during the previous activity. From this moment onward, the operand acts exactly as the down key and allows scrolling through the configured displays. The last display wraps up to the first one. The **INVOKE AND SCROLL** input and the DOWN key operate concurrently.

When the default timer expires (set by the **DEFAULT MESSAGE TIMEOUT** setting), the relay will start to cycle through the user displays. The next activity of the **INVOKE AND SCROLL** input stops the cycling at the currently displayed user display, not at the first user-defined display. The **INVOKE AND SCROLL** pulses must last for at least 250 ms to take effect.

b) USER DISPLAY 1(16)

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ USER-DEFINABLE DISPLAYS ⇒ USER DISPLAY 1(16)

■ USER DISPLAY 1	◀▶	DISP 1 TOP LINE:	Range: up to 20 alphanumeric characters
MESSAGE	▲▼	DISP 1 BOTTOM LINE:	Range: up to 20 alphanumeric characters
MESSAGE	▲▼	DISP 1 ITEM 1 0	Range: 0 to 65535 in steps of 1
MESSAGE	▲▼	DISP 1 ITEM 2 0	Range: 0 to 65535 in steps of 1
MESSAGE	▲▼	DISP 1 ITEM 3 0	Range: 0 to 65535 in steps of 1
MESSAGE	▲▼	DISP 1 ITEM 4 0	Range: 0 to 65535 in steps of 1
MESSAGE	▲	DISP 1 ITEM 5: 0	Range: 0 to 65535 in steps of 1

Any existing system display can be automatically copied into an available user display by selecting the existing display and pressing the ENTER key. The display will then prompt **ADD TO USER DISPLAY LIST?**. After selecting “Yes”, a message indicates that the selected display has been added to the user display list. When this type of entry occurs, the sub-menus are automatically configured with the proper content – this content may subsequently be edited.

This menu is used to enter user-defined text and user-selected Modbus-registered data fields into the particular user display. Each user display consists of two 20-character lines (top and bottom). The tilde (~) character is used to mark the start of a data field – the length of the data field needs to be accounted for. Up to five separate data fields can be entered in a user display – the *n*th tilde (~) refers to the *n*th item.

A user display may be entered from the faceplate keypad or the EnerVista UR Setup interface (preferred for convenience). The following procedure shows how to enter text characters in the top and bottom lines from the faceplate keypad:

1. Select the line to be edited.
2. Press the decimal key to enter text edit mode.
3. Use either VALUE key to scroll through the characters. A space is selected like a character.
4. Press the decimal key to advance the cursor to the next position.
5. Repeat step 3 and continue entering characters until the desired text is displayed.
6. The HELP key may be pressed at any time for context sensitive help information.
7. Press the ENTER key to store the new settings.

To enter a numerical value for any of the five items (the *decimal form* of the selected Modbus address) from the faceplate keypad, use the number keypad. Use the value of “0” for any items not being used. Use the HELP key at any selected system display (setting, actual value, or command) which has a Modbus address, to view the *hexadecimal form* of the Modbus address, then manually convert it to decimal form before entering it (EnerVista UR Setup usage conveniently facilitates this conversion).

Use the MENU key to go to the user displays menu to view the user-defined content. The current user displays will show in sequence, changing every four seconds. While viewing a user display, press the ENTER key and then select the “Yes” option to remove the display from the user display list. Use the MENU key again to exit the user displays menu.

An example user display setup and result is shown below:

■ USER DISPLAY 1		DISP 1 TOP LINE: Current X ~ A	Shows user-defined text with first tilde marker.
MESSAGE	 	DISP 1 BOTTOM LINE: Current Y ~ A	Shows user-defined text with second tilde marker.
MESSAGE	 	DISP 1 ITEM 1: 6016	Shows decimal form of user-selected Modbus register address, corresponding to first tilde marker.
MESSAGE	 	DISP 1 ITEM 2: 6357	Shows decimal form of user-selected Modbus register address, corresponding to second tilde marker.
MESSAGE	 	DISP 1 ITEM 3: 0	This item is not being used. There is no corresponding tilde marker in top or bottom lines.
MESSAGE	 	DISP 1 ITEM 4: 0	This item is not being used. There is no corresponding tilde marker in top or bottom lines.
MESSAGE		DISP 1 ITEM 5: 0	This item is not being used. There is no corresponding tilde marker in top or bottom lines.
USER DISPLAYS	→	Current X 0.850 Current Y 0.327 A	Shows the resultant display content.

5

If the parameters for the top line and the bottom line items have the same units, then the unit is displayed on the bottom line only. The units are only displayed on both lines if the units specified both the top and bottom line items are different.

5.2.17 INSTALLATION

PATH: SETTINGS ⇒ PRODUCT SETUP ⇒ INSTALLATION

<div> <div>■ INSTALLATION</div> <div>MESSAGE</div> </div>	<div> <div>◀▶</div> <div>▲</div> </div>	RELAY SETTINGS: Not Programmed	Range: Not Programmed, Programmed
		RELAY NAME: Relay-1	Range: up to 20 alphanumeric characters

To safeguard against the installation of a relay without any entered settings, the unit will not allow signaling of any output relay until **RELAY SETTINGS** is set to "Programmed". This setting is defaulted to "Not Programmed" when at the factory. The **UNIT NOT PROGRAMMED** self-test error message is displayed until the relay is put into the "Programmed" state.

The **RELAY NAME** setting allows the user to uniquely identify a relay. This name will appear on generated reports.

5.3.1 REMOTE RESOURCES CONFIGURATION

When L90 is ordered with a process card module as a part of HardFiber system, then an additional **Remote Resources** menu tree is available in EnerVista UR Setup software to allow configuration of the HardFiber system.

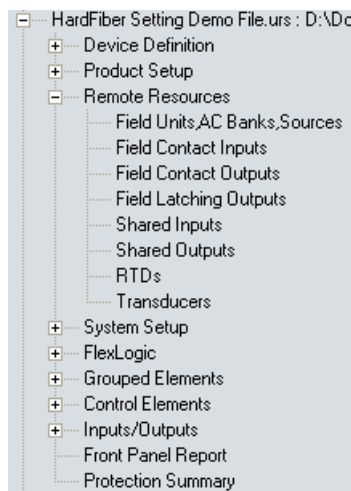

Figure 5–18: REMOTE RESOURCES CONFIGURATION MENU

The remote resources settings configure a L90 with a process bus module to work with HardFiber *Bricks*. Remote resources configuration is only available through the EnerVista UR Setup software, and is not available through the L90 front panel. A Brick provides eight AC measurements, along with contact inputs, DC analog inputs, and contact outputs, to be the remote interface to field equipment such as circuit breakers and transformers. The L90 with a process bus module has access to all of the capabilities of up to eight Bricks. Remote resources settings configure the point-to-point connection between specific fiber optic ports on the L90 process card and specific Brick. The relay is then configured to measure specific currents, voltages and contact inputs from those Bricks, and to control specific outputs.

The configuration process for remote resources is straightforward and consists of the following steps.

- *Configure the field units.* This establishes the point-to-point connection between a specific port on the relay process bus module, and a specific digital core on a specific Brick. This is a necessary first step in configuring a process bus relay.
- *Configure the AC banks.* This sets the primary and secondary quantities and connections for currents and voltages. AC bank configuration also provides a provision for redundant measurements for currents and voltages, a powerful reliability improvement possible with process bus.
- *Configure signal sources.* This functionality of the L90 has not changed other than the requirement to use currents and voltages established by AC bank configuration under the remote resources menu.
- *Configure field contact inputs, field contact outputs, RTDs, and transducers as required for the application's functionality.* These inputs and outputs are the physical interface to circuit breakers, transformers, and other equipment. They replace the traditional contact inputs and outputs located at the relay to virtually eliminate copper wiring.
- *Configure shared inputs and outputs as required for the application's functionality.* Shared inputs and outputs are distinct binary channels that provide high-speed protection quality signaling between relays through a Brick.

For additional information on how to configure a relay with a process bus module, see GE publication number GEK-113658: HardFiber Process Bus System Instruction Manual.

5.4.1 AC INPUTS

a) CURRENT BANKS

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ AC INPUTS ⇒ CURRENT BANK F1(L5)

■ CURRENT BANK F1	◀ ▶	PHASE CT F1 PRIMARY: 1 A	Range: 1 to 65000 A in steps of 1
MESSAGE	▲ ▼	PHASE CT F1 SECONDARY: 1 A	Range: 1 A, 5 A
MESSAGE	▲ ▼	GROUND CT F1 PRIMARY: 1 A	Range: 1 to 65000 A in steps of 1
MESSAGE	▲ ▼	GROUND CT F1 SECONDARY: 1 A	Range: 1 A, 5 A

Because energy parameters are accumulated, these values should be recorded and then reset immediately prior to changing CT characteristics.

Four banks of phase and ground CTs can be set, where the current banks are denoted in the following format (X represents the module slot position letter):

Xa, where **X** = {F, L} and **a** = {1, 5}.

See the *Introduction to AC Sources* section at the beginning of this chapter for additional details.

5

These settings are critical for all features that have settings dependent on current measurements. When the relay is ordered, the CT module must be specified to include a standard or sensitive ground input. As the phase CTs are connected in wye (star), the calculated phasor sum of the three phase currents ($I_A + I_B + I_C = \text{neutral current} = 3I_o$) is used as the input for the neutral overcurrent elements. In addition, a zero-sequence (core balance) CT which senses current in all of the circuit primary conductors, or a CT in a neutral grounding conductor may also be used. For this configuration, the ground CT primary rating must be entered. To detect low level ground fault currents, the sensitive ground input may be used. In this case, the sensitive ground CT primary rating must be entered. Refer to chapter 3 for more details on CT connections.

Enter the rated CT primary current values. For both 1000:5 and 1000:1 CTs, the entry would be 1000. For correct operation, the CT secondary rating must match the setting (which must also correspond to the specific CT connections used).

The following example illustrates how multiple CT inputs (current banks) are summed as one source current. Given the following current banks:

- F1: CT bank with 500:1 ratio.
- F5: CT bank with 1000:1 ratio.
- L1: CT bank with 800:1 ratio.

The following rule applies:

$$\text{SRC 1} = \text{F1} + \text{F5} + \text{L1} \quad (\text{EQ 5.7})$$

1 pu is the highest primary current. In this case, 1000 is entered and the secondary current from the 500:1 ratio CT will be adjusted to that created by a 1000:1 CT before summation. If a protection element is set up to act on SRC 1 currents, then a pickup level of 1 pu will operate on 1000 A primary.

The same rule applies for current sums from CTs with different secondary taps (5 A and 1 A).

b) VOLTAGE BANKS

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ AC INPUTS ⇒ VOLTAGE BANK F5(L5)

<div>■ VOLTAGE BANK F5</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div>	<div>◀▶</div> <div>PHASE VT F5 CONNECTION: Wye</div>	Range: Wye, Delta
	<div>▲▼</div> <div>PHASE VT F5 SECONDARY: 66.4 V</div>	Range: 25.0 to 240.0 V in steps of 0.1
	<div>▲▼</div> <div>PHASE VT F5 RATIO: 1.00 :1</div>	Range: 1.00 to 24000.00 in steps of 0.01
	<div>▲▼</div> <div>AUXILIARY VT F5 CONNECTION: Vag</div>	Range: Vn, Vag, Vbg, Vcg, Vab, Vbc, Vca
	<div>▲▼</div> <div>AUXILIARY VT F5 SECONDARY: 66.4 V</div>	Range: 25.0 to 240.0 V in steps of 0.1
	<div>▲</div> <div>AUXILIARY VT F5 RATIO: 1.00 :1</div>	Range: 1.00 to 24000.00 in steps of 0.01

NOTICE

Because energy parameters are accumulated, these values should be recorded and then reset immediately prior to changing VT characteristics.

Two banks of phase/auxiliary VTs can be set, where voltage banks are denoted in the following format (X represents the module slot position letter):

Xa, where **X** = {F, L} and **a** = {5}.

See the *Introduction to AC sources* section at the beginning of this chapter for additional details.

With VTs installed, the relay can perform voltage measurements as well as power calculations. Enter the **PHASE VT F5 CONNECTION** made to the system as “Wye” or “Delta”. An open-delta source VT connection would be entered as “Delta”.

The nominal **PHASE VT F5 SECONDARY** voltage setting is the voltage across the relay input terminals when nominal voltage is applied to the VT primary.

For example, on a system with a 13.8 kV nominal primary voltage and with a 14400:120 volt VT in a delta connection, the secondary voltage would be 115; that is, $(13800 / 14400) \times 120$. For a wye connection, the voltage value entered must be the phase to neutral voltage which would be $115 / \sqrt{3} = 66.4$.

On a 14.4 kV system with a delta connection and a VT primary to secondary turns ratio of 14400:120, the voltage value entered would be 120; that is, $14400 / 120$.

5.4.2 POWER SYSTEM

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ POWER SYSTEM

<div>■ POWER SYSTEM</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div>	<div>◀▶</div> <div>NOMINAL FREQUENCY: 60 Hz</div>	Range: 25 to 60 Hz in steps of 1
	<div>▲▼</div> <div>PHASE ROTATION: ABC</div>	Range: ABC, ACB
	<div>▲▼</div> <div>FREQUENCY AND PHASE REFERENCE: SRC 1</div>	Range: SRC 1, SRC 2, SRC 3, SRC 4
	<div>▲</div> <div>FREQUENCY TRACKING: Enabled</div>	Range: Disabled, Enabled

The power system **NOMINAL FREQUENCY** value is used as a default to set the digital sampling rate if the system frequency cannot be measured from available signals. This may happen if the signals are not present or are heavily distorted. Before reverting to the nominal frequency, the frequency tracking algorithm holds the last valid frequency measurement for a safe period of time while waiting for the signals to reappear or for the distortions to decay.

The phase sequence of the power system is required to properly calculate sequence components and power parameters. The **PHASE ROTATION** setting matches the power system phase sequence. Note that this setting informs the relay of the actual system phase sequence, either ABC or ACB. CT and VT inputs on the relay, labeled as A, B, and C, must be connected to system phases A, B, and C for correct operation.

The **FREQUENCY AND PHASE REFERENCE** setting determines which signal source is used (and hence which AC signal) for phase angle reference. The AC signal used is prioritized based on the AC inputs that are configured for the signal source: phase voltages takes precedence, followed by auxiliary voltage, then phase currents, and finally ground current.

For three phase selection, phase A is used for angle referencing ($V_{\text{ANGLE REF}} = V_A$), while Clarke transformation of the phase signals is used for frequency metering and tracking ($V_{\text{FREQUENCY}} = (2V_A - V_B - V_C)/3$) for better performance during fault, open pole, and VT and CT fail conditions.

The phase reference and frequency tracking AC signals are selected based upon the Source configuration, regardless of whether or not a particular signal is actually applied to the relay.

Phase angle of the reference signal will always display zero degrees and all other phase angles will be relative to this signal. If the pre-selected reference signal is not measurable at a given time, the phase angles are not referenced.

The phase angle referencing is done via a phase locked loop, which can synchronize independent UR-series relays if they have the same AC signal reference. This results in very precise correlation of phase angle indications between different UR-series relays.

FREQUENCY TRACKING is set to “Disabled” only in unusual circumstances; consult the factory for special variable-frequency applications.

The frequency tracking feature functions only when the L90 is in the “Programmed” mode. If the L90 is “Not Programmed”, then metering values are available but can exhibit significant errors.

The nominal system frequency should be selected as 50 Hz or 60 Hz only. The **FREQUENCY AND PHASE REFERENCE** setting, used as a reference for calculating all angles, must be identical for all terminals. Whenever the 87L function is “Enabled”, the frequency tracking function is disabled, and frequency tracking is driven by the L90 algorithm (see the *Theory of operation* chapter). Whenever the 87L function is “Disabled”, the frequency tracking mechanism reverts to the UR-series mechanism which uses the **FREQUENCY TRACKING** setting to provide frequency tracking for all other elements and functions.

5.4.3 SIGNAL SOURCES

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ SIGNAL SOURCES ⇒ SOURCE 1(4)

■ SOURCE 1	◀▶	SOURCE 1 NAME: SRC 1	Range: up to six alphanumeric characters
MESSAGE	▲▼	SOURCE 1 PHASE CT: None	Range: None, F1, F5, F1+F5,... up to a combination of any 6 CTs. Only Phase CT inputs are displayed.
MESSAGE	▲▼	SOURCE 1 GROUND CT: None	Range: None, F1, F5, F1+F5,... up to a combination of any 6 CTs. Only Ground CT inputs are displayed.
MESSAGE	▲▼	SOURCE 1 PHASE VT: None	Range: None, F5, L5 Only phase voltage inputs will be displayed.
MESSAGE	▲	SOURCE 1 AUX VT: None	Range: None, F5, L5 Only auxiliary voltage inputs will be displayed.

Identical menus are available for each source. The “SRC 1” text can be replaced by with a user-defined name appropriate for the associated source.

The first letter in the source identifier represents the module slot position. The number directly following this letter represents either the first bank of four channels (1, 2, 3, 4) called “1” or the second bank of four channels (5, 6, 7, 8) called “5” in a particular CT/VT module. Refer to the *Introduction to AC sources* section at the beginning of this chapter for additional details on this concept.

It is possible to select the sum of all CT combinations. The first channel displayed is the CT to which all others will be referred. For example, the selection “F1+F5” indicates the sum of each phase from channels “F1” and “F5”, scaled to whichever CT has the higher ratio. Selecting “None” hides the associated actual values.

The approach used to configure the AC sources consists of several steps; first step is to specify the information about each CT and VT input. For CT inputs, this is the nominal primary and secondary current. For VTs, this is the connection type, ratio and nominal secondary voltage. Once the inputs have been specified, the configuration for each source is entered, including specifying which CTs will be summed together.

User selection of AC parameters for comparator elements:

CT/VT modules automatically calculate all current and voltage parameters from the available inputs. Users must select the specific input parameters to be measured by every element in the relevant settings menu. The internal design of the element specifies which type of parameter to use and provides a setting for source selection. In elements where the parameter may be either fundamental or RMS magnitude, such as phase time overcurrent, two settings are provided. One setting specifies the source, the second setting selects between fundamental phasor and RMS.

AC input actual values:

The calculated parameters associated with the configured voltage and current inputs are displayed in the current and voltage sections of actual values. Only the phasor quantities associated with the actual AC physical input channels will be displayed here. All parameters contained within a configured source are displayed in the sources section of the actual values.

DISTURBANCE DETECTORS (INTERNAL):

The disturbance detector (ANSI 50DD) element is a sensitive current disturbance detector that detects any disturbance on the protected system. The 50DD function is used directly in some elements in the relay, for example VT Fuse Failure detector or Fault Report. It can also be used to supervise current-based elements to prevent maloperation as a result of the wrong settings or external CT wiring problem. A disturbance detector is provided for each source.

The 50DD function responds to the changes in magnitude of the sequence currents. The disturbance detector scheme logic is as follows:

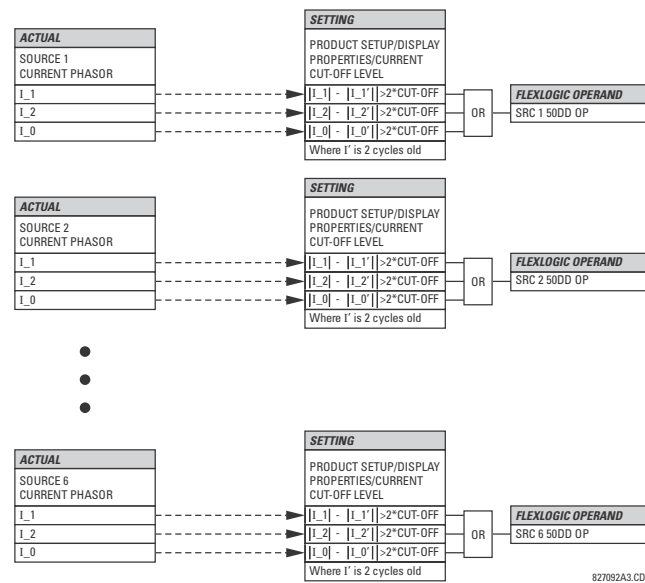

Figure 5-19: DISTURBANCE DETECTOR LOGIC DIAGRAM

The disturbance detector responds to the change in currents of twice the current cut-off level. The default cut-off threshold is 0.02 pu; thus by default the disturbance detector responds to a change of 0.04 pu. The metering sensitivity setting (**PRODUCT SETUP** ⇒ **DISPLAY PROPERTIES** ⇒ **CURRENT CUT-OFF LEVEL**) controls the sensitivity of the disturbance detector accordingly.

EXAMPLE USE OF SOURCES:

An example of the use of sources is shown in the diagram below. A relay could have the following hardware configuration:

INCREASING SLOT POSITION LETTER -->		
CT/VT MODULE 1	CT/VT MODULE 2	CT/VT MODULE 3
CTs	VTs	not applicable

This configuration could be used on a two-winding transformer, with one winding connected into a breaker-and-a-half system. The following figure shows the arrangement of sources used to provide the functions required in this application, and the CT/VT inputs that are used to provide the data.

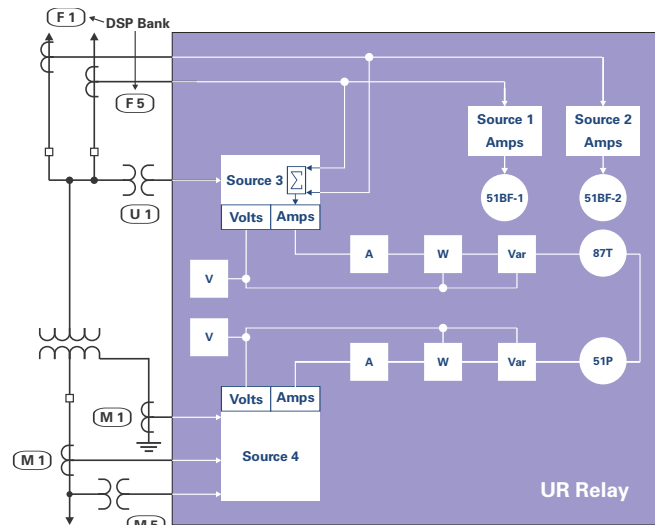

Figure 5–20: EXAMPLE USE OF SOURCES

	Y LV	D HV	AUX
	SRC 1	SRC 2	SRC 3
Phase CT	M1	F1+F5	None
Ground CT	M1	None	None
Phase VT	M5	None	None
Aux VT	None	None	U1

5.4.4 87L POWER SYSTEM

a) MAIN MENU

MESSAGE	▲▼	■ IN-ZONE ■ TRANSFORMER		See below.

Any changes to the L90 power system settings change the protection system configuration. As such, the 87L protection at all L90 protection system terminals must be temporarily disabled to allow the relays to acknowledge the new settings.

- **NUMBER OF TERMINALS:** This setting is the number of the terminals of the associated protected line.
- **NUMBER OF CHANNELS:** This setting should correspond to the type of communications module installed. If the relay is applied on two terminal lines with a single communications channel, this setting should be selected as "1". For a two terminal line with a second redundant channel for increased dependability, or for three terminal line applications, this setting should be selected as "2".
- **CHARGING CURRENT COMPENSATION:** This setting enables and disables the charging current calculations and corrections of current phasors. The voltage signals used for charging current compensation are taken from the source assigned with the **CURRENT DIFF SIGNAL SOURCE 1** setting. As such, it's critical to ensure that three-phase line voltage is assigned to this source. The following diagram shows possible configurations.

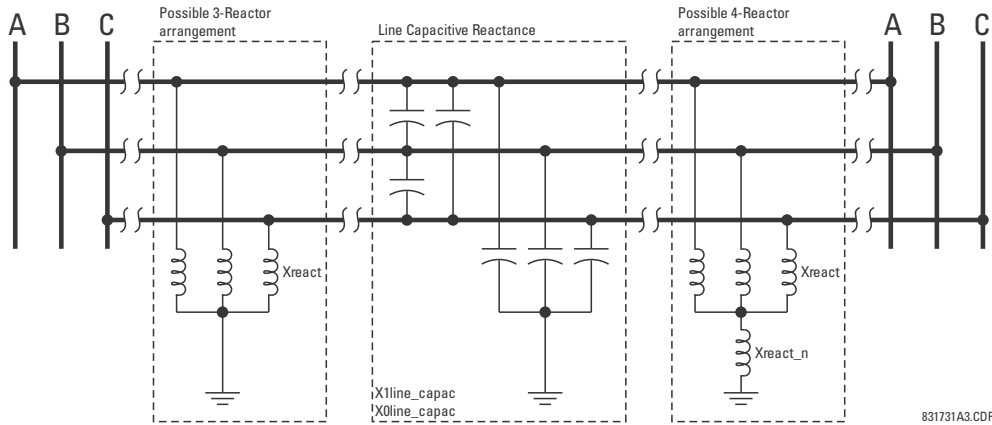

Figure 5-21: CHARGING CURRENT COMPENSATION CONFIGURATIONS

- **POSITIVE and ZERO SEQUENCE CAPACITIVE REACTANCE:** The values of positive and zero-sequence capacitive reactance of the protected line are required for charging current compensation calculations. The line capacitive reactance values should be entered in **primary kohms** for the total line length. Details of the charging current compensation algorithm can be found in Chapter 8: *Theory of operation*.

If shunt reactors are also installed on the line, the resulting value entered in the **POS SEQ CAPACITIVE REACTANCE** and **ZERO SEQ CAPACITIVE REACTANCE** settings should be calculated as follows:

1. **Three-reactor arrangement:** three identical line reactors (X_{react}) solidly connected phase to ground:

$$X_{C1} = \frac{X_{1line_capac} \cdot X_{react}}{X_{react} - X_{1line_capac}}, \quad X_{C0} = \frac{X_{0line_capac} \cdot X_{react}}{X_{react} - X_{0line_capac}} \quad (\text{EQ 5.8})$$

2. **Four-reactor arrangement:** three identical line reactors (X_{react}) wye-connected with the fourth reactor (X_{react_n}) connected between reactor-bank neutral and the ground.

$$X_{C1} = \frac{X_{1line_capac} \cdot X_{react}}{X_{react} - X_{1line_capac}}, \quad X_{C0} = \frac{X_{0line_capac} \cdot (X_{react} + 3X_{react_n})}{X_{react} + 3X_{react_n} - X_{0line_capac}} \quad (\text{EQ 5.9})$$

X_{1line_capac} = the total line positive-sequence capacitive reactance

X_{0line_capac} = the total line zero-sequence capacitive reactance

X_{react} = the total reactor inductive reactance per phase. If identical reactors are installed at both line ends, the value of the inductive reactance is divided by 2 (or 3 for a three-terminal line) before using in the above equations. If the reactors installed at both ends of the line are different, the following equations apply:

1. **For 2 terminal line:** $X_{react} = 1 / \left(\frac{1}{X_{react_terminal1}} + \frac{1}{X_{react_terminal2}} \right)$
2. **For 3 terminal line:** $X_{react} = 1 / \left(\frac{1}{X_{react_terminal1}} + \frac{1}{X_{react_terminal2}} + \frac{1}{X_{react_terminal3}} \right)$

X_{react_n} = the total neutral reactor inductive reactance. If identical reactors are installed at both line ends, the value of the inductive reactance is divided by 2 (or 3 for a three-terminal line) before using in the above equations. If the reactors installed at both ends of the line are different, the following equations apply:

1. **For 2 terminal line:** $X_{react_n} = 1 / \left(\frac{1}{X_{react_n_terminal1}} + \frac{1}{X_{react_n_terminal2}} \right)$
2. **For 3 terminal line:** $X_{react_n} = 1 / \left(\frac{1}{X_{react_n_terminal1}} + \frac{1}{X_{react_n_terminal2}} + \frac{1}{X_{react_n_terminal3}} \right)$

Charging current compensation calculations should be performed for an arrangement where the VTs are connected to the line side of the circuit; otherwise, opening the breaker at one end of the line will cause a calculation error.

Differential current is significantly decreased when **CHARGING CURRENT COMPENSATION** is “Enabled” and the proper reactance values are entered. The effect of charging current compensation is viewed in the **METERING** → **87L DIFFERENTIAL CURRENT** actual values menu. This effect is very dependent on CT and VT accuracy.

- **ZERO-SEQUENCE CURRENT REMOVAL:** This setting facilitates application of the L90 to transmission lines with one or more tapped transformers without current measurement at the taps. If the tapped transformer is connected in a grounded wye on the line side, it becomes a source of the zero-sequence current for external ground faults. As the transformer current is not measured by the L90 protection system, the zero-sequence current would create a spurious differential signal and may cause a false trip.

If enabled, this setting forces the L90 to remove zero-sequence current from the phase currents prior to forming their differential signals, ensuring protection stability on external ground faults. However, zero-sequence current removal may cause all three phases to trip for internal ground faults. Consequently, a phase selective operation of the L90 is not retained if the setting is enabled. This does not impose any limitation, as single-pole tripping is not recommended for lines with tapped transformers. Refer to chapter 9 for guidelines.

- **LOCAL (TERMINAL 1 and TERMINAL 2) ID NUMBER:** In installations using multiplexers or modems for communication, it is desirable to ensure the data used by the relays protecting a given line comes from the correct relays. The L90 performs this check by reading the ID number contained in the messages sent by transmitting relays and comparing this ID to the programmed correct ID numbers by the receiving relays. This check is used to block the differential element of a relay, if the channel is inadvertently set to loopback mode, by recognizing its own ID on a received channel. If an incorrect ID is found on a either channel during normal operation, the FlexLogic™ operand 87 CH1(2) ID FAIL is set, driving the event with the same name. The result of channel identification is also available in **ACTUAL VALUES** ⇒ **STATUS** ⇒ **CHANNEL TESTS** ⇒ **VALIDITY OF CHANNEL CONFIGURATION** for commissioning purposes. The default value “0” at local relay ID setting indicates that the channel ID number is not to be checked. Refer to the *Current differential* section in this chapter for additional information.

For two-terminal applications, only the **LOCAL ID NUMBER** and **TERMINAL 1 ID NUMBER** should be used. The **TERMINAL 2 ID NUMBER** is used for three-terminal applications.

- **CHNL ASYM COMP:** This setting enables/disables channel asymmetry compensation. The compensation is based on absolute time referencing provided by GPS-based clocks via the Precision Time Protocol or IRIG-B. Use this feature on multiplexed channels where channel asymmetry can be expected and which otherwise causes errors in current differential calculations. The feature takes effect if all terminals are provided with reliable GPS clock signals. If the GPS clock signal is lost at any terminal of the current differential protection system, or the real time clock not configured, then the compensation is not calculated. If the compensation is in place prior to losing the GPS time reference, the last (memorized) correction is applied as long as the value of **CHNL ASYM COMP** is “On”. See chapter 9 for additional information.

The GPS-based compensation for channel asymmetry can take three different effects:

- If the **CHNL ASYM COMP** selected FlexLogic operand is “Off”, compensation is not applied and the L90 uses only the ping-pong technique.
- If the **CHNL ASYM COMP** selected FlexLogic operand is “On” and all terminals have a valid time reference, then compensation is applied and the L90 effectively uses GPS time referencing tracking channel asymmetry if the latter fluctuates.
- If the **CHNL ASYM COMP** is “On” and not all terminals have a valid time reference, then compensation is not applied (if the system was not compensated prior to the problem), or the memorized (last valid) compensation is used if compensation was in effect prior to the problem.

A terminal is considered to have a valid time reference while the **BLOCK GPS TIME REF** selected FlexLogic operand is Off and the **LOCAL GPS TROUBLE** signal is Off. The **LOCAL GPS TROUBLE** signal is On if the real time clock is not locked to global time via PP, PTP, or IRIG-B. It is also On if locked via Amplitude Modulated IRIG-B, and if locked via PP or PTP and indicated clock accuracy is less than 250 μ s.

The **CHNL ASYM COMP** setting dynamically turns the GPS compensation on and off. A FlexLogic operand that combines several factors is typically used. The L90 protection system does not incorporate any pre-defined way of treating certain conditions, such as failure of the GPS receiver, loss of satellite signal, channel asymmetry prior to the loss of reference time, or change of the round trip time prior to loss of the time reference. Virtually any philosophy can be programmed by selecting the **CHNL ASYM COMP** setting. Factors to consider are:

- *Fail-safe output of the GPS receiver.* Some receivers may be equipped with the fail-safe output relay. The L90 system requires a maximum error of 250 μ s. The fail-safe output of the GPS receiver may be connected to the local L90 via an input contact. In the case of GPS receiver fail, the channel compensation function can be effectively disabled by using the input contact in conjunction with the **BLOCK GPS TIME REF** (GPS) setting.

- *Channel asymmetry prior to losing the GPS time reference.* This value is measured by the L90 and a user-programmable threshold is applied to it. The corresponding FlexLogic operands are produced if the asymmetry is above the threshold (87L DIFF MAX 1 ASYM and 87L DIFF 2 MAX ASYM). These operands can be latched in FlexLogic and combined with other factors to decide, upon GPS loss, if the relays continue to compensate using the memorized correction. Typically, one may decide to keep compensating if the pre-existing asymmetry was low.
- *Change in the round trip travel time.* This value is measured by the L90 and a user-programmable threshold applied to it. The corresponding FlexLogic operands are produced if the delta change is above the threshold (87L DIFF 1 TIME CHNG and 87L DIFF 2 TIME CHNG). These operands can be latched in FlexLogic and combined with other factors to decide, upon GPS loss, if the relays continue to compensate using the memorized correction. Typically, one may decide to disable compensation if the round trip time changes.
- **BLOCK GPS TIME REF:** This setting signals to the L90 that the time reference is not valid. The time reference may be not accurate due to problems with the GPS receiver. The user must be aware of the case when a GPS satellite receiver loses its satellite signal and reverts to its own calibrated crystal oscillator. In this case, accuracy degrades in time and may eventually cause relay misoperation. Verification from the manufacturer of receiver accuracy not worse than 250 μ s and the presence of an alarm contact indicating loss of the satellite signal is strongly recommended. If the time reference accuracy cannot be guaranteed, it should be relayed to the L90 via contact inputs and GPS compensation effectively blocked using the contact position in conjunction with the **BLOCK GPS TIME REF** setting. This setting is typically a signal from the GPS receiver signaling problems or time inaccuracy.

Some GPS receivers can supply erroneous IRIG-B signals during power-up and before locking to satellites. If the receiver's failsafe contact opens during power-up (allowing for an erroneous IRIG-B signal), then set a dropout delay up to 15 minutes (depending on GPS receiver specifications) to the failsafe contact via FlexLogic to prevent incorrect relay response.

- **MAX CHNL ASYMMETRY:** This setting detects excessive channel asymmetry. The same threshold is applied to both the channels, while the following per-channel FlexLogic operands are generated: 87L DIFF 1 MAX ASYM and 87L DIFF 2 MAX ASYM. These operands can be used to alarm on problems with communication equipment and/or to decide whether channel asymmetry compensation remains in operation should the GPS-based time reference be lost. Channel asymmetry is measured if both terminals of a given channel have valid time reference.

If the memorized asymmetry value is much greater than expected (indicating a significant problem with GPS clock timing), then this operand can be also used to block GPS compensation, forcing the relay to use the memorized asymmetry value.

- **ROUND TRIP TIME CHANGE:** This setting detects changes in round trip time. This threshold is applied to both channels, while the 87L DIFF 1 TIME CHNG and 87L DIFF 2 TIME CHNG ASYM per-channel FlexLogic operands are generated. These operands can be used to alarm on problems with communication equipment and/or to decide whether channel asymmetry compensation remains in operation should the GPS-based time reference be lost.

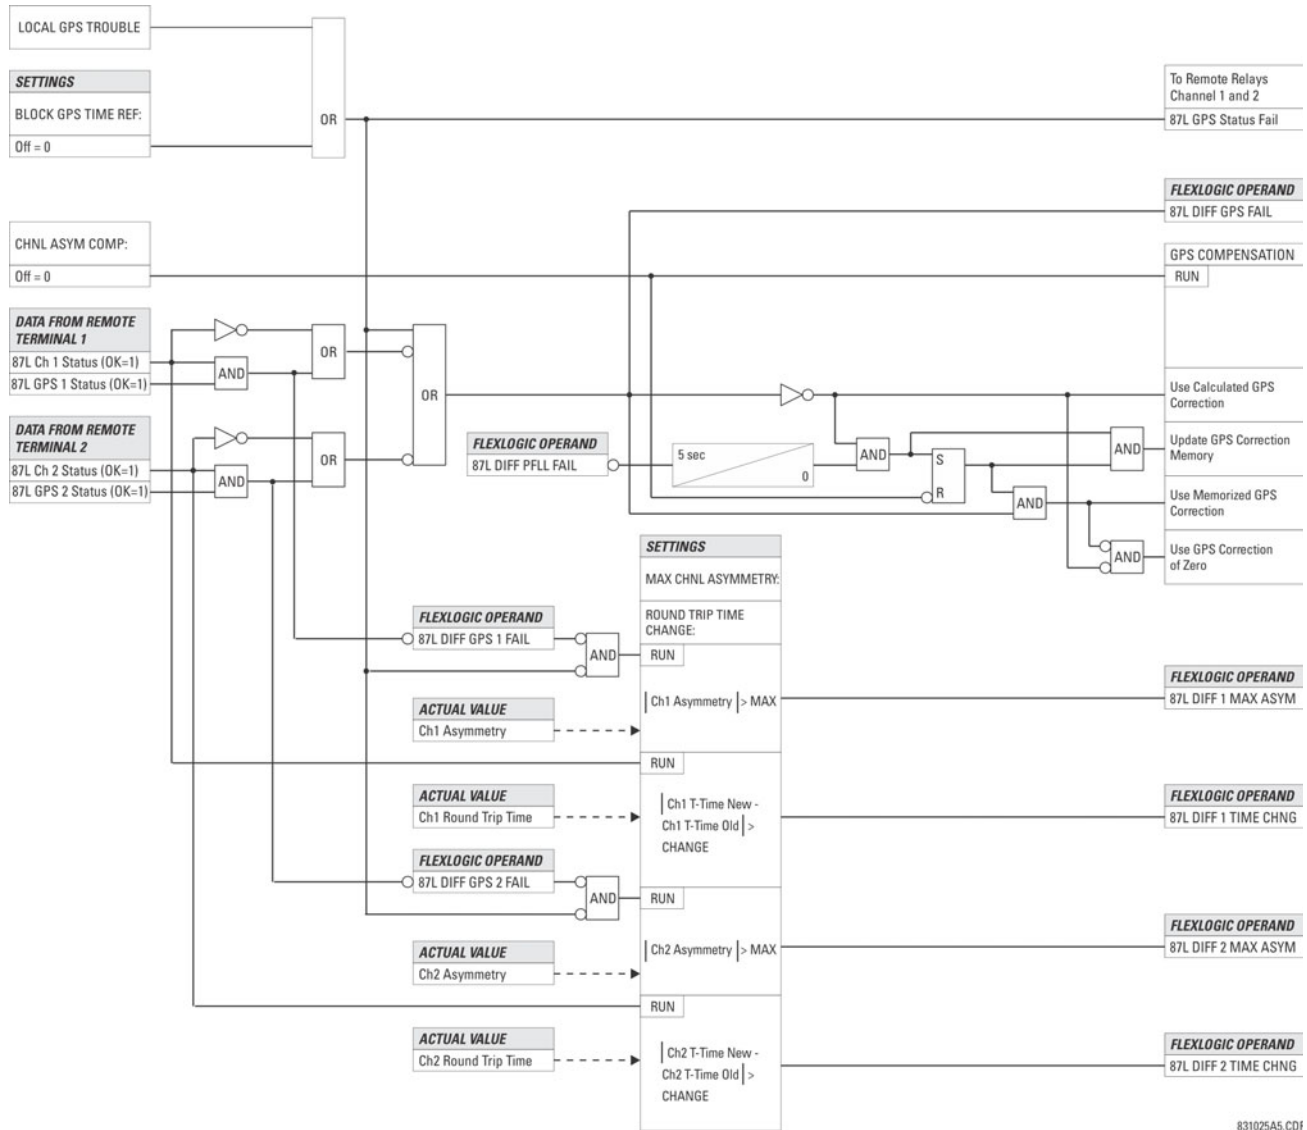

Figure 5-22: CHANNEL ASYMMETRY COMPENSATION LOGIC

b) IN-ZONE TRANSFORMER

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ 87L POWER SYSTEM ⇒ IN-ZONE TRANSFORMER

<input checked="" type="checkbox"/> IN-ZONE <input type="checkbox"/> TRANSFORMER	<div> <div> <div>IN-ZONE TRANSFORMER</div> <div>CONNECTION: None</div> </div> <div> <div>TRANSFORMER LOCATION:</div> <div>LOCAL-TAP</div> </div> </div>	Range: None, 0 to 330° lag in steps of 30° Range: LOCAL-TAP, REM1-TAP, REM2-TAP
---	---	--

The in-zone transformer settings described below ensure that the 87L element correctly applies magnitude and phase compensation for the in-zone transformer. To accommodate for the difference in CT ratios at line terminals, the **SETTINGS** ⇒ **GROUPED ELEMENTS** ⇒ **SETTING GROUP 1(6)** ⇒ **LINE DIFFERENTIAL ELEMENTS** ⇒ **CURRENT DIFFERENTIAL** ⇒ **CURRENT DIFF CT TAP** setting should be used. It is important to properly program the in-zone transformer setting for all terminals to ensure correct 87L performance.

- **IN-ZONE TRANSFORMER CONNECTION:** This setting is used to indicate the presence and group connection of the in-zone transformer. The winding angle selection specifies the phase shift of the remote terminal side winding with

respect to the local terminal side winding. For example, for the Dy1 group where the delta winding is connected to the local terminal side, and wye winding is connected to the remote terminal side, you need to select “30° lag” for the local terminal side. (At the remote terminal relay, select “330° lag” for this transformer group connection.) If there is no in-zone transformer connected, then program this setting as “None” (note that the “0° lag” value does not correspond to “None”). Only one in-zone transformer is allowed for both two-terminal and three-terminal applications. Enabling in-zone transformer functionality forces the L90 to automatically remove the zero-sequence component from all terminals currents. It also disables ground differential 87LG functionality and zero-sequence current removal functionality defined by the **ZERO SEQ CURRENT REMOVAL** setting.

- **TRANSFORMER LOCATION:** This setting selects the transformer location and is applicable only if the **TRANSFORMER CONNECTION** setting is not programmed as “None”.
 - Select the “LOCAL-TAP” value if the transformer is present between the local terminal and the tap point or for two-terminal applications.
 - Select the “REM1-TAP” if the transformer is present between remote terminal 1 and the tap point.
 - Select the “REM2-TAP” if the transformer is present between remote terminal 2 and the tap point.

Figure 5-23: ILLUSTRATION OF IN-ZONE TRANSFORMER FOR TWO-TERMINAL AND THREE-TERMINAL LINES

When the L90 ordered has in-zone functionality, it does not support the multi-ended fault locator.

Do not set the **IN-ZONE TRANSFORMER CONNECTION** setting to "None" at one terminal and set other terminals to a value other than "None." 87L is blocked under these circumstances.

A description of the operation of the breaker control and status monitoring features is provided in chapter 4. Only information concerning programming of the associated settings is covered here. These features are provided for two or more breakers; a user may use only those portions of the design relevant to a single breaker, which must be breaker 1.

The number of breaker control elements is dependent on the number of CT/VT modules specified with the L90. The following settings are available for each breaker control element.

- **BREAKER 1 FUNCTION:** This setting enables and disables the operation of the breaker control feature.
 - **BREAKER1 PUSH BUTTON CONTROL:** Set to “Enable” to allow faceplate push button operations.
 - **BREAKER 1 NAME:** Assign a user-defined name (up to six characters) to the breaker. This name will be used in flash messages related to breaker 1.
 - **BREAKER 1 MODE:** This setting selects “3-Pole” mode, where all breaker poles are operated simultaneously, or “1-Pole” mode where all breaker poles are operated either independently or simultaneously.
 - **BREAKER 1 OPEN:** This setting selects an operand that creates a programmable signal to operate an output relay to open breaker 1.
 - **BREAKER 1 BLK OPEN:** This setting selects an operand that prevents opening of the breaker. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.
 - **BREAKER 1 CLOSE:** This setting selects an operand that creates a programmable signal to operate an output relay to close breaker 1.
 - **BREAKER 1 BLK CLOSE:** This setting selects an operand that prevents closing of the breaker. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.
 - **BREAKER 1 Φ A/3P CLOSED:** This setting selects an operand, usually a contact input connected to a breaker auxiliary position tracking mechanism. This input should be a normally-open 52/a status input to create a logic 1 when the breaker is closed. If the **BREAKER 1 MODE** setting is selected as “3-Pole”, this setting selects a single input as the operand and used to track the breaker open or closed position. If the mode is selected as “1-Pole”, the input mentioned above is used to track phase A and the **BREAKER 1 Φ B** and **BREAKER 1 Φ C** settings select operands to track phases B and C, respectively.
 - **BREAKER 1 Φ A/3P OPND:** This setting selects an operand, usually a contact input, that should be a normally-closed 52/b status input to create a logic 1 when the breaker is open. If a separate 52/b contact input is not available, then the inverted **BREAKER 1 CLOSED** status signal can be used.
 - **BREAKER 1 Φ B CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase B closed position as above for phase A.
 - **BREAKER 1 Φ B OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase B opened position as above for phase A.
 - **BREAKER 1 Φ C CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase C closed position as above for phase A.
 - **BREAKER 1 Φ C OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase C opened position as above for phase A.
 - **BREAKER 1 Toperate:** This setting specifies the required interval to overcome transient disagreement between the 52/a and 52/b auxiliary contacts during breaker operation. If transient disagreement still exists after this time has expired, the **BREAKER 1 BAD STATUS** FlexLogic operand is asserted from alarm or blocking purposes.
 - **BREAKER 1 EXT ALARM:** This setting selects an operand, usually an external contact input, connected to a breaker alarm reporting contact.
 - **BREAKER 1 ALARM DELAY:** This setting specifies the delay interval during which a disagreement of status among the three-pole position tracking operands will not declare a pole disagreement. This allows for non-simultaneous operation of the poles.
- If single-pole tripping and reclosing is used, the breaker may trip unsymmetrically for faults. In this case, the minimum alarm delay setting must exceed the maximum time required for fault clearing and reclosing by a suitable margin.
- **MANUAL CLOSE RECAL1 TIME:** This setting specifies the interval required to maintain setting changes in effect after an operator has initiated a manual close command to operate a circuit breaker.
 - **BREAKER 1 OUT OF SV:** Selects an operand indicating that breaker 1 is out-of-service.

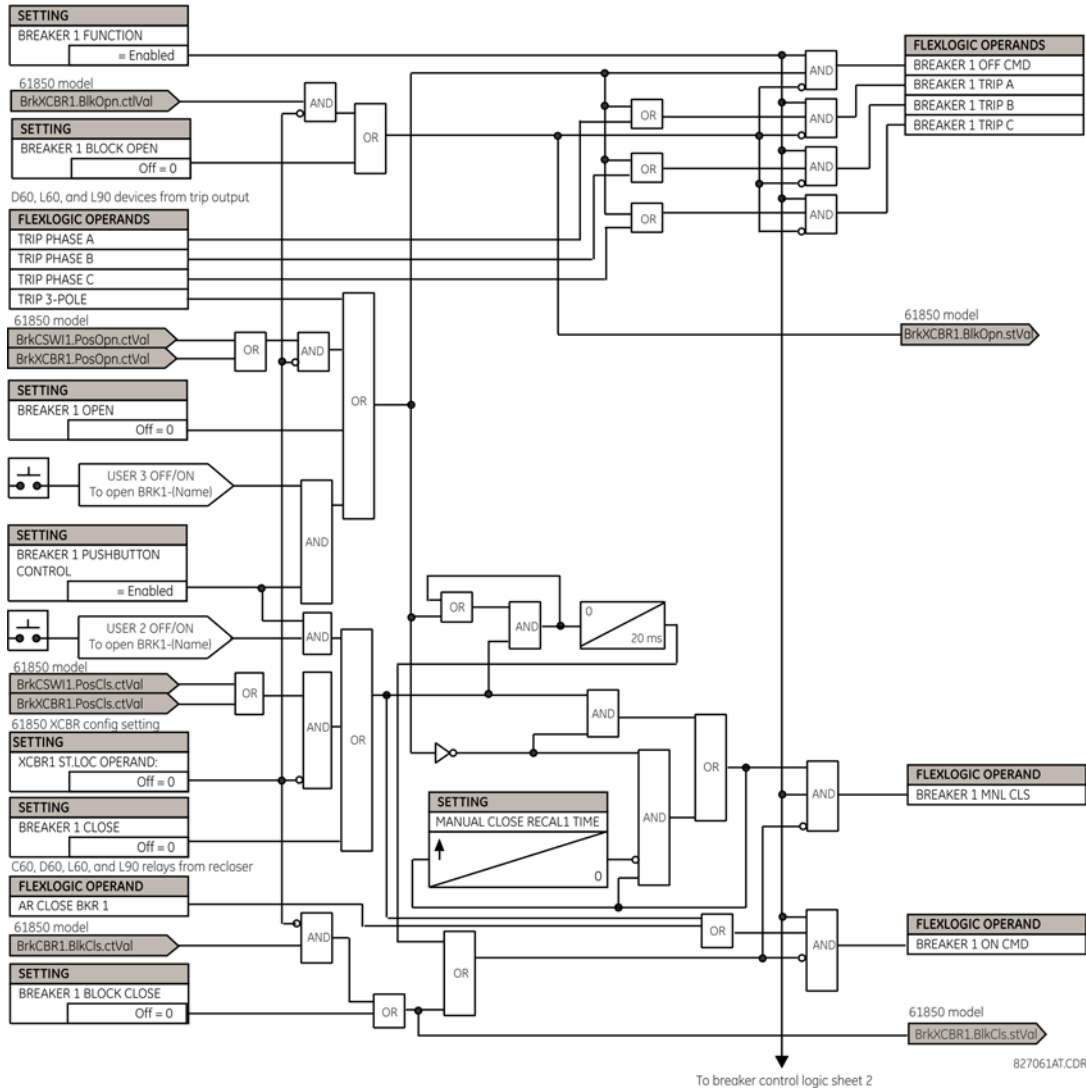

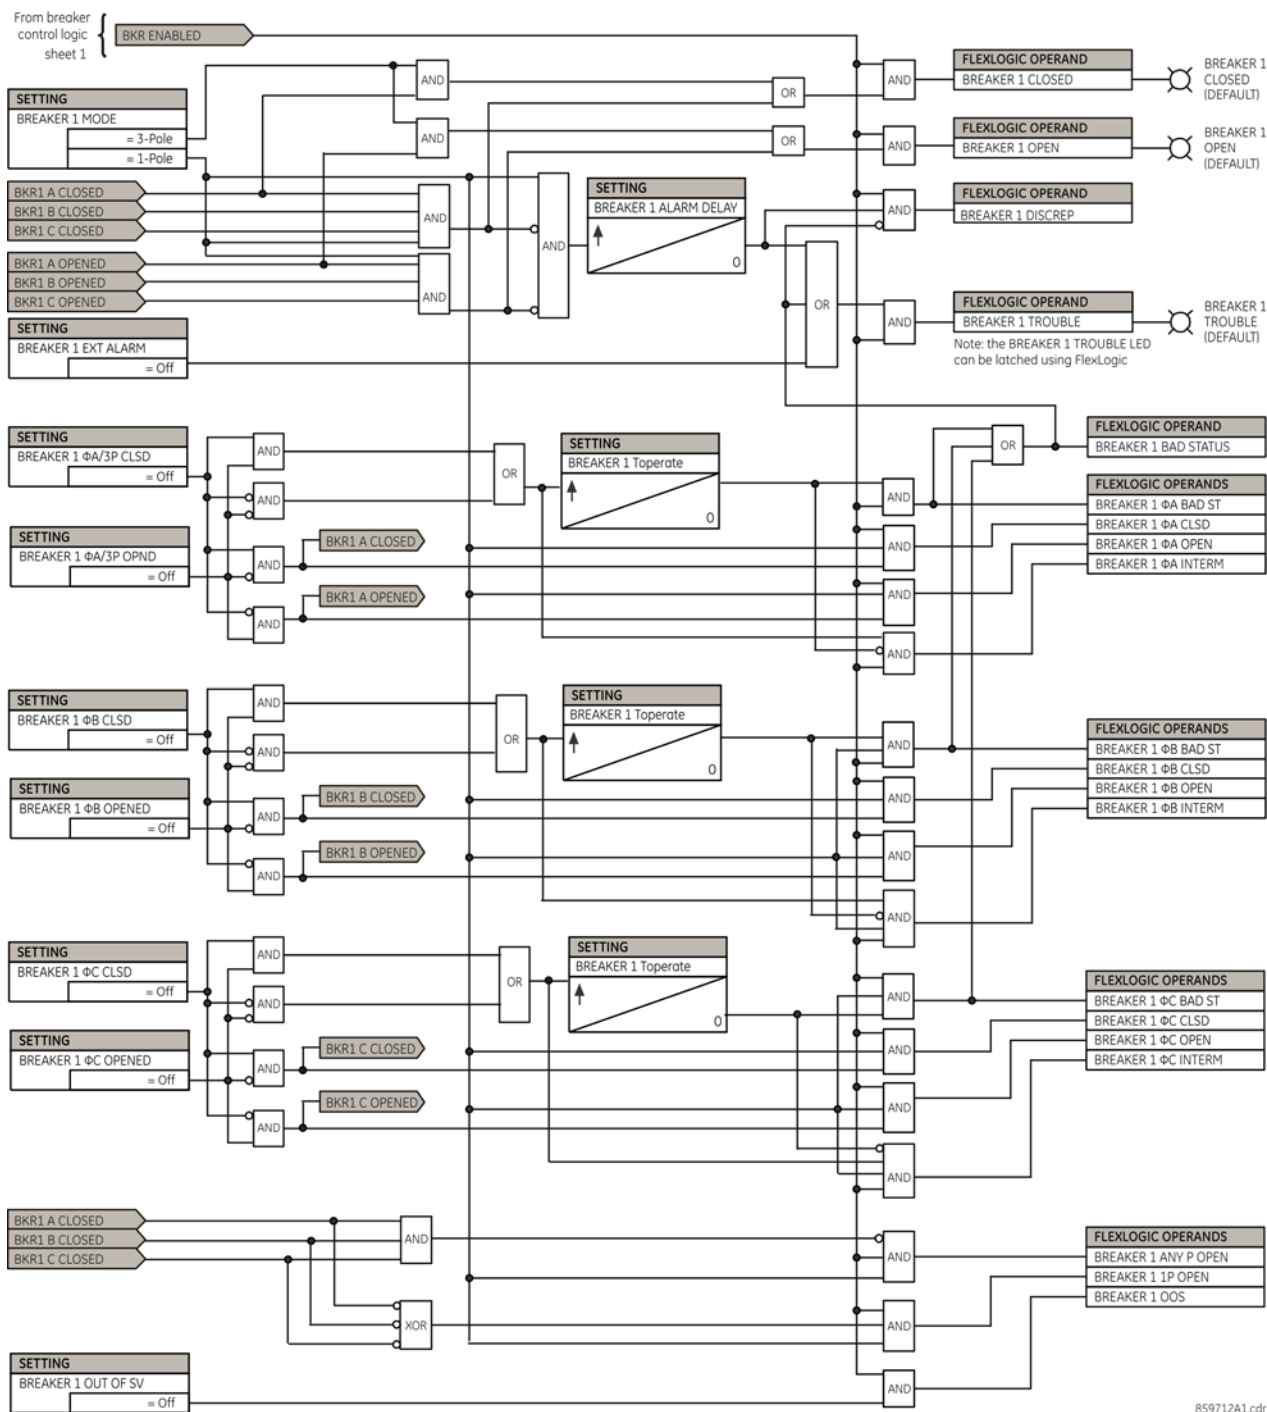

Figure 5-24: DUAL BREAKER CONTROL SCHEME LOGIC (Sheet 1 of 2)

IEC 61850 functionality is permitted when the L90 is in "Programmed" mode and not in the local control mode.

859712A1.cdr

Figure 5–25: DUAL BREAKER CONTROL SCHEME LOGIC (Sheet 2 of 2)

The breaker element has direct hard-coded connections to IEC 61850 model as shown in the logic diagram. This allows remote open/close operation of each breaker, using either CSWI or XCBR IEC 61850 logical nodes. IEC 61850 select-before-operate functionality, local/remote switch functionality along with a blocking of open/close commands are provided. Note that IEC 61850 commands are event-driven and dwell time for these is one protection pass only. If you want to maintain the close/open command for a certain time, do so either on the contact outputs using the "Seal-in" setting or in FlexLogic.

5.4.6 DISCONNECT SWITCHES

MESSAGE	<div> <div>▲▼</div> <div> <div>SWITCH 1 ALARM</div> <div>DELAY: 0.000 s</div> </div> </div> <div>Range: 0.000 to 65.535 s in steps of 0.001</div>
MESSAGE	<div> <div>▲</div> <div> <div>SWITCH 1 EVENTS:</div> <div>Disabled</div> </div> </div> <div>Range: Disabled, Enabled</div>

The disconnect switch element contains the auxiliary logic for status and serves as the interface for opening and closing of disconnect switches from SCADA or through the front panel interface. The disconnect switch element can be used to create an interlocking functionality. For greater security in determination of the switch pole position, both the 89/a and 89/b auxiliary contacts are used with reporting of the discrepancy between them. The number of available disconnect switches depends on the number of the CT/VT modules ordered with the L90.

- **SWITCH 1 FUNCTION:** This setting enables and disables the operation of the disconnect switch element.
- **SWITCH 1 NAME:** Assign a user-defined name (up to six characters) to the disconnect switch. This name will be used in flash messages related to disconnect switch 1.
- **SWITCH 1 MODE:** This setting selects “3-Pole” mode, where disconnect switch poles have a single common auxiliary switch, or “1-Pole” mode where each disconnect switch pole has its own auxiliary switch.

- **SWITCH 1 OPEN:** This setting selects an operand that creates a programmable signal to operate a contact output to open disconnect switch 1.
- **SWITCH 1 BLK OPEN:** This setting selects an operand that prevents opening of the disconnect switch. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.
- **SWITCH 1 CLOSE:** This setting selects an operand that creates a programmable signal to operate a contact output to close disconnect switch 1.
- **SWITCH 1 BLK CLOSE:** This setting selects an operand that prevents closing of the disconnect switch. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.
- **SWITCH 1 Φ A/3P CLSD:** This setting selects an operand, usually a contact input connected to a disconnect switch auxiliary position tracking mechanism. This input should be a normally-open 89/a status input to create a logic 1 when the disconnect switch is closed. If the **SWITCH 1 MODE** setting is selected as “3-Pole”, this setting selects a single input as the operand used to track the disconnect switch open or closed position. If the mode is selected as “1-Pole”, the input mentioned above is used to track phase A and the **SWITCH 1 Φ B** and **SWITCH 1 Φ C** settings select operands to track phases B and C, respectively.
- **SWITCH 1 Φ A/3P OPND:** This setting selects an operand, usually a contact input, that should be a normally-closed 89/b status input to create a logic 1 when the disconnect switch is open. If a separate 89/b contact input is not available, then an inverted 89/a status signal can be used.
- **SWITCH 1 Φ B CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase B closed position as above for phase A.
- **SWITCH 1 Φ B OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase B opened position as above for phase A.
- **SWITCH 1 Φ C CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase C closed position as above for phase A.
- **SWITCH 1 Φ C OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase C opened position as above for phase A.
- **SWITCH 1 Toperate:** This setting specifies the required interval to overcome transient disagreement between the 89/a and 89/b auxiliary contacts during disconnect switch operation. If transient disagreement still exists after this time has expired, the SWITCH 1 BAD STATUS FlexLogic operand is asserted from alarm or blocking purposes.
- **SWITCH 1 ALARM DELAY:** This setting specifies the delay interval during which a disagreement of status among the three-pole position tracking operands will not declare a pole disagreement. This allows for non-simultaneous operation of the poles.

IEC 61850 functionality is permitted when the L90 is in “Programmed” mode and not in the local control mode.

NOTE

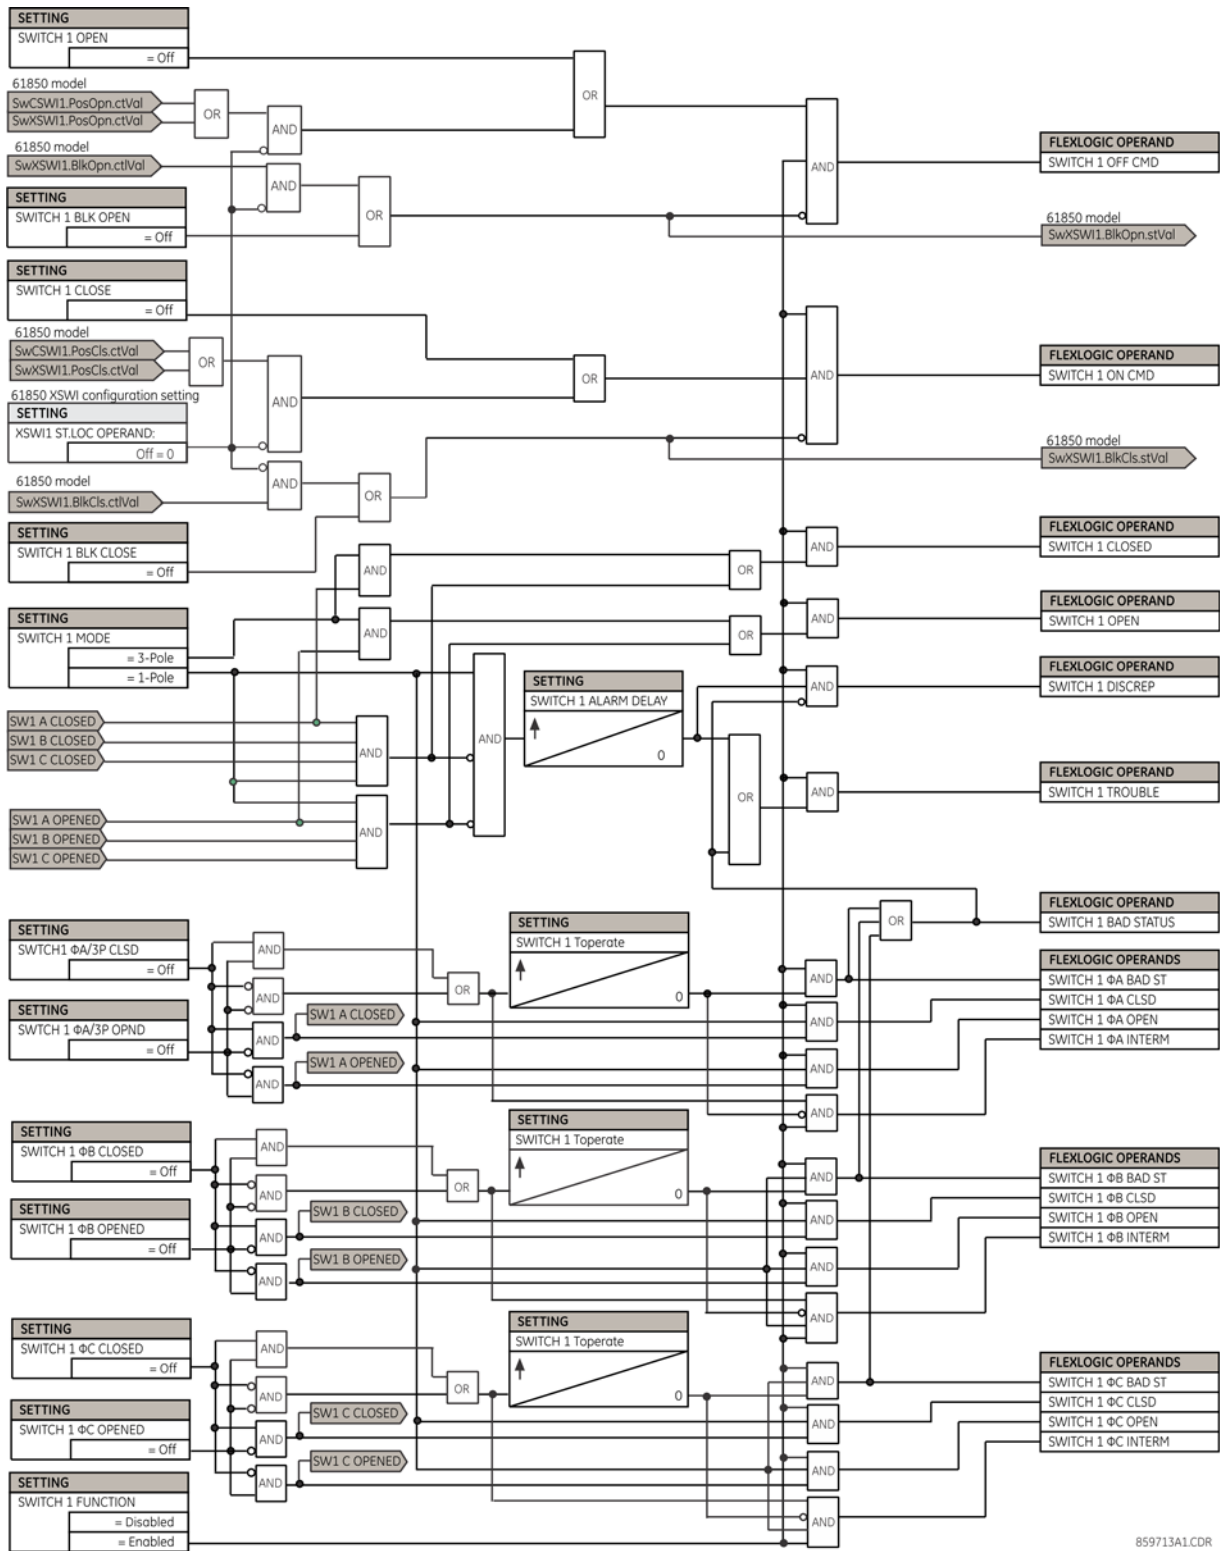

Figure 5-26: DISCONNECT SWITCH SCHEME LOGIC

The switch element has direct hard-coded connections to IEC 61850 model as shown in the logic diagram. This allows remote open/close operation of each switch, using either CSWI or XSWI IEC 61850 logical nodes. IEC 61850 select-before-operate functionality, local/remote switch functionality along with a blocking open/close commands are provided. Note that IEC 61850 commands are event-driven and dwell time for these is one protection pass only. If you want to maintain close/open command for a certain time, do so either on the contact outputs using the "Seal-in" setting or in FlexLogic.

5.4.7 FLEXCURVES

a) SETTINGS

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ FLEXCURVES ⇒ FLEXCURVE A(D)

■ FLEXCURVE A
 ■

◀▶

FLEXCURVE A TIME AT
 0.00 xPKP: 0 ms

Range: 0 to 65535 ms in steps of 1

FlexCurves A through D have settings for entering times to reset and operate at the following pickup levels: 0.00 to 0.98 and 1.03 to 20.00. This data is converted into two continuous curves by linear interpolation between data points. To enter a custom FlexCurve, enter the reset and operate times (using the VALUE keys) for each selected pickup point (using the MESSAGE UP/DOWN keys) for the desired protection curve (A, B, C, or D).

Table 5–9: FLEXCURVE TABLE

RESET	TIME MS	RESET	TIME MS	OPERATE	TIME MS	OPERATE	TIME MS	OPERATE	TIME MS	OPERATE	TIME MS
0.00		0.68		1.03		2.9		4.9		10.5	
0.05		0.70		1.05		3.0		5.0		11.0	
0.10		0.72		1.1		3.1		5.1		11.5	
0.15		0.74		1.2		3.2		5.2		12.0	
0.20		0.76		1.3		3.3		5.3		12.5	
0.25		0.78		1.4		3.4		5.4		13.0	
0.30		0.80		1.5		3.5		5.5		13.5	
0.35		0.82		1.6		3.6		5.6		14.0	
0.40		0.84		1.7		3.7		5.7		14.5	
0.45		0.86		1.8		3.8		5.8		15.0	
0.48		0.88		1.9		3.9		5.9		15.5	
0.50		0.90		2.0		4.0		6.0		16.0	
0.52		0.91		2.1		4.1		6.5		16.5	
0.54		0.92		2.2		4.2		7.0		17.0	
0.56		0.93		2.3		4.3		7.5		17.5	
0.58		0.94		2.4		4.4		8.0		18.0	
0.60		0.95		2.5		4.5		8.5		18.5	
0.62		0.96		2.6		4.6		9.0		19.0	
0.64		0.97		2.7		4.7		9.5		19.5	
0.66		0.98		2.8		4.8		10.0		20.0	

The relay using a given FlexCurve applies linear approximation for times between the user-entered points. Special care must be applied when setting the two points that are close to the multiple of pickup of 1; that is, 0.98 pu and 1.03 pu. It is recommended to set the two times to a similar value; otherwise, the linear approximation may result in undesired behavior for the operating quantity that is close to 1.00 pu.

b) FLEXCURVE CONFIGURATION WITH ENERVISTA UR SETUP

The EnerVista UR Setup software allows for easy configuration and management of FlexCurves and their associated data points. Prospective FlexCurves can be configured from a selection of standard curves to provide the best approximate fit, then specific data points can be edited afterwards. Alternately, curve data can be imported from a specified file (.csv format) by selecting the **Import Data From EnerVista UR Setup** setting.

Curves and data can be exported, viewed, and cleared by clicking the appropriate buttons. FlexCurves are customized by editing the operating time (ms) values at pre-defined per-unit current multiples. Note that the pickup multiples start at zero (implying the "reset time"), operating time below pickup, and operating time above pickup.

c) RECLOSER CURVE EDITING

Recloser curve selection is special in that recloser curves can be shaped into a composite curve with a minimum response time and a fixed time above a specified pickup multiples. There are 41 recloser curve types supported. These definite operating times are useful to coordinate operating times, typically at higher currents and where upstream and downstream protective devices have different operating characteristics. The recloser curve configuration window shown below appears when the Initialize From EnerVista UR Setup setting is set to "Recloser Curve" and the **Initialize FlexCurve** button is clicked.

Recloser Curve Initialization

Standard Recloser Curve: **GE_101**

Multiplier: **1** Adder (seconds): **0**

Minimum Response Time (MRT):

☐ Use MRT MRT (seconds): **0.013**

High Current Time (HCT):

☐ Use HCT HCT Ratio (Multiple of Pickup): **20** HCT (seconds): **0.016**

Buttons: Defaults, OK, Apply, Cancel

Multiplier: Scales (multiplies) the curve operating times

Adder: Adds the time specified in this field (in ms) to each curve operating time value.

Minimum Response Time (MRT): If enabled, the MRT setting defines the shortest operating time even if the curve suggests a shorter time at higher current multiples. A composite operating characteristic is effectively defined. For current multiples lower than the intersection point, the curve dictates the operating time; otherwise, the MRT does. An information message appears when attempting to apply an MRT shorter than the minimum curve time.

High Current Time: Allows the user to set a pickup multiple from which point onwards the operating time is fixed. This is normally only required at higher current levels. The **HCT Ratio** defines the high current pickup multiple; the **HCT** defines the operating time.

842721A1.CDR

Figure 5-27: RECLOSER CURVE INITIALIZATION

The multiplier and adder settings only affect the curve portion of the characteristic and not the MRT and HCT settings. The HCT settings override the MRT settings for multiples of pickup greater than the HCT ratio.

d) EXAMPLE

A composite curve can be created from the GE_111 standard with MRT = 200 ms and HCT initially disabled and then enabled at eight (8) times pickup with an operating time of 30 ms. At approximately four (4) times pickup, the curve operating time is equal to the MRT and from then onwards the operating time remains at 200 ms (see below).

Recloser Curve Initialization

Standard Recloser Curve: GE_111

Multiplier: 1 Adder (seconds): 0

Minimum Response Time

☒ Use MRT

MRT (seconds): 0.2

High Current Time

☐ Use HCT

HCT Ratio (Multiple of Pickup): 20

HCT (seconds): 0.016

Defaults OK Apply Cancel

Figure 5–28: COMPOSITE RECLOSER CURVE WITH HCT DISABLED

With the HCT feature enabled, the operating time reduces to 30 ms for pickup multiples exceeding 8 times pickup.

5

Recloser Curve Initialization

Standard Recloser Curve: GE_111

Multiplier: 1 Adder (seconds): 0

Minimum Response Time

☒ Use MRT

MRT (seconds): 0.2

High Current Time

☒ Use HCT

HCT Ratio (Multiple of Pickup): 8

HCT (seconds): 0.03

Defaults OK Apply Cancel

Figure 5–29: COMPOSITE RECLOSER CURVE WITH HCT ENABLED

Configuring a composite curve with an increase in operating time at increased pickup multiples is not allowed. If this is attempted, the EnerVista UR Setup software generates an error message and discards the proposed changes.

e) STANDARD RECLOSER CURVES

The standard recloser curves available for the L90 are displayed in the following graphs.

5.4.8 PHASOR MEASUREMENT UNIT

a) MAIN MENU

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR MEASUREMENT UNIT

The L90 Line Current Differential System is provided with an optional phasor measurement unit feature. This feature is specified as a software option at the time of ordering. The number of phasor measurement units available is also dependent on this option. See the *Ordering* section of chapter 2 for details.

UR Synchrophasor Implementation

PHASORS are used within protection relays. If these phasors are referenced to a common time base they are referred to as a **SYNCHROPHASOR**. A vastly improved method for tracking power system dynamic phenomena for improved power system monitoring, protection, operation, and control can be realized if Synchrophasors from different locations within the power system are networked to a central location.

The L90 offers PMU features over two communication standards, IEC61850-9-5 and IEEE C37.118. The figure shows complete Synchrophasor implementation.

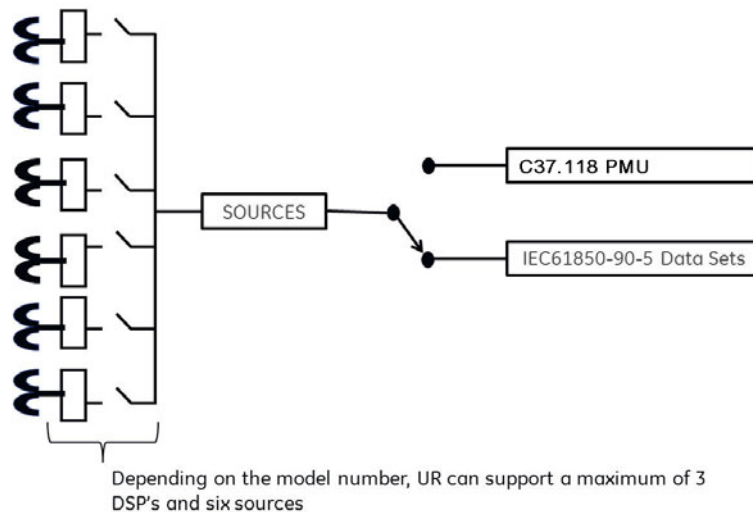

Figure 5-38: COMPLETE SYNCHROPHASOR IMPLEMENTATION

UR Implementation of IEC61850-90-5

Synchrophasor data as measured and calculated by phasor measurement units (PMUs) is very useful to assess the condition of the electrical power network. The IEEE C37.118 standards define synchrophasors and related message formats to transmit synchrophasor data. Synchrophasor streaming via IEEE C37.118 has proven to work but the desire to have a communication mechanism that is compliant with the concept of IEC 61850 has led to the development of IEC61850-90-5. The IEC61850-90-5 standard defines the packet structure for multicast routing of streamed Sampled Value (SV) known as R-SV.

Firmware versions 7.0 and above have a 90-5 based R-SV implementation equivalent in structure and configuration to that of the existing C37.118 implementation of firmware version 6.0, that is, synchrophasor data at rates up to 60 Hz for metering and 120 Hz for protection class synchrophasors. The two figures below depict the general data flow for the generation of synchrophasor data for IEC61850-90-5. In the first figure, when IEC61850-90-5 is selected all real and virtual sources are available for the IEC61850-90-5 PMUs.

Firmware version 7.0 allows the N60 to support a maximum of four Logical Device PMUs (Logical Device 2 through 5) and four aggregators (located in Logical Device 1 (LD1)), while other UR family members support one PMU and only one aggregator. The control blocks for the aggregators are located in LD1. A 64 char LDName setting is provided, see figure below..

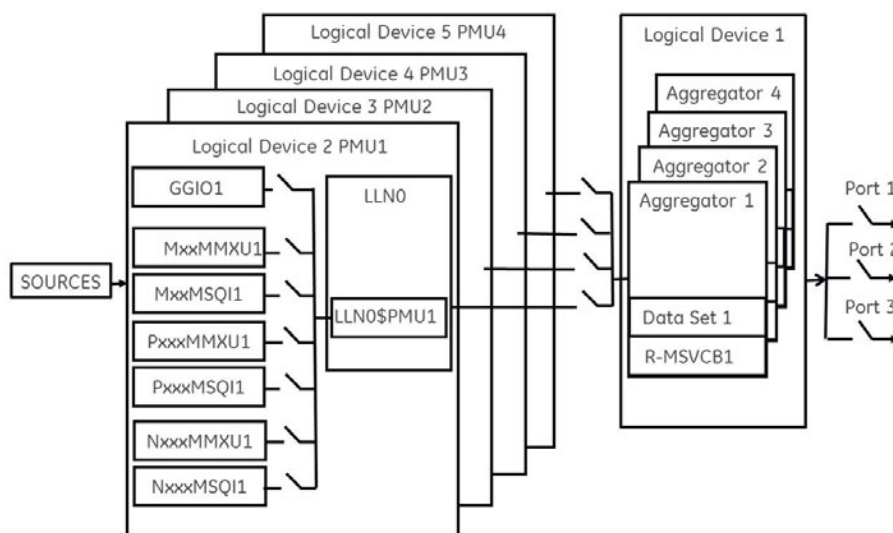

Figure 5-39: N60 SUPPORT FOR FOUR LOGICAL DEVICE PMUS

The specifics of implementation by model number is summarized in the table below.

Table 5-10: IMPLEMENTATION BY MODEL NUMBER

MODEL	NUMBER OF PMUS	NUMBER OF AGGREGATORS	NUMBER OF ANALOG INPUTS
N60	4	4	16
D60, F60, G60, L30, L90, T60	1	1	16

Precise time input to the relay from the international time standard, via either IRIG-B or PTP, is vital for correct synchrophasor measurement and reporting. For IRIG-B, a DC level shift IRIG-B receiver must be used for the phasor measurement unit to output proper synchrophasor values.

Depending on the applied filter, the Synchrophasors that are produced by PMUs are classified as either P (protection) or M (Measurement) class Synchrophasors. Synchrophasors available within the UR that have no filtering applied are classified as NONE which within the standard is classified as PRES OR UNKNOWN under the Calculation Method - ClcMth. Each Logical Device PMU supports one MxxMMXU1, MxxMSQI1, PxxxMMXU1, PxxxMSQI1, NxxxMMXU1, and one NxxxMSQI1 logical node.

Figure 5–40: LOGICAL NODES SUPPORTED IN EACH LOGICAL DEVICE

The following is a summary of LNs that are in each Logical Device (LD2 through LD5):

- PxxxMMXU1 ClcMth = P-Class (Note Vaux is mapped to Vneut of MMXU)
- PxxxMSQI1 ClcMth = P-CLASS
- MxxMMXU1 ClcMth = M-Class (Note Vaux is mapped to Vneut of MMXU)
- MxxMSQI1 ClcMth = M-CLASS
- NxxMMXU1 ClcMth = M-Class (Note Vaux is mapped to Vneut of MMXU)
- NxxMSQI1 ClcMth = M-CLASS
- GGIO1 which contains 16 digital status indication points and 16 analog points. The Analog GGIO values are selectable from any FlexAnalog value in the UR.

The Synchro Logical Nodes in an LD report at the same rate as set in the PMUn Basic Configuration setting. This is reflected in the instantiation of the Data Object – SmpRate in the msvcb## of LLN0 in the LD1. SmpRate is a Read Only Integer Status (INS).

When the first PMU from any LD is mapped into an aggregator, the aggregator inherits the Sample Rate (SmpRate) and IEEC C37.118 Class (P or M) of that PMU. The value of the SmpRate DO in the Report Control Block is set based on the value of the Sample Rate in the PMU. The Class of the Dataset are mapped into the MSVID of the Dataset (see text below for the overall name of the MSVID). If other PMUs are mapped into the same aggregator with different Sample Rates or from different classes, then a Self-Test error (DatSetErr) is set and dataset transmission is blocked.

A setting value – MSVID – is created with a maximum input range of 56 characters (=64 less 6 for the IDCode less 2 for the Class).

The value of MSVID in the dataset is a concatenation of the aggregator IDCode and the MSVID setting value in the format: MSVID-AggregatorIDCode-CLASS where CLASS is P, M, or N (for None) – depending on the Class of the first PMU included in the Aggregator.

Synchrophasor Rectangular Format and Integer data types are NOT supported in IEC 61850-90-5 (only supported with IEEE C37.118) and not to set — GGIO1 which contains 16 digital status indication points — aggregated as a 16 bit bitstring and 16 analog points. The Analog GGIO values are selectable from any FlexAnalog value in the UR. For version 7.0 and later the description fields for the phasors, analog and digital channels are populated with the 16 character name field provided within the Basic Configuration menu. Additionally, the names of the 16 binary points are implemented as numbered descriptions — d1, d2, d3, and so on. The number of descriptions are equal to the number of bits configured in the 16 bit digital status word.

All bitstrings less than or equal to 32 bits in length map into a 32 bit bitstring in an IEC 61850-90-5 dataset.

The Value of the Nominal Frequency of the chassis is instantiated as a DO in LPHD of LD1. The value is named HzNom and is an Integer Status (INS).

The UR also supports the option to apply no filtering to the synchrophasors. If no filtering is applied (PMU Class = None), according to the standard the ClcMth attribute will be PRES. The semantic of the ClcMth used is not carried in the individual DO and so it is recommended that one of letters of the prefix on the instantiated LNs be set to “P” or “M” accordingly in order to differentiate. For version 7.0 only FCDA data is supported. The *Implementation by Model Number* table, see above, describes the maximum size of each PMU data set for version 7.0 using FCDA data (non-structured data).

EXAMPLE: PROTECTION SYNCHROPHASORS DATA SET WITH REPORTING RATE 60 FRAMES/SECOND

This example gives the protection synchrophasors data set with a reporting rate of 60 frames per second (P60MMXU1). See figure above, Logical Nodes Supported in Each Logical Device. This data or list of items, see figure below, is not available to the UR setup program but is available to be mapped by the user into a selected aggregator or aggregators dataset. The logical device name – LDName - of each PMU LD will be a 64 character user setting. The C37.118 STN and IDCode is to be mapped as a concatenated value in the (d)escription field of LPL CDC of the NamPIt DO in LLN0. The mapping is implemented as STN-IDCode(text string).

From each PMU the user selects the phasor information of interest that is mapped into the selected aggregator dataset(s). For version 7.0 only FCDA data is supported.

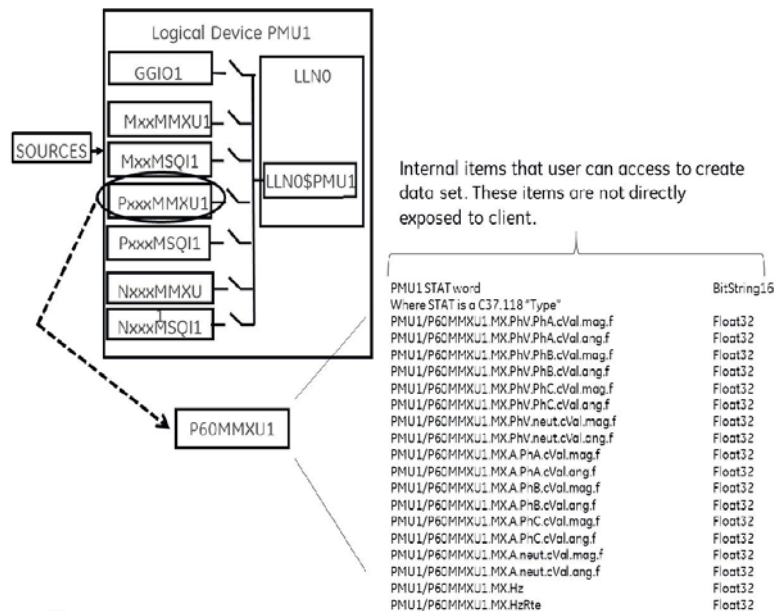

Figure 5-41: DATA SET CREATED FROM USER SELECTED INTERNAL ITEMS

EXAMPLE: THE CREATION OF DIFFERENT DATA SETS

The aggregators allow the aggregation of phasors from multiple PMUs (with the same reporting rate) into a single custom data set to optimize bandwidth when streaming.

Figure 5–42: EXAMPLE OF AGGREGATOR DATA SETS

CONFIGURATION EXAMPLE: CFG-2 BASED CONFIGURATION (USING IEC61850-90-5)

The L90 is expected to send the CFG-2 file (IEEE C37.118 config. file) upon request from the upstream synchrophasor devices (e.g., P30) without stopping R-SV multicasting, see figure below. The primary domain controller (PDC) does not need to use a stop/start data stream command if the UR protocol is set to IEC61850-90-5 prior to requesting the configuration via CFG-2 (IEEE C37.118 config. file). The CFG-2 request from the P30 can be on TCP/IP or UDP/IP, however, R-SV data streaming is only UDP multicasts (not TCP).

Figure 5–43: CFG-2 BASED CONFIGURATION SOLUTION

MODIFICATION OF SYNC WORD IN CFG-2 FOR TR 90-5 DATA SETS

In the CFG-2 file, all relevant information about the data being streamed is included. However, this file does not include the fact that it describes a 90-5 dataset or the number of Application Service Data Units (datasets). In order to communicate this information via the CFG-2 file for a given aggregator, when the aggregator is set to 90-5, the version number of the CFG-2 file (found in bits 0-3 of the frame SYNC word - which should presently be set to 2) is set as follows:

VALUE (DECIMAL)	# OF ASDUS
11	1
12	2
13	3
14	4

The PMU settings are organized in logical groups as follows.

MESSAGE		■ 37.118 PMU 1 ■ CONFIGURATION	See below
MESSAGE		■ 90-5 PMU 1 ■ CONFIGURATION	See below.

This section contains basic phasor measurement unit (PMU) data, such as functions, source settings, and names.

- **PMU 1 FUNCTION:** This setting enables the LOGICAL Device PMU 1 functionality. Use this setting to permanently enable or disable the feature.
- **PMU 1 IDCODE:** This setting assigns a numerical ID to the PMU. It corresponds to the IDCODE field of the data, configuration, header, and command frames of the IEEE C37.118 protocol. The PMU uses this value when sending data, configuration, and header frames; and it responds to this value when receiving the command frame. This is used when only data from one PMU is present.
- **PMU 1 STN:** This setting assigns an alphanumeric ID to the PMU station. It corresponds to the STN field of the configuration frame of the IEEE C37.118 protocol. This value is a 16-character ASCII string as per the IEEE C37.118 standard.
- **PMU 1 SIGNAL SOURCE:** This setting specifies one of the available L90 signal sources for processing in the PMU. Note that any combination of voltages and currents can be configured as a source. The current channels could be configured as sums of physically connected currents. This facilitates PMU applications in breaker-and-a-half, ring-bus, and similar arrangements. The PMU feature calculates voltage phasors for actual voltage (A, B, C, and auxiliary) and current (A, B, C, and ground) channels of the source, as well as symmetrical components (0, 1, and 2) of both voltages and currents. When configuring communication and recording features of the PMU, the user could select – from the above superset – the content to be sent out or recorded. When one source is selected by one PMU, it cannot be selected by another PMU.
- **PMU 1 CLASS (Range P, M, None):** This setting selects the synchrophasor class. Note that a reporting rate of 100 or 120 can only be selected for class P synchrophasors and if the system frequency is 50 Hz or 60 Hz, respectively.
- **PMU 1 NETWORK REPORTING FORMAT:** This setting selects whether synchrophasors are reported as 16-bit integers or 32-bit IEEE floating point numbers. This setting complies with bit-1 of the FORMAT field of the IEEE C37.118 configuration frame. This setting applies to synchrophasors only; the user-selectable FlexAnalog channels are always transmitted as 16-bit integer values.
- **PMU 1 NETWORK REPORTING STYLE:** This setting selects whether synchrophasors are reported in rectangular (real and imaginary) coordinates or in polar (magnitude and angle) coordinates. This setting complies with bit-0 of the FORMAT field of the IEEE C37.118 configuration frame.
- **PMU 1 RATE:** This setting specifies the reporting rate for the network (Ethernet) port. This value applies to all PMU streams of the device that are assigned to transmit over this aggregator. For a system frequency of 60 Hz (50 Hz), the L90 generates a reporting mismatch message if the selected rate is not set as 10 Hz, 12 Hz, 15 Hz, 20 Hz, 30 Hz, 60 Hz, or 120 Hz (or 10 Hz, 25 Hz, 50 Hz or 100 Hz when the system frequency is 50 Hz) when entered via the keypad or software; and the L90 stops the transmission of reports. Note that 4 Hz is not allowed for an M-class 50 Hz system).

- **PMU1 PHS-1 to PMU1 PHS-14:** These settings specify synchrophasors to be transmitted from the superset of all synchronized measurements. The available synchrophasor values are tabulated below.

SELECTION	MEANING
Va	First voltage channel, either Va or Vab
Vb	Second voltage channel, either Vb or Vbc
Vc	Third voltage channel, either Vc or Vca
Vx	Fourth voltage channel
Ia	Phase A current, physical channel or summation as per the source settings
Ib	Phase B current, physical channel or summation as per the source settings
Ic	Phase C current, physical channel or summation as per the source settings
Ig	Fourth current channel, physical or summation as per the source settings
V1	Positive-sequence voltage, referenced to Va
V2	Negative-sequence voltage, referenced to Va
V0	Zero-sequence voltage
I1	Positive-sequence current, referenced to Ia
I2	Negative-sequence current, referenced to Ia
I0	Zero-sequence current

These settings allow for optimizing the frame size and maximizing transmission channel usage, depending on a given application. Select “Off” to suppress transmission of a given value.

- **PMU1 PHS-1 NM to PMU1 PHS-14 NM:** These settings allow for custom naming of the synchrophasor channels. Sixteen-character ASCII strings are allowed as in the CHNAM field of the configuration frame. These names are typically based on station, bus, or breaker names.
- **PMU1 A-CH-1 to PMU1 A-CH-16:** These settings specify any analog data measured by the relay to be included as a user-selectable analog channel of the data frame. Up to 16 analog channels can be configured to send any FlexAnalog value from the relay. Examples include frequency, rate of frequency change, active and reactive power, per phase or three-phase power, power factor, temperature via RTD inputs, and THD. The configured analog values are sampled concurrently with the synchrophasor instant and sent as 32-bit floating-point values scaled to Engineering units.
- **PMU1 A-CH-1 NM to PMU1 A-CH-16 NM:** These settings allow for custom naming of the analog channels. Sixteen-character ASCII strings are allowed as in the CHNAM field of the configuration frame.
- **PMU1 D-CH-1 to PMU1 D-CH-16:** These settings specify any digital flag measured by the relay to be included as a user-selectable digital channel of the data frame. Up to sixteen digital channels can be configured to send any Flex-Logic operand from the relay. The configured digital flags are sampled concurrently with the synchrophasor instant. These values are mapped into a two-byte integer number, with byte 1 LSB corresponding to the digital channel 1 and byte 2 MSB corresponding to digital channel 16.
- **PMU1 D-CH-1 NM to PMU1 D-CH-16 NM:** These settings allow for custom naming of the digital channels. Sixteen-character ASCII strings are allowed as in the CHNAM field of the configuration frame.
- **PMU1 D-CH-1 NORMAL STATE to PMU1 D-CH-16 NORMAL STATE:** These settings allow for specifying a *normal state* for each digital channel. These states are transmitted in configuration frames to the data concentrator.

C37.118 PMU 1 CONFIGURATION

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR MEASUREMENT ⇒ BASIC CONFIGURATION ⇒ PMU 1 ⇒ PMU 1 BASIC CONFIGURATION ⇒ 37.118 PMU 1 CONFIGURATION

37.118 PMU 1

CONFIGURATION

PMU 1 FORMAT:
 Integer

Range: Integer, Floating-point

MESSAGE

PMU 1 STYLE:
 Polar

Range: Polar, Rectangular

PMU 1 FORMAT: This setting selects whether synchrophasors are reported as 16-bit integers or 32-bit IEEE floating point numbers. This setting complies with bit-1 of the FORMAT field of the IEEE C37.118 configuration frame. This setting applies to synchrophasors only; the user-selectable FlexAnalog channels are always transmitted as 16-bit integer values.

PMU 1 STYLE: This setting selects whether synchrophasors are reported in rectangular (real and imaginary) coordinates or in polar (magnitude and angle) coordinates. This setting complies with bit-0 of the FORMAT field of the IEEE C37.118 configuration frame.

With 90-5 PMU, the FORMAT and STYLE are Floating-point and Polar respectively, as specified in the IEC 61850 standard.

IEC 61850-90-5 PMU 1 CONFIGURATION

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR MEASUREMENT ⇒ BASIC CONFIGURATION ⇒ PMU1 ⇒ PMU 1 BASIC CONFIGURATION ⇒ 90-5 PMU 1 CONFIGURATION

<input type="checkbox"/> 90-5 PMU 1 <input type="checkbox"/> CONFIGURATION		PMU 1 LDINST: PMU1	Range: 64 char ASCII text
---	--	-----------------------	---------------------------

PMU1 LDINST: A user-defined visible string (maximum 64 char ASCII test) to assign Logical Device (LD) Inst for a PMU LD.

As per IEC 61850-6 standard specification, the PMU LD Name is the concatenated combination (to total 64 characters) of IED Name (specified in IEC 61850 Server Settings) appended with PMU X LDINST string.

c) PMU TRIGGERING OVERVIEW

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR... ⇒ PHASOR MEASUREMENT UNIT 1 ⇒ PMU 1 TRIGGERING

<div>5</div> <input type="checkbox"/> PMU 1 <input type="checkbox"/> TRIGGERING			<input type="checkbox"/> PMU 1 USER <input type="checkbox"/> TRIGGER	See page 5-119.
	MESSAGE		<input type="checkbox"/> PMU 1 FREQUENCY <input type="checkbox"/> TRIGGER	See page 5-119.
	MESSAGE		<input type="checkbox"/> PMU 1 VOLTAGE <input type="checkbox"/> TRIGGER	See page 5-120.
	MESSAGE		<input type="checkbox"/> PMU 1 CURRENT <input type="checkbox"/> TRIGGER	See page 5-121.
	MESSAGE		<input type="checkbox"/> PMU 1 POWER <input type="checkbox"/> TRIGGER	See page 5-122.
	MESSAGE		<input type="checkbox"/> PMU 1 df/dt <input type="checkbox"/> TRIGGER	See page 5-123.

Each logical phasor measurement unit (PMU) contains five triggering mechanisms to facilitate triggering of the associated PMU recorder, or cross-triggering of other PMUs of the system. They are:

- Overfrequency and underfrequency
- Overvoltage and undervoltage
- Overcurrent
- Overpower
- High rate of change of frequency

The pre-configured triggers could be augmented with a user-specified condition built freely using programmable logic of the relay. The entire triggering logic is refreshed once every two power system cycles.

All five triggering functions and the user-definable condition are consolidated (ORed) and connected to the PMU recorder. Each trigger can be programmed to log its operation into the event recorder, and to signal its operation via targets. The five triggers drive the STAT bits of the data frame to inform the destination of the synchrophasor data regarding the cause of trigger. The following convention is adopted to drive bits 11, 3, 2, 1, and 0 of the STAT word.

Figure 5-44: STAT BITS LOGIC

The trigger reset (drop-off) timer is available for all five triggering functions (FREQ, ROCOF, VOLT, CURR, POWER) in individual trigger settings under the TRIGGER DPO TIME setting. This asserts individual trigger operand and overall PMU x TRIGGERED operand with stat bits 3 and 11 for a fixed interval defined by this setting. If it is required that PMU x TRIGGERED operand with stat bits 3 and 11 stay longer than the individual reset timer, then use the PMU x USER TRIGGER setting assigned with appropriate elements and FlexLogic. In short, in case of USER TRIGGER, the drop-off time needs to be implemented using FlexLogic.

d) USER TRIGGERING

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR MEASUREMENT... ⇒ PMU 1 TRIGGERING ⇒ PMU 1 USER TRIGGER

<div> <div>PMU 1 USER</div> <div>TRIGGER</div> </div>	<div>PMU1 USER TRIGGER:</div> <div>Off</div>	Range: FlexLogic operands
---	--	---------------------------

The user trigger allows customized triggering logic to be constructed from FlexLogic. The entire triggering logic is refreshed once every two power system cycles.

e) FREQUENCY TRIGGERING

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR MEASUREMENT... ⇒ PMU 1 TRIGGERING ⇒ PMU 1 FREQUENCY TRIGGER

<div> <div>PMU 1 FREQUENCY</div> <div>TRIGGER</div> </div>	<div>PMU 1 FREQ TRIGGER</div> <div>FUNCTION: Disabled</div>	Range: Enabled, Disabled
MESSAGE	<div>PMU 1 FREQ TRIGGER</div> <div>LOW-FREQ: 49.00 Hz</div>	Range: 20.00 to 70.00 Hz in steps of 0.01
MESSAGE	<div>PMU 1 FREQ TRIGGER</div> <div>HIGH-FREQ: 61.00 Hz</div>	Range: 20.00 to 70.00 Hz in steps of 0.01
MESSAGE	<div>PMU 1 FREQ TRIGGER</div> <div>PKP TIME: 0.10 s</div>	Range: 0.00 to 600.00 s in steps of 0.01
MESSAGE	<div>PMU 1 FREQ TRIGGER</div> <div>DPO TIME: 1.00 s</div>	Range: 0.00 to 600.00 s in steps of 0.01
MESSAGE	<div>PMU 1 FREQ TRIG BLK:</div> <div>Off</div>	Range: FlexLogic operand
MESSAGE	<div>PMU 1 FREQ TRIGGER</div> <div>TARGET: Self-Reset</div>	Range: Self-Reset, Latched, Disabled
MESSAGE	<div>PMU 1 FREQ TRIGGER</div> <div>EVENTS: Disabled</div>	Range: Enabled, Disabled

The trigger responds to the frequency signal of the phasor measurement unit (PMU) source. The frequency is calculated from either phase voltages, auxiliary voltage, phase currents and ground current, in this hierarchy, depending on the source configuration as per L90 standards. This element requires the frequency is above the minimum measurable value. If the frequency is below this value, such as when the circuit is de-energized, the trigger drops out.

- **PMU 1 FREQ TRIGGER LOW-FREQ:** This setting specifies the low threshold for the abnormal frequency trigger. The comparator applies a 0.02 Hz hysteresis.

- **PMU 1 FREQ TRIGGER HIGH-FREQ:** This setting specifies the high threshold for the abnormal frequency trigger. The comparator applies a 0.02 Hz hysteresis.
- **PMU 1 FREQ TRIGGER PKP TIME:** This setting could be used to filter out spurious conditions and avoid unnecessary triggering of the recorder.
- **PMU 1 FREQ TRIGGER DPO TIME:** This setting could be used to extend the trigger after the situation returned to normal. This setting is of particular importance when using the recorder in the forced mode (recording as long as the triggering condition is asserted).

Figure 5-45: FREQUENCY TRIGGER SCHEME LOGIC

f) VOLTAGE TRIGGERING

PATH: SETTINGS ⇌ SYSTEM SETUP ⇌ PHASOR MEASUREMENT... ⇌ PMU 1 TRIGGERING ⇌ PMU 1 VOLTAGE TRIGGER

<div> <div>PMU 1 VOLTAGE TRIGGER</div> <div>MESSAGE</div> </div>	PMU 1 VOLT TRIGGER FUNCTION: Disabled	Range: Enabled, Disabled
	PMU 1 VOLT TRIGGER LOW-VOLT: 0.800 pu	Range: 0.250 to 1.250 pu in steps of 0.001
	PMU 1 VOLT TRIGGER HIGH-VOLT: 1.200 pu	Range: 0.750 to 1.750 pu in steps of 0.001
	PMU 1 VOLT TRIGGER PKP TIME: 0.10 s	Range: 0.00 to 600.00 s in steps of 0.01
	PMU 1 VOLT TRIGGER DPO TIME: 1.00 s	Range: 0.00 to 600.00 s in steps of 0.01
	PMU 1 VOLT TRIG BLK: Off	Range: FlexLogic operand
	PMU 1 VOLT TRIGGER TARGET: Self-Reset	Range: Self-Reset, Latched, Disabled
MESSAGE	PMU 1 VOLT TRIGGER EVENTS: Disabled	Range: Enabled, Disabled

This element responds to abnormal voltage. Separate thresholds are provided for low and high voltage. In terms of signaling its operation, the element does not differentiate between the undervoltage and overvoltage events. The trigger responds to the phase voltage signal of the phasor measurement unit (PMU) source. All voltage channels (A, B, and C or AB, BC, and CA) are processed independently and could trigger the recorder. A minimum voltage supervision of 0.1 pu is implemented to prevent pickup on a de-energized circuit, similarly to the undervoltage protection element.

- **PMU 1 VOLT TRIGGER LOW-VOLT:** This setting specifies the low threshold for the abnormal voltage trigger, in per-unit of the PMU source. 1 pu is a nominal voltage value defined as the nominal secondary voltage times VT ratio. The comparator applies a 1% hysteresis.

- **PMU 1 VOLT TRIGGER HIGH-VOLT:** This setting specifies the high threshold for the abnormal voltage trigger, in per-unit of the PMU source. 1 pu is a nominal voltage value defined as the nominal secondary voltage times VT ratio. The comparator applies a 1% hysteresis.
- **PMU 1 VOLT TRIGGER PKP TIME:** This setting could be used to filter out spurious conditions and avoid unnecessary triggering of the recorder.
- **PMU 1 VOLT TRIGGER DPO TIME:** This setting could be used to extend the trigger after the situation returned to normal. This setting is of particular importance when using the recorder in the forced mode (recording as long as the triggering condition is asserted).

Figure 5-46: VOLTAGE TRIGGER SCHEME LOGIC

g) CURRENT TRIGGERING

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR MEASUREMENT... ⇒ PMU 1 TRIGGERING ⇒ PMU 1 CURRENT TRIGGER

<div> <div>PMU 1 CURRENT TRIGGER</div> <div>TRIGGER</div> </div>		<div> <div>PMU 1 CURR TRIGGER FUNCTION: Disabled</div> <div>Range: Enabled, Disabled</div> </div>
MESSAGE	<div> <div>PMU 1 CURR TRIGGER PICKUP: 1.800 pu</div> <div>Range: 0.100 to 30.000 pu in steps of 0.001</div> </div>	
MESSAGE	<div> <div>PMU 1 CURR TRIGGER PKP TIME: 0.10 s</div> <div>Range: 0.00 to 600.00 s in steps of 0.01</div> </div>	
MESSAGE	<div> <div>PMU 1 CURR TRIGGER DPO TIME: 1.00 s</div> <div>Range: 0.00 to 600.00 s in steps of 0.01</div> </div>	
MESSAGE	<div> <div>PMU 1 CURR TRIG BLK: Off</div> <div>Range: FlexLogic operand</div> </div>	
MESSAGE	<div> <div>PMU 1 CURR TRIGGER TARGET: Self-Reset</div> <div>Range: Self-Reset, Latched, Disabled</div> </div>	
MESSAGE	<div> <div>PMU 1 CURR TRIGGER EVENTS: Disabled</div> <div>Range: Enabled, Disabled</div> </div>	

This element responds to elevated current. The trigger responds to the phase current signal of the phasor measurement unit (PMU) source. All current channel (A, B, and C) are processed independently and could trigger the recorder.

- **PMU 1 CURR TRIGGER PICKUP:** This setting specifies the pickup threshold for the overcurrent trigger, in per unit of the PMU source. A value of 1 pu is a nominal primary current. The comparator applies a 3% hysteresis.
- **PMU 1 CURR TRIGGER PKP TIME:** This setting could be used to filter out spurious conditions and avoid unnecessary triggering of the recorder.
- **PMU 1 CURR TRIGGER DPO TIME:** This setting could be used to extend the trigger after the situation returned to normal. This setting is of particular importance when using the recorder in the forced mode (recording as long as the triggering condition is asserted).

Figure 5-47: CURRENT TRIGGER SCHEME LOGIC

h) POWER TRIGGERING

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR MEASUREMENT... ⇒ PMU 1 TRIGGERING ⇒ PMU 1 POWER TRIGGER

<div>5</div>	<div>PMU 1 POWER TRIGGER</div> <div>TRIGGER</div>	<div>PMU 1 POWER TRIGGER FUNCTION: Disabled</div>	Range: Enabled, Disabled
	MESSAGE	<div>PMU 1 POWER TRIGGER ACTIVE: 1.250 pu</div>	Range: 0.250 to 3.000 pu in steps of 0.001
	MESSAGE	<div>PMU 1 POWER TRIGGER REACTIVE: 1.250 pu</div>	Range: 0.250 to 3.000 pu in steps of 0.001
	MESSAGE	<div>PMU 1 POWER TRIGGER APPARENT: 1.250 pu</div>	Range: 0.250 to 3.000 pu in steps of 0.001
	MESSAGE	<div>PMU 1 POWER TRIGGER PKP TIME: 0.10 s</div>	Range: 0.00 to 600.00 s in steps of 0.01
	MESSAGE	<div>PMU 1 POWER TRIGGER DPO TIME: 1.00 s</div>	Range: 0.00 to 600.00 s in steps of 0.01
	MESSAGE	<div>PMU 1 PWR TRIG BLK: Off</div>	Range: FlexLogic operand
	MESSAGE	<div>PMU 1 POWER TRIGGER TARGET: Self-Reset</div>	Range: Self-Reset, Latched, Disabled
	MESSAGE	<div>PMU 1 POWER TRIGGER EVENTS: Disabled</div>	Range: Enabled, Disabled

This element responds to abnormal power. Separate thresholds are provided for active, reactive, and apparent powers. In terms of signaling its operation the element does not differentiate between the three types of power. The trigger responds to the single-phase and three-phase power signals of the phasor measurement unit (PMU) source.

- PMU 1 POWER TRIGGER ACTIVE:** This setting specifies the pickup threshold for the active power of the source. For single-phase power, 1 pu is a product of 1 pu voltage and 1 pu current, or the product of nominal secondary voltage, the VT ratio and the nominal primary current. For the three-phase power, 1 pu is three times that for a single-phase power in case of wye-connected VTs and $\sqrt{3}$ times in case of delta-connected VTs. The comparator applies a 3% hysteresis.
- PMU 1 POWER TRIGGER REACTIVE:** This setting specifies the pickup threshold for the reactive power of the source. For single-phase power, 1 pu is a product of 1 pu voltage and 1 pu current, or the product of nominal secondary voltage, the VT ratio and the nominal primary current. For the three-phase power, 1 pu is three times that for a single-phase power in case of wye-connected VTs and $\sqrt{3}$ times in case of delta-connected VTs. The comparator applies a 3% hysteresis.
- PMU 1 POWER TRIGGER APPARENT:** This setting specifies the pickup threshold for the apparent power of the source. For single-phase power, 1 pu is a product of 1 pu voltage and 1 pu current, or the product of nominal second-

ary voltage, the VT ratio and the nominal primary current. For the three-phase power, 1 pu is three times that for a single-phase power in case of wye-connected VTs and $\sqrt{3}$ times in case of delta-connected VTs. The comparator applies a 3% hysteresis.

- **PMU 1 POWER TRIGGER PKP TIME:** This setting could be used to filter out spurious conditions and avoid unnecessary triggering of the recorder.
- **PMU 1 POWER TRIGGER DPO TIME:** This setting could be used to extend the trigger after the situation returned to normal. This setting is of particular importance when using the recorder in the forced mode (recording as long as the triggering condition is asserted).

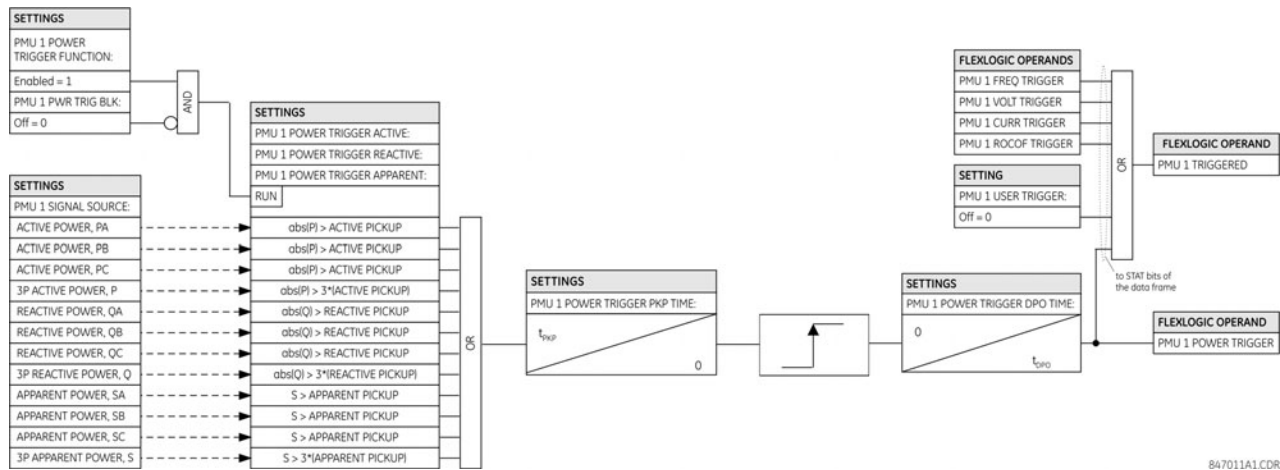

Figure 5-48: POWER TRIGGER SCHEME LOGIC

i) DF/DT TRIGGERING

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR MEASUREMENT... ⇒ PMU 1 TRIGGERING ⇒ PMU 1 df/dt TRIGGER

<div> <div>PMU 1 df/dt TRIGGER</div> <div>TRIGGER</div> </div>		<div> <div>PMU 1 df/dt TRIGGER FUNCTION: Disabled</div> <div>Range: Enabled, Disabled</div> </div>
	MESSAGE	<div> <div>PMU 1 df/dt TRIGGER RAISE: 0.25 Hz/s</div> <div>Range: 0.10 to 15.00 Hz/s in steps of 0.01</div> </div>
	MESSAGE	<div> <div>PMU 1 df/dt TRIGGER FALL: 0.25 Hz/s</div> <div>Range: 0.10 to 15.00 Hz/s in steps of 0.01</div> </div>
	MESSAGE	<div> <div>PMU 1 df/dt TRIGGER PKP TIME: 0.10 s</div> <div>Range: 0.00 to 600.00 s in steps of 0.01</div> </div>
	MESSAGE	<div> <div>PMU 1 df/dt TRIGGER DPO TIME: 1.00 s</div> <div>Range: 0.00 to 600.00 s in steps of 0.01</div> </div>
	MESSAGE	<div> <div>PMU 1 df/dt TRG BLK: Off</div> <div>Range: FlexLogic operand</div> </div>
	MESSAGE	<div> <div>PMU 1 df/dt TRIGGER TARGET: Self-Reset</div> <div>Range: Self-Reset, Latched, Disabled</div> </div>
	MESSAGE	<div> <div>PMU 1 df/dt TRIGGER EVENTS: Disabled</div> <div>Range: Enabled, Disabled</div> </div>

This element responds to frequency rate of change. Separate thresholds are provided for rising and dropping frequency. The trigger responds to the rate of change of frequency (df/dt) of the phasor measurement unit (PMU) source.

- **PMU 1 df/dt TRIGGER RAISE:** This setting specifies the pickup threshold for the rate of change of frequency in the raising direction (positive df/dt). The comparator applies a 4% hysteresis.

- **PMU 1 df/dt TRIGGER FALL:** This setting specifies the pickup threshold for the rate of change of frequency in the falling direction (negative df/dt). The comparator applies a 4% hysteresis.
- **PMU 1 df/dt TRIGGER PKP TIME:** This setting could be used to filter out spurious conditions and avoid unnecessary triggering of the recorder.
- **PMU 1 df/dt TRIGGER DPO TIME:** This setting could be used to extend the trigger after the situation returned to normal. This setting is of particular importance when using the recorder in the forced mode (recording as long as the triggering condition is asserted).

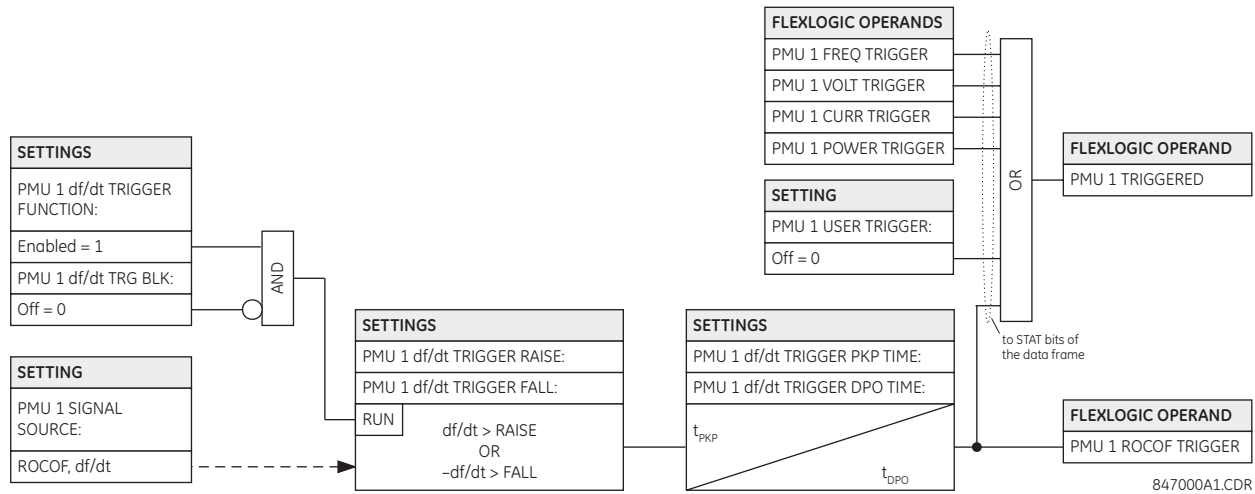

Figure 5-49: RATE OF CHANGE OF FREQUENCY TRIGGER SCHEME LOGIC

j) PMU RECORDING

PATH: SETTINGS ⇒ SYSTEM SETUP ⇒ PHASOR MEASUREMENT ⇒ PHASOR MEASUREMENT UNIT1 ↓ RECORDING PMU1

PMU 1	PMU 1 FUNCTION	Range: Enable, Disable
RECORDING	DISABLE	
MESSAGE	PMU 1 NO OF TIMED RECORDS: 10	Range: 2 to 128 in steps of 1
MESSAGE	PMU 1 TRIGGER MODE: AUTOMATIC OVERWRITE	Range: Automatic Overwrite, Protected
MESSAGE	PMU 1 TIMED TRIGGER POSITION: 10%	Range: 1 to 50% in steps of 1

- **PMU 1 FUNCTION:** This setting enables or disables the recorder for PMU 1. The rate is fixed at the reporting rate set within the aggregator (i.e., Aggregator 1).
- **PMU 1 NO OF TIMED RECORDS:** This setting specifies the number of timed records that are available for a given logical PMU 1(4). The length of each record is equal to the available memory divided by the content size and number of records. As the number of records is increased the available storage for each record is reduced. The relay supports a maximum of 128 records in either timed or forced mode.
- **PMU 1 TRIGGER MODE:** This setting specifies what happens when the recorder uses its entire available memory storage. Under the “Automatic Overwrite”, the last record is erased to facilitate new recording, when triggered. Under the “Protected” selection, the recorder stops creating new records when the entire memory is used up by the old un-cleared records.
- **PMU 1 TIMED TRIGGER POSITION:** This setting specifies the amount of pre-trigger data as a percent of the entire record. This setting applies only to the timed mode of recording.

k) AGGREGATORS

PATH: SETTINGS ⇌ SYSTEM SETUP ⇌ PHASOR MEASUREMENT UNIT ⇌ PMU AGGREGATOR 1

PMU AGGREGATOR 1	PMU AGGREGATOR 1 PROTOCOL: NONE	Range: NONE, 37.118, IEC 61850-90-5 Default: NONE
MESSAGE	PMU AGGREGATOR 1: IDCODE: 1	Range: 1 to 65534 in steps of 1 Default: 1
MESSAGE	PMU AGGREGATOR 1 INCLUDE PMU1: No	Range: No, Yes Default: No
MESSAGE	37.118 AGGR 1 CONFIGURATION	See below.
MESSAGE	90-5 AGGR 1 CONFIGURATION	See below.

When the protocol selection is set via the software or keypad, all aggregators whose protocol is not set to None will be set to the last protocol saved (i.e., IEEE C37.118 or IEC 61850-90-5) to any aggregators, as both IEEE C37.118 and IEC 61850-90-5 simultaneous streaming of both R-SV values is not possible.

PATH: SETTINGS ⇌ SYSTEM SETUP ⇌ PHASOR MEASUREMENT UNIT ⇌ PMU AGGREGATOR 1 ⇌ 37.118 AGGR 1 CONFIGURATION

MESSAGE	PMU AGGREGATOR 1 UDP PORT: 4713	Range: 1 to 65534 Default: 4713
MESSAGE	PMU AGGREGATOR 1 PDC CONTROL: Disabled	Range: Disabled, Enabled Default: Disabled

PATH: SETTINGS ⇌ SYSTEM SETUP ⇌ PHASOR MEASUREMENT UNIT ⇌ PMU AGGREGATOR 1 ⇌ 90-5 AGGR 1 CONFIGURATION

90-5 AGGR 1 CONFIGURATION	PMU AGGREGATOR 1 NAME:	Range: 56 character ASCII text Default: Blank
MESSAGE	PMU AGGREGATOR1: PORT: 1	Range: 1, 2, 3 Default: 1
MESSAGE	PMU AGGREGATOR 1: UDP PORT: 102	Range: 1 to 65534 in steps of 1 Default: 102
MESSAGE	PMU AGGREGATOR 1: NUMBER OF ASDUs: 1	Range: 1 to 4 Default: 1

- **PMU AGGREGATOR1 PROTOCOL:** This setting selects if the IEEE C37.118 or IEC 61850 standard is used.
- **PMU AGGREGATOR1 IDCODE:** Numeric identifier of the Aggregator / PDC function. In an IEEE C37.118 output stream, this identifies the ID of the aggregator - which is only used if there is more than 1 PMU mapped into an aggregator.
- **PMU AGGREGATOR1 PMU1:** If set to "Yes" aggregator 1 includes the PMU1 data set in the reporting data stream. AGGREGATOR1 will not include PMU1 data set in the report if set to "No".

C37.118 AGGREGATOR 1 CONFIGURATION

- **PMU AGGREGATOR1: TCP PORT:** This setting selects the TCP port number to be used by this aggregator for network reporting. All ports, even those of unused aggregators, must be valid and unique to avoid port number collisions.
- **PMU AGGREGATOR1 UDP PORT:** This setting selects the UDP port number to be used by this aggregator for network reporting. All ports, even those of unused aggregators, must be valid and unique to avoid port number collisions.

- **PMU AGGREGATOR1 PDC CONTROL:** The synchrophasor standard allows for user-defined controls originating at the PDC, to be executed on the PMU. The control is accomplished via an extended command frame. The relay decodes the first word of the extended field, EXTFRAME, to drive 16 dedicated FlexLogic operands. Each aggregator supports 16 FlexLogic operands as shown in table 2. The operands are asserted for 5 seconds following reception of the command frame. If the new command frame arrives within the 5 second period, the FlexLogic operands are updated, and the 5 second timer is re-started. This setting enables or disables the control. When enabled, all 16 operands for each aggregator are active; when disabled all 16 operands for each aggregator remain reset.

Table 5–11: FLEXLOGIC OPERANDS SUPPORTED BY AGGREGATOR

as above	AGTR1 PDC CNTRL 16	Phasor data concentrator asserts control bit 16, as received via the network.

IEC61850-90-5 AGGREGATOR 1 CONFIGURATION

- **PMU AGGREGATOR1: NAME:** A user-defined visible string of characters (max. 56) to identify the source of the stream. This value, concatenated with the Aggregator IDCode and Aggregator Class of Service, is mapped into the IEC61850 MSVID filed in the output stream.
- **AGGREGATOR1: PHYSICAL PORT:** This setting determines which physical ports through which the synchrophasor traffic will be transmitted. The range is 1, 2, 3.
- **PMU AGGREGATOR1: UDP:** This setting selects the UDP port number that is used by this dataset for network reporting. Default setting values for IEEE C37.118 and IEC 6150-90-5 are provided.
- **PMU AGGREGATOR1: #OF ASDUs:** This setting sets the number of ASDU's per from 1 through to 4. Refer to the table below.

Table 5–12: # OF ASDU

SETTINGS FOR # OF ASDU	TRANSMISSION
1	ASDU at T0 (current values)
2	ASDU at T-1 (previous values) + ASDU at T0 (current values)
3	values)+ ASDU at T-2 (previous values) + ASDU at T-1 (previous ASDU at T0 (current values)
4	ASDU at T-3 (previous values) + ASDU at T-2 (previous values) + ASDU at T-1 (previous values)+ASDU at T0 (current values)

- **MSVCB 1 SVENA:** The SV Stream Control is set by either toggling an assigned FlexLogic operand or a remote client write, to start and stop the streaming of R-SV frames. If remote client control is disabled, a negative response is provided to the client in response to a write attempt. A FlexLogic operand (SvEna) is provided for each Aggregator that reflects the state of the SvEna control where "1"= Enabled and "0"=Disabled. The logic for setting the SvEna control bit is shown in the following figure.

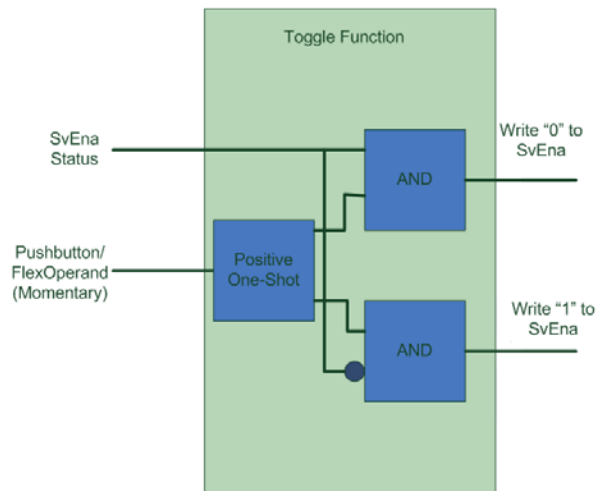

Figure 5–50: LOGIC FOR SETTING SVENA CONTROL BIT

- **MSVCB 1 Client CONTRL:** This setting determines if a client can write to the reserve bit. When the assigned FlexLogic operand is a logic 1 state, remote clients can write to both the reserve bit and the SvEna bit. When the FlexLogic operand is a logic 0 state, the remote client writes to the reserve bit, the SvEna is rejected by the UR, and a negative response with the appropriate Service Error is returned to the client.
- **MSVCB 1 SVENA Default:** This setting sets the default state of the stream (On or Off) on power-up or restart.
- **MSVCB 1 CONFREV:** The relay increments the Configuration revision every time the configuration is changed. This setting allows the user to reset the configuration back to 1 or a value from 1 to 4294967295.
- **MSVCB 1 PRIORITY:** A value from 0 through 7: The default value is 4.
- **MSVCB 1 IP Class:** The value represents the IPv4 Differentiated Services (formerly called TypeOfService) value. The default value is set for Expedited Forwarding (101110B (46 or 2EH). This value provides priority routing, when supported in the routers.

- **MSVCB 1 VID:** A range of values limited from 0 to 4095.
- **MSVCB 1 APPID:** This setting allows the selection of a specific application ID for each sending device.
- **MSVCB 1 DEST IP Address:** This is the destination multicast address IP address that is entered in Standard IPV4 address format. The valid range for IPv4 is from 224.0.0.0 to 239.255.255.255, but the UR does not test the address entered.
- **MSVCB 1 Security:** This setting selects the level of security and authentication used, as outlined in the following table, and is in the form of an enumeration as per standard. The range is 0 to 2.

Shaded settings in the table are not supported in firmware 7.0.

ENUMERATION	AUTHENTICATION	ENCRYPTION
0	no	no
1	yes	no
2	yes	yes

5.5.1 INTRODUCTION TO FLEXLOGIC

To provide maximum flexibility to the user, the arrangement of internal digital logic combines fixed and user-programmed parameters. Logic upon which individual features are designed is fixed, and all other logic, from digital input signals through elements or combinations of elements to digital outputs, is variable. The user has complete control of all variable logic through FlexLogic. In general, the system receives analog and digital inputs which it uses to produce analog and digital outputs. The major sub-systems of a generic UR-series relay involved in this process are shown below.

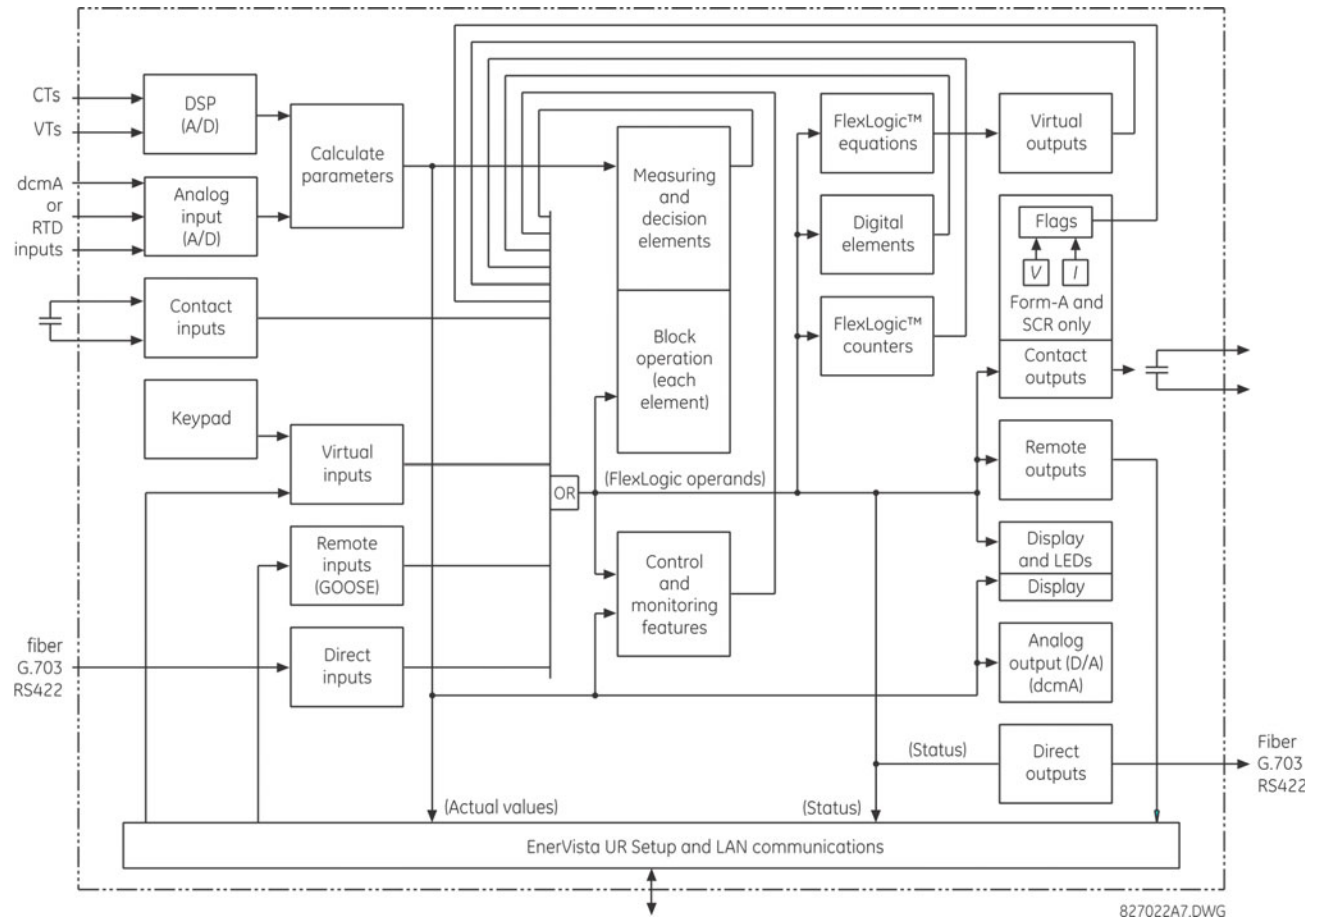

Figure 5-51: UR ARCHITECTURE OVERVIEW

The states of all digital signals used in the L90 are represented by flags (or FlexLogic operands, which are described later in this section). A digital “1” is represented by a 'set' flag. Any external contact change-of-state can be used to block an element from operating, as an input to a control feature in a FlexLogic equation, or to operate a contact output. The state of the contact input can be displayed locally or viewed remotely via the communications facilities provided. If a simple scheme where a contact input is used to block an element is desired, this selection is made when programming the element. This capability also applies to the other features that set flags: elements, virtual inputs, remote inputs, schemes, and human operators.

If more complex logic than presented above is required, it is implemented via FlexLogic. For example, if it is desired to have the closed state of contact input H7a and the operated state of the phase undervoltage element block the operation of the phase time overcurrent element, the two control input states are programmed in a FlexLogic equation. This equation ANDs the two control inputs to produce a virtual output which is then selected when programming the phase time overcurrent to be used as a blocking input. Virtual outputs can only be created by FlexLogic equations.

Traditionally, protective relay logic has been relatively limited. Any unusual applications involving interlocks, blocking, or supervisory functions had to be hard-wired using contact inputs and outputs. FlexLogic minimizes the requirement for auxiliary components and wiring while making more complex schemes possible.

The logic that determines the interaction of inputs, elements, schemes and outputs is field programmable through the use of logic equations that are sequentially processed. The use of virtual inputs and outputs in addition to hardware is available internally and on the communication ports for other relays to use (distributed FlexLogic).

FlexLogic allows users to customize the relay through a series of equations that consist of *operators* and *operands*. The operands are the states of inputs, elements, schemes and outputs. The operators are logic gates, timers and latches (with set and reset inputs). A system of sequential operations allows any combination of specified operands to be assigned as inputs to specified operators to create an output. The final output of an equation is a numbered register called a *virtual output*. Virtual outputs can be used as an input operand in any equation, including the equation that generates the output, as a seal-in or other type of feedback.

A FlexLogic equation consists of parameters that are either operands or operators. Operands have a logic state of 1 or 0. Operators provide a defined function, such as an AND gate or a Timer. Each equation defines the combinations of parameters to be used to set a Virtual Output flag. Evaluation of an equation results in either a 1 (=ON, i.e. flag set) or 0 (=OFF, i.e. flag not set). Each equation is evaluated at least 4 times every power system cycle.

Some types of operands are present in the relay in multiple instances; e.g. contact and remote inputs. These types of operands are grouped together (for presentation purposes only) on the faceplate display. The characteristics of the different types of operands are listed in the table below.

Table 5–13: L90 FLEXLOGIC OPERAND TYPES

OPERAND TYPE	STATE	EXAMPLE FORMAT	CHARACTERISTICS [INPUT IS '1' (= ON) IF...]
Contact Input	On	Cont Ip On	Voltage is presently applied to the input (external contact closed).
	Off	Cont Ip Off	Voltage is presently not applied to the input (external contact open).
Contact Output (type Form-A contact only)	Current On	Cont Op 1 Ion	Current is flowing through the contact.
	Voltage On	Cont Op 1 VOn	Voltage exists across the contact.
	Voltage Off	Cont Op 1 VOff	Voltage does not exist across the contact.
Direct Input	On	DIRECT INPUT 1 On	The direct input is presently in the ON state.
Element (Analog)	Pickup	PHASE TOC1 PKP	The tested parameter is presently above the pickup setting of an element which responds to rising values or below the pickup setting of an element which responds to falling values.
	Dropout	PHASE TOC1 DPO	This operand is the logical inverse of the above PKP operand.
	Operate	PHASE TOC1 OP	The tested parameter has been above/below the pickup setting of the element for the programmed delay time, or has been at logic 1 and is now at logic 0 but the reset timer has not finished timing.
	Block	PHASE TOC1 BLK	The output of the comparator is set to the block function.
Element (Digital)	Pickup	Dig Element 1 PKP	The input operand is at logic 1.
	Dropout	Dig Element 1 DPO	This operand is the logical inverse of the above PKP operand.
	Operate	Dig Element 1 OP	The input operand has been at logic 1 for the programmed pickup delay time, or has been at logic 1 for this period and is now at logic 0 but the reset timer has not finished timing.
Element (Digital Counter)	Higher than	Counter 1 HI	The number of pulses counted is above the set number.
	Equal to	Counter 1 EQL	The number of pulses counted is equal to the set number.
	Lower than	Counter 1 LO	The number of pulses counted is below the set number.
Fixed	On	On	Logic 1
	Off	Off	Logic 0
Remote Input	On	REMOTE INPUT 1 On	The remote input is presently in the ON state.
Virtual Input	On	Virt Ip 1 On	The virtual input is presently in the ON state.
Virtual Output	On	Virt Op 1 On	The virtual output is presently in the set state (i.e. evaluation of the equation which produces this virtual output results in a "1").

The operands available for this relay are listed alphabetically by types in the following table.

TEMPERATURE MONITOR	TEMP MONITOR	Asserted while the ambient temperature is greater than the maximum operating temperature (80°C)
USER-PROGRAMMABLE PUSHBUTTONS	PUSHBUTTON 1 ON PUSHBUTTON 1 OFF ANY PB ON	Pushbutton number 1 is in the "On" position Pushbutton number 1 is in the "Off" position Any of twelve pushbuttons is in the "On" position
	PUSHBUTTON 2 to 12	Same set of operands as PUSHBUTTON 1

Some operands can be re-named by the user. These are the names of the breakers in the breaker control feature, the ID (identification) of contact inputs, the ID of virtual inputs, and the ID of virtual outputs. If the user changes the default name or ID of any of these operands, the assigned name will appear in the relay list of operands. The default names are shown in the FlexLogic operands table above.

The characteristics of the logic gates are tabulated below, and the operators available in FlexLogic are listed in the Flex-Logic operators table.

Table 5–15: FLEXLOGIC GATE CHARACTERISTICS

GATES	NUMBER OF INPUTS	OUTPUT IS '1' (= ON) IF...
NOT	1	input is '0'
OR	2 to 16	any input is '1'
AND	2 to 16	all inputs are '1'
NOR	2 to 16	all inputs are '0'
NAND	2 to 16	any input is '0'
XOR	2	only one input is '1'

Table 5–16: FLEXLOGIC OPERATORS

TYPE	SYNTAX	DESCRIPTION	NOTES
Editor	INSERT	Insert a parameter in an equation list.	
	DELETE	Delete a parameter from an equation list.	
End	END	The first END encountered signifies the last entry in the list of processed FlexLogic parameters.	
One-shot	POSITIVE ONE SHOT	One shot that responds to a positive going edge.	A 'one shot' refers to a single input gate that generates a pulse in response to an edge on the input. The output from a 'one shot' is True (positive) for only one pass through the FlexLogic equation. There is a maximum of 64 'one shots'.
	NEGATIVE ONE SHOT	One shot that responds to a negative going edge.	
	DUAL ONE SHOT	One shot that responds to both the positive and negative going edges.	
Logic gate	NOT	Logical NOT	Operates on the previous parameter.
	OR(2)	2 input OR gate	Operates on the 2 previous parameters.
	↓ OR(16)	16 input OR gate	↓ Operates on the 16 previous parameters.
	AND(2)	2 input AND gate	Operates on the 2 previous parameters.
	↓ AND(16)	16 input AND gate	↓ Operates on the 16 previous parameters.
	NOR(2)	2 input NOR gate	Operates on the 2 previous parameters.
	↓ NOR(16)	16 input NOR gate	↓ Operates on the 16 previous parameters.
	NAND(2)	2 input NAND gate	Operates on the 2 previous parameters.
	↓ NAND(16)	16 input NAND gate	↓ Operates on the 16 previous parameters.
	XOR(2)	2 input Exclusive OR gate	Operates on the 2 previous parameters.
	LATCH (S,R)	Latch (set, reset): reset-dominant	The parameter preceding LATCH(S,R) is the reset input. The parameter preceding the reset input is the set input.
Timer	TIMER 1	Timer set with FlexLogic timer 1 settings.	The timer is started by the preceding parameter. The output of the timer is TIMER #.
	↓ TIMER 32	Timer set with FlexLogic timer 32 settings.	
Assign virtual output	= Virt Op 1	Assigns previous FlexLogic operand to virtual output 1.	The virtual output is set by the preceding parameter
	↓ = Virt Op 96	Assigns previous FlexLogic operand to virtual output 96.	

5.5.2 FLEXLOGIC RULES

When forming a FlexLogic equation, the sequence in the linear array of parameters must follow these general rules:

1. Operands must precede the operator which uses the operands as inputs.
2. Operators have only one output. The output of an operator must be used to create a virtual output if it is to be used as an input to two or more operators.
3. Assigning the output of an operator to a virtual output terminates the equation.
4. A timer operator (for example, "TIMER 1") or virtual output assignment (for example, "= Virt Op 1") may only be used once. If this rule is broken, a syntax error will be declared.

5.5.3 FLEXLOGIC EVALUATION

Each equation is evaluated in the order in which the parameters have been entered.

FlexLogic provides latches which by definition have a memory action, remaining in the set state after the set input has been asserted. However, they are volatile; that is, they reset on the re-application of control power.

When making changes to settings, all FlexLogic equations are re-compiled whenever any new setting value is entered, so all latches are automatically reset. If it is necessary to re-initialize FlexLogic during testing, for example, it is suggested to power the unit down and then back up.

5.5.4 FLEXLOGIC EXAMPLE

This section provides an example of implementing logic for a typical application. The sequence of the steps is quite important as it should minimize the work necessary to develop the relay settings. Note that the example presented in the figure below is intended to demonstrate the procedure, not to solve a specific application situation.

In the example below, it is assumed that logic has already been programmed to produce virtual outputs 1 and 2, and is only a part of the full set of equations used. When using FlexLogic, it is important to make a note of each virtual output used – a virtual output designation (1 to 96) can only be properly assigned once.

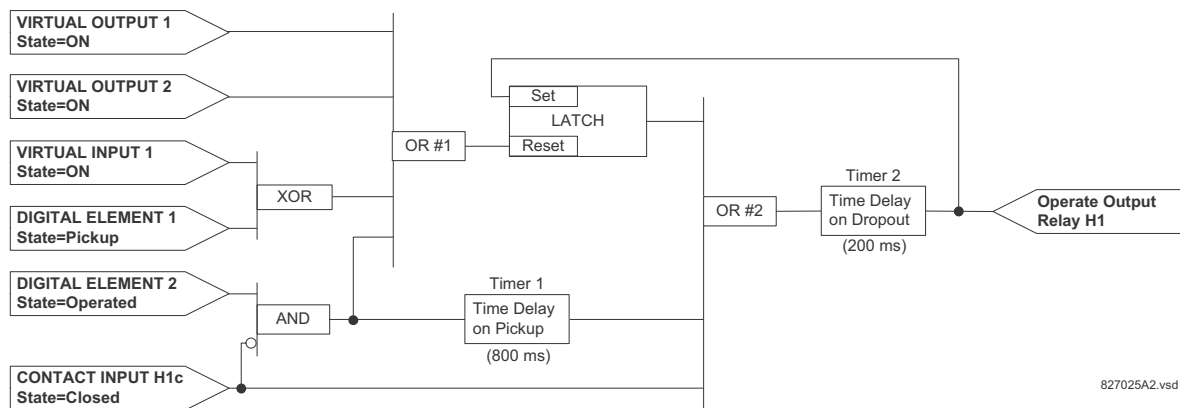

Figure 5-52: EXAMPLE LOGIC SCHEME

1. Inspect the example logic diagram to determine if the required logic can be implemented with the FlexLogic operators. If this is not possible, the logic must be altered until this condition is satisfied. Once this is done, count the inputs to each gate to verify that the number of inputs does not exceed the FlexLogic limits, which is unlikely but possible. If the number of inputs is too high, subdivide the inputs into multiple gates to produce an equivalent. For example, if 25 inputs to an AND gate are required, connect Inputs 1 through 16 to AND(16), 17 through 25 to AND(9), and the outputs from these two gates to AND(2).

Inspect each operator between the initial operands and final virtual outputs to determine if the output from the operator is used as an input to more than one following operator. If so, the operator output must be assigned as a virtual output.

For the example shown above, the output of the AND gate is used as an input to both OR#1 and Timer 1, and must therefore be made a virtual output and assigned the next available number (i.e. Virtual Output 3). The final output must also be assigned to a virtual output as virtual output 4, which will be programmed in the contact output section to operate relay H1 (that is, contact output H1).

Therefore, the required logic can be implemented with two FlexLogic equations with outputs of virtual output 3 and virtual output 4 as shown below.

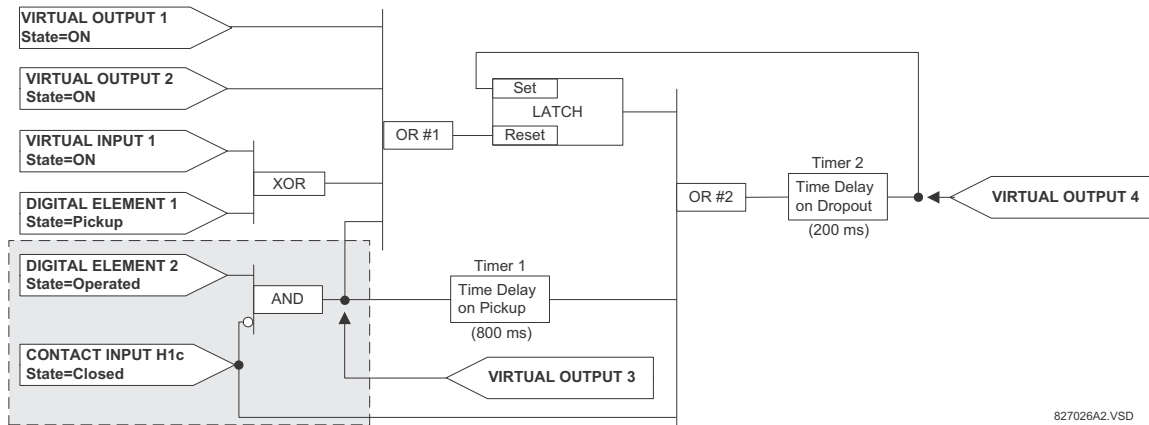

Figure 5-53: LOGIC EXAMPLE WITH VIRTUAL OUTPUTS

2. Prepare a logic diagram for the equation to produce virtual output 3, as this output will be used as an operand in the virtual output 4 equation (create the equation for every output that will be used as an operand first, so that when these operands are required they will already have been evaluated and assigned to a specific virtual output). The logic for virtual output 3 is shown below with the final output assigned.

Figure 5-54: LOGIC FOR VIRTUAL OUTPUT 3

3. Prepare a logic diagram for virtual output 4, replacing the logic ahead of virtual output 3 with a symbol identified as virtual output 3, as shown below.

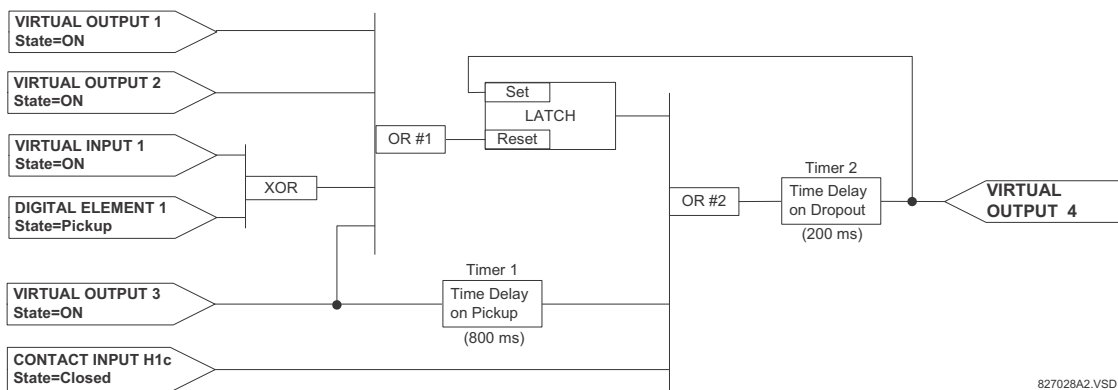

Figure 5-55: LOGIC FOR VIRTUAL OUTPUT 4

4. Program the FlexLogic equation for virtual output 3 by translating the logic into available FlexLogic parameters. The equation is formed one parameter at a time until the required logic is complete. It is generally easier to start at the output end of the equation and work back towards the input, as shown in the following steps. It is also recommended to list operator inputs from bottom to top. For demonstration, the final output will be arbitrarily identified as parameter 99, and each preceding parameter decremented by one in turn. Until accustomed to using FlexLogic, it is suggested that a worksheet with a series of cells marked with the arbitrary parameter numbers be prepared, as shown below.

Figure 5-56: FLEXLOGIC WORKSHEET

5. Following the procedure outlined, start with parameter 99, as follows:

- 99: The final output of the equation is virtual output 3, which is created by the operator "= Virt Op n". This parameter is therefore "= Virt Op 3."
- 98: The gate preceding the output is an AND, which in this case requires two inputs. The operator for this gate is a 2-input AND so the parameter is "AND(2)". Note that FlexLogic rules require that the number of inputs to most types of operators must be specified to identify the operands for the gate. As the 2-input AND will operate on the two operands preceding it, these inputs must be specified, starting with the lower.
- 97: This lower input to the AND gate must be passed through an inverter (the NOT operator) so the next parameter is "NOT". The NOT operator acts upon the operand immediately preceding it, so specify the inverter input next.
- 96: The input to the NOT gate is to be contact input H1c. The ON state of a contact input can be programmed to be set when the contact is either open or closed. Assume for this example the state is to be ON for a closed contact. The operand is therefore "Cont Ip H1c On".
- 95: The last step in the procedure is to specify the upper input to the AND gate, the operated state of digital element 2. This operand is "DIG ELEM 2 OP".

Writing the parameters in numerical order can now form the equation for virtual output 3:

```
[95] DIG ELEM 2 OP
[96] Cont Ip H1c On
[97] NOT
[98] AND (2)
[99] = Virt Op 3
```

It is now possible to check that this selection of parameters will produce the required logic by converting the set of parameters into a logic diagram. The result of this process is shown below, which is compared to the logic for virtual output 3 diagram as a check.

Figure 5-57: FLEXLOGIC EQUATION FOR VIRTUAL OUTPUT 3

6. Repeating the process described for virtual output 3, select the FlexLogic parameters for Virtual Output 4.

- 99: The final output of the equation is virtual output 4 which is parameter "= Virt Op 4".
- 98: The operator preceding the output is timer 2, which is operand "TIMER 2". Note that the settings required for the timer are established in the timer programming section.

- 97: The operator preceding timer 2 is OR #2, a 3-input OR, which is parameter "OR(3)".
- 96: The lowest input to OR #2 is operand "Cont Ip H1c On".
- 95: The center input to OR #2 is operand "TIMER 1".
- 94: The input to timer 1 is operand "Virt Op 3 On".
- 93: The upper input to OR #2 is operand "LATCH (S,R)".
- 92: There are two inputs to a latch, and the input immediately preceding the latch reset is OR #1, a 4-input OR, which is parameter "OR(4)".
- 91: The lowest input to OR #1 is operand "Virt Op 3 On".
- 90: The input just above the lowest input to OR #1 is operand "XOR(2)".
- 89: The lower input to the XOR is operand "DIG ELEM 1 PKP".
- 88: The upper input to the XOR is operand "Virt Ip 1 On".
- 87: The input just below the upper input to OR #1 is operand "Virt Op 2 On".
- 86: The upper input to OR #1 is operand "Virt Op 1 On".
- 85: The last parameter is used to set the latch, and is operand "Virt Op 4 On".

The equation for virtual output 4 is:

```
[85] Virt Op 4 On
[86] Virt Op 1 On
[87] Virt Op 2 On
[88] Virt Ip 1 On
[89] DIG ELEM 1 PKP
[90] XOR(2)
[91] Virt Op 3 On
[92] OR(4)
[93] LATCH (S,R)
[94] Virt Op 3 On
[95] TIMER 1
[96] Cont Ip H1c On
[97] OR(3)
[98] TIMER 2
[99] = Virt Op 4
```

It is now possible to check that the selection of parameters will produce the required logic by converting the set of parameters into a logic diagram. The result of this process is shown below, which is compared to the logic for virtual output 4 diagram as a check.

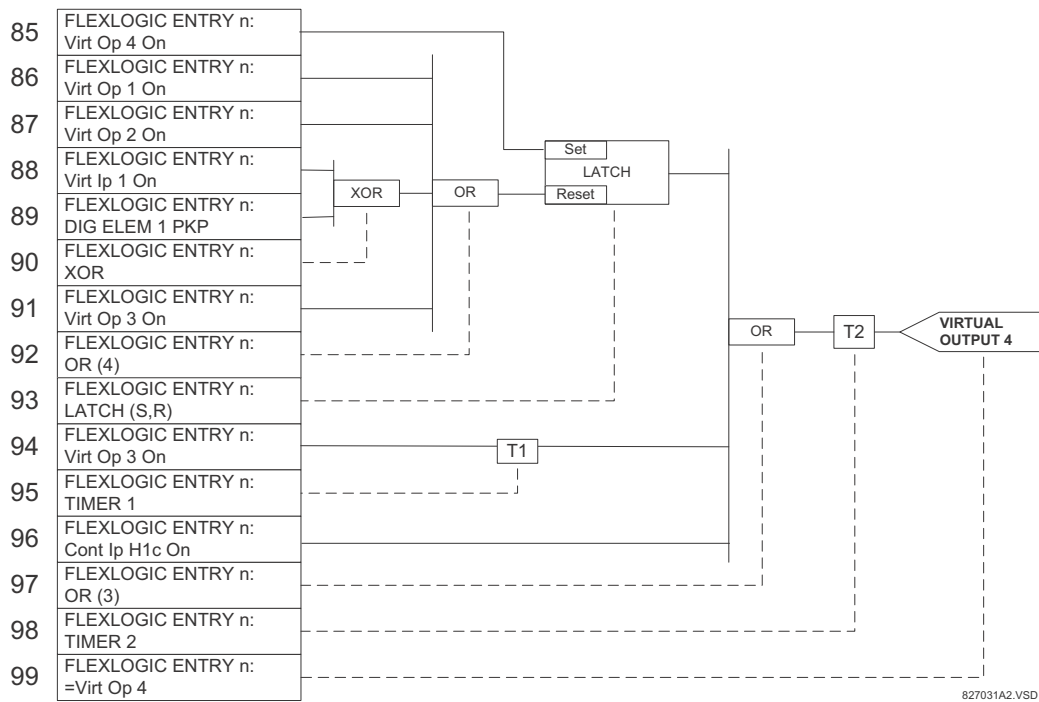

Figure 5-58: FLEXLOGIC EQUATION FOR VIRTUAL OUTPUT 4

7. Now write the complete FlexLogic expression required to implement the logic, making an effort to assemble the equation in an order where Virtual Outputs that will be used as inputs to operators are created before needed. In cases where a lot of processing is required to perform logic, this may be difficult to achieve, but in most cases will not cause problems as all logic is calculated at least four times per power frequency cycle. The possibility of a problem caused by sequential processing emphasizes the necessity to test the performance of FlexLogic before it is placed in service.

In the following equation, virtual output 3 is used as an input to both latch 1 and timer 1 as arranged in the order shown below:

```
DIG ELEM 2 OP
Cont Ip H1c On
NOT
AND(2)
= Virt Op 3
Virt Op 4 On
Virt Op 1 On
Virt Op 2 On
Virt Ip 1 On

```

In the expression above, the virtual output 4 input to the four-input OR is listed before it is created. This is typical of a form of feedback, in this case, used to create a seal-in effect with the latch, and is correct.

8. The logic should always be tested after it is loaded into the relay, in the same fashion as has been used in the past. Testing can be simplified by placing an "END" operator within the overall set of FlexLogic equations. The equations will then only be evaluated up to the first "END" operator.

The "On" and "Off" operands can be placed in an equation to establish a known set of conditions for test purposes, and the "INSERT" and "DELETE" commands can be used to modify equations.

5.5.5 FLEXLOGIC EQUATION EDITOR

PATH: SETTINGS ⇒ FLEXLOGIC ⇒ FLEXLOGIC EQUATION EDITOR

<input checked="" type="checkbox"/> FLEXLOGIC <input checked="" type="checkbox"/> EQUATION EDITOR	◀▶	FLEXLOGIC ENTRY 1: END	Range: FlexLogic operands
	MESSAGE ▲▼	FLEXLOGIC ENTRY 2: END	Range: FlexLogic operands
	↓		
MESSAGE ▲		FLEXLOGIC ENTRY 512: END	Range: FlexLogic operands

There are 512 FlexLogic entries available, numbered from 1 to 512, with default END entry settings. If a "Disabled" Element is selected as a FlexLogic entry, the associated state flag will never be set to '1'. The '+/-' key may be used when editing FlexLogic equations from the keypad to quickly scan through the major parameter types.

5.5.6 FLEXLOGIC TIMERS

PATH: SETTINGS ⇒ FLEXLOGIC ⇒ FLEXLOGIC TIMERS ⇒ FLEXLOGIC TIMER 1(32)

<input checked="" type="checkbox"/> FLEXLOGIC <input checked="" type="checkbox"/> TIMER 1	◀▶	TIMER 1 TYPE: millisecond	Range: millisecond, second, minute

A FlexElement is a universal comparator that can be used to monitor any analog actual value calculated by the relay or a net difference of any two analog actual values of the same type. The effective operating signal could be treated as a signed number or its absolute value could be used as per user's choice.

The element can be programmed to respond either to a signal level or to a rate-of-change (delta) over a pre-defined period of time. The output operand is asserted when the operating signal is higher than a threshold or lower than a threshold as per user's choice.

8A200A46.CDR

Figure 5-59: FLEXELEMENT SCHEME LOGIC

The **FLEXELEMENT 1 +IN** setting specifies the first (non-inverted) input to the FlexElement. Zero is assumed as the input if this setting is set to “Off”. For proper operation of the element at least one input must be selected. Otherwise, the element will not assert its output operands.

This **FLEXELEMENT 1 -IN** setting specifies the second (inverted) input to the FlexElement. Zero is assumed as the input if this setting is set to “Off”. For proper operation of the element at least one input must be selected. Otherwise, the element will not assert its output operands. This input should be used to invert the signal if needed for convenience, or to make the element respond to a differential signal such as for a top-bottom oil temperature differential alarm. The element will not operate if the two input signals are of different types, for example if one tries to use active power and phase angle to build the effective operating signal.

The element responds directly to the differential signal if the **FLEXELEMENT 1 INPUT MODE** setting is set to “Signed”. The element responds to the absolute value of the differential signal if this setting is set to “Absolute”. Sample applications for the “Absolute” setting include monitoring the angular difference between two phasors with a symmetrical limit angle in both directions; monitoring power regardless of its direction, or monitoring a trend regardless of whether the signal increases or decreases.

The element responds directly to its operating signal – as defined by the **FLEXELEMENT 1 +IN**, **FLEXELEMENT 1 -IN** and **FLEXELEMENT 1 INPUT MODE** settings – if the **FLEXELEMENT 1 COMP MODE** setting is set to “Level”. The element responds to the rate of change of its operating signal if the **FLEXELEMENT 1 COMP MODE** setting is set to “Delta”. In this case the **FLEXELEMENT 1 dt UNIT** and **FLEXELEMENT 1 dt** settings specify how the rate of change is derived.

The **FLEXELEMENT 1 DIRECTION** setting enables the relay to respond to either high or low values of the operating signal. The following figure explains the application of the **FLEXELEMENT 1 DIRECTION**, **FLEXELEMENT 1 PICKUP** and **FLEXELEMENT 1 HYSTERESIS** settings.

Figure 5-60: FLEXELEMENT DIRECTION, PICKUP, AND HYSTERESIS

In conjunction with the **FLEXELEMENT 1 INPUT MODE** setting the element could be programmed to provide two extra characteristics as shown in the figure below.

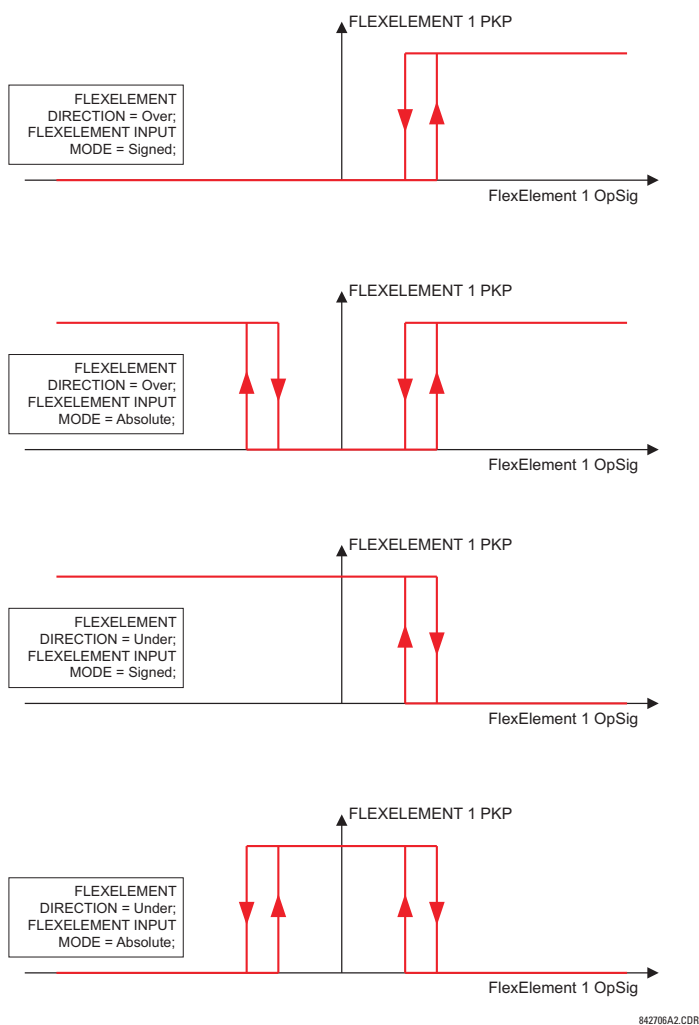

Figure 5-61: FLEXELEMENT INPUT MODE SETTING

The **FLEXELEMENT 1 PICKUP** setting specifies the operating threshold for the effective operating signal of the element. If set to “Over”, the element picks up when the operating signal exceeds the **FLEXELEMENT 1 PICKUP** value. If set to “Under”, the element picks up when the operating signal falls below the **FLEXELEMENT 1 PICKUP** value.

The **FLEXELEMENT 1 HYSTERESIS** setting controls the element dropout. It should be noticed that both the operating signal and the pickup threshold can be negative facilitating applications such as reverse power alarm protection. The FlexElement can be programmed to work with all analog actual values measured by the relay. The **FLEXELEMENT 1 PICKUP** setting is entered in per-unit values using the following definitions of the base units:

Table 5–17: FLEXELEMENT BASE UNITS

87L SIGNALS (Local IA Mag, IB, and IC) (Diff Curr IA Mag, IB, and IC) (Terminal 1 IA Mag, IB, and IC) (Terminal 2 IA Mag, IB and IC)	I_{BASE} = maximum primary RMS value of the +IN and –IN inputs (CT primary for source currents, and 87L source primary current for line differential currents)
87L SIGNALS (Op Square Curr IA, IB, and IC) (Rest Square Curr IA, IB, and IC)	BASE = Squared CT secondary of the 87L source
BREAKER ARCING AMPS (Brk X Arc Amp A, B, and C)	BASE = $2000 \text{ kA}^2 \times \text{cycle}$
dcmA	BASE = maximum value of the DCMA INPUT MAX setting for the two transducers configured under the +IN and –IN inputs.
DELTA TIME	BASE = 1 μs
FREQUENCY	f_{BASE} = 1 Hz
PHASE ANGLE	ϕ_{BASE} = 360 degrees (see the UR angle referencing convention)
POWER FACTOR	PF_{BASE} = 1.00
RTDs	BASE = 100°C
SOURCE CURRENT	I_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SOURCE ENERGY (Positive and Negative Watthours, Positive and Negative Varhours)	E_{BASE} = 10000 MWh or MVAh, respectively
SOURCE POWER	P_{BASE} = maximum value of $V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs
SOURCE VOLTAGE	V_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SYNCHROCHECK (Max Delta Volts)	V_{BASE} = maximum primary RMS value of all the sources related to the +IN and –IN inputs

The **FLEXELEMENT 1 HYSTERESIS** setting defines the pickup–dropout relation of the element by specifying the width of the hysteresis loop as a percentage of the pickup value as shown in the *FlexElement direction, pickup, and hysteresis* diagram.

The **FLEXELEMENT 1 DT UNIT** setting specifies the time unit for the setting **FLEXELEMENT 1 dt**. This setting is applicable only if **FLEXELEMENT 1 COMP MODE** is set to “Delta”. The **FLEXELEMENT 1 DT** setting specifies duration of the time interval for the rate of change mode of operation. This setting is applicable only if **FLEXELEMENT 1 COMP MODE** is set to “Delta”.

This **FLEXELEMENT 1 PKP DELAY** setting specifies the pickup delay of the element. The **FLEXELEMENT 1 RST DELAY** setting specifies the reset delay of the element.

5.5.8 NON-VOLATILE LATCHES

PATH: SETTINGS ⇒ FLEXLOGIC ⇒ NON-VOLATILE LATCHES ⇒ LATCH 1(16)

LATCH 1		LATCH 1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE	▲▼	LATCH 1 TYPE: Reset Dominant	Range: Reset Dominant, Set Dominant
MESSAGE	▲▼	LATCH 1 SET: Off	Range: FlexLogic operand

MESSAGE	▲▼	LATCH 1 TARGET: Self-reset	Range: Self-reset, Latched, Disabled
MESSAGE	▲	LATCH 1 EVENTS: Disabled	Range: Disabled, Enabled

The non-volatile latches provide a permanent logical flag that is stored safely and will not reset upon reboot after the relay is powered down. Typical applications include sustaining operator commands or permanently block relay functions, such as Autorecloser, until a deliberate interface action resets the latch. The settings element operation is described below:

- **LATCH 1 TYPE:** This setting characterizes Latch 1 to be Set- or Reset-dominant.
- **LATCH 1 SET:** If asserted, the specified FlexLogic operands 'sets' Latch 1.
- **LATCH 1 RESET:** If asserted, the specified FlexLogic operand 'resets' Latch 1.

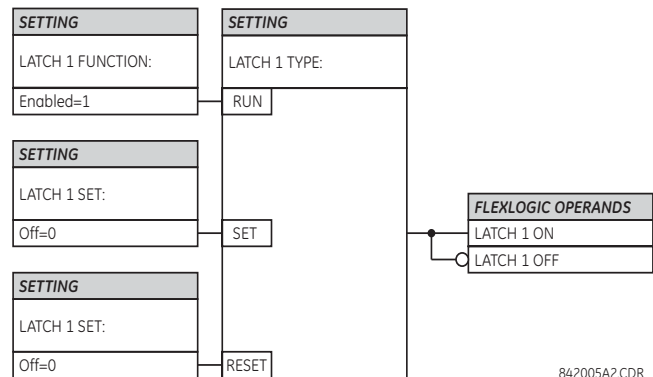

Figure 5–62: NON-VOLATILE LATCH OPERATION TABLE (N = 1 to 16) AND LOGIC

5.6.1 OVERVIEW

Each protection element can be assigned up to six different sets of settings according to setting group designations 1 to 6. The performance of these elements is defined by the active setting group at a given time. Multiple setting groups allow the user to conveniently change protection settings for different operating situations (for example, altered power system configuration, season of the year, etc.). The active setting group can be preset or selected via the **SETTING GROUPS** menu (see the *Control elements* section later in this chapter). See also the *Introduction to elements* section at the beginning of this chapter.

5.6.2 SETTING GROUP

PATH: SETTINGS ⇒ GROUPED ELEMENTS ⇒ SETTING GROUP 1(6)

■ SETTING GROUP 1	◀▶	■ LINE DIFFERENTIAL ■ ELEMENT	See page 5-154.

MESSAGE		CURRENT DIFF TARGET: Self-reset	Range: Self-reset, Latched, Disabled
MESSAGE		CURRENT DIFF EVENTS: Disabled	Range: Disabled, Enabled

The following settings are available for current differential protection.

- **CURRENT DIFF SIGNAL SOURCE 1:** This setting selects the first source for the current differential element local operating current. If more than one source is configured, the other source currents are scaled to the CT with the maximum primary current assigned by the **CURRENT DIFF SIGNAL SOURCE 1** to **CURRENT DIFF SIGNAL SOURCE 4** settings. This source is mandatory and is assigned with the **SYSTEM SETUP** ⇒ **SIGNAL SOURCES** ⇒ **SOURCE 1** menu.
- **CURRENT DIFF SIGNAL SOURCE 2, CURRENT DIFF SIGNAL SOURCE 3, and CURRENT DIFF SIGNAL SOURCE 4:** These settings select the second, third, and fourth sources for the current differential function for applications where more than one set of CT circuitry is connected directly to L90.
- **CURRENT DIFF BLOCK:** This setting selects a FlexLogic operand to block the operation of the current differential element.
- **CURRENT DIFF PICKUP:** This setting is used to select current differential pickup value.
- **CURRENT DIFF CT TAP 1 and CURRENT DIFF CT TAP 2:** These settings adapt the remote terminal 1 or 2 (communication channel 1 and 2 respectively) CT ratio to the local ratio if the CT ratios for the local and remote terminals differ. In 2-terminal, two-channel applications use the same value for both TAP 1 and TAP 2 settings, and in 3-terminals accordingly remote 1 and 2 CTs. The setting value is determined by $CT_{prim_rem} / CT_{prim_loc}$ for local and remote terminal CTs (where $CT_{prim_rem} / CT_{prim_loc}$ is referred to as the CT primary rated current). Ratio matching must always be performed against the remote CT with the maximum CT primary defined by the **CURRENT DIFF SIGNAL SOURCE 1** through **CURRENT DIFF SIGNAL SOURCE 4** settings. See the *Current differential settings* example in the *Application of settings* chapter for additional details.

When in-zone power transformer is present, this setting should be calculated and used by taking into account the in-zone power transformer as follows.

$$CT\ Tap = \frac{CT_{prim_rem} \times V_{prim_rem}}{CT_{prim_loc} \times V_{prim_loc}} \text{ for remote terminals 1 and 2, respectively} \quad (EQ\ 5.10)$$

In this equation, V_{prim_rem} is primary nominal voltage of the transformer winding at the remote terminal and V_{prim_loc} is primary nominal voltage of the transformer winding at the local terminal.

- **CURRENT DIFF RESTRAINT 1 and CURRENT DIFF RESTRAINT 2:** These settings select the bias characteristic for the first and second slope, respectively.
- **CURRENT DIFF BREAK PT:** This setting is used to select an intersection point between the two slopes.
- **INRUSH INHIBIT MODE:** This setting selects the mode for blocking differential protection during magnetizing inrush conditions. Modern transformers can produce small second harmonic ratios during inrush conditions. This can result undesired tripping of the protected line. Reducing the second harmonic inhibit threshold may jeopardize dependability and speed of differential protection. When low, the second harmonic ratio causes problems in one phase only. This may be utilized as a mean to ensure security by applying cross-phase blocking rather than lowering the inrush inhibit threshold.
 - If set to “Disabled”, no inrush inhibit action is taken.
 - If set to “Per phase”, the L90 performs inrush inhibit individually in each phase.
 - If set to “2-out-of-3”, the L90 checks second harmonic level in all three phases individually. If any two phases establish an inhibiting condition, then the remaining phase is restrained automatically.

- If set to “Average”, the L90 first calculates the average second harmonic ratio, then applies the inrush threshold to the calculated average.
- **INRUSH INHIBIT LEVEL:** This setting specifies the level of second harmonic component in the transformer magnetizing inrush current, above which the current differential element is inhibited from operating. The value of the **INRUSH INHIBIT MODE** setting must be taken into account when programming this value. This setting is typically programmed as “20% f_0 ”.
- **CURRENT DIFF GND FUNCTION:** This setting enables and disabled the 87LG neutral differential element, which may be used to detect high-resistive faults. This element uses restrained characteristics to cope with spurious zero-sequence current during system unbalance and signal distortions. The differential neutral current is calculated as the vector sum of all in-zone CT input neutral currents. The restraint current is derived as the maximum of phase currents from all terminals flowing through any individual CT, including breaker-and-a-half configurations. The 87LG neutral differential element is blocked when the phase current at any terminal is greater than 3 pu, since the phase differential element should operate for internal faults. To correctly derive the restraint quantity from the maximum through current at any terminal, it is important that the 87L phase-segregated differential pickup and slope settings are equal at all terminals. Refer to the *Applications of settings* chapter for additional details.
- **CURRENT DIFF GND PICKUP:** This setting specifies the pickup threshold for neutral current differential element.
- **CURRENT DIFF GND RESTRAINT:** This setting specifies the bias characteristic for the neutral current differential element.
- **CURRENT DIFF GND DELAY:** This setting specifies the operation delay for the neutral current differential element. Since this element is used to detect high-resistive faults where fault currents are relatively low, high-speed operation is usually not critical. This delay will provide security against spurious neutral current during switch-off transients and external fault clearing.
- **CURRENT DIFF DTT:** This setting enables and disables the sending of a DTT by the current differential element on per single-phase basis to remote devices. To allow the L90 to restart from master-master to master-slave mode (very important on three-terminal applications), **CURR DIFF DTT** must be set to “Enabled”.
- **CURRENT DIFF KEY DTT:** This setting selects an additional protection element (besides the current differential element; for example, distance element or breaker failure) which keys the DTT on a per three-phase basis.

For the current differential element to function properly, it is imperative that all L90 devices on the protected line have exactly identical firmware revisions. For example, revision 5.62 is only compatible with 5.62, not 5.61 or 5.63.

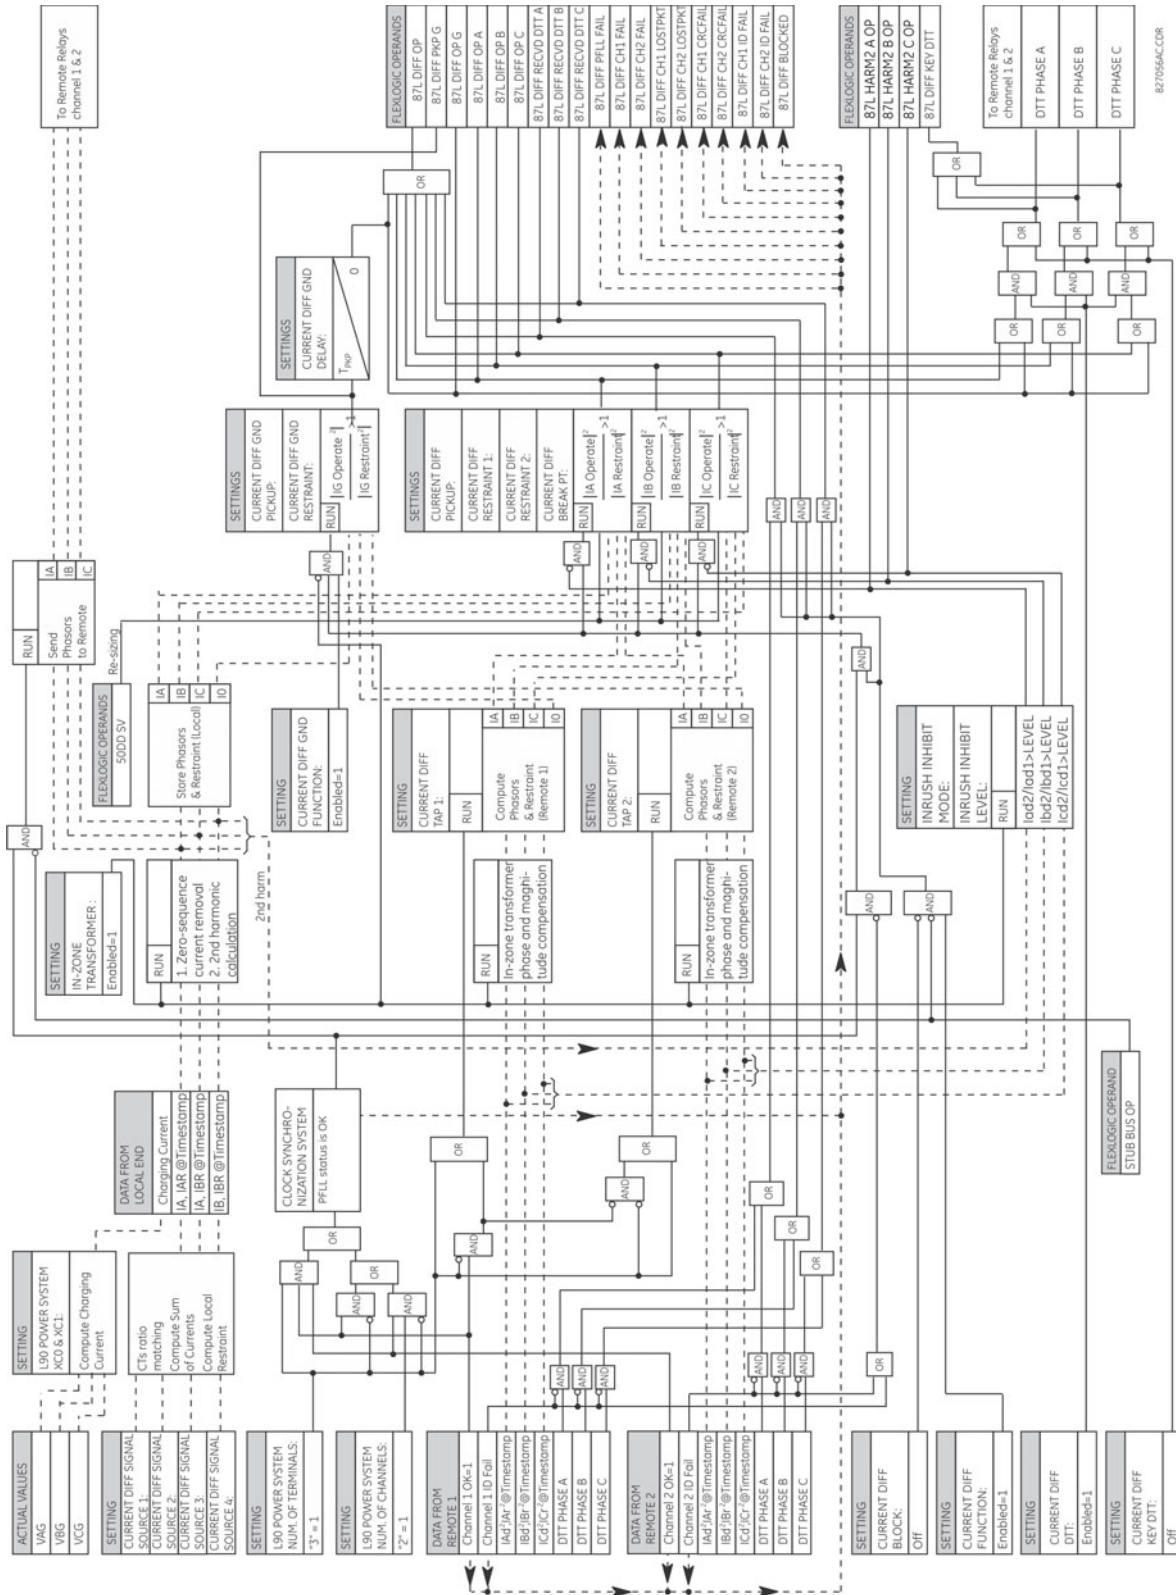

Figure 5-63: CURRENT DIFFERENTIAL SCHEME LOGIC

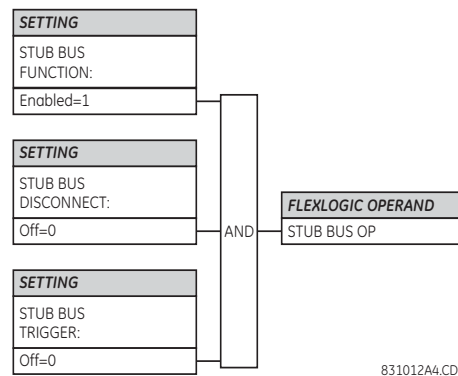

c) STUB BUS

PATH: SETTINGS ⇒ GROUPED ELEMENTS ⇒ SETTING GROUP 1(6) ⇒ LINE DIFFERENTIAL ELEMENT ⇒ STUB BUS

<div>■ STUB BUS</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div>	<div>STUB BUS FUNCTION:</div> <div>Disabled</div>	Range: Disabled, Enabled
	<div>STUB BUS DISCONNECT:</div> <div>Off</div>	Range: FlexLogic operand
	<div>STUB BUS TRIGGER:</div> <div>Off</div>	Range: FlexLogic operand
	<div>STUB BUS TARGET:</div> <div>Self-reset</div>	Range: Self-reset, Latched, Disabled
	<div>STUB BUS EVENTS:</div> <div>Disabled</div>	Range: Disabled, Enabled

The stub bus element protects for faults between two breakers in a breaker-and-a-half or ring bus configuration when the line disconnect switch is open. At the same time, if the line is still energized through the remote terminal(s), differential protection is still required (the line may still need to be energized because there is a tapped load on a two terminal line or because the line is a three terminal line with two of the terminals still connected). Correct operation for this condition is achieved by the local relay sending zero current values to the remote end(s) so that a local bus fault does not result in tripping the line. At the local end, the differential element is disabled and stub bus protection is provided by a user-selected overcurrent element. If there is a line fault, the remote end(s) will trip on differential but local differential function and DTT signal (if enabled) to the local end, will be blocked by the stub bus logic allowing the local breakers to remain closed.

- STUB BUS FUNCTION:** There are three requirements for stub bus operation: the element must be enabled, an indication that the line disconnect is open, and the **STUB BUS TRIGGER** setting is set as indicated below. There are two methods of setting the stub bus trigger and thus setting up stub bus operation:
 - If **STUB BUS TRIGGER** is “On”, the STUB BUS OPERATE operand picks up as soon as the disconnect switch opens, causing zero currents to be transmitted to remote end(s) and DTT receipt from remote end(s) to be permanently blocked. An overcurrent element, blocked by disconnect switch closed, provides protection for the local bus.
 - An alternate method is to set **STUB BUS TRIGGER** to be the pickup of an assigned instantaneous overcurrent element. The instantaneous overcurrent element must operate quickly enough to pick up the STUB BUS OPERATE operand, disable the local differential, and send zero currents to the other terminal(s). If the bus minimum fault current is above five times the instantaneous overcurrent pickup, tests have confirmed that the STUB BUS OPERATE operand always pick up correctly for a stub bus fault and prevents tripping of the remote terminal. If minimum stub bus fault current is below this value, then method 1 should be used. Note also that correct testing of stub bus operation, when this method is used, requires sudden injection of a fault currents above five times instantaneous overcurrent pickup. The assigned current element should be mapped to appropriate output contact(s) to trip the stub bus breakers. It should be blocked unless disconnect is open. To prevent 87L tripping from remote L90 relays still protecting the line, the auxiliary contact of line disconnect switch (logic “1” when line switch is open) should be assigned to block the local 87L function by using the **CURRENT DIFF BLOCK** setting.
- STUB BUS DISCONNECT:** Selects a FlexLogic operand to represent the open state of auxiliary contact of line disconnect switch (logic “1” when line disconnect switch is open). If necessary, simple logic representing not only line disconnect switch but also the closed state of the breakers can be created with FlexLogic and assigned to this setting.
- STUB BUS TRIGGER:** Selects a FlexLogic operand that causes the STUB BUS OPERATE operand to pick up if the line disconnect is open. It can be set either to “On” or to an instantaneous overcurrent element (see above). If the instantaneous overcurrent used for the stub bus protection is set with a time delay, then **STUB BUS TRIGGER** should use the associated instantaneous overcurrent pickup operand. The source assigned for the current of this element must cover the stub between CTs of the associated breakers and disconnect switch.

		EVENTS: Disabled	

The line pickup feature uses a combination of undercurrent and undervoltage to identify a line that has been de-energized (line end open). Alternately, the user may assign a FlexLogic operand to the **TERMINAL OPEN** setting that specifies the terminal status. Three instantaneous overcurrent elements are used to identify a previously de-energized line that has been closed onto a fault. Faults other than close-in faults can be identified satisfactorily with the distance elements.

Co-ordination features are included to ensure satisfactory operation when high speed automatic reclosure (AR) is employed. The **AR CO-ORD DELAY** setting allows the overcurrent setting to be below the expected load current seen after reclose. Co-ordination is achieved by all of the **LINE PICKUP UV** elements resetting and blocking the trip path before the **AR CO-ORD DELAY** times out. The **AR CO-ORD BYPASS** setting is normally enabled. It is disabled if high speed autoreclosure is implemented.

The line pickup protection incorporates zone 1 extension capability. When the line is being re-energized from the local terminal, pickup of an overreaching zone 2 or excessive phase current within eight power cycles after the autorecloser issues a close command results in the **LINE PICKUP RCL TRIP** FlexLogic operand. For security, the overcurrent trip is supervised by

an undervoltage condition, which in turn is controlled by the VT FUSE FAIL OP operand with a 10 ms coordination timer. If a trip from distance is not required, then it can be disabled with the **LINE PICKUP DISTANCE TRIP** setting. Configure the **LINE PICKUP RCL TRIP** operand to perform a trip action if the intent is apply zone 1 extension.

The zone 1 extension philosophy used here normally operates from an under-reaching zone, and uses an overreaching distance zone when reclosing the line with the other line end open. The **AR ACCELERATE** setting is provided to achieve zone 1 extension functionality if external autoreclosure is employed. Another zone 1 extension approach is to permanently apply an overreaching zone, and reduce the reach when reclosing. This philosophy can be programmed via the autoreclose scheme.

Four common settings are available for distance protection. The **DISTANCE SOURCE** identifies the signal source for all distance functions. The mho distance functions use a dynamic characteristic: the positive-sequence voltage – either memorized or actual – is used as a polarizing signal. The memory voltage is also used by the built-in directional supervising functions applied for both the mho and quad characteristics.

The **MEMORY DURATION** setting specifies the length of time a memorized positive-sequence voltage should be used in the distance calculations. After this interval expires, the relay checks the magnitude of the actual positive-sequence voltage. If it is higher than 10% of the nominal, the actual voltage is used, if lower – the memory voltage continues to be used.

The memory is established when the positive-sequence voltage stays above 80% of its nominal value for five power system cycles. For this reason it is important to ensure that the nominal secondary voltage of the VT is entered correctly under the **SETTINGS ⇨ ⇩ SYSTEM SETUP ⇨ AC INPUTS ⇨ ⇩ VOLTAGE BANK** menu.

Set **MEMORY DURATION** long enough to ensure stability on close-in reverse three-phase faults. For this purpose, the maximum fault clearing time (breaker fail time) in the substation should be considered. On the other hand, the **MEMORY DURATION** cannot be too long as the power system may experience power swing conditions rotating the voltage and current phasors slowly while the memory voltage is static, as frozen at the beginning of the fault. Keeping the memory in effect for too long may eventually lead to incorrect operation of the distance functions.

The distance zones can be forced to become self-polarized through the **FORCE SELF-POLAR** setting. Any user-selected condition (FlexLogic operand) can be configured to force self-polarization. When the selected operand is asserted (logic 1), the distance functions become self-polarized regardless of other memory voltage logic conditions. When the selected operand is de-asserted (logic 0), the distance functions follow other conditions of the memory voltage logic as shown below.

The distance zones can be forced to become memory-polarized through the **FORCE MEM-POLAR** setting. Any user-selected condition (any FlexLogic operand) can be configured to force memory polarization. When the selected operand is asserted (logic 1), the distance functions become memory-polarized regardless of the positive-sequence voltage magnitude at this time. When the selected operand is de-asserted (logic 0), the distance functions follow other conditions of the memory voltage logic.

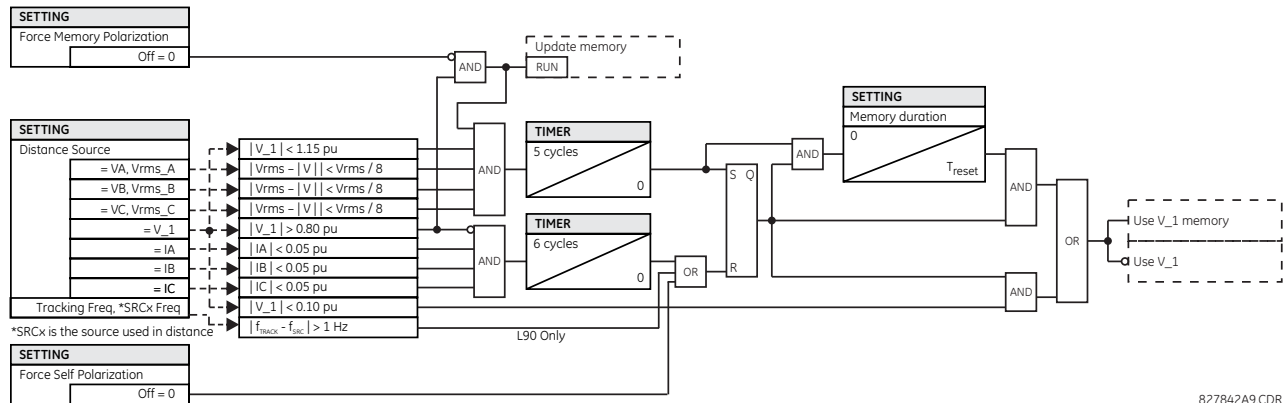

The **FORCE SELF-POLAR** and **FORCE MEM-POLAR** settings should never be asserted simultaneously. If this happens, the logic will give higher priority to forcing self-polarization as indicated in the logic below. This is consistent with the overall philosophy of distance memory polarization.

The memory polarization cannot be applied permanently but for a limited time only; the self-polarization may be applied permanently and therefore should take higher priority.

The distance zones of the L90 are identical to that of the UR-series D60 Line Distance Relay. For additional information on the L90 distance functions, see the Theory of Operation chapter of the D60 manual, available on the GE EnerVista CD or free on the GE Digital Energy web page.

827842A9.CDR

Figure 5-66: MEMORY VOLTAGE LOGIC

The figure shows a condition for the L90 only that forces distance to be self-polarized to assure correct distance operation when L90 relays are synchronizing to each other.

b) PHASE DISTANCE (ANSI 21P, IEC PDIS)

The phase mho distance function uses a dynamic 100% memory-polarized mho characteristic with additional reactance, directional, and overcurrent supervising characteristics. When set to “Non-directional”, the mho function becomes an offset mho with the reverse reach controlled independently from the forward reach, and all the directional characteristics removed.

The phase quadrilateral distance function is comprised of a reactance characteristic, right and left blinders, and 100% memory-polarized directional and current supervising characteristics. When set to “Non-directional”, the quadrilateral function applies a reactance line in the reverse direction instead of the directional comparators. Refer to Chapter 8 for additional information.

Each phase distance zone is configured individually through its own setting menu. All of the settings can be independently modified for each of the zones except:

1. The **SIGNAL SOURCE** setting (common for the distance elements of all zones as entered under **SETTINGS** ⇒ **GROUPED ELEMENTS** ⇒ **SETTING GROUP 1(6)** ⇒ **DISTANCE**).
2. The **MEMORY DURATION** setting (common for the distance elements of all zones as entered under **SETTINGS** ⇒ **GROUPED ELEMENTS** ⇒ **SETTING GROUP 1(6)** ⇒ **DISTANCE**).

The common distance settings described earlier must be properly chosen for correct operation of the phase distance elements. Additional details may be found in chapter 8: *Theory of operation*.

Although all zones can be used as either instantaneous elements (pickup [PKP] and dropout [DPO] FlexLogic operands) or time-delayed elements (operate [OP] FlexLogic operands), only zone 1 is intended for the instantaneous under-reaching tripping mode.

NOTICE

Ensure that the Phase VT Secondary Voltage setting (see the **SETTINGS** ⇒ **SYSTEM SETUP** ⇒ **AC INPUTS** ⇒ **VOLTAGE BANK** menu) is set correctly to prevent improper operation of associated memory action.

- **PHS DIST Z1 DIR:** All phase distance zones are reversible. The forward direction is defined by the **PHS DIST Z1 RCA** setting, whereas the reverse direction is shifted 180° from that angle. The non-directional zone spans between the forward reach impedance defined by the **PHS DIST Z1 REACH** and **PHS DIST Z1 RCA** settings, and the reverse reach impedance defined by **PHS DIST Z1 REV REACH** and **PHS DIST Z1 REV REACH RCA** as illustrated below.
- **PHS DIST Z1 SHAPE:** This setting selects the shape of the phase distance function between the mho and quadrilateral characteristics. The selection is available on a per-zone basis. The two characteristics and their possible variations are shown in the following figures.

Figure 5-67: DIRECTIONAL MHO DISTANCE CHARACTERISTIC

Figure 5-72: QUADRILATERAL DISTANCE CHARACTERISTIC SAMPLE SHAPES

- PHS DIST Z1 XFMR VOL CONNECTION:** The phase distance elements can be applied to look through a three-phase delta-wye or wye-delta power transformer. In addition, VTs and CTs could be located independently from one another at different windings of the transformer. If the potential source is located at the correct side of the transformer, this setting shall be set to “None”.

This setting specifies the location of the voltage source with respect to the involved power transformer in the direction of the zone. The following figure illustrates the usage of this setting. In section (a), zone 1 is looking through a transformer from the delta into the wye winding. Therefore, the Z1 setting shall be set to “Dy11”. In section (b), Zone 3 is looking through a transformer from the wye into the delta winding. Therefore, the Z3 setting shall be set to “Yd1”. The zone is restricted by the potential point (location of the VTs) as illustrated in Figure (e).

- PHS DIST Z1 XFMR CUR CONNECTION:** This setting specifies the location of the current source with respect to the involved power transformer in the direction of the zone. In section (a) of the following figure, zone 1 is looking through a transformer from the delta into the wye winding. Therefore, the Z1 setting shall be set to “Dy11”. In section (b), the CTs are located at the same side as the read point. Therefore, the Z3 setting shall be set to “None”.

See the *Theory of operation* chapter for more details, and the *Application of settings* chapter for information on calculating distance reach settings in applications involving power transformers.

Figure 5-73: APPLICATIONS OF THE PHS DIST XFMR VOL/CUR CONNECTION SETTINGS

- PHS DIST Z1 REACH:** This setting defines the zone reach for the forward and reverse applications. In the non-directional applications, this setting defines the forward reach of the zone. The reverse reach impedance in non-directional applications is set independently. The reach impedance is entered in secondary ohms. The reach impedance angle is entered as the **PHS DIST Z1 RCA** setting.

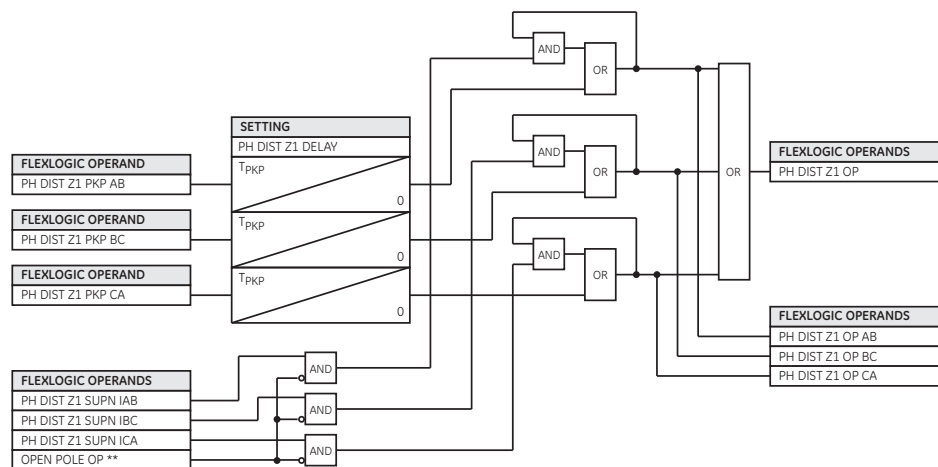

To achieve specified operating speed of distance elements, the relay internally calculates source to line impedance ratio (SIR) from fault phasors. In these calculations, line impedance is estimated based on the zone 1 reach setting. Therefore, in order to calculate the SIR value properly and to maintain the optimal operating speed of the distance elements, you need to set zone 1 reach with a regular 80 to 85% of the line impedance reach setting, even when zone 1 is disabled.

- **PHS DIST Z1 RCA:** This setting specifies the characteristic angle (similar to the 'maximum torque angle' in previous technologies) of the phase distance characteristic for the forward and reverse applications. In the non-directional applications, this setting defines the angle of the forward reach impedance. The reverse reach impedance in the non-directional applications is set independently. The setting is an angle of reach impedance as shown in the distance characteristic figures shown earlier. This setting is independent from **PHS DIST Z1 DIR RCA**, the characteristic angle of an extra directional supervising function.
- **PHS DIST Z1 REV REACH:** This setting defines the reverse reach of the zone set to non-directional (**PHS DIST Z1 DIR** setting). The value must be entered in secondary ohms. This setting does not apply when the zone direction is set to "Forward" or "Reverse".
- **PHS DIST Z1 REV REACH RCA:** This setting defines the angle of the reverse reach impedance if the zone is set to non-directional (**PHS DIST Z1 DIR** setting). This setting does not apply when the zone direction is set to "Forward" or "Reverse".
- **PHS DIST Z1 COMP LIMIT:** This setting shapes the operating characteristic. In particular, it produces the lens-type characteristic of the mho function and a tent-shaped characteristic of the reactance boundary of the quadrilateral function. If the mho shape is selected, the same limit angle applies to both the mho and supervising reactance comparators. In conjunction with the mho shape selection, the setting improves loadability of the protected line. In conjunction with the quadrilateral characteristic, this setting improves security for faults close to the reach point by adjusting the reactance boundary into a tent-shape.
- **PHS DIST Z1 DIR RCA:** This setting selects the characteristic angle (or maximum torque angle) of the directional supervising function. If the mho shape is applied, the directional function is an extra supervising function as the dynamic mho characteristic is itself directional. In conjunction with the quadrilateral shape, this setting defines the only directional function built into the phase distance element. The directional function uses the memory voltage for polarization. This setting typically equals the distance characteristic angle **PHS DIST Z1 RCA**.
- **PHS DIST Z1 DIR COMP LIMIT:** Selects the comparator limit angle for the directional supervising function.
- **PHS DIST Z1 QUAD RGT BLD:** This setting defines the right blinder position of the quadrilateral characteristic along the resistive axis of the impedance plane (see the *Quadrilateral distance characteristic* figures). The angular position of the blinder is adjustable with the use of the **PHS DIST Z1 QUAD RGT BLD RCA** setting. This setting applies only to the quadrilateral characteristic and should be set giving consideration to the maximum load current and required resistive coverage.
- **PHS DIST Z1 QUAD RGT BLD RCA:** This setting defines the angular position of the right blinder of the quadrilateral characteristic (see the *Quadrilateral distance characteristic* figures).
- **PHS DIST Z1 QUAD LFT BLD:** This setting defines the left blinder position of the quadrilateral characteristic along the resistive axis of the impedance plane (see the *Quadrilateral distance characteristic* figures). The angular position of the blinder is adjustable with the use of the **PHS DIST Z1 QUAD LFT BLD RCA** setting. This setting applies only to the quadrilateral characteristic and should be set with consideration to the maximum load current.
- **PHS DIST Z1 QUAD LFT BLD RCA:** This setting defines the angular position of the left blinder of the quadrilateral characteristic (see the *Quadrilateral distance characteristic* figures).
- **PHS DIST Z1 SUPV:** The phase distance elements are supervised by the magnitude of the line-to-line current (fault loop current used for the distance calculations). For convenience, $\sqrt{3}$ is accommodated by the pickup (that is, before being used, the entered value of the threshold setting is multiplied by $\sqrt{3}$).

If the minimum fault current level is sufficient, the current supervision pickup should be set above maximum full load current preventing maloperation under VT fuse fail conditions. This requirement may be difficult to meet for remote faults at the end of zones 2 and above. If this is the case, the current supervision pickup would be set below the full load current, but this may result in maloperation during fuse fail conditions.
- **PHS DIST Z1 VOLT LEVEL:** This setting is relevant for applications on series-compensated lines, or in general, if series capacitors are located between the relaying point and a point where the zone shall not overreach. For plain (non-compensated) lines, set to zero. Otherwise, the setting is entered in per unit of the phase VT bank configured under the **DISTANCE SOURCE**. Effectively, this setting facilitates dynamic current-based reach reduction. In non-directional applications (**PHS DIST Z1 DIR** set to "Non-directional"), this setting applies only to the forward reach of the non-directional zone. See chapters 8 and 9 for information on calculating this setting for series compensated lines.
- **PHS DIST Z1 DELAY:** This setting allows the user to delay operation of the distance elements and implement stepped distance protection. The distance element timers for zones 2 and higher apply a short dropout delay to cope with faults

located close to the zone boundary when small oscillations in the voltages or currents could inadvertently reset the timer. Zone 1 does not need any drop out delay since it is sealed-in by the presence of current.

- **PHS DIST Z1 BLK:** This setting enables the user to select a FlexLogic operand to block a given distance element. VT fuse fail detection is one of the applications for this setting.

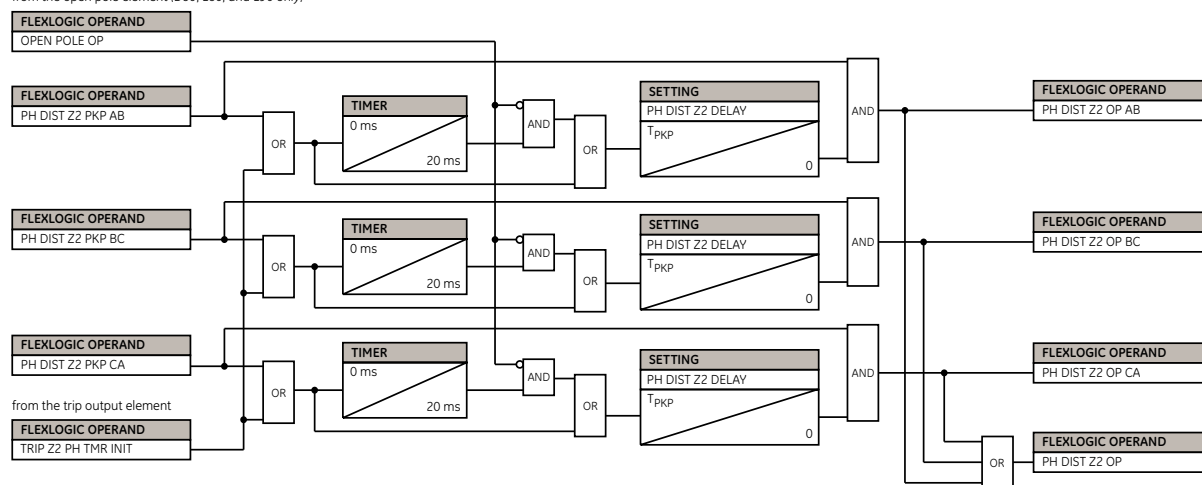

** D60, L60, and L90 only. Other UR-series models apply regular current seal-in for zone 1.

837036A1.CDR

Figure 5-75: PHASE DISTANCE ZONE 2 OP SCHEME

For phase distance zone 2, there is a provision to start the zone timer with other distance zones or loop the pickup flag to avoid prolonging phase distance zone 2 operation when the fault evolves from one type to another or migrates from the initial zone to zone 2. Desired zones in the trip output function should be assigned to accomplish this functionality.

The ground mho distance function uses a dynamic 100% memory-polarized mho characteristic with additional reactance, directional, current, and phase selection supervising characteristics. The ground quadrilateral distance function is composed of a reactance characteristic, right and left blinders, and 100% memory-polarized directional, overcurrent, and phase selection supervising characteristics.

When set to non-directional, the mho function becomes an offset mho with the reverse reach controlled independently from the forward reach, and all the directional characteristics removed. When set to non-directional, the quadrilateral function applies a reactance line in the reverse direction instead of the directional comparators.

The reactance supervision for the mho function uses the zero-sequence current for polarization. The reactance line of the quadrilateral function uses either zero-sequence or negative-sequence current as a polarizing quantity. The selection is controlled by a user setting and depends on the degree of non-homogeneity of the zero-sequence and negative-sequence equivalent networks.

The directional supervision uses memory voltage as polarizing quantity and both zero- and negative-sequence currents as operating quantities.

The phase selection supervision restrains the ground elements during double-line-to-ground faults as they – by principles of distance relaying – may be inaccurate in such conditions. Ground distance zones 1 and higher apply additional zero-sequence directional supervision. See chapter 8 for additional details.

Each ground distance zone is configured individually through its own setting menu. All of the settings can be independently modified for each of the zones except:

1. The **SIGNAL SOURCE** setting (common for both phase and ground elements for all zones as entered under the **SETTINGS** ⇒ **GROUPED ELEMENTS** ⇒ **SETTING GROUP 1(6)** ⇒ **DISTANCE** menu).
2. The **MEMORY DURATION** setting (common for both phase and ground elements for all zones as entered under the **SETTINGS** ⇒ **GROUPED ELEMENTS** ⇒ **SETTING GROUP 1(6)** ⇒ **DISTANCE** menu).

The common distance settings noted at the start of this section must be properly chosen for correct operation of the ground distance elements.

Although all ground distance zones can be used as either instantaneous elements (pickup [PKP] and dropout [DPO] FlexLogic signals) or time-delayed elements (operate [OP] FlexLogic signals), only zone 1 is intended for the instantaneous under-reaching tripping mode.

Ensure that the PHASE VT SECONDARY VOLTAGE (see the SETTINGS ⇒ SYSTEM SETUP ⇒ AC INPUTS ⇒ VOLTAGE BANK menu) is set correctly to prevent improper operation of associated memory action.

- **GND DIST Z1 DIR:** All ground distance zones are reversible. The forward direction is defined by the **GND DIST Z1 RCA** setting and the reverse direction is shifted by 180° from that angle. The non-directional zone spans between the forward reach impedance defined by the **GND DIST Z1 REACH** and **GND DIST Z1 RCA** settings, and the reverse reach impedance defined by the **GND DIST Z1 REV REACH** and **GND DIST Z1 REV REACH RCA** settings.
- **GND DIST Z1 SHAPE:** This setting selects the shape of the ground distance characteristic between the mho and quadrilateral characteristics. The selection is available on a per-zone basis.

The directional and non-directional quadrilateral ground distance characteristics are shown below. The directional and non-directional mho ground distance characteristics are the same as those shown for the phase distance element in the previous sub-section.

Figure 5-78: DIRECTIONAL QUADRILATERAL GROUND DISTANCE CHARACTERISTIC

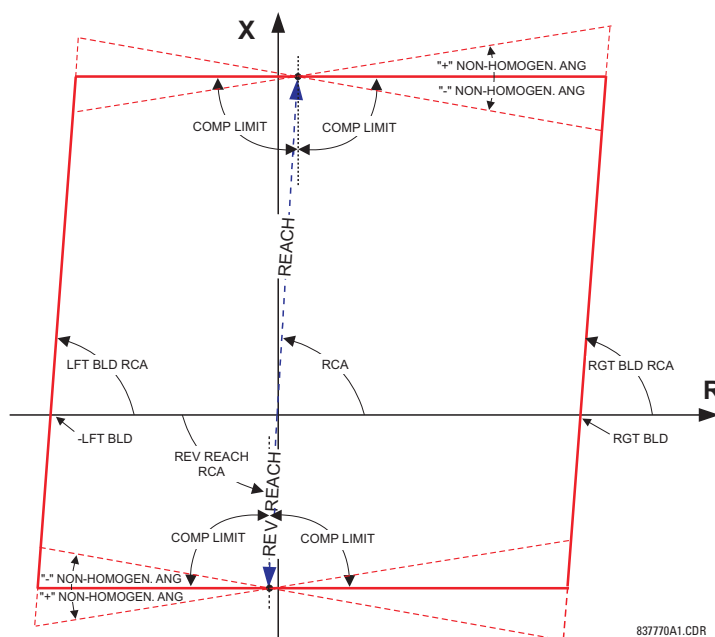

Figure 5-79: NON-DIRECTIONAL QUADRILATERAL GROUND DISTANCE CHARACTERISTIC

- **GND DIST Z1 Z0/Z1 MAG:** This setting specifies the ratio between the zero-sequence and positive-sequence impedance required for zero-sequence compensation of the ground distance elements. This setting is available on a per-zone basis, enabling precise settings for tapped, non-homogeneous, and series compensated lines.
- **GND DIST Z1 Z0/Z1 ANG:** This setting specifies the angle difference between the zero-sequence and positive-sequence impedance required for zero-sequence compensation of the ground distance elements. The entered value is the zero-sequence impedance angle minus the positive-sequence impedance angle. This setting is available on a per-zone basis, enabling precise values for tapped, non-homologous, and series-compensated lines.
- **GND DIST Z1 ZOM/Z1 MAG:** The ground distance elements can be programmed to apply compensation for the zero-sequence mutual coupling between parallel lines. If this compensation is required, the ground current from the parallel line (3I₀) measured in the direction of the zone being compensated must be connected to the ground input CT of the CT bank configured under the **DISTANCE SOURCE**. This setting specifies the ratio between the magnitudes of the mutual zero-sequence impedance between the lines and the positive-sequence impedance of the protected line. It is imperative to set this setting to zero if the compensation is not to be performed.

- **GND DIST Z1 ZOM/Z1 ANG:** This setting specifies the angle difference between the mutual zero-sequence impedance between the lines and the positive-sequence impedance of the protected line.
- **GND DIST Z1 REACH:** This setting defines the reach of the zone for the forward and reverse applications. In non-directional applications, this setting defines the forward reach of the zone. The reverse reach impedance in non-directional applications is set independently. The angle of the reach impedance is entered as the **GND DIST Z1 RCA** setting. The reach impedance is entered in secondary ohms.

To achieve specified operating speed of distance elements, the relay internally calculates source to line impedance ratio (SIR) from fault phasors. In these calculations, line impedance is estimated based on the zone 1 reach setting. Therefore, in order to calculate the SIR value properly and to maintain the optimal operating speed of the distance elements, you need to set zone 1 reach with a regular 80 to 85% of the line impedance reach setting, even when zone 1 is disabled.

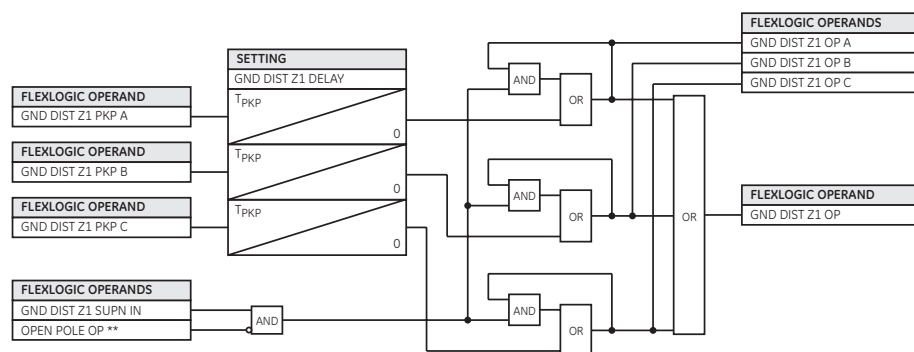

- **GND DIST Z1 RCA:** This setting specifies the characteristic angle (similar to the maximum torque angle in previous technologies) of the ground distance characteristic for the forward and reverse applications. In the non-directional applications this setting defines the forward reach of the zone. The reverse reach impedance in the non-directional applications is set independently. This setting is independent from the **GND DIST Z1 DIR RCA** setting (the characteristic angle of an extra directional supervising function).

The relay internally performs zero-sequence compensation for the protected circuit based on the values entered for **GND DIST Z1 Z0/Z1 MAG** and **GND DIST Z1 Z0/Z1 ANG**, and if configured to do so, zero-sequence compensation for mutual coupling based on the values entered for **GND DIST Z1 Z0M/Z1 MAG** and **GND DIST Z1 Z0M/Z1 ANG**. The **GND DIST Z1 REACH** and **GND DIST Z1 RCA** should, therefore, be entered in terms of positive sequence quantities. Refer to chapters 8 for additional information

- **GND DIST Z1 REV REACH:** This setting defines the reverse reach of the zone set to non-directional (**GND DIST Z1 DIR** setting). The value must be entered in secondary ohms. This setting does not apply when the zone direction is set to "Forward" or "Reverse".
- **GND DIST Z1 REV REACH RCA:** This setting defines the angle of the reverse reach impedance if the zone is set to non-directional (**GND DIST Z1 DIR** setting). This setting does not apply when the zone direction is set to "Forward" or "Reverse".
- **GND DIST Z1 POL CURRENT:** This setting applies only if the **GND DIST Z1 SHAPE** is set to "Quad" and controls the polarizing current used by the reactance comparator of the quadrilateral characteristic. Either the zero-sequence or negative-sequence current could be used. In general, a variety of system conditions must be examined to select an optimum polarizing current. This setting becomes less relevant when the resistive coverage and zone reach are set conservatively. Also, this setting is more relevant in lower voltage applications such as on distribution lines or cables, as compared with high-voltage transmission lines. This setting applies to both the zone 1 and reverse reactance lines if the zone is set to non-directional. Refer to chapters 8 and 9 for additional information.
- **GND DIST Z1 NON-HOMOGEN ANG:** This setting applies only if the **GND DIST Z1 SHAPE** is set to "Quad" and provides a method to correct the angle of the polarizing current of the reactance comparator for non-homogeneity of the zero-sequence or negative-sequence networks. In general, a variety of system conditions must be examined to select this setting. In many applications this angle is used to reduce the reach at high resistances in order to avoid overreaching under far-out reach settings and/or when the sequence networks are greatly non-homogeneous. This setting applies to both the forward and reverse reactance lines if the zone is set to non-directional. Refer to chapters 8 and 9 for additional information.
- **GND DIST Z1 COMP LIMIT:** This setting shapes the operating characteristic. In particular, it enables a lens-shaped characteristic of the mho function and a tent-shaped characteristic of the quadrilateral function reactance boundary. If the mho shape is selected, the same limit angle applies to mho and supervising reactance comparators. In conjunction with the mho shape selection, this setting improves loadability of the protected line. In conjunction with the quadrilateral characteristic, this setting improves security for faults close to the reach point by adjusting the reactance boundary into a tent-shape.
- **GND DIST Z1 DIR RCA:** Selects the characteristic angle (or 'maximum torque angle') of the directional supervising function. If the mho shape is applied, the directional function is an extra supervising function, as the dynamic mho characteristic itself is a directional one. In conjunction with the quadrilateral shape selection, this setting defines the only directional function built into the ground distance element. The directional function uses memory voltage for polarization.
- **GND DIST Z1 DIR COMP LIMIT:** This setting selects the comparator limit angle for the directional supervising function.

- **GND DIST Z1 QUAD RGT BLD:** This setting defines the right blinder position of the quadrilateral characteristic along the resistive axis of the impedance plane (see the *Quadrilateral distance characteristic* figure). The angular position of the blinder is adjustable with the use of the **GND DIST Z1 QUAD RGT BLD RCA** setting. This setting applies only to the quadrilateral characteristic and should be set with consideration to the maximum load current and required resistive coverage.
- **GND DIST Z1 QUAD RGT BLD RCA:** This setting defines the angular position of the right blinder of the quadrilateral characteristic (see the *Quadrilateral distance characteristic* figure).
- **GND DIST Z1 QUAD LFT BLD:** This setting defines the left blinder position of the quadrilateral characteristic along the resistive axis of the impedance plane (see the *Quadrilateral distance characteristic* figure). The angular position of the blinder is adjustable with the use of the **GND DIST Z1 QUAD LFT BLD RCA** setting. This setting applies only to the quadrilateral characteristic and should be set with consideration to the maximum load current.
- **GND DIST Z1 QUAD LFT BLD RCA:** This setting defines the angular position of the left blinder of the quadrilateral characteristic (see the *Quadrilateral distance characteristic* figure).
- **GND DIST Z1 SUPV:** The ground distance elements are supervised by the magnitude of the neutral (3I₀) current. The current supervision pickup should be set less than the minimum 3I₀ current for the end of the zone fault, taking into account the desired fault resistance coverage to prevent maloperation due to VT fuse failure. Settings less than 0.2 pu are not recommended and should be applied with caution. To enhance ground distance security against spurious neutral current during switch-off transients, three-phase faults, and phase-to-phase faults, a positive-sequence current restraint of 5% is applied to the neutral current supervision magnitude. This setting should be at least three times the **CURRENT CUTOFF LEVEL** setting specified in the **PRODUCT SETUP** ⇒ **DISPLAY PROPERTIES** menu
- **GND DIST Z1 VOLT LEVEL:** This setting is relevant for applications on series-compensated lines, or in general, if series capacitors are located between the relaying point and a point for which the zone shall not overreach. For plain (non-compensated) lines, this setting shall be set to zero. Otherwise, the setting is entered in per unit of the VT bank configured under the **DISTANCE SOURCE**. Effectively, this setting facilitates dynamic current-based reach reduction. In non-directional applications (**GND DIST Z1 DIR** set to “Non-directional”), this setting applies only to the forward reach of the non-directional zone. See chapters 8 and 9 for additional details and information on calculating this setting value for applications on series compensated lines.
- **GND DIST Z1 DELAY:** This setting enables the user to delay operation of the distance elements and implement a stepped distance backup protection. The distance element timer applies a short drop out delay to cope with faults located close to the boundary of the zone when small oscillations in the voltages or currents could inadvertently reset the timer.
- **GND DIST Z1 BLK:** This setting enables the user to select a FlexLogic operand to block the given distance element. VT fuse fail detection is one of the applications for this setting.

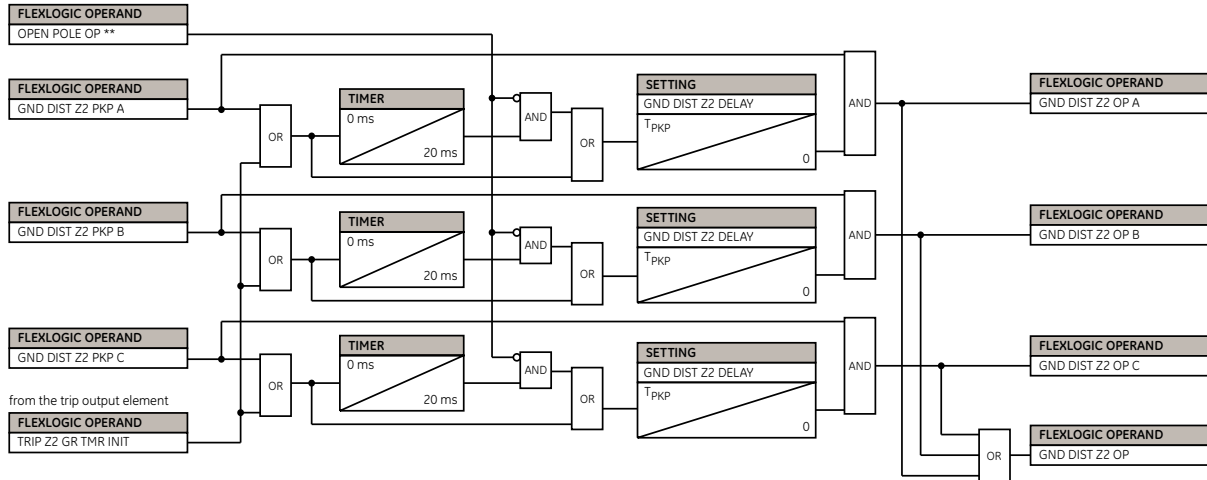

** D60, L60, and L90 only. Other UR-series models apply regular current seal-in for zone 1.

from the open pole detector element D60, L60, and L90 only)

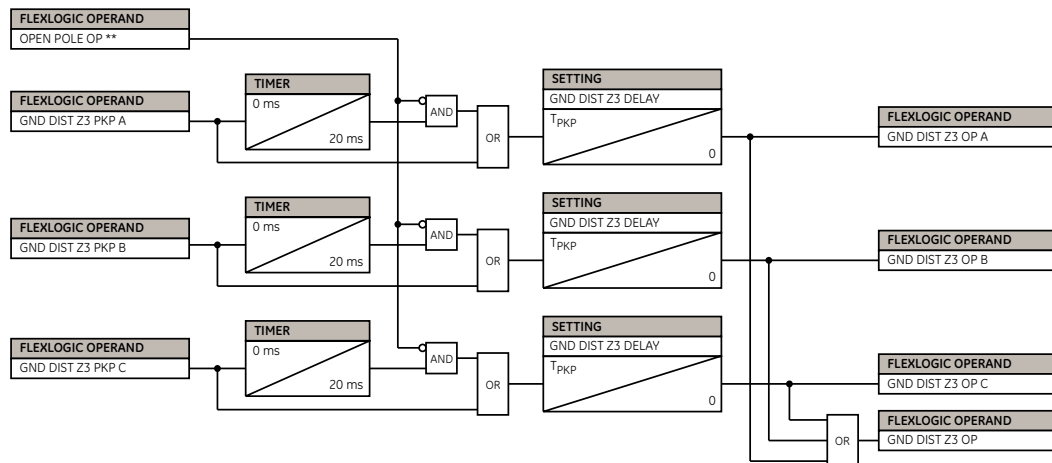

837037A1.CDR

Figure 5-81: GROUND DISTANCE ZONE 2 OP SCHEME

For ground distance zone 2, there is a provision to start the zone timer with the other distance zones or loop pickup flags to avoid prolonging ground distance zone 2 operation if the fault evolves from one type to another or migrates from zone 3 or 4 to zone 2. The desired zones should be assigned in the trip output element to accomplish this functionality.

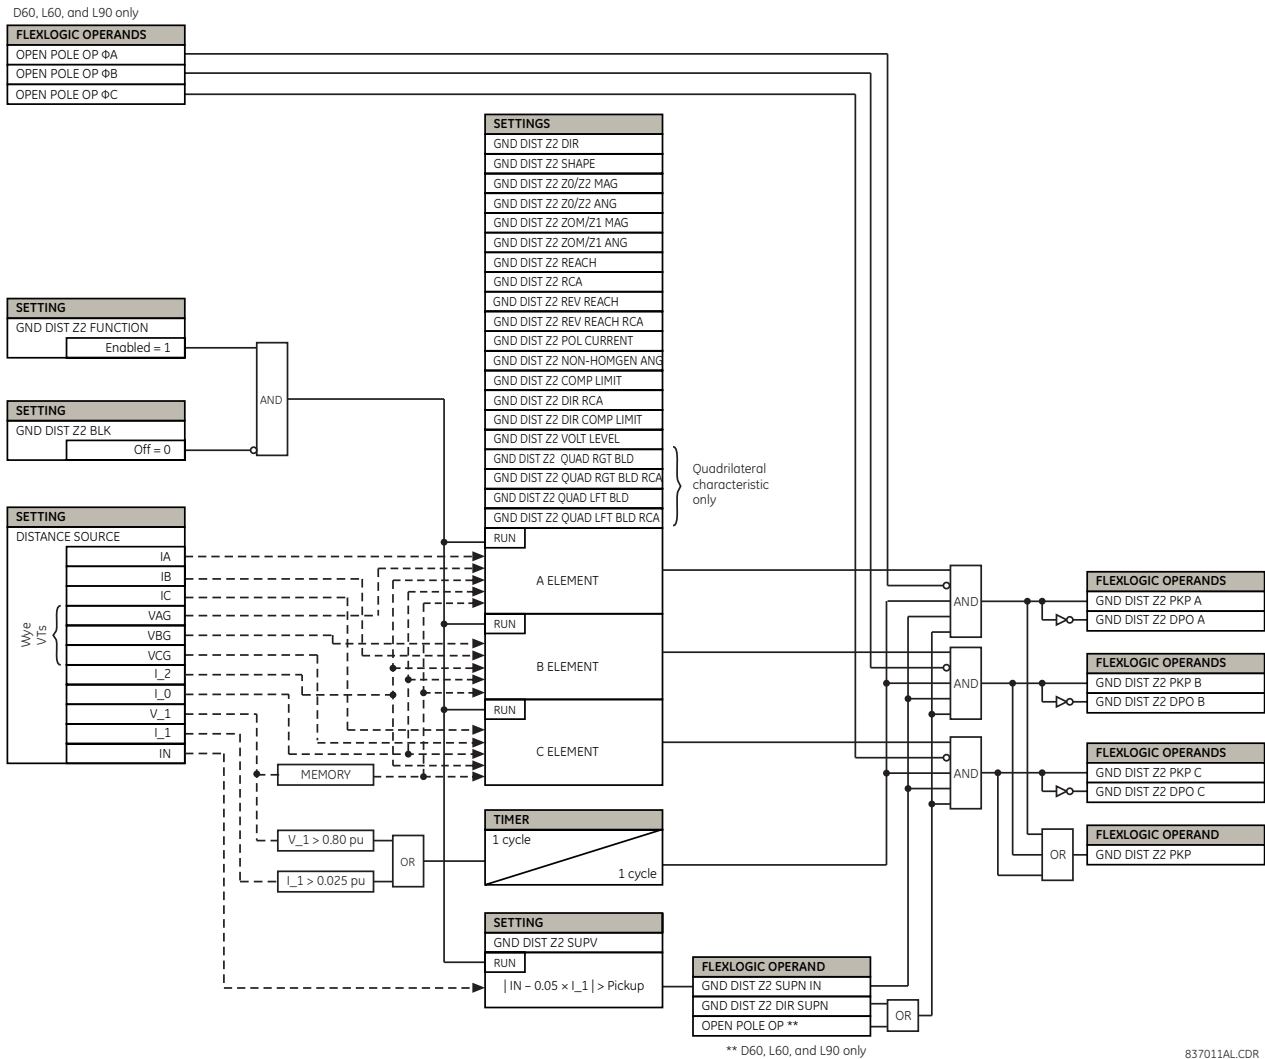

Figure 5-84: GROUND DISTANCE ZONES 2 AND HIGHER SCHEME LOGIC

GROUND DIRECTIONAL SUPERVISION:

A dual (zero-sequence and negative-sequence) memory-polarized directional supervision applied to the ground distance protection elements has been shown to give good directional integrity. However, a reverse double-line-to-ground fault can lead to a maloperation of the ground element in a sound phase if the zone reach setting is increased to cover high resistance faults.

Ground distance zones 2 and higher use an additional ground directional supervision to enhance directional integrity. The element's directional characteristic angle is used as a *maximum torque angle* together with a 90° limit angle.

The supervision is biased toward operation in order to avoid compromising the sensitivity of ground distance elements at low signal levels. Otherwise, the reverse fault condition that generates concern will have high polarizing levels so that a correct reverse fault decision can be reliably made.

The power swing detect element provides both power swing blocking and out-of-step tripping functions. The element measures the positive-sequence apparent impedance and traces its locus with respect to either two or three user-selectable operating characteristic boundaries. Upon detecting appropriate timing relations, the blocking and tripping indications are given through FlexLogic operands. The element incorporates an adaptive disturbance detector. This function does not trigger on power swings, but is capable of detecting faster disturbances – faults in particular – that may occur during power swings. Operation of this dedicated disturbance detector is signaled via the POWER SWING 50DD operand.

The power swing detect element asserts two outputs intended for blocking selected protection elements on power swings: POWER SWING BLOCK is a traditional signal that is safely asserted for the entire duration of the power swing, and POWER SWING UN/BLOCK is established in the same way, but resets when an extra disturbance is detected during the power swing. The POWER SWING UN/BLOCK operand may be used for blocking selected protection elements if the intent is to respond to faults during power swing conditions.

Different protection elements respond differently to power swings. If tripping is required for faults during power swing conditions, some elements may be blocked permanently (using the POWER SWING BLOCK operand), and others may be blocked and dynamically unblocked upon fault detection (using the POWER SWING UN/BLOCK operand).

The operating characteristic and logic figures should be viewed along with the following discussion to develop an understanding of the operation of the element.

The power swing detect element operates in three-step or two-step mode:

- **Three-step operation:** The power swing blocking sequence essentially times the passage of the locus of the positive-sequence impedance between the outer and the middle characteristic boundaries. If the locus enters the outer characteristic (indicated by the POWER SWING OUTER FlexLogic operand) but stays outside the middle characteristic (indicated by the POWER SWING MIDDLE FlexLogic operand) for an interval longer than **POWER SWING PICKUP DELAY 1**, the power swing blocking signal (POWER SWING BLOCK FlexLogic operand) is established and sealed-in. The blocking signal resets when the locus leaves the outer characteristic, but not sooner than the **POWER SWING RESET DELAY 1** time.
- **Two-step operation:** If the two-step mode is selected, the sequence is identical, but it is the outer and inner characteristics that are used to time the power swing locus.

The out-of-step tripping feature operates as follows for three-step and two-step power swing detection modes:

- **Three-step operation:** The out-of-step trip sequence identifies unstable power swings by determining if the impedance locus spends a finite time between the outer and middle characteristics and then a finite time between the middle and inner characteristics. The first step is similar to the power swing blocking sequence. After timer **POWER SWING PICKUP DELAY 1** times out, latch 1 is set as long as the impedance stays within the outer characteristic.

If afterwards, at any time (given the impedance stays within the outer characteristic), the locus enters the middle characteristic but stays outside the inner characteristic for a period of time defined as **POWER SWING PICKUP DELAY 2**, latch 2 is set as long as the impedance stays inside the outer characteristic. If afterwards, at any time (given the impedance stays within the outer characteristic), the locus enters the inner characteristic and stays there for a period of time defined as **POWER SWING PICKUP DELAY 3**, latch 2 is set as long as the impedance stays inside the outer characteristic; the element is now ready to trip.

If the "Early" trip mode is selected, the POWER SWING TRIP operand is set immediately and sealed-in for the interval set by the **POWER SWING SEAL-IN DELAY**. If the "Delayed" trip mode is selected, the element waits until the impedance locus leaves the inner characteristic, then times out the **POWER SWING PICKUP DELAY 2** and sets Latch 4; the element is now ready to trip. The trip operand is set later, when the impedance locus leaves the outer characteristic.

- **Two-step operation:** The two-step mode of operation is similar to the three-step mode with two exceptions. First, the initial stage monitors the time spent by the impedance locus between the outer and inner characteristics. Second, the stage involving the **POWER SWING PICKUP DELAY 2** timer is bypassed. It is up to the user to integrate the blocking (POWER SWING BLOCK) and tripping (POWER SWING TRIP) FlexLogic operands with other protection functions and output contacts in order to make this element fully operational.

The element can be set to use either lens (mho) or rectangular (quadrilateral) characteristics as illustrated below. When set to "Mho", the element applies the right and left blinders as well. If the blinders are not required, their settings should be set high enough to effectively disable the blinders.

Figure 5-86: POWER SWING DETECT MHO OPERATING CHARACTERISTICS

Figure 5-87: EFFECTS OF BLINDERS ON THE MHO CHARACTERISTICS

Figure 5-88: POWER SWING DETECT QUADRILATERAL OPERATING CHARACTERISTICS

The FlexLogic output operands for the power swing detect element are described below:

- The POWER SWING OUTER, POWER SWING MIDDLE, POWER SWING INNER, POWER SWING TMR2 PKP, POWER SWING TMR3 PKP, and POWER SWING TMR4 PKP FlexLogic operands are auxiliary operands that could be used to facilitate testing and special applications.
- The POWER SWING BLOCK FlexLogic operand shall be used to block selected protection elements such as distance functions.
- The POWER SWING UN/BLOCK FlexLogic operand shall be used to block those protection elements that are intended to be blocked under power swings, but subsequently unblocked should a fault occur after the power swing blocking condition has been established.
- The POWER SWING 50DD FlexLogic operand indicates that an adaptive disturbance detector integrated with the element has picked up. This operand will trigger on faults occurring during power swing conditions. This includes both three-phase and single-pole-open conditions.
- The POWER SWING INCOMING FlexLogic operand indicates an unstable power swing with an incoming locus (the locus enters the inner characteristic).
- The POWER SWING OUTGOING FlexLogic operand indicates an unstable power swing with an outgoing locus (the locus leaving the outer characteristic). This operand can be used to count unstable swings and take certain action only after pre-defined number of unstable power swings.
- The POWER SWING TRIP FlexLogic operand is a trip command.

The settings for the power swing detect element are described below:

- **POWER SWING FUNCTION:** This setting enables and disables the entire power swing detection element. The setting applies to both power swing blocking and out-of-step tripping functions.
- **POWER SWING SOURCE:** The source setting identifies the signal source for both blocking and tripping functions.
- **POWER SWING SHAPE:** This setting selects the shapes (either “Mho” or “Quad”) of the outer, middle and, inner characteristics of the power swing detect element. The operating principle is not affected. The “Mho” characteristics use the left and right blinders.

- **POWER SWING MODE:** This setting selects between the two-step and three-step operating modes and applies to both power swing blocking and out-of-step tripping functions. The three-step mode applies if there is enough space between the maximum load impedances and distance characteristics of the relay that all three (outer, middle, and inner) characteristics can be placed between the load and the distance characteristics. Whether the spans between the outer and middle as well as the middle and inner characteristics are sufficient should be determined by analysis of the fastest power swings expected in correlation with settings of the power swing timers.

The two-step mode uses only the outer and inner characteristics for both blocking and tripping functions. This leaves more space in heavily loaded systems to place two power swing characteristics between the distance characteristics and the maximum load, but allows for only one determination of the impedance trajectory.
- **POWER SWING SUPV:** A common overcurrent pickup level supervises all three power swing characteristics. The supervision responds to the positive sequence current.
- **POWER SWING FWD REACH:** This setting specifies the forward reach of all three mho characteristics and the inner quadrilateral characteristic. For a simple system consisting of a line and two equivalent sources, this reach should be higher than the sum of the line and remote source positive-sequence impedances. Detailed transient stability studies may be needed for complex systems in order to determine this setting. The angle of this reach impedance is specified by the **POWER SWING FWD RCA** setting.
- **POWER SWING QUAD FWD REACH MID:** This setting specifies the forward reach of the middle quadrilateral characteristic. The angle of this reach impedance is specified by the **POWER SWING FWD RCA** setting. The setting is not used if the shape setting is “Mho”.
- **POWER SWING QUAD FWD REACH OUT:** This setting specifies the forward reach of the outer quadrilateral characteristic. The angle of this reach impedance is specified by the **POWER SWING FWD RCA** setting. The setting is not used if the shape setting is “Mho”.
- **POWER SWING FWD RCA:** This setting specifies the angle of the forward reach impedance for the mho characteristics, angles of all the blinders, and both forward and reverse reach impedances of the quadrilateral characteristics.
- **POWER SWING REV REACH:** This setting specifies the reverse reach of all three mho characteristics and the inner quadrilateral characteristic. For a simple system of a line and two equivalent sources, this reach should be higher than the positive-sequence impedance of the local source. Detailed transient stability studies may be needed for complex systems to determine this setting. The angle of this reach impedance is specified by the **POWER SWING REV RCA** setting for “Mho”, and the **POWER SWING FWD RCA** setting for “Quad”.
- **POWER SWING QUAD REV REACH MID:** This setting specifies the reverse reach of the middle quadrilateral characteristic. The angle of this reach impedance is specified by the **POWER SWING FWD RCA** setting. The setting is not used if the shape setting is “Mho”.
- **POWER SWING QUAD REV REACH OUT:** This setting specifies the reverse reach of the outer quadrilateral characteristic. The angle of this reach impedance is specified by the **POWER SWING FWD RCA** setting. The setting is not used if the shape setting is “Mho”.
- **POWER SWING REV RCA:** This setting specifies the angle of the reverse reach impedance for the mho characteristics. This setting applies to mho shapes only.
- **POWER SWING OUTER LIMIT ANGLE:** This setting defines the outer power swing characteristic. The convention depicted in the *Power swing detect characteristic* diagram should be observed: values greater than 90° result in an apple-shaped characteristic; values less than 90° result in a lens shaped characteristic. This angle must be selected in consideration of the maximum expected load. If the maximum load angle is known, the outer limit angle should be coordinated with a 20° security margin. Detailed studies may be needed for complex systems to determine this setting. This setting applies to mho shapes only.
- **POWER SWING MIDDLE LIMIT ANGLE:** This setting defines the middle power swing detect characteristic. It is relevant only for the 3-step mode. A typical value would be close to the average of the outer and inner limit angles. This setting applies to mho shapes only.
- **POWER SWING INNER LIMIT ANGLE:** This setting defines the inner power swing detect characteristic. The inner characteristic is used by the out-of-step tripping function: beyond the inner characteristic out-of-step trip action is definite (the actual trip may be delayed as per the **TRIP MODE** setting). Therefore, this angle must be selected in consideration to the power swing angle beyond which the system becomes unstable and cannot recover.

The inner characteristic is also used by the power swing blocking function in the two-step mode. In this case, set this angle large enough so that the characteristics of the distance elements are safely enclosed by the inner characteristic. This setting applies to mho shapes only.

- **POWER SWING OUTER, MIDDLE, and INNER RGT BLD:** These settings specify the resistive reach of the right blinder. The blinder applies to both “Mho” and “Quad” characteristics. Set these value high if no blinder is required for the “Mho” characteristic.
- **POWER SWING OUTER, MIDDLE, and INNER LFT BLD:** These settings specify the resistive reach of the left blinder. Enter a positive value; the relay automatically uses a negative value. The blinder applies to both “Mho” and “Quad” characteristics. Set this value high if no blinder is required for the “Mho” characteristic.
- **POWER SWING PICKUP DELAY 1:** All the coordinating timers are related to each other and should be set to detect the fastest expected power swing and produce out-of-step tripping in a secure manner. The timers should be set in consideration to the power swing detect characteristics, mode of power swing detect operation and mode of out-of-step tripping. This timer defines the interval that the impedance locus must spend between the outer and inner characteristics (two-step operating mode), or between the outer and middle characteristics (three-step operating mode) before the power swing blocking signal is established. This time delay must be set shorter than the time required for the impedance locus to travel between the two selected characteristics during the fastest expected power swing. This setting is relevant for both power swing blocking and out-of-step tripping.
- **POWER SWING RESET DELAY 1:** This setting defines the dropout delay for the power swing blocking signal. Detection of a condition requiring a block output sets latch 1 after **PICKUP DELAY 1** time. When the impedance locus leaves the outer characteristic, timer **POWER SWING RESET DELAY 1** is started. When the timer times-out the latch is reset. This setting should be selected to give extra security for the power swing blocking action.
- **POWER SWING PICKUP DELAY 2:** Controls the out-of-step tripping function in the three-step mode only. This timer defines the interval the impedance locus must spend between the middle and inner characteristics before the second step of the out-of-step tripping sequence is completed. This time delay must be set shorter than the time required for the impedance locus to travel between the two characteristics during the fastest expected power swing.
- **POWER SWING PICKUP DELAY 3:** Controls the out-of-step tripping function only. It defines the interval the impedance locus must spend within the inner characteristic before the last step of the out-of-step tripping sequence is completed and the element is armed to trip. The actual moment of tripping is controlled by the **TRIP MODE** setting. This time delay is provided for extra security before the out-of-step trip action is executed.
- **POWER SWING PICKUP DELAY 4:** Controls the out-of-step tripping function in “Delayed” trip mode only. This timer defines the interval the impedance locus must spend outside the inner characteristic but within the outer characteristic before the element is armed for the delayed trip. The delayed trip occurs when the impedance leaves the outer characteristic. This time delay is provided for extra security and should be set considering the fastest expected power swing.
- **POWER SWING SEAL-IN DELAY:** The out-of-step trip FlexLogic operand (**POWER SWING TRIP**) is sealed-in for the specified period of time. The sealing-in is crucial in the delayed trip mode, as the original trip signal is a very short pulse occurring when the impedance locus leaves the outer characteristic after the out-of-step sequence is completed.
- **POWER SWING TRIP MODE:** Selection of the “Early” trip mode results in an instantaneous trip after the last step in the out-of-step tripping sequence is completed. The early trip mode will stress the circuit breakers as the currents at that moment are high (the electromotive forces of the two equivalent systems are approximately 180° apart). Selection of the “Delayed” trip mode results in a trip at the moment when the impedance locus leaves the outer characteristic. delayed trip mode will relax the operating conditions for the breakers as the currents at that moment are low. The selection should be made considering the capability of the breakers in the system.
- **POWER SWING BLK:** This setting specifies the FlexLogic operand used for blocking the out-of-step function only. The power swing blocking function is operational all the time as long as the element is enabled. The blocking signal resets the output **POWER SWING TRIP** operand but does not stop the out-of-step tripping sequence.

The load encroachment element responds to the positive-sequence voltage and current and applies a characteristic shown in the figure below.

Figure 5-92: LOAD ENCROACHMENT CHARACTERISTIC

The element operates if the positive-sequence voltage is above a settable level and asserts its output signal that can be used to block selected protection elements such as distance or phase overcurrent. The following figure shows an effect of the load encroachment characteristics used to block the quadrilateral distance element.

Figure 5-93: LOAD ENCROACHMENT APPLIED TO DISTANCE ELEMENT

- **LOAD ENCROACHMENT MIN VOLT:** This setting specifies the minimum positive-sequence voltage required for operation of the element. If the voltage is below this threshold a blocking signal will not be asserted by the element. When selecting this setting one must remember that the L90 measures the phase-to-ground sequence voltages regardless of the VT connection.

The nominal VT secondary voltage as specified with the **SYSTEM SETUP** ⇒ **AC INPUTS** ⇒ **VOLTAGE BANK X5** ⇒ **PHASE VT SECONDARY** setting is the per-unit base for this setting.

- **LOAD ENCROACHMENT REACH:** This setting specifies the resistive reach of the element as shown in the *Load encroachment characteristic* diagram. This setting should be entered in secondary ohms and be calculated as the positive-sequence resistance seen by the relay under maximum load conditions and unity power factor.
- **LOAD ENCROACHMENT ANGLE:** This setting specifies the size of the blocking region as shown on the *Load encroachment characteristic* diagram and applies to the positive-sequence impedance.

b) INVERSE TIME OVERCURRENT CHARACTERISTICS

The inverse time overcurrent curves used by the time overcurrent elements are the IEEE, IEC, GE Type IAC, and I^2t standard curve shapes. This allows for simplified coordination with downstream devices.

If none of these curve shapes is adequate, FlexCurves may be used to customize the inverse time curve characteristics. The definite time curve is also an option that may be appropriate if only simple protection is required.

Table 5-18: OVERCURRENT CURVE TYPES

IEEE	IEC	GE TYPE IAC	OTHER
IEEE Extremely Inverse	IEC Curve A (BS142)	IAC Extremely Inverse	I^2t
IEEE Very Inverse	IEC Curve B (BS142)	IAC Very Inverse	FlexCurves A, B, C, and D
IEEE Moderately Inverse	IEC Curve C (BS142)	IAC Inverse	Recloser Curves
	IEC Short Inverse	IAC Short Inverse	Definite Time

A time dial multiplier setting allows selection of a multiple of the base curve shape (where the time dial multiplier = 1) with the curve shape (CURVE) setting. Unlike the electromechanical time dial equivalent, operate times are directly proportional to the time multiplier (TD MULTIPLIER) setting value. For example, all times for a multiplier of 10 are 10 times the multiplier 1 or base curve values. Setting the multiplier to zero results in an instantaneous response to all current levels above pickup.

Time overcurrent time calculations are made with an internal *energy capacity* memory variable. When this variable indicates that the energy capacity has reached 100%, a time overcurrent element will operate. If less than 100% energy capacity is accumulated in this variable and the current falls below the dropout threshold of 97 to 98% of the pickup value, the variable must be reduced. Two methods of this resetting operation are available: “Instantaneous” and “Timed”. The “Instantaneous” selection is intended for applications with other relays, such as most static relays, which set the energy capacity directly to zero when the current falls below the reset threshold. The “Timed” selection can be used where the relay must coordinate with electromechanical relays.

IEEE CURVES:

The IEEE time overcurrent curve shapes conform to industry standards and the IEEE C37.112-1996 curve classifications for extremely, very, and moderately inverse. The IEEE curves are derived from the formulae:

$$T = TDM \times \left[\frac{A}{\left(\frac{I}{I_{pickup}} \right)^p - 1} + B \right], T_{RESET} = TDM \times \left[\frac{t_r}{1 - \left(\frac{I}{I_{pickup}} \right)^2} \right] \quad (\text{EQ 5.11})$$

where: T = operate time (in seconds), TDM = Multiplier setting, I = input current, I_{pickup} = Pickup Current setting
 A , B , p = constants, T_{RESET} = reset time in seconds (assuming energy capacity is 100% and RESET is "Timed"),
 t_r = characteristic constant

Table 5–19: IEEE INVERSE TIME CURVE CONSTANTS

IEEE CURVE SHAPE	A	B	P	T _R
IEEE Extremely Inverse	28.2	0.1217	2.0000	29.1
IEEE Very Inverse	19.61	0.491	2.0000	21.6
IEEE Moderately Inverse	0.0515	0.1140	0.02000	4.85

IEC CURVES

For European applications, the relay offers three standard curves defined in IEC 255-4 and British standard BS142. These are defined as IEC Curve A, IEC Curve B, and IEC Curve C. The formulae for these curves are:

$$T = TDM \times \left[\frac{K}{(I/I_{pickup})^E - 1} \right], T_{RESET} = TDM \times \left[\frac{t_r}{1 - (I/I_{pickup})^2} \right] \quad (\text{EQ 5.12})$$

where: T = operate time (in seconds), TDM = Multiplier setting, I = input current, I_{pickup} = Pickup Current setting, K , E = constants, t_r = characteristic constant, and T_{RESET} = reset time in seconds (assuming energy capacity is 100% and RESET is "Timed")

Table 5-21: IEC (BS) INVERSE TIME CURVE CONSTANTS

IAC CURVES:

The curves for the General Electric type IAC relay family are derived from the formulae:

$$T = TDM \times \left(A + \frac{B}{(I/I_{pkp}) - C} + \frac{D}{((I/I_{pkp}) - C)^2} + \frac{E}{((I/I_{pkp}) - C)^3} \right), T_{RESET} = TDM \times \left[\frac{t_r}{1 - (I/I_{pkp})^2} \right] \quad (\text{EQ 5.13})$$

where: T = operate time (in seconds), TDM = Multiplier setting, I = Input current, I_{pkp} = Pickup Current setting, A to E = constants, t_r = characteristic constant, and T_{RESET} = reset time in seconds (assuming energy capacity is 100% and RESET is "Timed")

I²t CURVES:

The curves for the I²t are derived from the formulae:

$$T = \text{TDM} \times \left[\frac{100}{\left(\frac{I}{I_{pickup}} \right)^2} \right], T_{RESET} = \text{TDM} \times \left[\frac{100}{\left(\frac{I}{I_{pickup}} \right)^{-2}} \right] \quad (\text{EQ 5.14})$$

where: T = Operate Time (sec.); TDM = Multiplier Setting; I = Input Current; I_{pickup} = Pickup Current Setting;
 T_{RESET} = Reset Time in sec. (assuming energy capacity is 100% and RESET: Timed)

Table 5-25: I²T CURVE TRIP TIMES

FLEXCURVES:

The custom FlexCurves are described in detail in the FlexCurves section of this chapter. The curve shapes for the FlexCurves are derived from the formulae:

$$T = \text{TDM} \times \left[\text{FlexCurve Time at } \left(\frac{I}{I_{pickup}} \right) \right] \text{ when } \left(\frac{I}{I_{pickup}} \right) \geq 1.00 \quad (\text{EQ 5.15})$$

$$T_{RESET} = \text{TDM} \times \left[\text{FlexCurve Time at } \left(\frac{I}{I_{pickup}} \right) \right] \text{ when } \left(\frac{I}{I_{pickup}} \right) \leq 0.98 \quad (\text{EQ 5.16})$$

where: T = Operate Time (sec.), TDM = Multiplier setting
 I = Input Current, I_{pickup} = Pickup Current setting
 T_{RESET} = Reset Time in seconds (assuming energy capacity is 100% and RESET: Timed)

DEFINITE TIME CURVE:

The Definite Time curve shape operates as soon as the pickup level is exceeded for a specified period of time. The base definite time curve delay is in seconds. The curve multiplier of 0.00 to 600.00 makes this delay adjustable from instantaneous to 600.00 seconds in steps of 10 ms.

$$T = \text{TDM} \text{ in seconds, when } I > I_{pickup} \quad (\text{EQ 5.17})$$

$$T_{RESET} = \text{TDM} \text{ in seconds} \quad (\text{EQ 5.18})$$

where: T = Operate Time (sec.), TDM = Multiplier setting
 I = Input Current, I_{pickup} = Pickup Current setting
 T_{RESET} = Reset Time in seconds (assuming energy capacity is 100% and RESET: Timed)

RECLOSER CURVES:

The L90 uses the FlexCurve feature to facilitate programming of 41 recloser curves. Please refer to the FlexCurve section in this chapter for additional details.

The phase time overcurrent element can provide a desired time-delay operating characteristic versus the applied current or be used as a simple definite time element. The phase current input quantities may be programmed as fundamental phasor magnitude or total waveform RMS magnitude as required by the application.

Two methods of resetting operation are available: “Timed” and “Instantaneous” (refer to the *Inverse Time overcurrent curves characteristic* sub-section earlier for details on curve setup, trip times, and reset operation). When the element is blocked, the time accumulator will reset according to the reset characteristic. For example, if the element reset characteristic is set to “Instantaneous” and the element is blocked, the time accumulator will be cleared immediately.

The **PHASE TOC1 PICKUP** setting can be dynamically reduced by a voltage restraint feature (when enabled). This is accomplished via the multipliers (Mvr) corresponding to the phase-phase voltages of the voltage restraint characteristic curve (see the figure below); the pickup level is calculated as ‘Mvr’ times the **PHASE TOC1 PICKUP** setting. If the voltage restraint feature is disabled, the pickup level always remains at the setting value.

The phase instantaneous overcurrent element may be used as an instantaneous element with no intentional delay or as a definite time element. The input current is the fundamental phasor magnitude. For timing curves, see the publication Instantaneous Overcurrent Element Response to Saturated Waveforms in UR-Series Relays ([GET-8400A](#)).

The phase directional elements (one for each of phases A, B, and C) determine the phase current flow direction for steady state and fault conditions and can be used to control the operation of the phase overcurrent elements via the **BLOCK** inputs of these elements.

Figure 5-98: PHASE A DIRECTIONAL POLARIZATION

This element is intended to apply a block signal to an overcurrent element to prevent an operation when current is flowing in a particular direction. The direction of current flow is determined by measuring the phase angle between the current from the phase CTs and the line-line voltage from the VTs, based on the 90° or quadrature connection. If there is a requirement to supervise overcurrent elements for flows in opposite directions, such as can happen through a bus-tie breaker, two phase directional elements should be programmed with opposite element characteristic angle (ECA) settings.

To increase security for three phase faults very close to the VTs used to measure the polarizing voltage, a voltage memory feature is incorporated. This feature stores the polarizing voltage the moment before the voltage collapses, and uses it to determine direction. The voltage memory remains valid for one second after the voltage has collapsed.

The main component of the phase directional element is the phase angle comparator with two inputs: the operating signal (phase current) and the polarizing signal (the line voltage, shifted in the leading direction by the characteristic angle, ECA).

The following table shows the operating and polarizing signals used for phase directional control:

PHASE	OPERATING SIGNAL	POLARIZING SIGNAL V_{pol}	
		ABC PHASE SEQUENCE	ACB PHASE SEQUENCE
A	angle of IA	angle of VBC $\times (1\angle ECA)$	angle of VCB $\times (1\angle ECA)$
B	angle of IB	angle of VCA $\times (1\angle ECA)$	angle of VAC $\times 1\angle ECA)$
C	angle of IC	angle of VAB $\times (1\angle ECA)$	angle of VBA $\times (1\angle ECA)$

MODE OF OPERATION:

- When the function is “Disabled”, or the operating current is below $5\% \times CT$ nominal, the element output is “0”.
- When the function is “Enabled”, the operating current is above $5\% \times CT$ nominal, and the polarizing voltage is above the **PRODUCT SETUP** \Rightarrow **DISPLAY PROPERTIES** \Rightarrow **VOLTAGE CUT-OFF LEVEL** value, the element output is dependent on the phase angle between the operating and polarizing signals:
 - The element output is logic “0” when the operating current is within polarizing voltage $\pm 90^\circ$.
 - For all other angles, the element output is logic “1”.
- Once the voltage memory has expired, the phase overcurrent elements under directional control can be set to block or trip on overcurrent as follows:
 - When **BLOCK WHEN V MEM EXP** is set to “Yes”, the directional element will block the operation of any phase overcurrent element under directional control when voltage memory expires.
 - When **BLOCK WHEN V MEM EXP** is set to “No”, the directional element allows tripping of phase overcurrent elements under directional control when voltage memory expires.

In all cases, directional blocking will be permitted to resume when the polarizing voltage becomes greater than the ‘polarizing voltage threshold’.

SETTINGS:

- PHASE DIR 1 SIGNAL SOURCE:** This setting is used to select the source for the operating and polarizing signals. The operating current for the phase directional element is the phase current for the selected current source. The polarizing voltage is the line voltage from the phase VTs, based on the 90° or ‘quadrature’ connection and shifted in the leading direction by the element characteristic angle (ECA).
- PHASE DIR 1 ECA:** This setting is used to select the element characteristic angle, i.e. the angle by which the polarizing voltage is shifted in the leading direction to achieve dependable operation. In the design of the UR-series elements, a block is applied to an element by asserting logic 1 at the blocking input. This element should be programmed via the ECA setting so that the output is **logic 1 for current in the non-tripping direction**.
- PHASE DIR 1 POL V THRESHOLD:** This setting is used to establish the minimum level of voltage for which the phase angle measurement is reliable. The setting is based on VT accuracy. The default value is “0.700 pu”.
- PHASE DIR 1 BLOCK WHEN V MEM EXP:** This setting is used to select the required operation upon expiration of voltage memory. When set to “Yes”, the directional element blocks the operation of any phase overcurrent element under directional control, when voltage memory expires; when set to “No”, the directional element allows tripping of phase overcurrent elements under directional control.

The phase directional element responds to the forward load current. In the case of a following reverse fault, the element needs some time – in the order of 8 ms – to establish a blocking signal. Some protection elements such as instantaneous overcurrent may respond to reverse faults before the blocking signal is established. Therefore, a coordination time of at least 10 ms must be added to all the instantaneous protection elements under the supervision of the phase directional element. If current reversal is of a concern, a longer delay – in the order of 20 ms – may be needed.

The neutral time overcurrent element can provide a desired time-delay operating characteristic versus the applied current or be used as a simple definite time element. The neutral current input value is a quantity calculated as $3I_0$ from the phase currents and may be programmed as fundamental phasor magnitude or total waveform RMS magnitude as required by the application.

Two methods of resetting operation are available: “Timed” and “Instantaneous” (refer to the *Inverse time overcurrent curve characteristics* section for details on curve setup, trip times and reset operation). When the element is blocked, the time accumulator will reset according to the reset characteristic. For example, if the element reset characteristic is set to “Instantaneous” and the element is blocked, the time accumulator will be cleared immediately.

The neutral instantaneous overcurrent element may be used as an instantaneous function with no intentional delay or as a definite time function. The element essentially responds to the magnitude of a neutral current fundamental frequency phasor calculated from the phase currents. A positive-sequence restraint is applied for better performance. A small portion (6.25%) of the positive-sequence current magnitude is subtracted from the zero-sequence current magnitude when forming the operating quantity of the element as follows:

$$I_{op} = 3 \times (|I_0| - K \cdot |I_1|) \quad \text{where } K = 1/16 \quad (\text{EQ 5.19})$$

The positive-sequence restraint allows for more sensitive settings by counterbalancing spurious zero-sequence currents resulting from:

- System unbalances under heavy load conditions
- Transformation errors of current transformers (CTs) during double-line and three-phase faults.
- Switch-off transients during double-line and three-phase faults.

The positive-sequence restraint must be considered when testing for pickup accuracy and response time (multiple of pickup). The operating quantity depends on how test currents are injected into the relay (single-phase injection: $I_{op} = 0.9375 \cdot I_{injected}$; three-phase pure zero-sequence injection: $I_{op} = 3 \times I_{injected}$).

	MESSAGE	NEUTRAL DIR OC1 EVENTS: Disabled	Range: Disabled, Enabled

The neutral directional overcurrent element provides both forward and reverse fault direction indications the NEUTRAL DIR OC1 FWD and NEUTRAL DIR OC1 REV operands, respectively. The output operand is asserted if the magnitude of the operating current is above a pickup level (overcurrent unit) and the fault direction is seen as *forward* or *reverse*, respectively (directional unit).

The **overcurrent unit** responds to the magnitude of a fundamental frequency phasor of the either the neutral current calculated from the phase currents or the ground current. There are separate pickup settings for the forward-looking and reverse-looking functions. If set to use the calculated 3I₀, the element applies a *positive-sequence restraint* for better performance: a small user-programmable portion of the positive-sequence current magnitude is subtracted from the zero-sequence current magnitude when forming the operating quantity.

$$I_{op} = 3 \times (|I_0| - K \times |I_1|) \quad (\text{EQ 5.20})$$

The positive-sequence restraint allows for more sensitive settings by counterbalancing spurious zero-sequence currents resulting from:

- System unbalances under heavy load conditions.

- Transformation errors of current transformers (CTs) during double-line and three-phase faults.
- Switch-off transients during double-line and three-phase faults.

The positive-sequence restraint must be considered when testing for pickup accuracy and response time (multiple of pickup). The operating quantity depends on the way the test currents are injected into the relay (single-phase injection: $I_{op} = (1 - K) \times I_{injected}$; three-phase pure zero-sequence injection: $I_{op} = 3 \times I_{injected}$).

The positive-sequence restraint is removed for low currents. If the positive-sequence current is below 0.8 pu, the restraint is removed by changing the constant K to zero. This facilitates better response to high-resistance faults when the unbalance is very small and there is no danger of excessive CT errors as the current is low.

The **directional unit** uses the zero-sequence current (I_0) or ground current (IG) for fault direction discrimination and may be programmed to use either zero-sequence voltage ("Calculated V0" or "Measured VX"), ground current (IG), or both for polarizing. The zero-sequence current (I_0) must be greater than the **PRODUCT SETUP** ⇨ ⇩ **DISPLAY PROPERTIES** ⇨ ⇩ **CURRENT CUT-OFF LEVEL** setting value and IG must be greater than 0.05 pu to be validated as the operating quantity for directional current. The following tables define the neutral directional overcurrent element.

Table 5–26: QUANTITIES FOR "CALCULATED 3I0" CONFIGURATION

DIRECTIONAL UNIT				OVERCURRENT UNIT
POLARIZING MODE	DIRECTION	COMPARED PHASORS		
Voltage	Forward	$-V_0 + Z_offset \times I_0$	$I_0 \times 1\angle ECA$	$I_{op} = 3 \times (I_0 - K \times I_1)$ if $ I_1 > 0.8$ pu $I_{op} = 3 \times (I_0)$ if $ I_1 \leq 0.8$ pu
	Reverse	$-V_0 + Z_offset \times I_0$	$-I_0 \times 1\angle ECA$	
Current	Forward	IG	I_0	
	Reverse	IG	$-I_0$	
Dual, Dual-V, Dual-I	Forward	$-V_0 + Z_offset \times I_0$	$I_0 \times 1\angle ECA$	
		or		
		IG	I_0	
	Reverse	$-V_0 + Z_offset \times I_0$	$-I_0 \times 1\angle ECA$	
		or		
		IG	$-I_0$	

Table 5–27: QUANTITIES FOR "MEASURED IG" CONFIGURATION

DIRECTIONAL UNIT				OVERCURRENT UNIT
POLARIZING MODE	DIRECTION	COMPARED PHASORS		
Voltage	Forward	$-V_{_0} + Z_{_offset} \times IG/3$	$IG \times 1 \angle ECA$	$I_{op} = IG $
	Reverse	$-V_{_0} + Z_{_offset} \times IG/3$	$-IG \times 1 \angle ECA$	

where: $V_0 = \frac{1}{3}(V_{AG} + V_{BG} + V_{CG})$ = zero sequence voltage ,

$$I_0 = \frac{1}{3}I_N = \frac{1}{3}(I_A + I_B + I_C) = \text{zero sequence current ,}$$

ECA = element characteristic angle and IG = ground current

When **NEUTRAL DIR OC1 POL VOLT** is set to "Measured VX", one-third of this voltage is used in place of V_0 . The following figure explains the usage of the voltage polarized directional unit of the element.

The figure below shows the voltage-polarized phase angle comparator characteristics for a phase A to ground fault, with:

- ECA = 90° (element characteristic angle = centerline of operating characteristic)
- FWD LA = 80° (forward limit angle = the ± angular limit with the ECA for operation)
- REV LA = 80° (reverse limit angle = the ± angular limit with the ECA for operation)

The element incorporates a current reversal logic: if the reverse direction is indicated for at least 1.25 of a power system cycle, the prospective forward indication is delayed by 1.5 of a power system cycle. The element is designed to emulate an electromechanical directional device. Larger operating and polarizing signals results in faster directional discrimination bringing more security to the element operation.

The forward-looking function is designed to be more secure as compared to the reverse-looking function, and therefore, should be used for the tripping direction. The reverse-looking function is designed to be faster as compared to the forward-looking function and should be used for the blocking direction. This allows for better protection coordination.

The above bias should be taken into account when using the neutral directional overcurrent element to directionalize other protection elements.

Figure 5-102: NEUTRAL DIRECTIONAL VOLTAGE-POLARIZED CHARACTERISTICS

- **NEUTRAL DIR OC1 POLARIZING:** This setting selects the polarizing mode for the directional unit.
 - If “Voltage” polarizing is selected, the element uses the zero-sequence voltage angle for polarization. The user can use either the zero-sequence voltage V_0 calculated from the phase voltages, or the zero-sequence voltage supplied externally as the auxiliary voltage V_X , both from the **NEUTRAL DIR OC1 SOURCE**.

The calculated V_0 can be used as polarizing voltage only if the voltage transformers are connected in Wye. The auxiliary voltage can be used as the polarizing voltage provided **SYSTEM SETUP** ⇒ **AC INPUTS** ⇒ **VOLTAGE BANK** ⇒ **AUXILIARY VT CONNECTION** is set to “Vn” and the auxiliary voltage is connected to a zero-sequence voltage source (such as broken delta connected secondary of VTs).

The zero-sequence (V_0) or auxiliary voltage (V_X), accordingly, must be greater than the **VOLTAGE CUTOFF LEVEL** setting specified in the **PRODUCT SETUP** ⇒ **DISPLAY PROPERTIES** menu to be validated for use as a polarizing signal. If the polarizing signal is invalid, neither forward nor reverse indication is given.

- If “Current” polarizing is selected, the element uses the ground current angle connected externally and configured under **NEUTRAL OC1 SOURCE** for polarization. The ground CT must be connected between the ground and neutral point of an adequate local source of ground current. The ground current must be greater than 0.05 pu to be validated as a polarizing signal. If the polarizing signal is not valid, neither forward nor reverse indication is given. In addition, the zero-sequence current (I_0) must be greater than the **PRODUCT SETUP** ⇒ **DISPLAY PROPERTIES** ⇒ **CURRENT CUT-OFF LEVEL** setting value.

For a choice of current polarizing, it is recommended that the polarizing signal be analyzed to ensure that a known direction is maintained irrespective of the fault location. For example, if using an autotransformer neutral current as a polarizing source, it should be ensured that a reversal of the ground current does not occur for a high-side fault. The low-side system impedance should be assumed minimal when checking for this condition. A similar situation arises for a wye/delta/wye transformer, where current in one transformer winding neutral may reverse when faults on both sides of the transformer are considered.

- If “Dual” polarizing is selected, the element performs both directional comparisons as described above. A given direction is confirmed if either voltage or current comparators indicate so. If a conflicting (simultaneous forward and reverse) indication occurs, the forward direction overrides the reverse direction.
- **NEUTRAL DIR OC1 POL VOLT:** Selects the polarizing voltage used by the directional unit when "Voltage," "Dual," "Dual-V," or "Dual-I" polarizing mode is set. The polarizing voltage can be programmed to be either the zero-sequence voltage calculated from the phase voltages ("Calculated V0") or supplied externally as an auxiliary voltage ("Measured VX").
- **NEUTRAL DIR OC1 OP CURR:** This setting indicates whether the 3I₀ current calculated from the phase currents, or the ground current shall be used by this protection. This setting acts as a switch between the neutral and ground modes of operation (67N and 67G). If set to “Calculated 3I0” the element uses the phase currents and applies the positive-sequence restraint; if set to “Measured IG” the element uses ground current supplied to the ground CT of the CT bank configured as **NEUTRAL DIR OC1 SOURCE**. If this setting is “Measured IG”, then the **NEUTRAL DIR OC1 POLARIZING** setting must be “Voltage”, as it is not possible to use the ground current as an operating and polarizing signal simultaneously. IG current has to be above 0.05 ps to be used as operate quantity.
- **NEUTRAL DIR OC1 POS-SEQ RESTRAINT:** This setting controls the amount of the positive-sequence restraint. Set to 0.063 for backward compatibility with firmware revision 3.40 and older. Set to zero to remove the restraint. Set higher if large system unbalances or poor CT performance are expected.
- **NEUTRAL DIR OC1 OFFSET:** This setting specifies the offset impedance used by this protection. The primary application for the offset impedance is to guarantee correct identification of fault direction on series compensated lines. In regular applications, the offset impedance ensures proper operation even if the zero-sequence voltage at the relaying point is very small. If this is the intent, the offset impedance shall not be larger than the zero-sequence impedance of the protected circuit. Practically, it shall be several times smaller. The offset impedance shall be entered in secondary ohms.
See chapter 8 for additional details and chapter 9 for information on how to calculate this setting
- **NEUTRAL DIR OC1 FWD ECA:** This setting defines the characteristic angle (ECA) for the forward direction in the "Voltage" polarizing mode. The "Current" polarizing mode uses a fixed ECA of 0°. The ECA in the reverse direction is the angle set for the forward direction shifted by 180°.
- **NEUTRAL DIR OC1 FWD LIMIT ANGLE:** This setting defines a symmetrical (in both directions from the ECA) limit angle for the forward direction.
- **NEUTRAL DIR OC1 FWD PICKUP:** This setting defines the pickup level for the overcurrent unit of the element in the forward direction. When selecting this setting it must be kept in mind that the design uses a ‘positive-sequence restraint’ technique for the “Calculated 3I0” mode of operation.
- **NEUTRAL DIR OC1 REV LIMIT ANGLE:** This setting defines a symmetrical (in both directions from the ECA) limit angle for the reverse direction.
- **NEUTRAL DIR OC1 REV PICKUP:** This setting defines the pickup level for the overcurrent unit of the element in the reverse direction. When selecting this setting it must be kept in mind that the design uses a *positive-sequence restraint* technique for the “Calculated 3I0” mode of operation.

The wattmetric zero-sequence directional element responds to power derived from zero-sequence voltage and current in a direction specified by the element characteristic angle. The angle can be set within all four quadrants and the power can be active or reactive. Therefore, the element may be used to sense either forward or reverse ground faults in either inductive, capacitive or resistive networks. The inverse time characteristic allows time coordination of elements across the network.

Typical applications include ground fault protection in solidly grounded transmission networks, grounded/ungrounded/resistor-grounded/resonant-grounded distribution networks, or for directionalizing other non-directional ground elements.

- **WATTMETRIC GND FLT 1 VOLT:** The element uses neutral voltage (that is, three times the zero-sequence voltage). This setting allows selecting between the internally calculated neutral voltage, or externally supplied voltage (broken delta VT connected to the auxiliary channel bank of the relay). When the latter selection is made, the auxiliary channel must be identified by the user as a neutral voltage under the VT bank settings. This element operates when the auxiliary voltage is configured as neutral.

- **WATTMETRIC GND FLT 1 OV PKP:** This setting specifies the minimum zero sequence voltage supervising the directional power measurement. This threshold should be higher than possible unbalance during normal operation of the system. Typically, this setting would be selected at 0.1 to 0.2 pu for the ungrounded or resonant grounded systems, and at 0.05 to 0.1 pu for solidly or resistor-grounded systems. When using externally supplied voltage via the auxiliary voltage channel, 1 pu is the nominal voltage of this channel as per VT bank settings. When using internally calculated neutral voltage, 1 pu is the nominal phase to ground voltage as per the VT bank settings.
- **WATTMETRIC GND FLT 1 CURR:** The element responds to the neutral current (that is, three times zero-sequence current), either calculated internally from the phase currents or supplied externally via the ground CT input from more accurate sources such as the core balanced CT. This setting allows selecting the source of the operating current.
- **WATTMETRIC GND FLT 1 OC PKP:** This setting specifies the current supervision level for the measurement of the zero-sequence power.
- **WATTMETRIC GND FLT 1 OC PKP DEL:** This setting specifies delay for the overcurrent portion of this element. The delay applies to the WATTMETRIC 1 PKP operand driven from the overcurrent condition.
- **WATTMETRIC GND FLT 1 PWR PKP:** This setting specifies the operating point of the element. A value of 1 pu is a product of the 1 pu voltage as specified for the overvoltage condition of this element, and 1 pu current as specified for the overcurrent condition of this element.
- **WATTMETRIC GND FLT 1 REF PWR:** This setting is used to calculate the inverse time characteristic delay (defined by S_{ref} in the following equations). A value of 1 pu represents the product of a 1 pu voltage (as specified in the overvoltage condition for this element) and a 1 pu current (as specified in the overcurrent condition for this element).
- **WATTMETRIC GND FLT 1 ECA:** This setting adjusts the maximum torque angle of the element. The operating power is calculated as:

$$S_{op} = \text{Re}(V_n(I_n \times 1\angle ECA)^*) \quad (\text{EQ 5.21})$$

where * indicates complex conjugate. By varying the element characteristic angle (ECA), the element can be made to respond to forward or reverse direction in inductive, resistive, or capacitive networks as shown in the *Wattmetric characteristic angle response* diagram.

- **WATTMETRIC GND FLT 1 PWR PKP DEL:** This setting defines a definite time delay before the inverse time characteristic is activated. If the curve selection is set as “Definite Time”, the element would operate after this security time delay. If the curve selection is “Inverse” or one of the FlexCurves, the element uses both the definite and inverse time timers simultaneously. The definite time timer, specified by this setting, is used and when expires it releases the inverse time timer for operation (torque control).
- **WATTMETRIC GND FLT 1 CURVE:** This setting allows choosing one of three methods to delay operate signal once all conditions are met to discriminate fault direction.

The “Definite Time” selection allows for a fixed time delay defined by the **WATTMETRIC GND FLT 1 PWR PKP DEL** setting.

The “Inverse” selection allows for inverse time characteristics delay defined by the following formula:

$$t = m \times \frac{S_{ref}}{S_{op}} \quad (\text{EQ 5.22})$$

where m is a multiplier defined by the multiplier setting, S_{ref} is the multiplier setting, and S_{op} is the operating power at the time. This timer starts after the definite time timer expires.

The four FlexCurves allow for custom user-programmable time characteristics. When working with FlexCurves, the element uses the operate to pickup ratio, and the multiplier setting is not applied:

$$t = \text{FlexCurve}\left(\frac{S_{op}}{S_{ref}}\right) \quad (\text{EQ 5.23})$$

Again, the FlexCurve timer starts after the definite time timer expires.

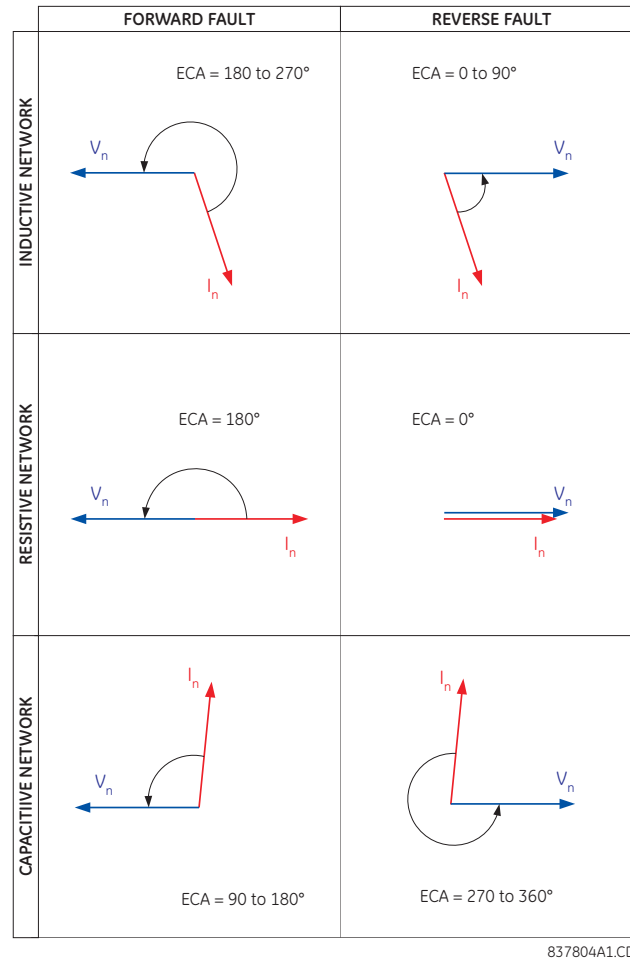

Figure 5–104: WATTMETRIC CHARACTERISTIC ANGLE RESPONSE

- **WATTMETRIC GND FLT 1 MULTIPLIER:** This setting is applicable if **WATTMETRIC GND FLT 1 CURVE** above is selected to Inverse and defines the multiplier factor for the inverse time delay.

This element can provide a desired time-delay operating characteristic versus the applied current or be used as a simple definite time element. The ground current input value is the quantity measured by the ground input CT and is the fundamental phasor or RMS magnitude. Two methods of resetting operation are available: “Timed” and “Instantaneous” (refer to the *Inverse time overcurrent curve characteristics* section for details). When the element is blocked, the time accumulator will reset according to the reset characteristic. For example, if the element reset characteristic is set to “Instantaneous” and the element is blocked, the time accumulator will be cleared immediately.

These elements measure the current that is connected to the ground channel of a CT/VT module. The conversion range of a standard channel is from 0.02 to 46 times the CT rating.

Restricted ground fault (RGF) protection provides sensitive ground fault detection for low-magnitude fault currents, primarily faults close to the neutral point of a wye-connected winding. An internal ground fault on an impedance grounded wye winding will produce a fault current dependent on the ground impedance value and the fault position on the winding with respect to the neutral point. The resultant primary current will be negligible for faults on the lower 30% of the winding since the fault voltage is not the system voltage, but rather the result of the transformation ratio between the primary windings and the percentage of shorted turns on the secondary. Therefore, the resultant differential currents may be below the slope threshold of the main differential element and the fault could go undetected. Application of the restricted ground fault protection extends the coverage towards the neutral point (see the *RGF and Percent Differential Zones of Protection* diagram).

842731A1.CDR

Figure 5-108: RGF AND PERCENT DIFFERENTIAL ZONES OF PROTECTION

This protection is often applied to transformers having impedance-grounded wye windings. The element may also be applied to the stator winding of a generator having the neutral point grounded with a CT installed in the grounding path, or the ground current obtained by external summation of the neutral-side stator CTs. The *Typical Applications of RGF Protection* diagram explains the basic application and wiring rules.

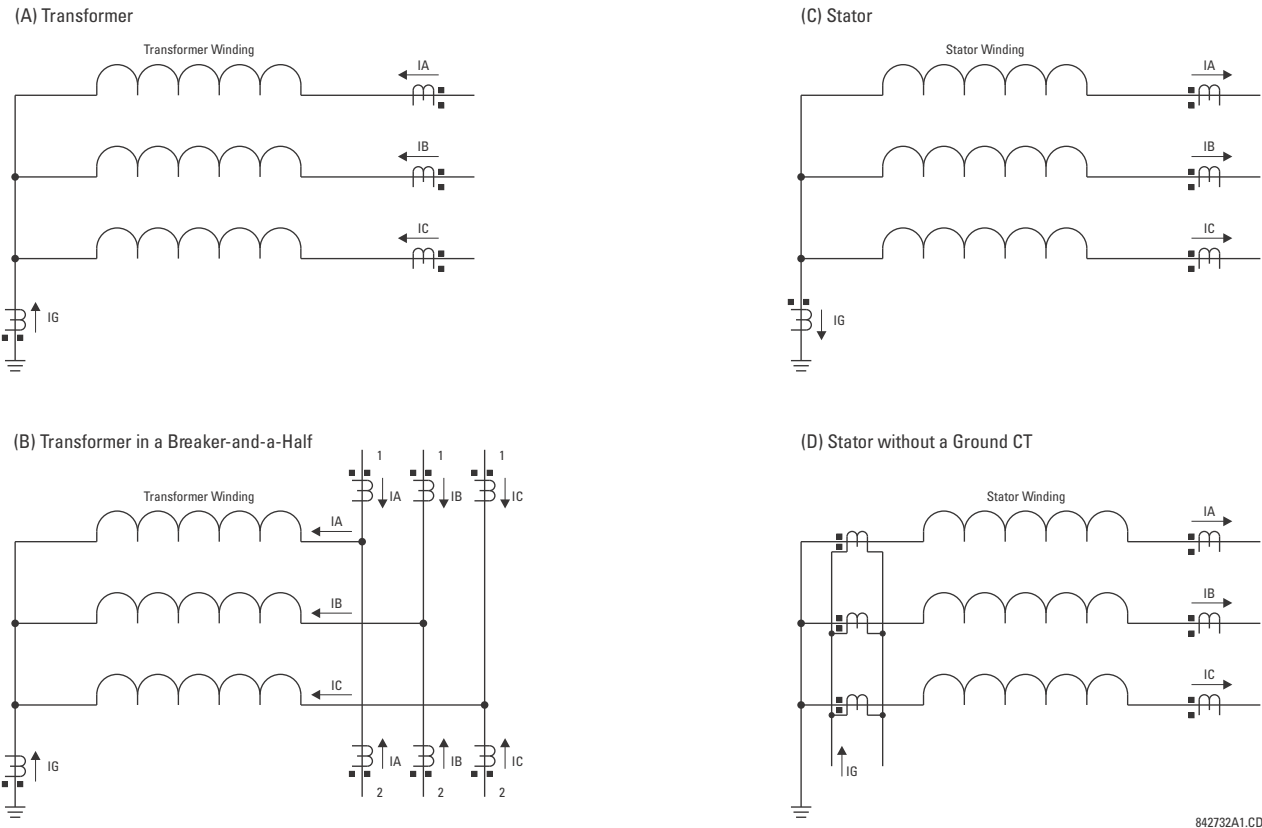

Figure 5-109: TYPICAL APPLICATIONS OF RGF PROTECTION

The relay incorporates low-impedance restricted ground fault protection. This low-impedance form of protection faces potential stability problems. An external phase-to-phase fault is an ultimate case. Ideally, there is neither ground (I_G) nor neutral ($I_N = I_A + I_B + I_C$) current present. If one or more of the phase CTs saturate, a spurious neutral current is seen by the relay. This is similar to a single infeed situation and may be mistaken for an internal fault. Similar difficulties occur in a breaker-and-a-half application of the restricted ground fault, where any through fault with a weak infeed from the winding itself may cause problems.

The UR uses a novel definition of the restraining signal to cope with the above stability problems while providing for fast and sensitive protection. Even with the improved definition of the restraining signal, the breaker-and-a-half application of the restricted ground fault must be approached with care, and is not recommended unless the settings are carefully selected to avoid maloperation due to CT saturation.

The differential current is produced as an unbalance current between the ground current of the neutral CT (I_G) and the neutral current derived from the phase CTs ($I_N = I_A + I_B + I_C$):

$$I_{gd} = |I_G + I_N| = |I_G + I_A + I_B + I_C| \quad (\text{EQ 5.24})$$

The relay automatically matches the CT ratios between the phase and ground CTs by re-scaling the ground CT to the phase CT level. The restraining signal ensures stability of protection during CT saturation conditions and is produced as a maximum value between three components related to zero, negative, and positive-sequence currents of the three phase CTs as follows:

$$I_{rest} = \max(I_{R0}, I_{R1}, I_{R2}) \quad (\text{EQ 5.25})$$

The zero-sequence component of the restraining signal (I_{R0}) is meant to provide maximum restraint during external ground faults, and therefore is calculated as a vectorial difference of the ground and neutral currents:

$$I_{R0} = |I_G - I_N| = |I_G - (I_A + I_B + I_C)| \quad (\text{EQ 5.26})$$

The equation above brings an advantage of generating the restraining signal of twice the external ground fault current, while reducing the restraint below the internal ground fault current. The negative-sequence component of the restraining signal (IR2) is meant to provide maximum restraint during external phase-to-phase faults and is calculated as follows:

$$IR2 = |I_{-2}| \quad \text{or} \quad IR2 = 3 \times |I_{-2}| \quad (\text{EQ 5.27})$$

The multiplier of 1 is used by the relay for first two cycles following complete de-energization of the winding (all three phase currents below 5% of nominal for at least five cycles). The multiplier of 3 is used during normal operation; that is, two cycles after the winding has been energized. The lower multiplier is used to ensure better sensitivity when energizing a faulty winding.

The positive-sequence component of the restraining signal (IR1) is meant to provide restraint during symmetrical conditions, either symmetrical faults or load, and is calculated according to the following algorithm:

- 1 If $|I_{-1}| > 2 \text{ pu}$ of phase CT, then
- 2 If $|I_{-1}| > |I_{-0}|$, then $IR1 = 3 \times (|I_{-1}| - |I_{-0}|)$
- 3 else $IR1 = 0$
- 4 else $IR1 = |I_{-1}|/8$

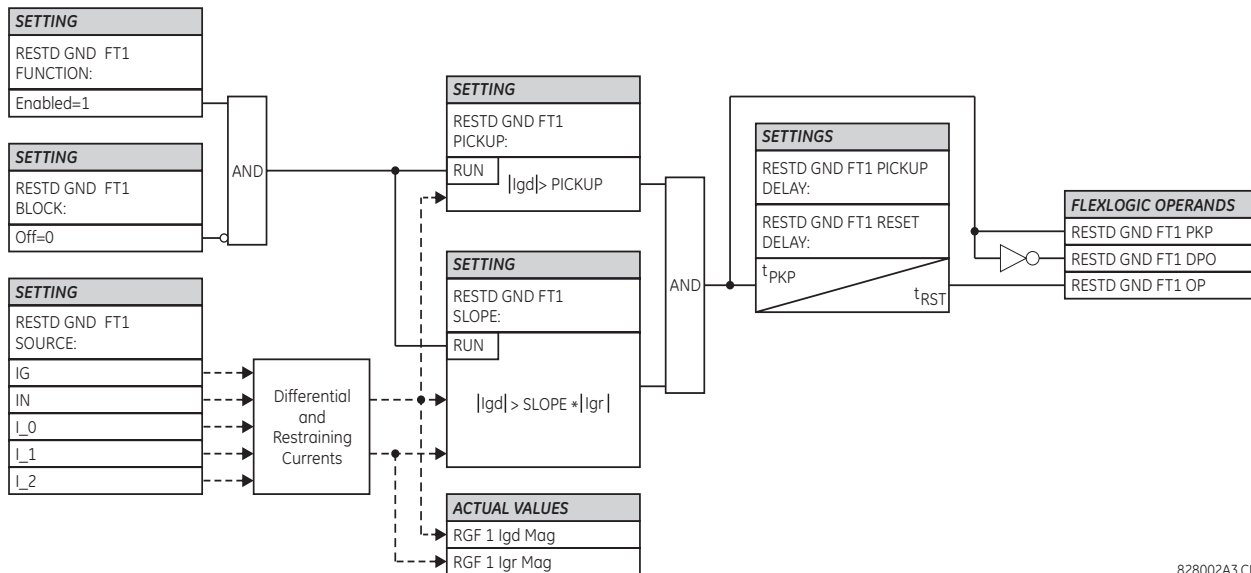

Under load-level currents (below 150% of nominal), the positive-sequence restraint is set to 1/8th of the positive-sequence current (line 4). This is to ensure maximum sensitivity during low-current faults under full load conditions. Under fault-level currents (above 150% of nominal), the positive-sequence restraint is removed if the zero-sequence component is greater than the positive-sequence (line 3), or set at the net difference of the two (line 2).

The raw restraining signal (Irest) is further post-filtered for better performance during external faults with heavy CT saturation and for better switch-off transient control:

$$I_{gr}(k) = \max(I_{rest}(k), \alpha \times I_{gr}(k-1)) \quad (\text{EQ 5.28})$$

where k represents a present sample, $k-1$ represents the previous sample, and α is a factory constant ($\alpha < 1$). The equation above introduces a decaying memory to the restraining signal. Should the raw restraining signal (Irest) disappear or drop significantly, such as when an external fault gets cleared or a CT saturates heavily, the actual restraining signal ($I_{gr}(k)$) will not reduce instantly but will keep decaying decreasing its value by 50% each 15.5 power system cycles.

Having the differential and restraining signals developed, the element applies a single slope differential characteristic with a minimum pickup as shown in the logic diagram below.

828002A3.CDR

Figure 5-110: RESTRICTED GROUND FAULT SCHEME LOGIC

The following examples explain how the restraining signal is created for maximum sensitivity and security. These examples clarify the operating principle and provide guidance for testing of the element.

EXAMPLE 1: EXTERNAL SINGLE-LINE-TO-GROUND FAULT

Given the following inputs: $I_A = 1 \text{ pu } \angle 0^\circ$, $I_B = 0$, $I_C = 0$, and $I_G = 1 \text{ pu } \angle 180^\circ$

The relay calculates the following values:

$$I_{gd} = 0, I_{R0} = \text{abs}\left(3 \times \frac{1}{3} - (-1)\right) = 2 \text{ pu}, I_{R2} = 3 \times \frac{1}{3} = 1 \text{ pu}, I_{R1} = \frac{1/3}{8} = 0.042 \text{ pu}, \text{ and } I_{gr} = 2 \text{ pu}$$

The restraining signal is twice the fault current. This gives extra margin should the phase or neutral CT saturate.

EXAMPLE 2: EXTERNAL HIGH-CURRENT SLG FAULT

Given the following inputs: $I_A = 10 \text{ pu } \angle 0^\circ$, $I_B = 0$, $I_C = 0$, and $I_G = 10 \text{ pu } \angle -180^\circ$

The relay calculates the following values:

$$I_{gd} = 0, I_{R0} = \text{abs}\left(3 \times \frac{1}{3} - (-10)\right) = 20 \text{ pu}, I_{R2} = 3 \times \frac{10}{3} = 10 \text{ pu}, I_{R1} = 3 \times \left(\frac{10}{3} - \frac{10}{3}\right) = 0, \text{ and } I_{gr} = 20 \text{ pu}.$$

EXAMPLE 3: EXTERNAL HIGH-CURRENT THREE-PHASE SYMMETRICAL FAULT

Given the following inputs: $I_A = 10 \text{ pu } \angle 0^\circ$, $I_B = 10 \text{ pu } \angle -120^\circ$, $I_C = 10 \text{ pu } \angle 120^\circ$, and $I_G = 0 \text{ pu}$

The relay calculates the following values:

$$I_{gd} = 0, I_{R0} = \text{abs}(3 \times 0 - (0)) = 0 \text{ pu}, I_{R2} = 3 \times 0 = 0 \text{ pu}, I_{R1} = 3 \times \left(\frac{10}{3} - 0\right) = 10 \text{ pu}, \text{ and } I_{gr} = 10 \text{ pu}.$$

EXAMPLE 4: INTERNAL LOW-CURRENT SINGLE-LINE-TO-GROUND FAULT UNDER FULL LOAD

Given the following inputs: $I_A = 1.10 \text{ pu } \angle 0^\circ$, $I_B = 1.0 \text{ pu } \angle -120^\circ$, $I_C = 1.0 \text{ pu } \angle 120^\circ$, and $I_G = 0.05 \text{ pu } \angle 0^\circ$

The relay calculates the following values:

$$I_{_0} = 0.033 \text{ pu } \angle 0^\circ, I_{_2} = 0.033 \text{ pu } \angle 0^\circ, \text{ and } I_{_1} = 1.033 \text{ pu } \angle 0^\circ$$

$$I_{gd} = \text{abs}(3 \times 0.0333 + 0.05) = 0.15 \text{ pu}, I_{R0} = \text{abs}(3 \times 0.033 - (0.05)) = 0.05 \text{ pu}, I_{R2} = 3 \times 0.033 = 0.10 \text{ pu}, I_{R1} = 1.033 / 8 = 0.1292 \text{ pu}, \text{ and } I_{gr} = 0.1292 \text{ pu}$$

Despite very low fault current level the differential current is above 100% of the restraining current.

EXAMPLE 5: INTERNAL LOW-CURRENT, HIGH-LOAD SINGLE-LINE-TO-GROUND FAULT WITH NO FEED FROM THE GROUND

Given the following inputs: $I_A = 1.10 \text{ pu } \angle 0^\circ$, $I_B = 1.0 \text{ pu } \angle -120^\circ$, $I_C = 1.0 \text{ pu } \angle 120^\circ$, and $I_G = 0.0 \text{ pu } \angle 0^\circ$

The relay calculates the following values:

$$I_{_0} = 0.033 \text{ pu } \angle 0^\circ, I_{_2} = 0.033 \text{ pu } \angle 0^\circ, \text{ and } I_{_1} = 1.033 \text{ pu } \angle 0^\circ$$

$$I_{gd} = \text{abs}(3 \times 0.0333 + 0.0) = 0.10 \text{ pu}, I_{R0} = \text{abs}(3 \times 0.033 - (0.0)) = 0.10 \text{ pu}, I_{R2} = 3 \times 0.033 = 0.10 \text{ pu}, I_{R1} = 1.033 / 8 = 0.1292 \text{ pu}, \text{ and } I_{gr} = 0.1292 \text{ pu}$$

Despite very low fault current level the differential current is above 75% of the restraining current.

EXAMPLE 6: INTERNAL HIGH-CURRENT SINGLE-LINE-TO-GROUND FAULT WITH NO FEED FROM THE GROUND

Given the following inputs: $I_A = 10 \text{ pu } \angle 0^\circ$, $I_B = 0 \text{ pu}$, $I_C = 0 \text{ pu}$, and $I_G = 0 \text{ pu}$

The relay calculates the following values:

$$I_{_0} = 3.3 \text{ pu } \angle 0^\circ, I_{_2} = 3.3 \text{ pu } \angle 0^\circ, \text{ and } I_{_1} = 3.3 \text{ pu } \angle 0^\circ$$

$$I_{gd} = \text{abs}(3 \times 3.3 + 0.0) = 10 \text{ pu}, I_{R0} = \text{abs}(3 \times 3.3 - (0.0)) = 10 \text{ pu}, I_{R2} = 3 \times 3.3 = 10 \text{ pu}, I_{R1} = 3 \times (3.33 - 3.33) = 0 \text{ pu}, \text{ and } I_{gr} = 10 \text{ pu}$$

The differential current is 100% of the restraining current.

5.6.12 NEGATIVE SEQUENCE CURRENT

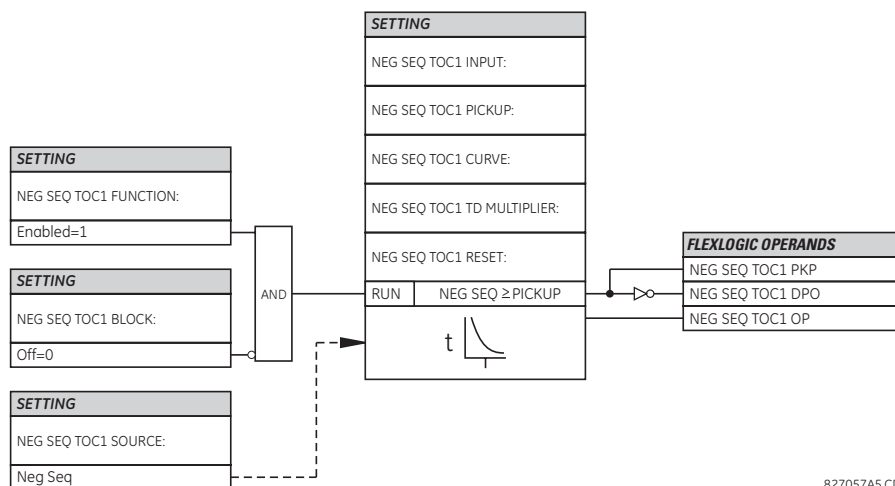

a) NEGATIVE SEQUENCE TIME OVERCURRENT (ANSI 51Q, IEC PTOC)

PATH: SETTINGS ↓ GROUPED ELEMENTS ⇒ SETTING GROUP 1(6) ⇒ NEGATIVE SEQUENCE CURRENT ⇒ NEG SEQ TOC1(2)

■ NEG SEQ TOC1	◀▶	NEG SEQ TOC1 FUNCTION: Disabled	Range: Disabled, Enabled

The negative-sequence time overcurrent element may be used to determine and clear unbalance in the system. The input for calculating negative-sequence current is the fundamental phasor value.

Two methods of resetting operation are available; “Timed” and “Instantaneous” (refer to the *Inverse Time Overcurrent Characteristics* sub-section for details on curve setup, trip times and reset operation). When the element is blocked, the time accumulator resets according to the reset characteristic. For example, if the element reset characteristic is set to “Instantaneous” and the element is blocked, the time accumulator is cleared immediately.

827057A5.CDR

Figure 5-111: NEGATIVE SEQUENCE TOC1 SCHEME LOGIC

b) NEGATIVE SEQUENCE INSTANTANEOUS OVERCURRENT (ANSI 50Q, IEC PIOC)

MESSAGE ▲	▲	NEG SEQ IOC1 EVENTS: Disabled	Range: Disabled, Enabled

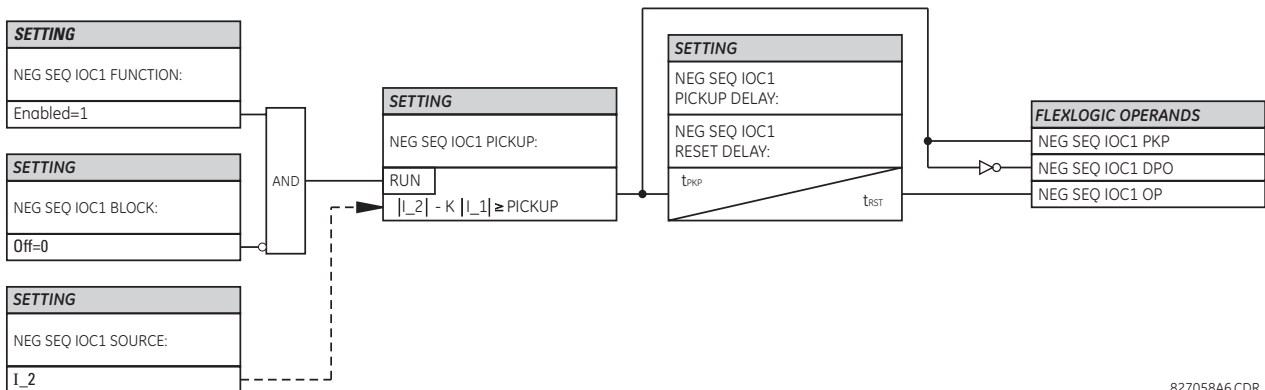

The negative-sequence instantaneous overcurrent element may be used as an instantaneous function with no intentional delay or as a definite time function. The element responds to the negative-sequence current fundamental frequency phasor magnitude (calculated from the phase currents) and applies a positive-sequence restraint for better performance: a small portion (12.5%) of the positive-sequence current magnitude is subtracted from the negative-sequence current magnitude when forming the operating quantity:

$$I_{op} = |I_2| - K \cdot |I_1| \quad \text{where } K = 1/8 \quad (\text{EQ 5.29})$$

The positive-sequence restraint allows for more sensitive settings by counterbalancing spurious negative-sequence currents resulting from:

- system unbalances under heavy load conditions
- transformation errors of current transformers (CTs) during three-phase faults
- fault inception and switch-off transients during three-phase faults

The positive-sequence restraint must be considered when testing for pickup accuracy and response time (multiple of pickup). The operating quantity depends on the way the test currents are injected into the relay (single-phase injection: $I_{op} = 0.2917 \cdot I_{injected}$; three-phase injection, opposite rotation: $I_{op} = I_{injected}$).

827058A6.CDR

Figure 5-112: NEGATIVE SEQUENCE IOC1 SCHEME LOGIC

		EVENTS: Disabled	

There are two negative-sequence directional overcurrent protection elements available. The element provides both forward and reverse fault direction indications through its output operands NEG SEQ DIR OC1 FWD and NEG SEQ DIR OC1 REV, respectively. The output operand is asserted if the magnitude of the operating current is above a pickup level (overcurrent unit) and the fault direction is seen as *forward* or *reverse*, respectively (directional unit).

The overcurrent unit of the element essentially responds to the magnitude of a fundamental frequency phasor of either the negative-sequence or neutral current as per user selection.

A positive-sequence restraint is applied for better performance: a small user-programmable portion of the positive-sequence current magnitude is subtracted from the negative or zero-sequence current magnitude, respectively, when forming the element operating quantity.

$$I_{op} = |I_{-2}| - K \times |I_{-1}| \quad \text{or} \quad I_{op} = 3 \times (|I_{-0}| - K \times |I_{-1}|) \quad (\text{EQ 5.30})$$

The positive-sequence restraint allows for more sensitive settings by counterbalancing spurious negative-sequence and zero-sequence currents resulting from:

- System unbalances under heavy load conditions.
- Transformation errors of current transformers (CTs).
- Fault inception and switch-off transients.

The positive-sequence restraint must be considered when testing for pick-up accuracy and response time (multiple of pickup). The positive-sequence restraint is removed for low currents. If the positive-sequence current is less than 0.8 pu, then the restraint is removed by changing the constant K to zero. This results in better response to high-resistance faults when the unbalance is very small and there is no danger of excessive CT errors, since the current is low.

The *operating quantity* depends on the way the test currents are injected into the L90. For single phase injection:

- $I_{op} = \frac{1}{3} \times (1 - K) \times I_{injected}$ for I_2 mode.
- $I_{op} = (1 - K) \times I_{injected}$ for I_0 mode if $I_{-1} > 0.8$ pu.

The *directional unit* uses the negative-sequence current (I_{-2}) and negative-sequence voltage (V_{-2}).

The following tables define the negative-sequence directional overcurrent element.

Table 5–28: NEGATIVE-SEQUENCE DIRECTIONAL OVERCURRENT UNIT

MODE	OPERATING CURRENT
Negative-sequence	$I_{op} = I_{-2} - K \times I_{-1} $
Zero-sequence	$I_{op} = 3 \times (I_{-0} - K \times I_{-1})$ if $ I_{-1} > 0.8$ pu $I_{op} = 3 \times I_{-0} $ if $ I_{-1} \leq 0.8$ pu

Table 5–29: NEGATIVE-SEQUENCE DIRECTIONAL UNIT

DIRECTION	COMPARED PHASORS	
Forward	$-V_{-2} + Z_{offset} \times I_{-2}$	$I_{-2} \times 1 \angle ECA$
Reverse	$-V_{-2} + Z_{offset} \times I_{-2}$	$-(I_{-2} \times 1 \angle ECA)$
Forward	$-V_{-2} + Z_{offset} \times I_{-2}$	$I_{-2} \times 1 \angle ECA$
Reverse	$-V_{-2} + Z_{offset} \times I_{-2}$	$-(I_{-2} \times 1 \angle ECA)$

The negative-sequence voltage must be greater than the **VOLTAGE CUTOFF LEVEL** setting specified in the **PRODUCT SETUP** ⇒ **DISPLAY PROPERTIES** menu to be validated for use as a polarizing signal. If the polarizing signal is not validated neither forward nor reverse indication is given. The following figure explains the usage of the voltage polarized directional unit of the element.

The figure below shows the phase angle comparator characteristics for a phase A to ground fault, with settings of:

- ECA = 75° (element characteristic angle = centerline of operating characteristic)
- FWD LA = 80° (forward limit angle = \pm the angular limit with the ECA for operation)
- REV LA = 80° (reverse limit angle = \pm the angular limit with the ECA for operation)

The element incorporates a current reversal logic: if the reverse direction is indicated for at least 1.25 of a power system cycle, the prospective forward indication will be delayed by 1.5 of a power system cycle. The element is designed to emulate an electromechanical directional device. Larger operating and polarizing signals will result in faster directional discrimination bringing more security to the element operation.

Figure 5-113: NEGATIVE-SEQUENCE DIRECTIONAL CHARACTERISTIC

The forward-looking function is designed to be more secure as compared to the reverse-looking function, and therefore should be used for the tripping direction. The reverse-looking function is designed to be faster as compared to the forward-looking function and should be used for the blocking direction. This allows for better protection coordination. Take this bias into account when using the negative-sequence directional overcurrent element to directionalize other protection elements. The negative-sequence directional pickup must be greater than the **PRODUCT SETUP** ⇌ **DISPLAY PROPERTIES** ⇌ **CURRENT CUT-OFF LEVEL** setting value.

- **NEG SEQ DIR OC1 OFFSET:** This setting specifies the offset impedance used by this protection. The primary application for the offset impedance is to guarantee correct identification of fault direction on series compensated lines (see the *Application of settings* chapter for information on how to calculate this setting). In regular applications, the offset impedance ensures proper operation even if the negative-sequence voltage at the relaying point is very small. If this is the intent, the offset impedance shall not be larger than the negative-sequence impedance of the protected circuit. Practically, it is several times smaller. The offset impedance is entered in secondary ohms. See the *Theory of operation* chapter for additional details.
- **NEG SEQ DIR OC1 TYPE:** This setting selects the operating mode for the overcurrent unit of the element. The choices are "Neg Sequence" and "Zero Sequence". In some applications it is advantageous to use a directional negative-sequence overcurrent function instead of a directional zero-sequence overcurrent function as inter-circuit mutual effects are minimized.
- **NEG SEQ DIR OC1 POS-SEQ RESTRAINT:** This setting controls the positive-sequence restraint. Set to 0.063 (in "Zero Sequence" mode) or 0.125 (in "Neg Sequence" mode) for backward compatibility with revisions 3.40 and earlier. Set to zero to remove the restraint. Set higher if large system unbalances or poor CT performance are expected.
- **NEG SEQ DIR OC1 FWD ECA:** This setting select the element characteristic angle (ECA) for the forward direction. The element characteristic angle in the reverse direction is the angle set for the forward direction shifted by 180°.
- **NEG SEQ DIR OC1 FWD LIMIT ANGLE:** This setting defines a symmetrical (in both directions from the ECA) limit angle for the forward direction.

- **NEG SEQ DIR OC1 FWD PICKUP:** This setting defines the pickup level for the overcurrent unit in the forward direction. Upon **NEG SEQ DIR OC1 TYPE** selection, this pickup threshold applies to zero- or negative-sequence current. When selecting this setting it must be kept in mind that the design uses a *positive-sequence restraint* technique.
- **NEG SEQ DIR OC1 REV LIMIT ANGLE:** This setting defines a symmetrical (in both directions from the ECA) limit angle for the reverse direction.
- **NEG SEQ DIR OC1 REV PICKUP:** This setting defines the pickup level for the overcurrent unit in the reverse direction. Upon **NEG SEQ DIR OC1 TYPE** selection, this pickup threshold applies to zero- or negative-sequence current. When selecting this setting it must be kept in mind that the design uses a *positive-sequence restraint* technique.

In general, a breaker failure scheme determines that a breaker signaled to trip has not cleared a fault within a definite time, so further tripping action must be performed. Tripping from the breaker failure scheme should trip all breakers, both local and remote, that can supply current to the faulted zone. Usually operation of a breaker failure element will cause clearing of a larger section of the power system than the initial trip. Because breaker failure can result in tripping a large number of breakers and this affects system safety and stability, a very high level of security is required.

Two schemes are provided: one for three-pole tripping only (identified by the name “3BF”) and one for three pole plus single-pole operation (identified by the name “1BF”). The philosophy used in these schemes is identical. The operation of a breaker failure element includes three stages: initiation, determination of a breaker failure condition, and output.

INITIATION STAGE:

A FlexLogic operand representing the protection trip signal initially sent to the breaker must be selected to initiate the scheme. The initiating signal should be sealed-in if primary fault detection can reset before the breaker failure timers have finished timing. The seal-in is supervised by current level, so it is reset when the fault is cleared. If desired, an incomplete sequence seal-in reset can be implemented by using the initiating operand to also initiate a FlexLogic timer, set longer than any breaker failure timer, whose output operand is selected to block the breaker failure scheme.

For the L90 relay, the protection trip signal initially sent to the breaker is already programmed as a trip output. The protection trip signal does not include other breaker commands that are not indicative of a fault in the protected zone.

Schemes can be initiated either directly or with current level supervision. It is particularly important in any application to decide if a current-supervised initiate is to be used. The use of a current-supervised initiate results in the breaker failure element not being initiated for a breaker that has very little or no current flowing through it, which may be the case for transformer faults. For those situations where it is required to maintain breaker fail coverage for fault levels below the **BF1 PH AMP SUPV PICKUP** or the **BF1 N AMP SUPV PICKUP** setting, a current supervised initiate should *not* be used. This feature should be utilized for those situations where coordinating margins may be reduced when high speed reclosing is used. Thus, if this choice is made, fault levels must always be above the supervision pickup levels for dependable operation of

the breaker fail scheme. This can also occur in breaker-and-a-half or ring bus configurations where the first breaker closes into a fault; the protection trips and attempts to initiate breaker failure for the second breaker, which is in the process of closing, but does not yet have current flowing through it.

When the scheme is initiated, it immediately sends a trip signal to the breaker initially signaled to trip (this feature is usually described as re-trip). This reduces the possibility of widespread tripping that results from a declaration of a failed breaker.

DETERMINATION OF A BREAKER FAILURE CONDITION:

The schemes determine a breaker failure condition via three *paths*. Each of these paths is equipped with a time delay, after which a failed breaker is declared and trip signals are sent to all breakers required to clear the zone. The delayed paths are associated with breaker failure timers 1, 2, and 3, which are intended to have delays increasing with increasing timer numbers. These delayed paths are individually enabled to allow for maximum flexibility.

Timer 1 logic (early path) is supervised by a fast-operating breaker auxiliary contact. If the breaker is still closed (as indicated by the auxiliary contact) and fault current is detected after the delay interval, an output is issued. Operation of the breaker auxiliary switch indicates that the breaker has mechanically operated. The continued presence of current indicates that the breaker has failed to interrupt the circuit.

Timer 2 logic (main path) is not supervised by a breaker auxiliary contact. If fault current is detected after the delay interval, an output is issued. This path is intended to detect a breaker that opens mechanically but fails to interrupt fault current; the logic therefore does not use a breaker auxiliary contact.

The timer 1 and 2 paths provide two levels of current supervision, high-set and low-set, that allow the supervision level to change from a current which flows before a breaker inserts an opening resistor into the faulted circuit to a lower level after resistor insertion. The high-set detector is enabled after timeout of timer 1 or 2, along with a timer that will enable the low-set detector after its delay interval. The delay interval between high-set and low-set is the expected breaker opening time. Both current detectors provide a fast operating time for currents at small multiples of the pickup value. The overcurrent detectors are required to operate after the breaker failure delay interval to eliminate the need for very fast resetting overcurrent detectors.

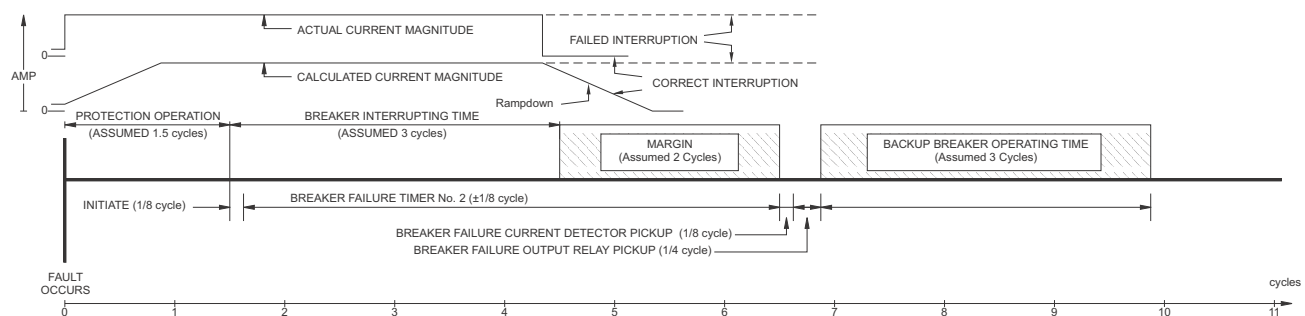

Timer 3 logic (slow path) is supervised by a breaker auxiliary contact and a control switch contact used to indicate that the breaker is in or out-of-service, disabling this path when the breaker is out-of-service for maintenance. There is no current level check in this logic as it is intended to detect low magnitude faults and it is therefore the slowest to operate.

OUTPUT:

The outputs from the schemes are:

- FlexLogic operands that report on the operation of portions of the scheme
- FlexLogic operand used to re-trip the protected breaker
- FlexLogic operands that initiate tripping required to clear the faulted zone. The trip output can be sealed-in for an adjustable period.
- Target message indicating a failed breaker has been declared
- Illumination of the faceplate Trip LED (and the Phase A, B or C LED, if applicable)

MAIN PATH SEQUENCE:

827083A6.CDR

Figure 5-115: BREAKER FAILURE MAIN PATH SEQUENCE

The current supervision elements reset in less than 0.7 of a power cycle for any multiple of pickup current as shown below.

Figure 5-116: BREAKER FAILURE OVERCURRENT SUPERVISION RESET TIME

SETTINGS:

- **BF1 MODE:** This setting is used to select the breaker failure operating mode: single or three pole.
- **BF1 USE AMP SUPV:** If set to "Yes", the element will only be initiated if current flowing through the breaker is above the supervision pickup level.
- **BF1 USE SEAL-IN:** If set to "Yes", the element will only be sealed-in if current flowing through the breaker is above the supervision pickup level.
- **BF1 3-POLE INITIATE:** This setting selects the FlexLogic operand that will initiate three-pole tripping of the breaker.
- **BF1 PH AMP SUPV PICKUP:** This setting is used to set the phase current initiation and seal-in supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker. It can be set as low as necessary (lower than breaker resistor current or lower than load current) – high-set and low-set current supervision will guarantee correct operation.
- **BF1 N AMP SUPV PICKUP:** This setting is used to set the neutral current initiate and seal-in supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker. Neutral current supervision is used only in the three phase scheme to provide increased sensitivity. This setting is valid only for three-pole tripping schemes.
- **BF1 USE TIMER 1:** If set to "Yes", the early path is operational.
- **BF1 TIMER 1 PICKUP DELAY:** Timer 1 is set to the shortest time required for breaker auxiliary contact Status-1 to open, from the time the initial trip signal is applied to the breaker trip circuit, plus a safety margin.
- **BF1 USE TIMER 2:** If set to "Yes", the main path is operational.
- **BF1 TIMER 2 PICKUP DELAY:** Timer 2 is set to the expected opening time of the breaker, plus a safety margin. This safety margin was historically intended to allow for measuring and timing errors in the breaker failure scheme equipment. In microprocessor relays this time is not significant. In L90 relays, which use a Fourier transform, the calculated current magnitude will ramp-down to zero one power frequency cycle after the current is interrupted, and this lag should be included in the overall margin duration, as it occurs after current interruption. The *Breaker failure main path sequence* diagram below shows a margin of two cycles; this interval is considered the minimum appropriate for most applications.

Note that in bulk oil circuit breakers, the interrupting time for currents less than 25% of the interrupting rating can be significantly longer than the normal interrupting time.
- **BF1 USE TIMER 3:** If set to "Yes", the Slow Path is operational.
- **BF1 TIMER 3 PICKUP DELAY:** Timer 3 is set to the same interval as timer 2, plus an increased safety margin. Because this path is intended to operate only for low level faults, the delay can be in the order of 300 to 500 ms.

- **BF1 BKR POS1 ϕ A/3P:** This setting selects the FlexLogic operand that represents the protected breaker early-type auxiliary switch contact (52/a). When using the single-pole breaker failure scheme, this operand represents the protected breaker early-type auxiliary switch contact on pole A. This is normally a non-multiplied form-A contact. The contact may even be adjusted to have the shortest possible operating time.
- **BF1 BKR POS2 ϕ A/3P:** This setting selects the FlexLogic operand that represents the breaker normal-type auxiliary switch contact (52/a). When using the single-pole breaker failure scheme, this operand represents the protected breaker auxiliary switch contact on pole A. This may be a multiplied contact.
- **BF1 BREAKER TEST ON:** This setting is used to select the FlexLogic operand that represents the breaker in-service/out-of-service switch set to the out-of-service position.
- **BF1 PH AMP HISET PICKUP:** This setting sets the phase current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, before a breaker opening resistor is inserted.
- **BF1 N AMP HISET PICKUP:** This setting sets the neutral current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, before a breaker opening resistor is inserted. Neutral current supervision is used only in the three pole scheme to provide increased sensitivity. *This setting is valid only for three-pole breaker failure schemes.*
- **BF1 PH AMP LOSET PICKUP:** This setting sets the phase current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, after a breaker opening resistor is inserted (approximately 90% of the resistor current).
- **BF1 N AMP LOSET PICKUP:** This setting sets the neutral current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, after a breaker opening resistor is inserted (approximately 90% of the resistor current). *This setting is valid only for three-pole breaker failure schemes.*
- **BF1 LOSET TIME DELAY:** Sets the pickup delay for current detection after opening resistor insertion.
- **BF1 TRIP DROPOUT DELAY:** This setting is used to set the period of time for which the trip output is sealed-in. This timer must be coordinated with the automatic reclosing scheme of the failed breaker, to which the breaker failure element sends a cancel reclosure signal. Reclosure of a remote breaker can also be prevented by holding a transfer trip signal on longer than the reclaim time.
- **BF1 PH A INITIATE / BF1 PH B INITIATE / BF 1 PH C INITIATE:** These settings select the FlexLogic operand to initiate phase A, B, or C single-pole tripping of the breaker and the phase A, B, or C portion of the scheme, accordingly. *This setting is only valid for single-pole breaker failure schemes.*
- **BF1 BKR POS1 ϕ B / BF1 BKR POS 1 ϕ C:** These settings select the FlexLogic operand to represents the protected breaker early-type auxiliary switch contact on poles B or C, accordingly. This contact is normally a non-multiplied Form-A contact. The contact may even be adjusted to have the shortest possible operating time. *This setting is valid only for single-pole breaker failure schemes.*
- **BF1 BKR POS2 ϕ B:** Selects the FlexLogic operand that represents the protected breaker normal-type auxiliary switch contact on pole B (52/a). This may be a multiplied contact. *This setting is valid only for single-pole breaker failure schemes.*
- **BF1 BKR POS2 ϕ C:** This setting selects the FlexLogic operand that represents the protected breaker normal-type auxiliary switch contact on pole C (52/a). This may be a multiplied contact. For single-pole operation, the scheme has the same overall general concept except that it provides re-tripping of each single pole of the protected breaker. The approach shown in the following single pole tripping diagram uses the initiating information to determine which pole is supposed to trip. The logic is segregated on a per-pole basis. The overcurrent detectors have ganged settings. *This setting is valid only for single-pole breaker failure schemes.*

Upon operation of the breaker failure element for a single pole trip command, a three-pole trip command should be given via output operand BKR FAIL 1 TRIP OP.

These protection elements can be used for a variety of applications such as:

- **Undervoltage Protection:** For voltage sensitive loads, such as induction motors, a drop in voltage increases the drawn current which may cause dangerous overheating in the motor. The undervoltage protection feature can be used to either cause a trip or generate an alarm when the voltage drops below a specified voltage setting for a specified time delay.
- **Permissive Functions:** The undervoltage feature may be used to block the functioning of external devices by operating an output relay when the voltage falls below the specified voltage setting. The undervoltage feature may also be used to block the functioning of other elements through the block feature of those elements.
- **Source Transfer Schemes:** In the event of an undervoltage, a transfer signal may be generated to transfer a load from its normal source to a standby or emergency power source.

The undervoltage elements can be programmed to have a definite time delay characteristic. The definite time curve operates when the voltage drops below the pickup level for a specified period of time. The time delay is adjustable from 0 to 600.00 seconds in steps of 0.01. The undervoltage elements can also be programmed to have an inverse time delay characteristic.

The undervoltage delay setting defines the family of curves shown below.

$$T = \frac{D}{\left(1 - \frac{V}{V_{pickup}}\right)} \quad (\text{EQ 5.31})$$

where: T = operating time

D = undervoltage delay setting ($D = 0.00$ operates instantaneously)

V = secondary voltage applied to the relay

V_{pickup} = pickup level

842788A1.CDR

Figure 5-121: INVERSE TIME UNDERVOLTAGE CURVES

At 0% of pickup, the operating time equals the UNDERVOLTAGE DELAY setting.

This element may be used to give a desired time-delay operating characteristic versus the applied fundamental voltage (phase-to-ground or phase-to-phase for wye VT connection, or phase-to-phase for delta VT connection) or as a definite time element. The element resets instantaneously if the applied voltage exceeds the dropout voltage. The delay setting selects the minimum operating time of the phase undervoltage. The minimum voltage setting selects the operating voltage below which the element is blocked (a setting of "0" will allow a dead source to be considered a fault condition).

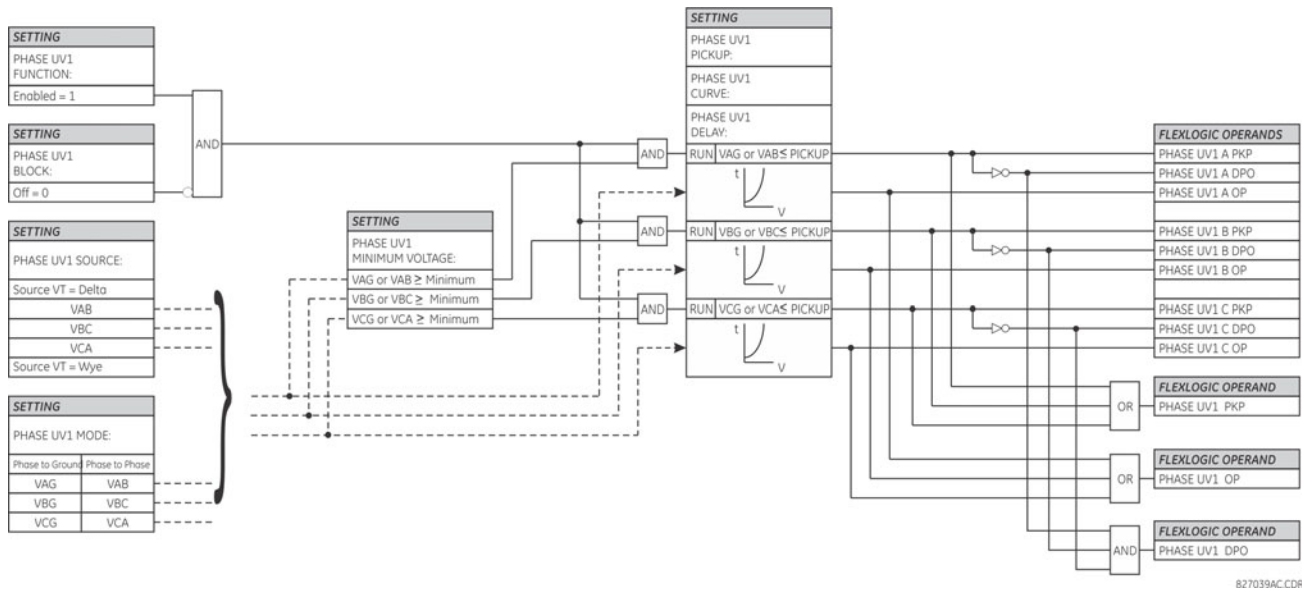

Figure 5-122: PHASE UNDERVOLTAGE1 SCHEME LOGIC

The phase overvoltage element may be used as an instantaneous element with no intentional time delay or as a definite time element. The input voltage is the phase-to-phase voltage, either measured directly from delta-connected VTs or as calculated from phase-to-ground (wye) connected VTs. The specific voltages to be used for each phase are shown below.

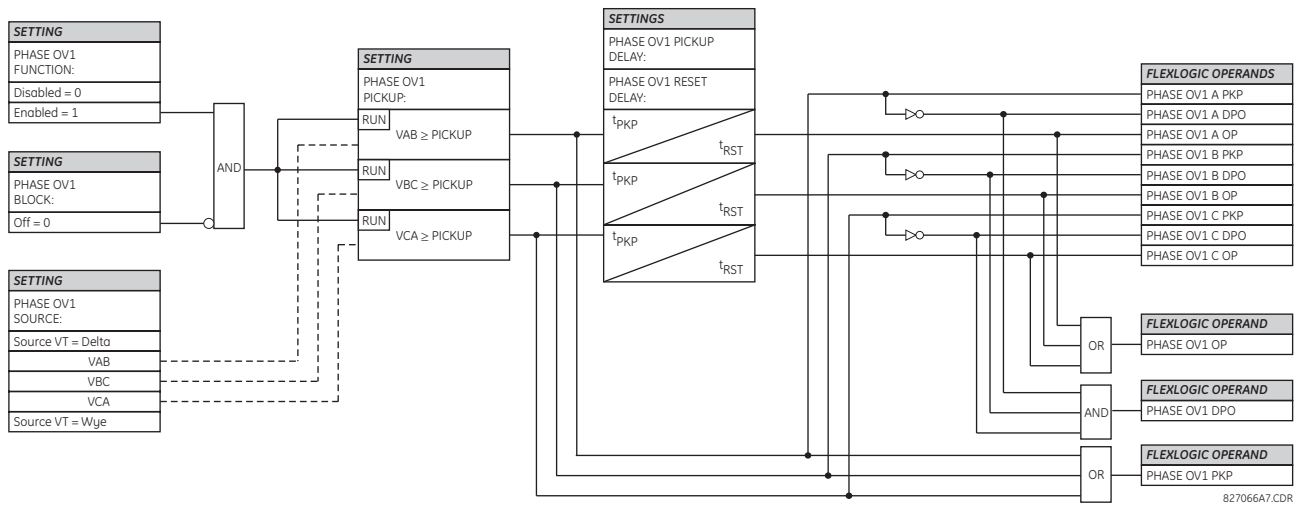

Figure 5-123: PHASE OVERVOLTAGE SCHEME LOGIC

If the source VT is wye-connected, then the phase overvoltage pickup condition is $V > \sqrt{3} \times \text{Pickup}$ for V_{AB} , V_{BC} , and V_{CA} .

d) NEUTRAL OVERVOLTAGE (ANSI 59N, IEC PTOV)

There are three neutral overvoltage elements available. The neutral overvoltage element can be used to detect asymmetrical system voltage condition due to a ground fault or to the loss of one or two phases of the source. The element responds to the system neutral voltage ($3V_0$), calculated from the phase voltages. The nominal secondary voltage of the phase voltage channels entered under **SETTINGS** ⇒ ↓ **SYSTEM SETUP** ⇒ **AC INPUTS** ⇒ ↓ **VOLTAGE BANK** ⇒ **PHASE VT SECONDARY** is the p.u. base used when setting the pickup level.

The neutral overvoltage element can provide a time-delayed operating characteristic versus the applied voltage (initialized from FlexCurves A, B, or C) or be used as a definite time element. The **NEUTRAL OV1 PICKUP DELAY** setting applies only if the **NEUTRAL OV1 CURVE** setting is "Definite time". The source assigned to this element must be configured for a phase VT.

VT errors and normal voltage unbalance must be considered when setting this element. This function requires the VTs to be wye-connected.

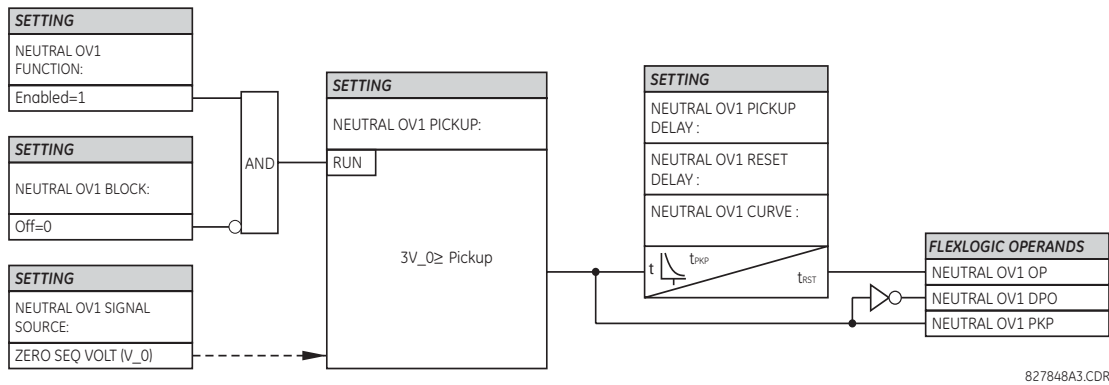

Figure 5-124: NEUTRAL OVERVOLTAGE1 SCHEME LOGIC

e) AUXILIARY UNDERVOLTAGE (ANSI 27X, IEC PTUV)

PATH: SETTINGS ⇒ ↓ GROUPED ELEMENTS ⇒ SETTING GROUP 1(6) ⇒ ↓ VOLTAGE ELEMENTS ⇒ ↓ AUXILIARY UV1(2)

■ AUXILIARY UV1		◀▶	AUX UV1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE	▲▼		AUX UV1 SIGNAL SOURCE: SRC 1	Range: SRC 1, SRC 2, SRC 3, SRC 4
MESSAGE	▲▼		AUX UV1 PICKUP: 0.700 pu	Range: 0.000 to 3.000 pu in steps of 0.001
MESSAGE	▲▼		AUX UV1 CURVE: Definite Time	Range: Definite Time, Inverse Time
MESSAGE	▲▼		AUX UV1 DELAY: 1.00 s	Range: 0.00 to 600.00 s in steps of 0.01

MESSAGE	▲▼		AUX UV1 BLOCK: Off	Range: FlexLogic operand
MESSAGE	▲▼		AUX UV1 TARGET: Self-reset	Range: Self-reset, Latched, Disabled
MESSAGE	▲		AUX UV1 EVENTS: Disabled	Range: Disabled, Enabled

The L90 contains one auxiliary undervoltage element for each VT bank. This element is intended for monitoring undervoltage conditions of the auxiliary voltage. The **AUX UV1 PICKUP** selects the voltage level at which the time undervoltage element starts timing. The nominal secondary voltage of the auxiliary voltage channel entered under **SETTINGS** ⇒ ↓ **SYSTEM SETUP** ⇒ **AC INPUTS** ⇒ ↓ **VOLTAGE BANK X5** ⇒ ↓ **AUXILIARY VT X5 SECONDARY** is the per-unit base used when setting the pickup level.

The **AUX UV1 DELAY** setting selects the minimum operating time of the auxiliary undervoltage element. Both **AUX UV1 PICKUP** and **AUX UV1 DELAY** settings establish the operating curve of the undervoltage element. The auxiliary undervoltage element can be programmed to use either definite time delay or inverse time delay characteristics. The operating characteristics and equations for both definite and inverse time delay are as for the phase undervoltage element.

The element resets instantaneously. The minimum voltage setting selects the operating voltage below which the element is blocked.

The L90 contains one auxiliary overvoltage element for each VT bank. This element is intended for monitoring overvoltage conditions of the auxiliary voltage. The nominal secondary voltage of the auxiliary voltage channel entered under **SYSTEM SETUP ⇒ AC INPUTS ⇒ VOLTAGE BANK X5 ⇒ AUXILIARY VT X5 SECONDARY** is the per-unit (pu) base used when setting the pickup level.

A typical application for this element is monitoring the zero-sequence voltage (3V_0) supplied from an open-corner-delta VT connection.

The sensitive directional power element responds to three-phase directional power and is designed for reverse power and low forward power applications for synchronous machines or interconnections involving co-generation. The relay measures the three-phase power from either full set of wye-connected VTs or full-set of delta-connected VTs. In the latter case, the two-wattmeter method is used. Refer to the *UR-series metering conventions* section in chapter 6 for details regarding the active and reactive powers used by the sensitive directional power element.

The element has an adjustable characteristic angle and minimum operating power as shown in the *Directional power characteristic* diagram. The element responds to the following condition:

$$P \cos \theta + Q \sin \theta > S_{MIN} \quad (\text{EQ 5.32})$$

where: P and Q are active and reactive powers as measured per the UR-series metering convention,
 θ is a sum of the element characteristic (**DIR POWER 1 RCA**) and calibration (**DIR POWER 1 CALIBRATION**) angles, and
 $SMIN$ is the minimum operating power

The operating quantity is displayed in the **ACTUAL VALUES** ⇒ **METERING** ⇒ **SENSITIVE DIRECTIONAL POWER 1(2)** actual value. The element has two independent (as to the pickup and delay settings) stages for alarm and trip, respectively.

Figure 5-127: DIRECTIONAL POWER CHARACTERISTIC

By making the characteristic angle adjustable and providing for both negative and positive values of the minimum operating power a variety of operating characteristics can be achieved as presented in the figure below. For example, section (a) in the figure below shows settings for reverse power, while section (b) shows settings for low forward power applications.

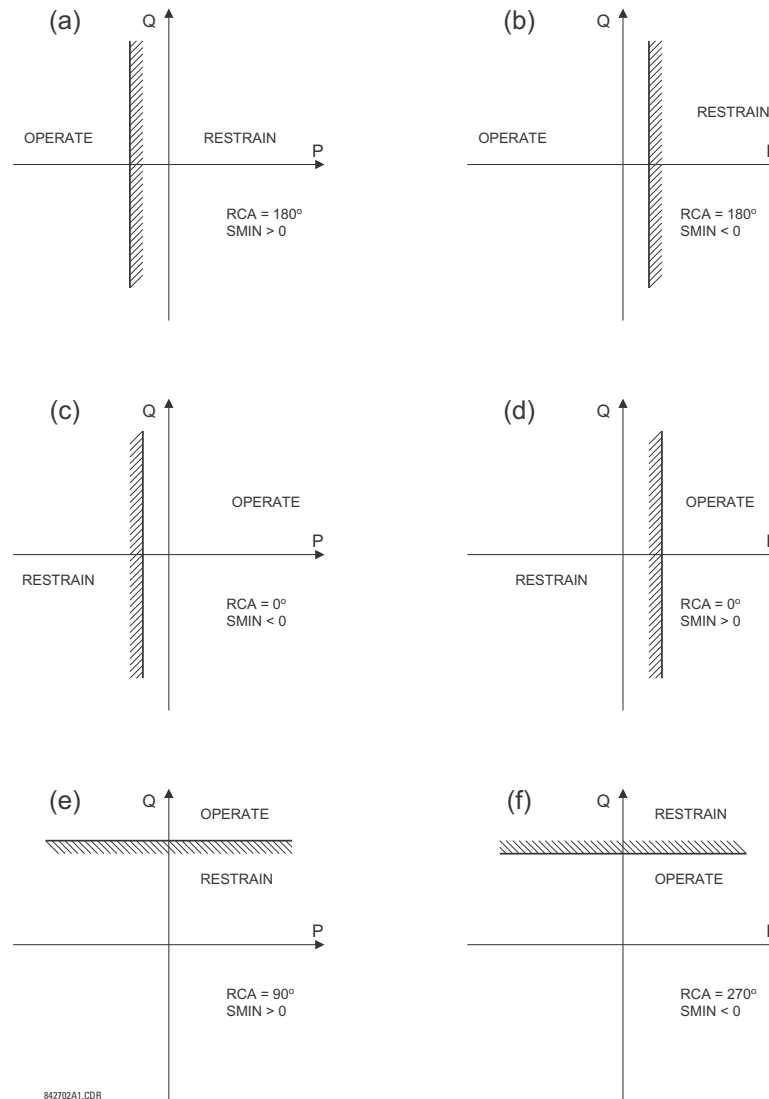

Figure 5-128: DIRECTIONAL POWER ELEMENT SAMPLE APPLICATIONS

- **DIR POWER 1 RCA:** Specifies the relay characteristic angle (RCA) for the sensitive directional power function. Application of this setting is threefold:
 1. It allows the element to respond to active or reactive power in any direction (active overpower/underpower, etc.).
 2. Together with a precise calibration angle, it allows compensation for any CT and VT angular errors to permit more sensitive settings.
 3. It allows for required direction in situations when the voltage signal is taken from behind a delta-wye connected power transformer and the phase angle compensation is required.

For example, the active overpower characteristic is achieved by setting **DIR POWER 1 RCA** to "0°", reactive overpower by setting **DIR POWER 1 RCA** to "90°", active underpower by setting **DIR POWER 1 RCA** to "180°", and reactive underpower by setting **DIR POWER 1 RCA** to "270°".
- **DIR POWER 1 CALIBRATION:** This setting allows the relay characteristic angle to change in steps of 0.05°. This may be useful when a small difference in VT and CT angular errors is to be compensated to permit more sensitive settings.

This setting virtually enables calibration of the directional power function in terms of the angular error of applied VTs and CTs. The element responds to the sum of the **DIR POWER 1 RCA** and **DIR POWER 1 CALIBRATION** settings.

- **DIR POWER 1 STG1 SMIN:** This setting specifies the minimum power as defined along the relay characteristic angle (RCA) for the stage 1 of the element. The positive values imply a shift towards the operate region along the RCA line; the negative values imply a shift towards the restrain region along the RCA line. Refer to the *Directional power sample applications* figure for details. Together with the RCA, this setting enables a wide range of operating characteristics. This setting applies to three-phase power and is entered in per-unit (pu) values. The base quantity is 3-phase power on primary side, which is calculated as $\sqrt{3} \times \text{Phase CT Primary} \times \text{Phase VT Ratio} \times \text{Phase VT Secondary}$ in case of delta connected VTs; and $3 \times \text{Phase CT Primary} \times \text{Phase VT Ratio} \times \text{Phase VT Secondary}$ in case of wye connected VTs.

For example, a setting of 2% for a 200 MW machine is $0.02 \times 200 \text{ MW} = 4 \text{ MW}$. If 7.967 kV is a primary VT voltage and 10 kA is a primary CT current, the source pu quantity is 239 MVA, and thus, SMIN should be set at $4 \text{ MW} / 239 \text{ MVA} = 0.0167 \text{ pu} \approx 0.017 \text{ pu}$. If the reverse power application is considered, $\text{RCA} = 180^\circ$ and $\text{SMIN} = 0.017 \text{ pu}$.

The element drops out if the magnitude of the positive-sequence current becomes virtually zero, that is, it drops below the cutoff level.

- **DIR POWER 1 STG1 DELAY:** This setting specifies a time delay for stage 1. For reverse power or low forward power applications for a synchronous machine, stage 1 is typically applied for alarming and stage 2 for tripping.

5.6.16 SUPERVISING ELEMENTS

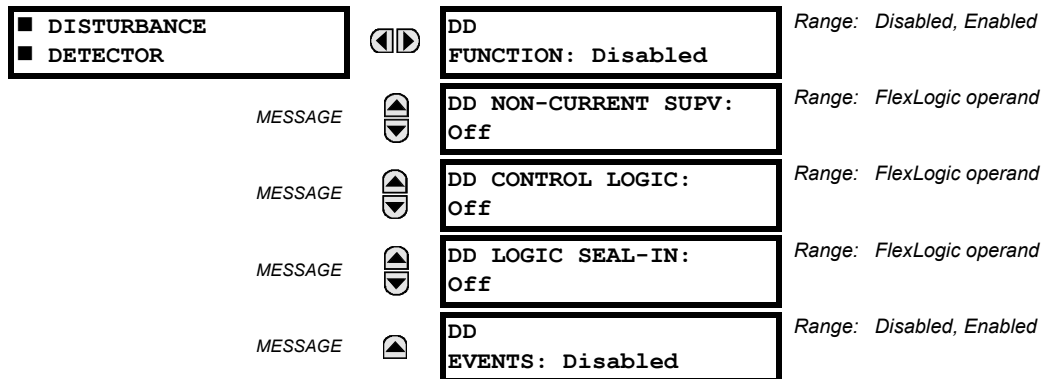

a) MAIN MENU

PATH: SETTINGS ⇩ GROUPED ELEMENTS ⇨⇩ SETTING GROUP 1(6) ⇨⇩ SUPERVISING ELEMENTS

b) DISTURBANCE DETECTOR

PATH: SETTINGS ⇨⇩ GROUPED ELEMENTS ⇨⇩ SETTING GROUP 1(6) ⇨⇩ SUPERVISING ELEMENTS ⇨ DISTURBANCE DETECTOR

The disturbance detector (50DD) element is an 87L-dedicated sensitive current disturbance detector that is used to detect any disturbance on the protected system. This detector is intended for such functions as trip output supervision and starting oscillography. The disturbance detector also signals the 87L function that a disturbance (possible fault) occurred and to resize the operating window to remove the pre-fault current. It is essential to have the disturbance detector enabled for applications where the 87L operating time is critical.

If the disturbance detector is used to supervise the operation of the 87L function, it is recommended that the 87L trip element be used. The 50DD SV disturbance detector FlexLogic operand must then be assigned to an **87L TRIP SUPV** setting.

The disturbance detector function measures the magnitude of the negative-sequence current (I_{-2}), the magnitude of the zero-sequence current (I_{-0}), the change in negative-sequence current (ΔI_{-2}), the change in zero-sequence current (ΔI_{-0}), and the change in positive-sequence current (ΔI_{+1}). The disturbance detector element uses net local current, computed as a sum of all sources configured in the current differential element, to detect system disturbances.

The adaptive level detector operates as follows:

- When the absolute level increases above 0.12 pu for I_{-0} or I_{-2} , the adaptive level detector output is active and the next highest threshold level is increased 8 cycles later from 0.12 to 0.24 pu in steps of 0.02 pu. If the level exceeds 0.24 pu, the current adaptive level detector setting remains at 0.24 pu and the output remains active (as well as the disturbance detector output) when the measured value remains above the current setting.
- When the absolute level is decreasing from in range from 0.24 to 0.12 pu, the lower level is set every 8 cycles without the adaptive level detector active. Note that the 50DD output remains inactive during this change as long as the delta change is less than 0.04 pu.

The delta level detectors (ΔI) detectors are designed to pickup for the 0.04 pu change in I_{+1} , I_{-2} , and I_{-0} currents. The ΔI value is measured by comparing the present value to the value calculated 4 cycles earlier.

- DD FUNCTION:** This setting is used to enable/disable the operation of the disturbance detector.
- DD NON-CURRENT SUPV:** This setting is used to select a FlexLogic operand which will activate the output of the disturbance detector upon events (such as frequency or voltage change) not accompanied by a current change.
- DD CONTROL LOGIC:** This setting is used to prevent operation of I_{-0} and I_{-2} logic of disturbance detector during conditions such as single breaker pole being open which leads to unbalanced load current in single-pole tripping schemes. Breaker auxiliary contact can be used for such scheme.

- **DD LOGIC SEAL-IN:** This setting is used to maintain disturbance detector output for such conditions as balanced three-phase fault, low level time overcurrent fault, etc. whenever the disturbance detector might reset. Output of the disturbance detector will be maintained until the chosen FlexLogic operand resets.

The user may disable the **DD EVENTS** setting as the disturbance detector element will respond to any current disturbance on the system which may result in filling the events buffer and possible loss of valuable data.

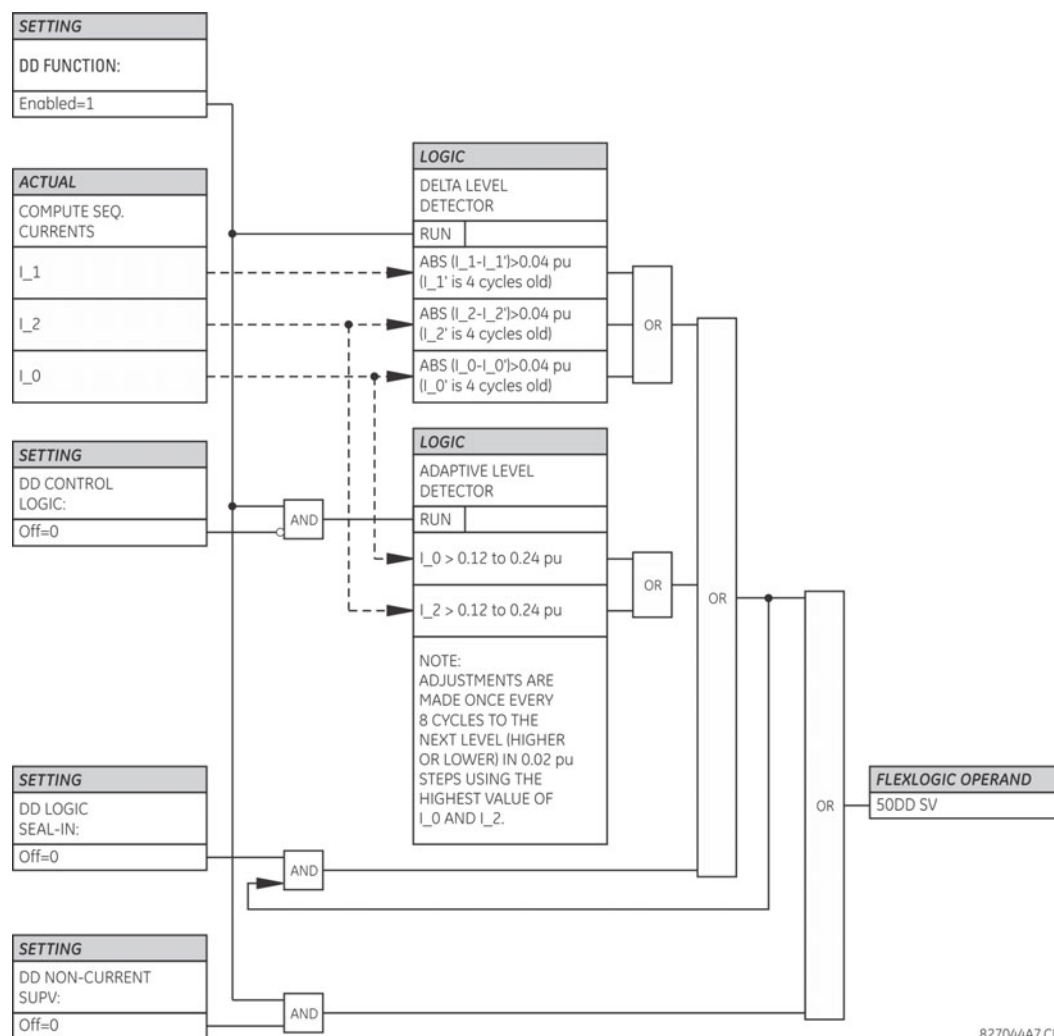

Figure 5-130: DISTURBANCE DETECTOR SCHEME LOGIC

c) 87L TRIP

PATH: SETTINGS ⇒ GROUPED ELEMENTS ⇒ SETTING GROUP 1(6) ⇒ SUPERVISING ELEMENTS ⇒ 87L TRIP

<div> <div>87L TRIP</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> </div>	<div> <div>⏮⏭</div> <div>⏮⏭</div> <div>⏮⏭</div> <div>⏮⏭</div> <div>⏮⏭</div> <div>⏮⏭</div> <div>⏮⏭</div> <div>⏮⏭</div> </div>	87L TRIP FUNCTION: Disabled	Range: Disabled, Enabled
		87L TRIP SOURCE: SRC 1	Range: SRC 1, SRC 2, SRC 3, SRC 4
		87L TRIP MODE: 3-Pole	Range: 3-Pole, 1-Pole
		87L TRIP SUPV: Off	Range: FlexLogic™ operand
		87L TRIP FORCE 3-Φ: Off	Range: FlexLogic™ operand
		87L TRIP SEAL-IN: Disabled	Range: Disabled, Enabled
		87L TRIP SEAL-IN PICKUP: 0.20 pu	Range: 0.20 to 0.80 pu in steps of 0.01
		87L TRIP TARGET: Self-reset	Range: Self-reset, Latched, Disabled
		87L TRIP EVENTS: Disabled	Range: Disabled, Enabled

The 87L trip element must be used to secure the generation of tripping outputs. It is especially recommended for use in all single-pole tripping applications. It provides the user with the capability of maintaining the trip signal while the fault current is still flowing, to choose single-pole or three-pole tripping, to employ the received direct transfer trip (DTT) signals, and to assign supervising trip elements like the disturbance detector. The logic is used to ensure that the relay will:

- Trip the faulted phase for a single line to ground fault, as detected by the line differential element.
- Trip all three phases for any internal multiphase fault.
- Trip all three phases for a second single line to ground fault during or following a single pole trip cycle.

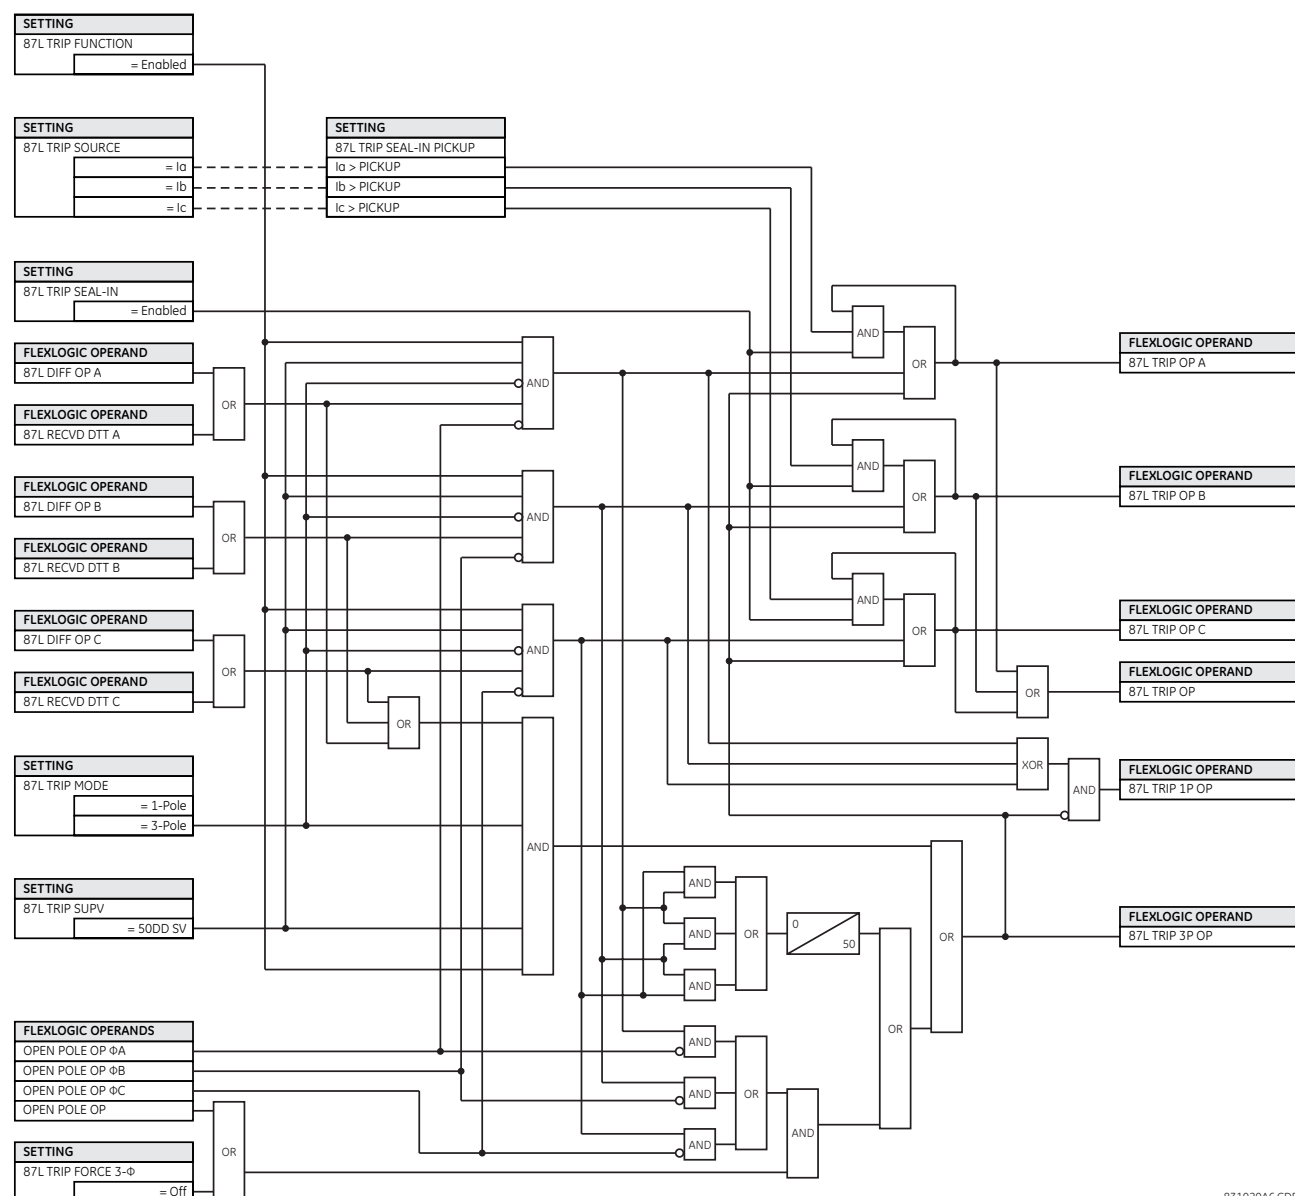

For maximum security, it is recommended the disturbance detector (plus other elements if required) be assigned to see a change in system status before a trip output is permitted. This ensures the relay will not issue a trip signal as a result of incorrect settings, incorrect manipulations with a relay, or inter-relay communications problems (for example, extremely noisy channels). The open pole detector provides forcing of three-pole tripping for sequential faults and close-onto-fault if desired. The open pole detector feature must be employed and adequately programmed for proper operation of this feature. The 87L TRIP 1P OP and 87L TRIP 3P OP operands are provided to initiate single-pole or three-pole autoreclosing.

If a direct transfer trip (DTT) is not required for the 87L trip scheme to operate, it should be disabled at the remote relay via the **GROUPED ELEMENTS ⇒ SETTING GROUP 1(6) ⇒ LINE DIFFERENTIAL ELEMENT ⇒ CURRENT DIFFERENTIAL** settings menu.

- **87L TRIP FUNCTION:** This setting is used to enable or disable the element.
- **87L TRIP SOURCE:** This setting is used to assign a source for seal-in function.
- **87L TRIP MODE:** This setting is used to select either three-pole or single-pole mode of operation.
- **87L TRIP SUPV:** This setting is used to assign a trip supervising element. The 50DD SV FlexLogic™ operand is recommended (the element has to be enabled); otherwise, elements like instantaneous overcurrent, distance, etc. can be used.
- **87L TRIP FORCE 3-Φ:** This setting is used to select an element forcing three-pole tripping if any type fault occurs when this element is active. Autoreclosure disabled can be utilized, or the autoreclosure counter if, for example, the second trip is required to be a three-pole signal. Likewise, any operand representing a change in the power system configuration, can be applied.

- **87L TRIP SEAL-IN:** This setting is used to enable/disable seal-in of the trip signal by measurement of the current flowing.
- **87L TRIP SEAL-IN PICKUP:** This setting is used to select a pickup setting of the current seal-in function.

The trip bus element allows aggregating outputs of protection and control elements without using FlexLogic and assigning them a simple and effective manner. Each trip bus can be assigned for either trip or alarm actions. Simple trip conditioning such as latch, delay, and seal-in delay are available.

The easiest way to assign element outputs to a trip bus is through the EnerVista UR Setup software. A protection summary is displayed by navigating to a specific protection or control protection element and checking the desired bus box. Once the desired element is selected for a specific bus, a list of element operate-type operands are displayed and can be assigned to a trip bus. If more than one operate-type operand is required, it may be assigned directly from the trip bus menu.

Quick Connect Device

Figure 5–132: TRIP BUS FIELDS IN THE PROTECTION SUMMARY

The following settings are available.

- **TRIP BUS 1 BLOCK:** The trip bus output is blocked when the operand assigned to this setting is asserted.
- **TRIP BUS 1 PICKUP DELAY:** This setting specifies a time delay to produce an output depending on how output is used.
- **TRIP BUS 1 RESET DELAY:** This setting specifies a time delay to reset an output command. The time delay should be set long enough to allow the breaker or contactor to perform a required action.
- **TRIP BUS 1 INPUT 1 to TRIP BUS 1 INPUT 16:** These settings select a FlexLogic operand to be assigned as an input to the trip bus.
- **TRIP BUS 1 LATCHING:** This setting enables or disables latching of the trip bus output. This is typically used when lockout is required or user acknowledgement of the relay response is required.
- **TRIP BUS 1 RESET:** The trip bus output is reset when the operand assigned to this setting is asserted. Note that the RESET OP operand is pre-wired to the reset gate of the latch, As such, a reset command the front panel interface or via communications will reset the trip bus output.

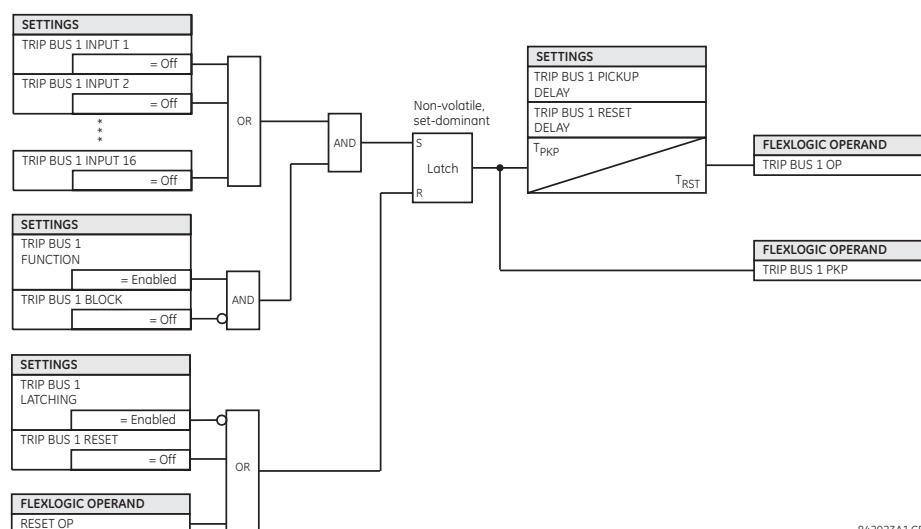

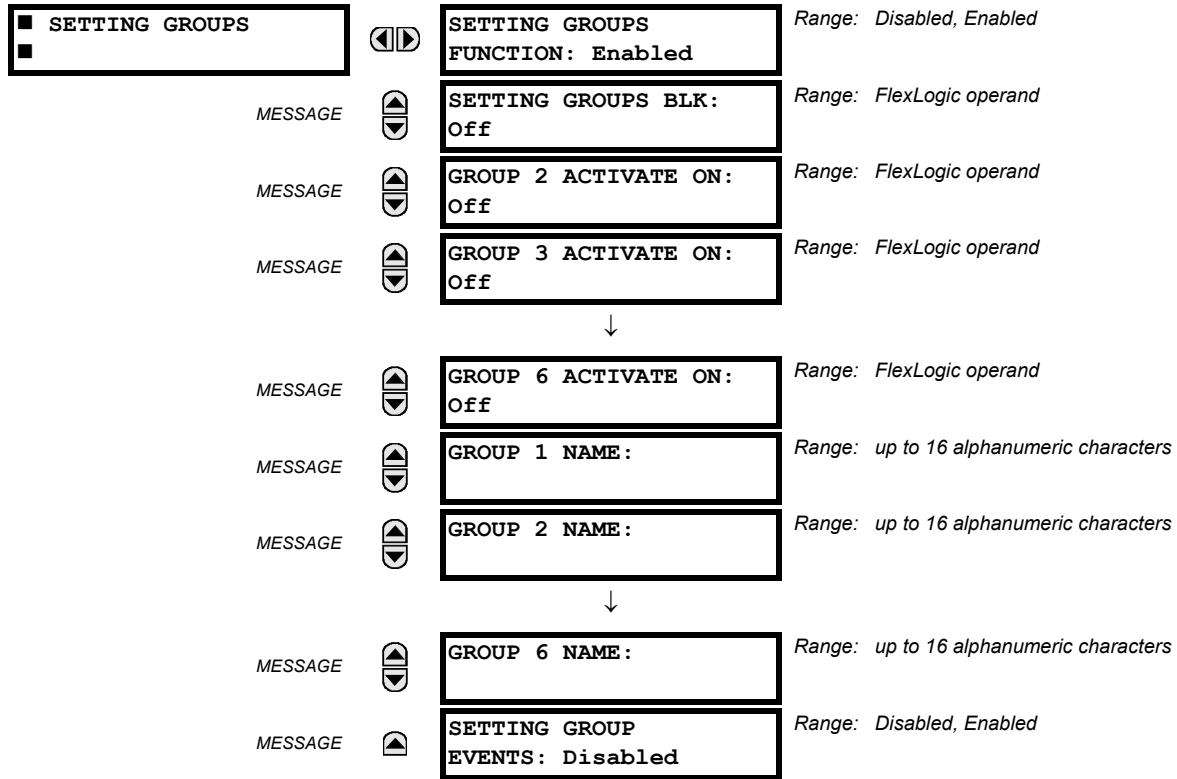

Figure 5–133: TRIP BUS LOGIC

842023A1.CDR

5.7.3 SETTING GROUPS

PATH: SETTINGS ⇨ ⇩ CONTROL ELEMENTS ⇨ SETTINGS GROUPS

The 61850 standard provides for the ability to monitor, edit, and change setting groups in a relay through a series of services operating on Setting Group Control Block values. There is one SGCB in LLN0 in LD1 in the UR as, at present, the other LDs do not support multiple setting groups. The default value of **SETTING GROUPS** is Disabled. In order for 61850 and/or UR setting group control to function, the **SETTING GROUPS FUNCTION** must be set to Enabled.

The active setting group in the UR is settable from either the value set via a FlexLogic operand in the UR (present practice) or a SelectActiveSG command from a 61850 Client. For both the UR and IEC 61850, the default active setting group is "1".

A 61850 SelectActiveSG command sets one of the internal Non-Volatile flags (61850 SG Level x) that represents the requested Active Setting Group shown as follows:

Table 5-30: ACTIVE SETTING GROUP

SELECTACTIVESG VALUE	FLAG SET
1 (default)	SG Level 1
2	SG Level 2
3	SG Level 3
4	SG Level 4
5	SG Level 4
6	SG Level 6

On power-up or restart, the previously selected 61850 SG Level x is re-instated. Similarly, the input to the setting group control in the UR can be designed with Non-Volatile latches to achieve the same effect.

The setting groups menu controls the activation and deactivation of up to six possible groups of settings in the **GROUPED ELEMENTS** settings menu. The faceplate Settings In Use LEDs indicate which active group (with a non-flashing energized LED) is in service.

The **SETTING GROUPS BLK** setting prevents the active setting group from changing when the FlexLogic parameter is set to "On". This can be useful in applications where it is undesirable to change the settings under certain conditions, such as the breaker being open.

The **GROUP 2 ACTIVATE ON** to **GROUP 6 ACTIVATE ON** settings select a FlexLogic operand which, when set, makes the particular setting group active for use by any grouped element. A priority scheme ensures that only one group is active at a given time – the highest-numbered group that is activated by its **ACTIVATE ON** parameter takes priority over the lower-numbered groups. There is no activate on setting for group 1 (the default active group), because group 1 automatically becomes active if no other group is active.

The **SETTING GROUP 1 NAME** to **SETTING GROUP 6 NAME** settings allows the user to assign a name to each of the six settings groups. Once programmed, this name appears on the second line of the **GROUPED ELEMENTS** ⇒ **SETTING GROUP 1(6)** menu display.

The relay can be set up via a FlexLogic equation to receive requests to activate or de-activate a particular non-default settings group. The following FlexLogic equation (see the following figure) illustrates requests via remote communications (for example, VIRTUAL INPUT 1 ON) or from a local contact input (for example, CONTACT IP 1 ON) to initiate the use of a particular settings group, and requests from several overcurrent pickup measuring elements to inhibit the use of the particular settings group. The assigned VIRTUAL OUTPUT 1 operand is used to control the "On" state of a particular settings group.

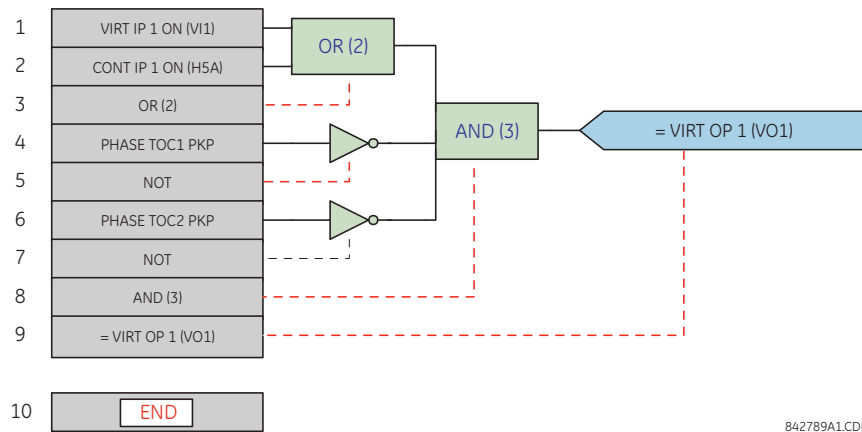

Figure 5-134: EXAMPLE FLEXLOGIC CONTROL OF A SETTINGS GROUP

The selector switch element is intended to replace a mechanical selector switch. Typical applications include setting group control or control of multiple logic sub-circuits in user-programmable logic.

The element provides for two control inputs. The step-up control allows stepping through selector position one step at a time with each pulse of the control input, such as a user-programmable pushbutton. The three-bit control input allows setting the selector to the position defined by a three-bit word.

The element allows pre-selecting a new position without applying it. The pre-selected position gets applied either after time-out or upon acknowledgement via separate inputs (user setting). The selector position is stored in non-volatile memory. Upon power-up, either the previous position is restored or the relay synchronizes to the current three-bit word (user setting). Basic alarm functionality alerts the user under abnormal conditions; for example, the three-bit control input being out of range.

- **SELECTOR 1 FULL RANGE:** This setting defines the upper position of the selector. When stepping up through available positions of the selector, the upper position wraps up to the lower position (position 1). When using a direct three-bit control word for programming the selector to a desired position, the change would take place only if the control word is within the range of 1 to the **SELECTOR FULL RANGE**. If the control word is outside the range, an alarm is established by setting the SELECTOR ALARM FlexLogic operand for 3 seconds.

- **SELECTOR 1 TIME-OUT:** This setting defines the time-out period for the selector. This value is used by the relay in the following two ways. When the **SELECTOR STEP-UP MODE** is “Time-out”, the setting specifies the required period of inactivity of the control input after which the pre-selected position is automatically applied. When the **SELECTOR STEP-UP MODE** is “Acknowledge”, the setting specifies the period of time for the acknowledging input to appear. The timer is re-started by any activity of the control input. The acknowledging input must come before the **SELECTOR 1 TIME-OUT** timer expires; otherwise, the change will not take place and an alarm will be set.
- **SELECTOR 1 STEP-UP:** This setting specifies a control input for the selector switch. The switch is shifted to a new position at each rising edge of this signal. The position changes incrementally, wrapping up from the last (**SELECTOR 1 FULL RANGE**) to the first (position 1). Consecutive pulses of this control operand must not occur faster than every 50 ms. After each rising edge of the assigned operand, the time-out timer is restarted and the **SELECTOR SWITCH 1: POS Z CHNG INITIATED** target message is displayed, where **Z** the pre-selected position. The message is displayed for the time specified by the **FLASH MESSAGE TIME** setting. The pre-selected position is applied after the selector times out (“Time-out” mode), or when the acknowledging signal appears before the element times out (“Acknowledge” mode). When the new position is applied, the relay displays the **SELECTOR SWITCH 1: POSITION Z IN USE** message. Typically, a user-programmable pushbutton is configured as the stepping up control input.
- **SELECTOR 1 STEP-UP MODE:** This setting defines the selector mode of operation. When set to “Time-out”, the selector will change its position after a pre-defined period of inactivity at the control input. The change is automatic and does not require any explicit confirmation of the intent to change the selector's position. When set to “Acknowledge”, the selector will change its position only after the intent is confirmed through a separate acknowledging signal. If the acknowledging signal does not appear within a pre-defined period of time, the selector does not accept the change and an alarm is established by setting the **SELECTOR STP ALARM** output FlexLogic operand for 3 seconds.
- **SELECTOR 1 ACK:** This setting specifies an acknowledging input for the stepping up control input. The pre-selected position is applied on the rising edge of the assigned operand. This setting is active only under “Acknowledge” mode of operation. The acknowledging signal must appear within the time defined by the **SELECTOR 1 TIME-OUT** setting after the last activity of the control input. A user-programmable pushbutton is typically configured as the acknowledging input.
- **SELECTOR 1 3BIT A0, A1, and A2:** These settings specify a three-bit control input of the selector. The three-bit control word pre-selects the position using the following encoding convention:

A2	A1	A0	POSITION
0	0	0	rest
0	0	1	1
0	1	0	2
0	1	1	3
1	0	0	4
1	0	1	5
1	1	0	6
1	1	1	7

The “rest” position (0, 0, 0) does not generate an action and is intended for situations when the device generating the three-bit control word is having a problem. When **SELECTOR 1 3BIT MODE** is “Time-out”, the pre-selected position is applied in **SELECTOR 1 TIME-OUT** seconds after the last activity of the three-bit input. When **SELECTOR 1 3BIT MODE** is “Acknowledge”, the pre-selected position is applied on the rising edge of the **SELECTOR 1 3BIT ACK** acknowledging input.

The stepping up control input (**SELECTOR 1 STEP-UP**) and the three-bit control inputs (**SELECTOR 1 3BIT A0** through **A2**) lock-out mutually: once the stepping up sequence is initiated, the three-bit control input is inactive; once the three-bit control sequence is initiated, the stepping up input is inactive.

- **SELECTOR 1 3BIT MODE:** This setting defines the selector mode of operation. When set to “Time-out”, the selector changes its position after a pre-defined period of inactivity at the control input. The change is automatic and does not require explicit confirmation to change the selector position. When set to “Acknowledge”, the selector changes its position only after confirmation via a separate acknowledging signal. If the acknowledging signal does not appear within a pre-defined period of time, the selector rejects the change and an alarm established by invoking the **SELECTOR BIT ALARM** FlexLogic operand for 3 seconds.
- **SELECTOR 1 3BIT ACK:** This setting specifies an acknowledging input for the three-bit control input. The pre-selected position is applied on the rising edge of the assigned FlexLogic operand. This setting is active only under the

“Acknowledge” mode of operation. The acknowledging signal must appear within the time defined by the **SELECTOR TIME-OUT** setting after the last activity of the three-bit control inputs. Note that the stepping up control input and three-bit control input have independent acknowledging signals (**SELECTOR 1 ACK** and **SELECTOR 1 3BIT ACK**, accordingly).

- **SELECTOR 1 POWER-UP MODE:** This setting specifies the element behavior on power up of the relay.

When set to “Restore”, the last position of the selector (stored in the non-volatile memory) is restored after powering up the relay. If the position restored from memory is out of range, position 0 (no output operand selected) is applied and an alarm is set (SELECTOR 1 PWR ALARM).

When set to “Synchronize” selector switch acts as follows. For two power cycles, the selector applies position 0 to the switch and activates SELECTOR 1 PWR ALARM. After two power cycles expire, the selector synchronizes to the position dictated by the three-bit control input. This operation does not wait for time-out or the acknowledging input. When the synchronization attempt is unsuccessful (that is, the three-bit input is not available (0,0,0) or out of range) then the selector switch output is set to position 0 (no output operand selected) and an alarm is established (SELECTOR 1 PWR ALARM).

The operation of “Synch/Restore” mode is similar to the “Synchronize” mode. The only difference is that after an unsuccessful synchronization attempt, the switch will attempt to restore the position stored in the relay memory. The “Synch/Restore” mode is useful for applications where the selector switch is employed to change the setting group in redundant (two relay) protection schemes.

- **SELECTOR 1 EVENTS:** If enabled, the following events are logged:

EVENT NAME	DESCRIPTION
SELECTOR 1 POS Z	Selector 1 changed its position to Z.
SELECTOR 1 STP ALARM	The selector position pre-selected via the stepping up control input has not been confirmed before the time out.
SELECTOR 1 BIT ALARM	The selector position pre-selected via the three-bit control input has not been confirmed before the time out.

The following figures illustrate the operation of the selector switch. In these diagrams, “T” represents a time-out setting.

Figure 5-135: TIME-OUT MODE

Figure 5-136: ACKNOWLEDGE MODE

APPLICATION EXAMPLE

Consider an application where the selector switch is used to control setting groups 1 through 4 in the relay. The setting groups are to be controlled from both user-programmable pushbutton 1 and from an external device via contact inputs 1 through 3. The active setting group shall be available as an encoded three-bit word to the external device and SCADA via output contacts 1 through 3. The pre-selected setting group shall be applied automatically after 5 seconds of inactivity of the control inputs. When the relay powers up, it should synchronize the setting group to the three-bit control input.

Make the following changes to setting group control in the **SETTINGS** ⇒ **CONTROL ELEMENTS** ⇒ **SETTING GROUPS** menu:

SETTING GROUPS FUNCTION: "Enabled"
SETTING GROUPS BLK: "Off"
GROUP 2 ACTIVATE ON: "SELECTOR 1 POS 2"
GROUP 3 ACTIVATE ON: "SELECTOR 1 POS 3"

GROUP 4 ACTIVATE ON: "SELECTOR 1 POS 4"
GROUP 5 ACTIVATE ON: "Off"
GROUP 6 ACTIVATE ON: "Off"

Make the following changes to selector switch element in the **SETTINGS** ⇒ **CONTROL ELEMENTS** ⇒ **SELECTOR SWITCH** ⇒ **SELECTOR SWITCH 1** menu to assign control to user programmable pushbutton 1 and contact inputs 1 through 3:

SELECTOR 1 FUNCTION: "Enabled"
SELECTOR 1 FULL-RANGE: "4"
SELECTOR 1 STEP-UP MODE: "Time-out"
SELECTOR 1 TIME-OUT: "5.0 s"
SELECTOR 1 STEP-UP: "PUSHBUTTON 1 ON"
SELECTOR 1 ACK: "Off"

SELECTOR 1 3BIT A0: "CONT IP 1 ON"
SELECTOR 1 3BIT A1: "CONT IP 2 ON"
SELECTOR 1 3BIT A2: "CONT IP 3 ON"
SELECTOR 1 3BIT MODE: "Time-out"
SELECTOR 1 3BIT ACK: "Off"
SELECTOR 1 POWER-UP MODE: "Synchronize"

Now, assign the contact output operation (assume the H6E module) to the selector switch element by making the following changes in the **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **CONTACT OUTPUTS** menu:

OUTPUT H1 OPERATE: "SELECTOR 1 BIT 0"
OUTPUT H2 OPERATE: "SELECTOR 1 BIT 1"
OUTPUT H3 OPERATE: "SELECTOR 1 BIT 2"

Finally, assign configure user-programmable pushbutton 1 by making the following changes in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **USER-PROGRAMMABLE PUSHBUTTONS** ⇒ **USER PUSHBUTTON 1** menu:

PUSHBUTTON 1 FUNCTION: "Self-reset"
PUSHBUTTON 1 DROP-OUT TIME: "0.10 s"

The logic for the selector switch is shown below:

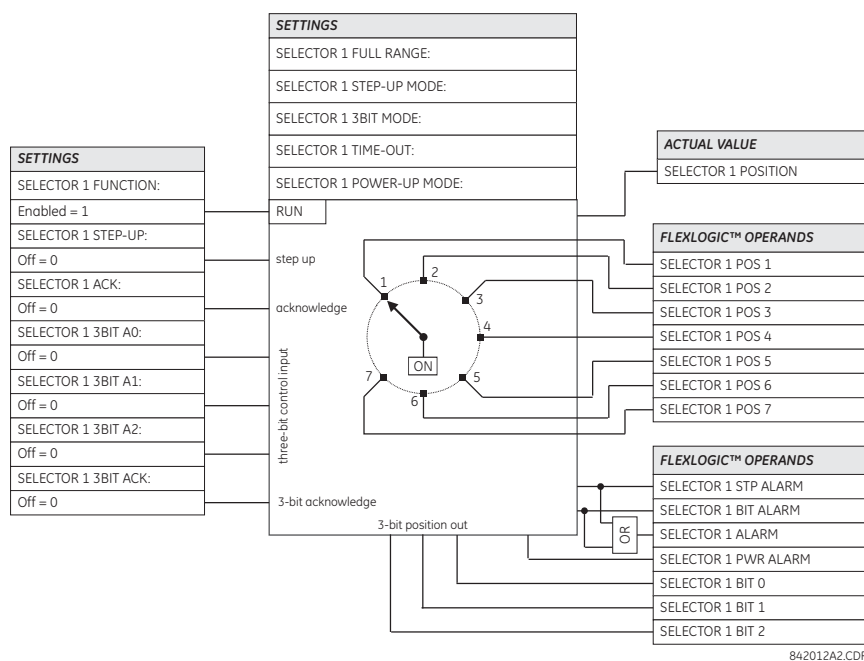

Figure 5-137: SELECTOR SWITCH LOGIC

The trip output element is primarily used to collect trip requests from protection elements and other inputs to generate output operands to initiate trip operations. Three pole trips will only initiate reclosure if programmed to do so, whereas single pole trips will always automatically initiate reclosure. The TRIP 3-POLE and TRIP 1-POLE output operands can also be used as inputs to a FlexLogic OR gate to operate the faceplate Trip indicator LED.

THREE POLE OPERATION:

In applications where single-pole tripping is not required this element provides a convenient method of collecting inputs to initiate tripping of circuit breakers, the reclose element and breaker failure elements.

SINGLE POLE OPERATION:

This element *must* be used in single pole operation applications.

5

In these applications this element is used to:

- Determine if a single pole operation should be performed.
- Collect inputs to initiate three pole tripping, the recloser and breaker failure elements.
- Collect inputs to initiate single pole tripping, the recloser and breaker failure elements.
- Assign a higher priority to pilot aided scheme outputs than to exclusively local inputs.

The trip output element works in association with other L90 elements (refer to the *Theory of operation* chapter for a complete description of single-pole operations) that must be programmed and in-service for successful operation. The necessary elements are: recloser, breaker control, open pole detector, and phase selector. The recloser must also be in the "Reset" state before a single pole trip can be issued. Outputs from this element are also directly connected as initiate signals to the breaker failure elements.

The trip output element is used to aggregate inputs from appropriate protection elements (including 87L line differential, distance, and instantaneous overcurrent functions) to provide single-pole tripping. The line current differential function is hard-wired through the 87L TRIP function, which has to be enabled and configured properly.

The 87L TRIP function collects inputs from both the 87L line differential and 87L DTT functions. It can be supervised by the disturbance detector and determines if the fault type is single-line-to-ground or multi-phase. The 87L TRIP function sends a direct command to the trip output element to execute appropriate tripping action without any consultation with phase selector.

Other protective functions, such as distance and overcurrent, need to be assigned to appropriate trip output single-pole or three-pole inputs and will require phase selector fault identification for tripping action. A timer defined by the **TRIP PILOT PRIORITY** setting can be used to delay the output decision from other local protection elements to give 87L operational priority. This prevents three-pole operation where a single pole operation is permitted.

To ensure correct operation of the single-pole tripping feature, any non-distance protection used for single pole tripping (such as high-set overcurrent using the instantaneous or directional overcurrent elements) must be blocked by the OPEN POLE OP Φ A, OPEN POLE OP Φ B, or OPEN POLE OP Φ C operands. For example, instantaneous overcurrent phase A will be blocked by OPEN POLE OP Φ A operand. This blocking condition is pre-wired for distance protection.

The following settings are available for the trip output element.

- **TRIP MODE:** This setting is used to select the required mode of operation. If selected to “3 Pole Only” outputs for all three phases are always set simultaneously. If selected to “3 Pole & 1 Pole” outputs for all three phases are set simultaneously unless the phase selector or a pilot aided scheme determines the fault is single-phase-to-ground. If the fault is identified as being AG, BG or CG only the operands for the faulted phase will be asserted.
- **TRIP 3-POLE INPUT-1 to TRIP 3-POLE INPUT-6:** These settings are used to select an operand representing a fault condition that is not desired to initiate a single pole operation (for example, phase undervoltage). Use a FlexLogic OR-gate if more than six inputs are required.
- **TRIP 1-POLE INPUT-1 to TRIP 1-POLE INPUT-6:** These settings are used to select an operand representing a fault condition that is desired to initiate a single pole trip-and-reclose if the fault is single phase to ground (for example, distance zone 1). Use a FlexLogic OR-gate if more than six inputs are required. The inputs do not have to be phase-specific as the phase selector determines the fault type.

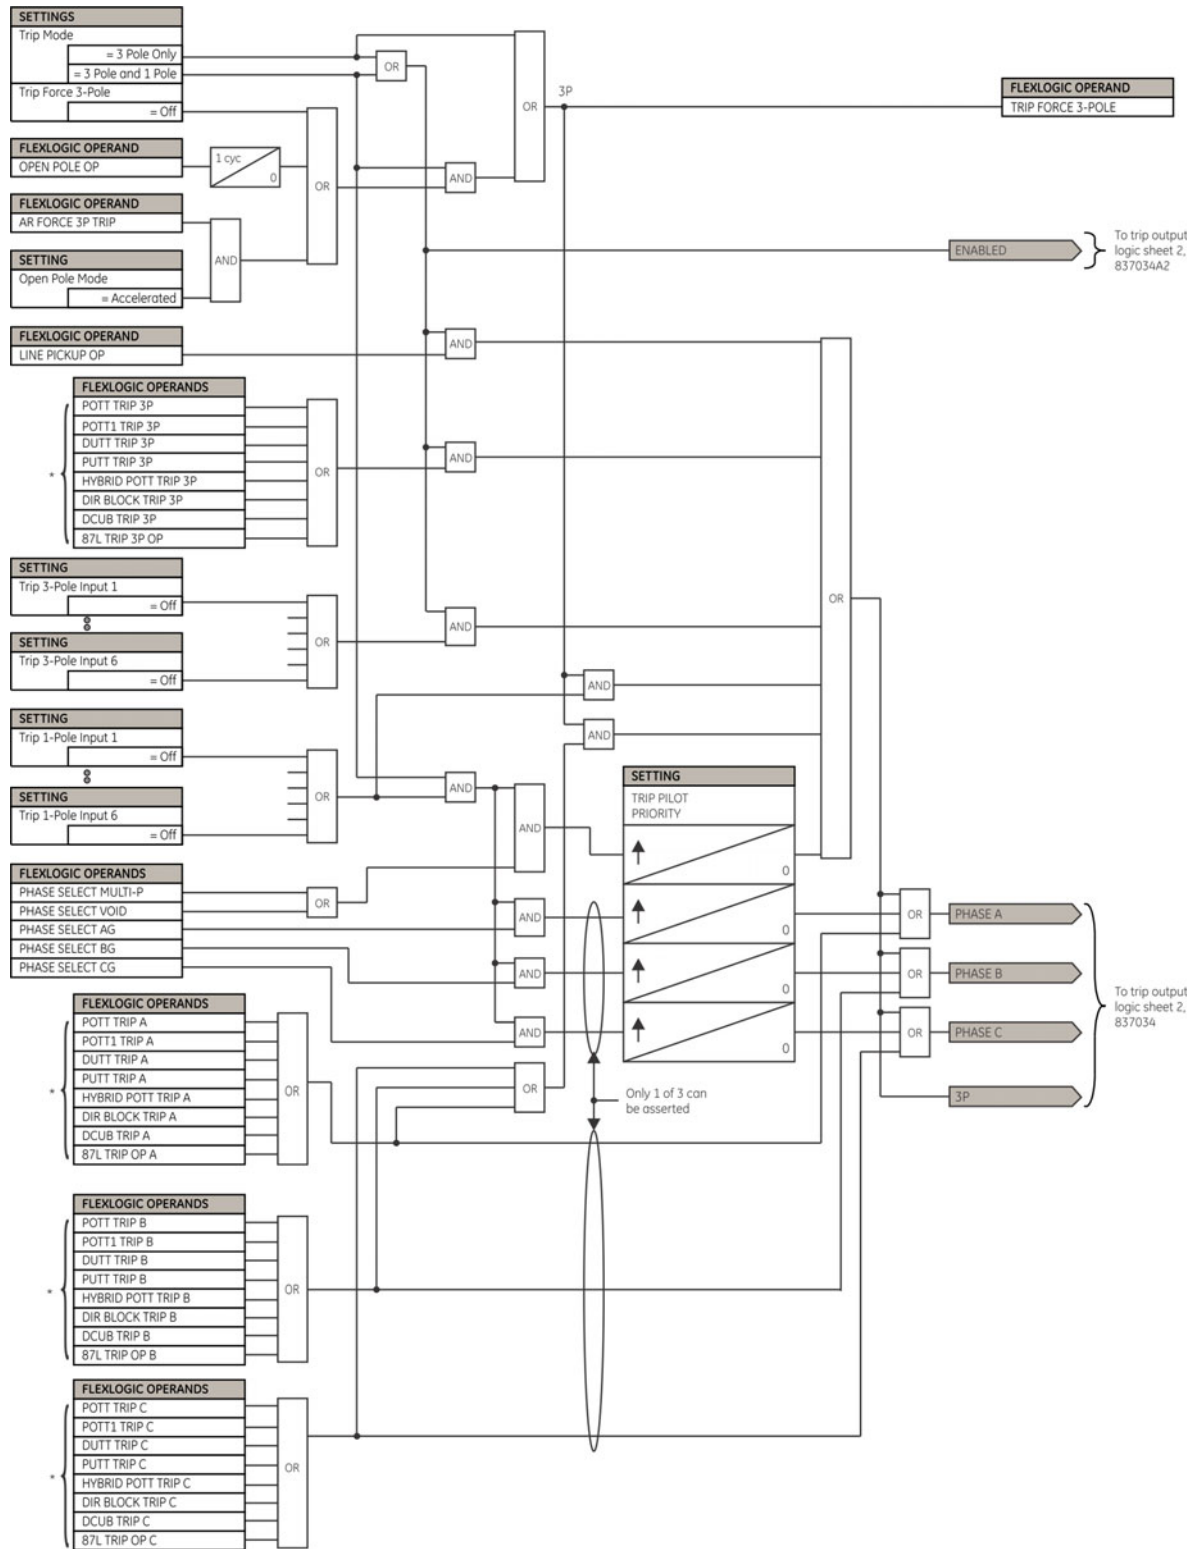

The AR FORCE 3-P TRIP operand is asserted by the autorecloser 1.5 cycles after single-pole reclosing is initiated. This operand calls for a three-pole trip if any protection element configured under **TRIP 1-POLE INPUT** remains picked-up. The open pole detector provides blocking inputs to distance elements, and therefore the latter will reset immediately after the TRIP 1-POLE operand is asserted. For other protection elements used in single-pole tripping, the user must ensure they will reset immediately after tripping, otherwise the fact that they are still picked up will be detected as an evolving fault and the relay will trip three-poles. For example, if high-set phase instantaneous overcurrent is used (**TRIP 1-POLE INPUT X: “PHASE IOC1 OP”**), then OPEN POLE OP ΦA shall be used for blocking phase A of the instantaneous overcurrent element. In this way, after tripping phase A, the phase a instantaneous overcurrent element is forced to reset. Phases B and C are still operational and can detect an evolving fault as soon as 8 ms after tripping phase A. Neutral and negative-sequence instantaneous overcurrent elements shall be blocked from the OPEN POLE BLK N operand unless the pickup setting is high enough to prevent pickup during single-pole reclosing.

- **TRIP RECLOSE INPUT-1 to TRIP RECLOSE INPUT-6:** These settings select an operand representing a fault condition that is desired to initiate three pole reclosing (for example, phase distance zone 1). Use a FlexLogic OR-gate if more than six inputs are required. These inputs also include the **TRIP 1-POLE INPUT-1 to TRIP 1-POLE INPUT-6** values, which are intended to initiate three-pole reclosing in situations where single-pole tripping commands are changed to three-pole tripping commands. This can happen in cases where the phase selector identifies a multi-phase fault or the **AR FORCE 3P TRIP** command is present.
- **TRIP SEAL-IN DELAY:** This setting specifies the minimum time that trip command signals are maintained to provide sufficient time to open the breaker poles. If a value of “0” is specified, then the output signal is reset once the protection elements initiating the trip are reset. If a value other than “0” is specified, then the protection elements must reset and the timer initiated at the first trip command must expire.
- **TRIP RESET:** This setting selects the option to reset the trip latches. If “Pole Curr OR Custom” is chosen, then the **OPEN POLE CURRENT PKP** setting should be programmed accordingly. If “CBaux OR Custom” is chosen, then the breakers should be set appropriately. Both the “Current” and “CBaux” options can be complimented by custom conditions using the **BKR ΦA OPEN**, **BKR ΦB OPEN**, and **BKR ΦC OPEN** settings indicated below. Alternately, a purely custom condition can be applied to reset trip output latches.
- **START TMR Z2PH Inp1 and START TMR Z2PH Inp2:** These settings select an operand that will start the phase distance zone 2 timer to avoid a trip delay if the fault evolves from one type to another type (for example, from a single-line-to-ground fault to a multi-phase fault) or from one zone of protection to another zone of protection (for example, from zone 3 to zone 2). For instance, the GND DIST Z2 PKP FlexLogic operand or the PH DIST Z3 PKP FlexLogic operand could be assigned to either of these settings. Use a FlexLogic OR-gate if more than two inputs are required. Refer to phase distance logic diagrams for additional information.
- **START TMR Z2GR Inp1 and START TMR Z2GR Inp2:** These settings select an operand that will start the ground distance zone 2 timer to avoid a trip delay if the fault evolves from one zone of protection to another zone of protection (for example, from zone 3 to zone 2). For instance, the GND DIST Z3 PKP FlexLogic operand could be assigned to these settings. Use a FlexLogic OR-gate if more than two inputs are required. Refer to ground distance logic diagrams for additional information.
- **BKR ΦA OPEN**, **BKR ΦB OPEN**, and **BKR ΦC OPEN:** These settings are used to select an operand to indicate that phase A, B, or C of the breaker is open, respectively.
- **TRIP FORCE 3-POLE:** Selects an operand that will force an input selected for single pole operation to produce a three pole operation. The AR DISABLED FlexLogic operand is the recommended value for this setting. Power system configurations or conditions which require such operations may be considered as well.

- **TRIP PILOT PRIORITY:** This setting is used to set an interval equal to the inter-relay channel communications time, plus an appropriate margin, during which outputs are not asserted. This delay permits fault identification information from a remote terminal to be used instead of local data only.
- **REVERSE FAULT:** This setting should be used to guarantee accuracy of single-pole tripping under evolving external to internal faults. When a close-in external fault occurs, the relay is biased toward very fast operation on a following internal fault. This is primarily due to depressed voltages and elevated currents in response to the first, external fault. The phase selector can exhibit some time lag compared to the main protection elements. This can potentially result in a spurious three-pole operation on a single-line-to-ground internal fault. Delaying tripping on internal faults that follow detection of reverse faults solves the problem.

As long as the operand indicated under this setting is asserted the trip action is delayed by **TRIP DELAY ON EVOLV FAULTS** time. Typically this operand should combine reverse zone indications (such as zone 4 pickup) with a half-cycle pickup delay, and two-cycle dropout delay. This setting should be used only in single-pole tripping applications, when evolving faults are of importance, and slightly delayed operation on evolving faults could be traded for enhanced accuracy of single-pole tripping.

- **TRIP DELAY ON EVOLV FAULTS:** Use this setting in conjunction with the **REVERSE FAULT** setting (see above). Typically this value is set around half a power system cycle. Use it only in single-pole tripping applications, when evolving faults are of importance, and slightly delayed operation on evolving faults could be traded for enhanced accuracy of single-pole tripping.

* Inputs are mapped depending on function availability in the relay

		<div>UNDERFREQ 1 EVENTS:</div> <div>Disabled</div>	Range: Disabled, Enabled

There are six identical underfrequency elements, numbered from 1 through 6.

The steady-state frequency of a power system is a certain indicator of the existing balance between the generated power and the load. Whenever this balance is disrupted through the loss of an important generating unit or the isolation of part of the system from the rest of the system, the effect will be a reduction in frequency. If the control systems of the system generators do not respond fast enough, the system may collapse. A reliable method to quickly restore the balance between load and generation is to automatically disconnect selected loads, based on the actual system frequency. This technique, called “load-shedding”, maintains system integrity and minimize widespread outages. After the frequency returns to normal, the load may be automatically or manually restored.

The **UNDERFREQ 1 SOURCE** setting is used to select the source for the signal to be measured. The element first checks for a live phase voltage available from the selected source. If voltage is not available, the element attempts to use a phase current. If neither voltage nor current is available, the element will not operate, as it will not measure a parameter below the minimum voltage/current setting.

The **UNDERFREQ 1 MIN VOLT/AMP** setting selects the minimum per unit voltage or current level required to allow the underfrequency element to operate. This threshold is used to prevent an incorrect operation because there is no signal to measure.

This **UNDERFREQ 1 PICKUP** setting is used to select the level at which the underfrequency element is to pickup. For example, if the system frequency is 60 Hz and the load shedding is required at 59.5 Hz, the setting will be 59.50 Hz.

5

There are four overfrequency elements, numbered 1 through 4.

A frequency calculation for a given source is made on the input of a voltage or current channel, depending on which is available. The channels are searched for the signal input in the following order: voltage channel A, auxiliary voltage channel, current channel A, ground current channel. The first available signal is used for frequency calculation.

The steady-state frequency of a power system is an indicator of the existing balance between the generated power and the load. Whenever this balance is disrupted through the disconnection of significant load or the isolation of a part of the system that has a surplus of generation, the effect will be an increase in frequency. If the control systems of the generators do not respond fast enough, to quickly ramp the turbine speed back to normal, the overspeed can lead to the turbine trip. The overfrequency element can be used to control the turbine frequency ramp down at a generating location. This element can also be used for feeder reclosing as part of the "after load shedding restoration".

The **OVERFREQ 1 SOURCE** setting selects the source for the signal to be measured. The **OVERFREQ 1 PICKUP** setting selects the level at which the overfrequency element is to pickup.

Four independent rate of change of frequency elements are available. The element responds to rate of change of frequency with voltage, current and frequency supervision.

- **FREQ RATE 1 TREND:** This setting allows configuring the element to respond to increasing or decreasing frequency, or to frequency change in either direction.
- **FREQ RATE 1 PICKUP:** This setting specifies an intended df/dt pickup threshold. For applications monitoring a decreasing trend, set **FREQ RATE 1 TREND** to “Decreasing” and specify the pickup threshold accordingly. The operating condition is: $-df/dt > \text{Pickup}$.

For applications monitoring an increasing trend, set **FREQ RATE 1 TREND** to “Increasing” and specify the pickup threshold accordingly. The operating condition is: $df/dt > \text{Pickup}$.

For applications monitoring rate of change of frequency in any direction set **FREQ RATE 1 TREND** to “Bi-Directional” and specify the pickup threshold accordingly. The operating condition is: $\text{abs}(df/dt) > \text{Pickup}$

- **FREQ RATE 1 OV SUPV PICKUP:** This setting defines minimum voltage level required for operation of the element. The supervising function responds to the positive-sequence voltage. Overvoltage supervision should be used to prevent operation under specific system conditions such as faults.
- **FREQ RATE 1 OC SUPV PICKUP:** This setting defines minimum current level required for operation of the element. The supervising function responds to the positive-sequence current. Typical application includes load shedding. Set the pickup threshold to zero if no overcurrent supervision is required.

- **FREQ RATE 1 MIN FREQUENCY:** This setting defines minimum frequency level required for operation of the element. The setting may be used to effectively block the feature based on frequency. For example, if the intent is to monitor an increasing trend but only if the frequency is already above certain level, this setting should be set to the required frequency level.
- **FREQ RATE 1 MAX FREQUENCY:** This setting defines maximum frequency level required for operation of the element. The setting may be used to effectively block the feature based on frequency. For example, if the intent is to monitor a decreasing trend but only if the frequency is already below certain level (such as for load shedding), this setting should be set to the required frequency level.

If the signal source assigned to the frequency rate of change element is only set to auxiliary VT, then the minimum voltage supervision is 3 V.

MESSAGE	▲▼	SYNCHK1 TARGET: Self-reset	Range: Self-reset, Latched, Disabled
MESSAGE	▲	SYNCHK1 EVENTS: Disabled	Range: Disabled, Enabled

There are four identical synchrocheck elements available, numbered 1 to 4.

The synchronism check function is intended for supervising the paralleling of two parts of a system which are to be joined by the closure of a circuit breaker. The synchrocheck elements are typically used at locations where the two parts of the system are interconnected through at least one other point in the system.

Synchrocheck verifies that the voltages (V1 and V2) on the two sides of the supervised circuit breaker are within set limits of magnitude, angle and frequency differences. The time that the two voltages remain within the admissible angle difference is determined by the setting of the phase angle difference $\Delta\Phi$ and the frequency difference ΔF (slip frequency). It can be defined as the time it would take the voltage phasor V1 or V2 to traverse an angle equal to $2 \times \Delta\Phi$ at a frequency equal to the frequency difference ΔF . This time can be calculated by:

$$T = \frac{1}{\frac{360^\circ}{2 \times \Delta\Phi} \times \Delta F} \quad (\text{EQ 5.33})$$

where: $\Delta\Phi$ = phase angle difference in degrees; ΔF = frequency difference in Hz.

If one or both sources are de-energized, the synchrocheck programming can allow for closing of the circuit breaker using undervoltage control to by-pass the synchrocheck measurements (dead source function).

- **SYNCHK1 V1 SOURCE:** This setting selects the source for voltage V1 (see NOTES below).
- **SYNCHK1 V2 SOURCE:** This setting selects the source for voltage V2, which must not be the same as used for the V1 (see NOTES below).
- **SYNCHK1 MAX VOLT DIFF:** This setting selects the maximum primary voltage difference in volts between the two sources. A primary voltage magnitude difference between the two input voltages below this value is within the permissible limit for synchronism.
- **SYNCHK1 MAX ANGLE DIFF:** This setting selects the maximum angular difference in degrees between the two sources. An angular difference between the two input voltage phasors below this value is within the permissible limit for synchronism.
- **SYNCHK1 MAX FREQ DIFF:** This setting selects the maximum frequency difference in 'Hz' between the two sources. A frequency difference between the two input voltage systems below this value is within the permissible limit for synchronism.
- **SYNCHK1 MAX FREQ HYSTERESIS:** This setting specifies the required hysteresis for the maximum frequency difference condition. The condition becomes satisfied when the frequency difference becomes lower than **SYNCHK1 MAX FREQ DIFF**. Once the Synchrocheck element has operated, the frequency difference must increase above the **SYNCHK1 MAX FREQ DIFF + SYNCHK1 MAX FREQ HYSTERESIS** sum to drop out (assuming the other two conditions, voltage and angle, remain satisfied).
- **SYNCHK1 DEAD SOURCE SELECT:** This setting selects the combination of dead and live sources that will by-pass synchronism check function and permit the breaker to be closed when one or both of the two voltages (V1 or/and V2) are below the maximum voltage threshold. A dead or live source is declared by monitoring the voltage level. Six options are available:
 - None: Dead Source function is disabled
 - LV1 and DV2: Live V1 and Dead V2
 - DV1 and LV2: Dead V1 and Live V2
 - DV1 or DV2: Dead V1 or Dead V2
 - DV1 Xor DV2: Dead V1 exclusive-or Dead V2 (one source is Dead and the other is Live)
 - DV1 and DV2: Dead V1 and Dead V2
- **SYNCHK1 DEAD V1 MAX VOLT:** This setting establishes a maximum voltage magnitude for V1 in 1 'pu'. Below this magnitude, the V1 voltage input used for synchrocheck will be considered "Dead" or de-energized.
- **SYNCHK1 DEAD V2 MAX VOLT:** This setting establishes a maximum voltage magnitude for V2 in 'pu'. Below this magnitude, the V2 voltage input used for synchrocheck will be considered "Dead" or de-energized.
- **SYNCHK1 LIVE V1 MIN VOLT:** This setting establishes a minimum voltage magnitude for V1 in 'pu'. Above this magnitude, the V1 voltage input used for synchrocheck will be considered "Live" or energized.
- **SYNCHK1 LIVE V2 MIN VOLT:** This setting establishes a minimum voltage magnitude for V2 in 'pu'. Above this magnitude, the V2 voltage input used for synchrocheck will be considered "Live" or energized.

NOTES ON THE SYNCHROCHECK FUNCTION:

1. The selected sources for synchrocheck inputs V1 and V2 (which must not be the same source) may include both a three-phase and an auxiliary voltage. The relay will automatically select the specific voltages to be used by the synchrocheck element in accordance with the following table.

NO.	V1 OR V2 (SOURCE Y)	V2 OR V1 (SOURCE Z)	AUTO-SELECTED COMBINATION		AUTO-SELECTED VOLTAGE
			SOURCE Y	SOURCE Z	
1	Phase VTs and Auxiliary VT	Phase VTs and Auxiliary VT	Phase	Phase	VAB
2	Phase VTs and Auxiliary VT	Phase VT	Phase	Phase	VAB
3	Phase VT	Phase VT	Phase	Phase	VAB

NO.	V1 OR V2 (SOURCE Y)	V2 OR V1 (SOURCE Z)	AUTO-SELECTED COMBINATION		AUTO-SELECTED VOLTAGE
			SOURCE Y	SOURCE Z	
4	Phase VT and Auxiliary VT	Auxiliary VT	Phase	Auxiliary	V auxiliary (as set for Source z)
5	Auxiliary VT	Auxiliary VT	Auxiliary	Auxiliary	V auxiliary (as set for selected sources)

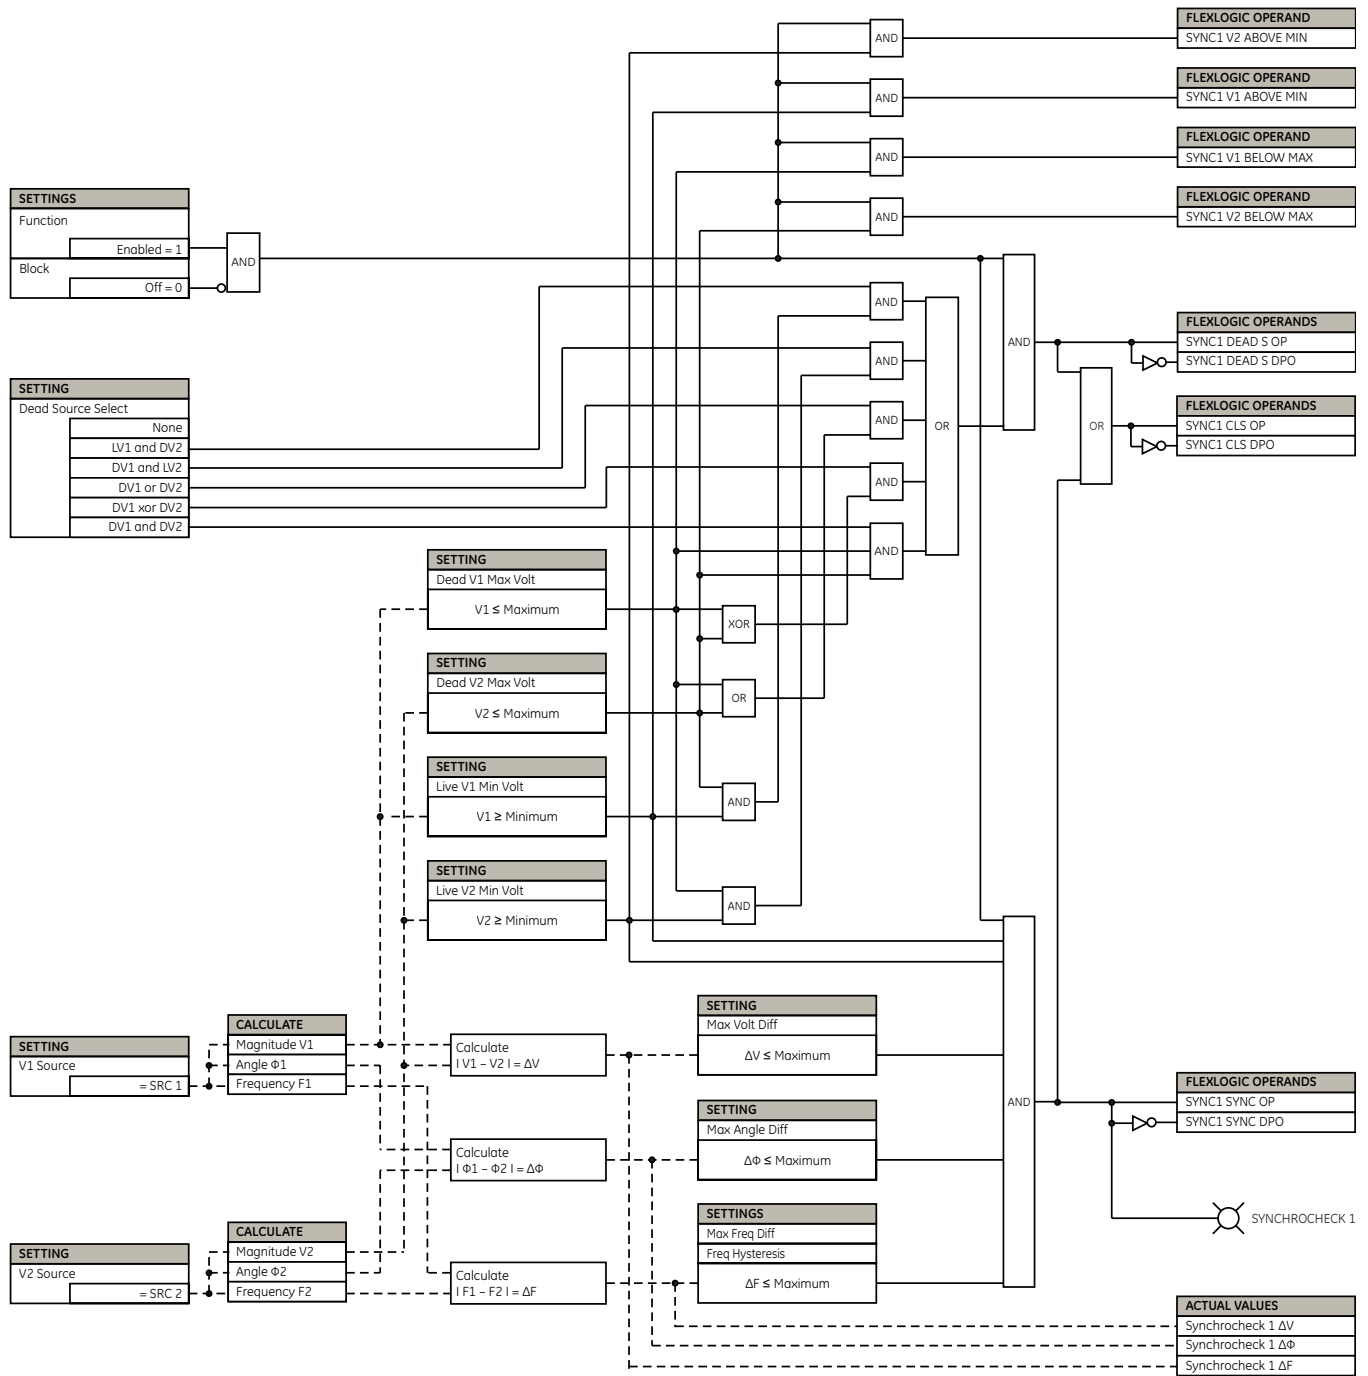

The voltages V1 and V2 will be matched automatically so that the corresponding voltages from the two sources will be used to measure conditions. A phase to phase voltage will be used if available in both sources; if one or both of the Sources have only an auxiliary voltage, this voltage will be used. For example, if an auxiliary voltage is programmed to VAG, the synchrocheck element will automatically select VAG from the other source. If the comparison is required on a specific voltage, the user can externally connect that specific voltage to auxiliary voltage terminals and then use this "Auxiliary Voltage" to check the synchronism conditions.

If using a single CT/VT module with both phase voltages and an auxiliary voltage, ensure that only the auxiliary voltage is programmed in one of the sources to be used for synchrocheck.

Exception: Synchronism cannot be checked between Delta connected phase VTs and a Wye connected auxiliary voltage.

- The relay measures frequency and Volts/Hz from an input on a given source with priorities as established by the configuration of input channels to the source. The relay will use the phase channel of a three-phase set of voltages if programmed as part of that source. The relay will use the auxiliary voltage channel only if that channel is programmed as part of the Source and a three-phase set is not.

MESSAGE ▲	▲	DIGITAL ELEMENT 1 EVENTS: Disabled	Range: Disabled, Enabled

There are 48 identical digital elements available, numbered 1 to 48. A digital element can monitor any FlexLogic operand and present a target message and/or enable events recording depending on the output operand state. The digital element settings include a name which will be referenced in any target message, a blocking input from any selected FlexLogic operand, and a timer for pickup and reset delays for the output operand.

- **DIGITAL ELEMENT 1 INPUT:** Selects a FlexLogic operand to be monitored by the digital element.
- **DIGITAL ELEMENT 1 PICKUP DELAY:** Sets the time delay to pickup. If a pickup delay is not required, set to "0".
- **DIGITAL ELEMENT 1 RESET DELAY:** Sets the time delay to reset. If a reset delay is not required, set to "0".
- **DIGITAL ELEMENT 1 PICKUP LED:** This setting enables or disabled the digital element pickup LED. When set to "Disabled", the operation of the pickup LED is blocked.

Figure 5-144: DIGITAL ELEMENT SCHEME LOGIC

CIRCUIT MONITORING APPLICATIONS:

Some versions of the digital input modules include an active voltage monitor circuit connected across form-A contacts. The voltage monitor circuit limits the trickle current through the output circuit (see technical specifications for form-A).

As long as the current through the voltage monitor is above a threshold (see technical specifications for form-A), the “Cont Op 1 VOn” FlexLogic operand will be set (for contact input 1 – corresponding operands exist for each contact output). If the output circuit has a high resistance or the DC current is interrupted, the trickle current will drop below the threshold and the “Cont Op 1 VOff” FlexLogic operand will be set. Consequently, the state of these operands can be used as indicators of the integrity of the circuits in which form-A contacts are inserted.

EXAMPLE 1: BREAKER TRIP CIRCUIT INTEGRITY MONITORING

In many applications it is desired to monitor the breaker trip circuit integrity so problems can be detected before a trip operation is required. The circuit is considered to be healthy when the voltage monitor connected across the trip output contact detects a low level of current, well below the operating current of the breaker trip coil. If the circuit presents a high resistance, the trickle current will fall below the monitor threshold and an alarm would be declared.

In most breaker control circuits, the trip coil is connected in series with a breaker auxiliary contact which is open when the breaker is open (see diagram below). To prevent unwanted alarms in this situation, the trip circuit monitoring logic must include the breaker position.

Figure 5-145: TRIP CIRCUIT EXAMPLE 1

Assume the output contact H1 is a trip contact. Using the contact output settings, this output will be given an ID name; for example, “Cont Op 1”. Assume a 52a breaker auxiliary contact is connected to contact input H7a to monitor breaker status. Using the contact input settings, this input will be given an ID name, for example, “Cont Ip 1”, and will be set “On” when the breaker is closed. The settings to use digital element 1 to monitor the breaker trip circuit are indicated below (EnerVista UR Setup example shown):

Digital Elements // D60_500.urs : C:\Document...	
Save Restore Default Reset	
PARAMETER	DIGITAL ELEMENT 1
Function	Enabled
Digital Element 1 Name	Bkr Trip Cct Out
Input	Cont Op 1 VOff (H1)
Pickup Delay	0.200 s
Reset Delay	0.100 s
Pickup Led	Enabled
Block	Cont Ip 1 Off(H5a)
Target	Self-reset
Events	Enabled
D60_500.urs Control Elements	

The PICKUP DELAY setting should be greater than the operating time of the breaker to avoid nuisance alarms.

EXAMPLE 2: BREAKER TRIP CIRCUIT INTEGRITY MONITORING

If it is required to monitor the trip circuit continuously, independent of the breaker position (open or closed), a method to maintain the monitoring current flow through the trip circuit when the breaker is open must be provided (as shown in the figure below). This can be achieved by connecting a suitable resistor (see figure below) across the auxiliary contact in the trip circuit. In this case, it is not required to supervise the monitoring circuit with the breaker position – the **BLOCK** setting is selected to “Off”. In this case, the settings are as follows (EnerVista UR Setup example shown).

PARAMETER	DIGITAL ELEMENT 1
Function	Enabled
Digital Element 1 Name	Bkr Trip Cct Out
Input	Cont Op 1 VOff (H1)
Pickup Delay	0.200 s
Reset Delay	0.100 s
Pickup Led	Enabled
Block	OFF
Target	Self-reset
Events	Enabled

The wiring connection for two examples above is applicable to both form-A contacts with voltage monitoring and solid-state contact with voltage monitoring.

PATH: SETTINGS ⇒ CONTROL ELEMENTS ⇒ DIGITAL COUNTERS ⇒ COUNTER 1(8)

■ COUNTER 1		COUNTER 1 FUNCTION: Disabled		Range: Disabled, Enabled
MESSAGE		COUNTER 1 NAME: Counter 1		Range: 12 alphanumeric characters
MESSAGE		COUNTER 1 UNITS:		Range: 6 alphanumeric characters
MESSAGE		COUNTER 1 PRESET: 0		Range: -2,147,483,648 to +2,147,483,647
MESSAGE		COUNTER 1 COMPARE: 0		Range: -2,147,483,648 to +2,147,483,647
MESSAGE		COUNTER 1 UP: Off		Range: FlexLogic operand
MESSAGE		COUNTER 1 DOWN: Off		Range: FlexLogic operand
MESSAGE		COUNTER 1 BLOCK: Off		Range: FlexLogic operand
MESSAGE		CNT1 SET TO PRESET: Off		Range: FlexLogic operand
MESSAGE		COUNTER 1 RESET: Off		Range: FlexLogic operand
MESSAGE		COUNT1 FREEZE/RESET: Off		Range: FlexLogic operand
MESSAGE		COUNT1 FREEZE/COUNT: Off		Range: FlexLogic operand

- **COUNTER 1 UNITS:** Assigns a label to identify the unit of measure pertaining to the digital transitions to be counted. The units label will appear in the corresponding actual values status.
- **COUNTER 1 PRESET:** Sets the count to a required preset value before counting operations begin, as in the case where a substitute relay is to be installed in place of an in-service relay, or while the counter is running.
- **COUNTER 1 COMPARE:** Sets the value to which the accumulated count value is compared. Three FlexLogic output operands are provided to indicate if the present value is 'more than (HI)', 'equal to (EQL)', or 'less than (LO)' the set value.
- **COUNTER 1 UP:** Selects the FlexLogic operand for incrementing the counter. If an enabled UP input is received when the accumulated value is at the limit of +2,147,483,647 counts, the counter will rollover to -2,147,483,648.
- **COUNTER 1 DOWN:** Selects the FlexLogic operand for decrementing the counter. If an enabled DOWN input is received when the accumulated value is at the limit of -2,147,483,648 counts, the counter will rollover to +2,147,483,647.
- **COUNTER 1 BLOCK:** Selects the FlexLogic operand for blocking the counting operation. All counter operands are blocked.

- **CNT1 SET TO PRESET:** Selects the FlexLogic operand used to set the count to the preset value. The counter will be set to the preset value in the following situations:
 1. When the counter is enabled and the **CNT1 SET TO PRESET** operand has the value 1 (when the counter is enabled and **CNT1 SET TO PRESET** operand is 0, the counter will be set to 0).
 2. When the counter is running and the **CNT1 SET TO PRESET** operand changes the state from 0 to 1 (**CNT1 SET TO PRESET** changing from 1 to 0 while the counter is running has no effect on the count).
 3. When a reset or reset/freeze command is sent to the counter and the **CNT1 SET TO PRESET** operand has the value 1 (when a reset or reset/freeze command is sent to the counter and the **CNT1 SET TO PRESET** operand has the value 0, the counter will be set to 0).
- **COUNTER 1 RESET:** Selects the FlexLogic operand for setting the count to either “0” or the preset value depending on the state of the **CNT1 SET TO PRESET** operand.
- **COUNTER 1 FREEZE/RESET:** Selects the FlexLogic operand for capturing (freezing) the accumulated count value into a separate register with the date and time of the operation, and resetting the count to “0”.
- **COUNTER 1 FREEZE/COUNT:** Selects the FlexLogic operand for capturing (freezing) the accumulated count value into a separate register with the date and time of the operation, and continuing counting. The present accumulated value and captured frozen value with the associated date/time stamp are available as actual values. If control power is interrupted, the accumulated and frozen values are saved into non-volatile memory during the power down operation.

There is one breaker arcing current element available per CT bank, with a minimum of two elements. This element calculates an estimate of the per-phase wear on the breaker contacts by measuring and integrating the current squared passing through the breaker contacts as an arc. These per-phase values are added to accumulated totals for each phase and compared to a programmed threshold value. When the threshold is exceeded in any phase, the relay can set an output operand to "1". The accumulated value for each phase can be displayed as an actual value.

The operation of the scheme is shown in the following logic diagram. The same output operand that is selected to operate the output relay used to trip the breaker, indicating a tripping sequence has begun, is used to initiate this feature. A time delay is introduced between initiation and the starting of integration to prevent integration of current flow through the breaker before the contacts have parted. This interval includes the operating time of the output relay, any other auxiliary relays and the breaker mechanism. For maximum measurement accuracy, the interval between change-of-state of the operand (from 0 to 1) and contact separation should be measured for the specific installation. Integration of the measured current continues for 100 ms, which is expected to include the total arcing period.

The feature is programmed to perform fault duration calculations. Fault duration is defined as a time between operation of the disturbance detector occurring before initiation of this feature, and reset of an internal low-set overcurrent function. Correction is implemented to account for a non-zero reset time of the overcurrent function.

Breaker arcing currents and fault duration values are available under the **ACTUAL VALUES** ⇒ **RECORDS** ⇒ **MAINTENANCE** ⇒ **BREAKER 1(4)** menus.

- **BKR 1 ARC AMP INT-A(C):** Select the same output operands that are configured to operate the output relays used to trip the breaker. In three-pole tripping applications, the same operand should be configured to initiate arcing current calculations for poles A, B and C of the breaker. In single-pole tripping applications, per-pole tripping operands should be configured to initiate the calculations for the poles that are actually tripped.
- **BKR 1 ARC AMP DELAY:** This setting is used to program the delay interval between the time the tripping sequence is initiated and the time the breaker contacts are expected to part, starting the integration of the measured current.
- **BKR 1 ARC AMP LIMIT:** Selects the threshold value above which the output operand is set.

The detection of the breaker flashover is based on the following condition:

1. Breaker open,
2. Voltage difference drop, and
3. Measured flashover current through the breaker.

Furthermore, the scheme is applicable for cases where either one or two sets of three-phase voltages are available across the breaker.

THREE VT BREAKER FLASHOVER APPLICATION

When only one set of VTs is available across the breaker, the **BRK 1 FLSHOVR SIDE 2 SRC** setting should be “None”. To detect an open breaker condition in this application, the scheme checks if the per-phase voltages were recovered (picked up), the status of the breaker is open (contact input indicating the breaker status is off), and no flashover current is flowing. A contact showing the breaker status must be provided to the relay. The voltage difference will not be considered as a condition for open breaker in this part of the logic.

Voltages must be present prior to flashover conditions. If the three VTs are placed after the breaker on the line (or feeder), and the downstream breaker is open, the measured voltage would be zero and the flashover element will not be initiated.

The flashover detection will reset if the current drops back to zero, the breaker closes, or the selected FlexLogic operand for supervision changes to high. Using supervision through the **BRK 1 FLSHOVR SPV A**, **BRK 1 FLSHOVR SPV B**, and **BRK 1 FLSHOVR SPV C** settings is recommended by selecting a trip operand that will not allow the flashover element to pickup prior to the trip.

The flashover detection can be used for external alarm, re-tripping the breaker, or energizing the lockout relay.

Consider the following configuration:

The source 1 (SRC1) phase currents are feeder CTs and phase voltages are bus VTs, and Contact Input 1 is set as Breaker 52a contact. The conditions prior to flashover detection are:

1. 52a status = 0.
2. V_{Ag} , V_{Bg} , or V_{Cg} is greater than the pickup setting.
3. I_A , I_B , $I_C = 0$; no current flows through the breaker.
4. ΔV_A is greater than pickup (not applicable in this scheme).

The conditions at flashover detection are:

1. 52a status = 0.
2. I_A , I_B , or I_C is greater than the pickup current flowing through the breaker.
3. ΔV_A is greater than pickup (not applicable in this scheme).

SIX VT BREAKER FLASHOVER APPLICATION

The per-phase voltage difference approaches zero when the breaker is closed. This is well below any typical minimum pickup voltage. Select the level of the **BRK 1 FLSHOVR DIFF V PKP** setting to be less than the voltage difference measured across the breaker when the close or open breaker resistors are left in service. Prior to flashover, the voltage difference is larger than **BRK 1 FLSHOVR DIFF V PKP**. This applies to either the difference between two live voltages per phase or when the voltage from one side of the breaker has dropped to zero (line de-energized), at least one per-phase voltage is larger than the **BRK 1 FLSHOVR V PKP** setting, and no current flows through the breaker poles. During breaker flashover, the per-phase voltages from both sides of the breaker drops below the pickup value defined by the **BRK 1 FLSHOVR V PKP** setting, the voltage difference drops below the pickup setting, and flashover current is detected. These flashover conditions initiate FlexLogic pickup operands and start the **BRK 1 FLSHOVR PKP DELAY** timer.

This application does not require detection of breaker status via a 52a contact, as it uses a voltage difference larger than the **BRK 1 FLSHOVR DIFF V PKP** setting. However, monitoring the breaker contact will ensure scheme stability.

Consider the following configuration:

The source 1 (SRC1) phase currents are CTs and phase voltages are bus VTs. The source 2 (SRC2) phase voltages are line VTs. Contact input 1 is set as the breaker 52a contact (optional).

The conditions prior to flashover detection are:

1. ΔVA is greater than pickup
2. $IA, IB, IC = 0$; no current flows through the breaker
3. 52a status = 0 (optional)

The conditions at flashover detection are:

1. ΔVA is less than pickup
2. $VAg, VBg, or VCg$ is lower than the pickup setting
3. $IA, IB, or IC$ is greater than the pickup current flowing through the breaker
4. 52a status = 0 (optional)

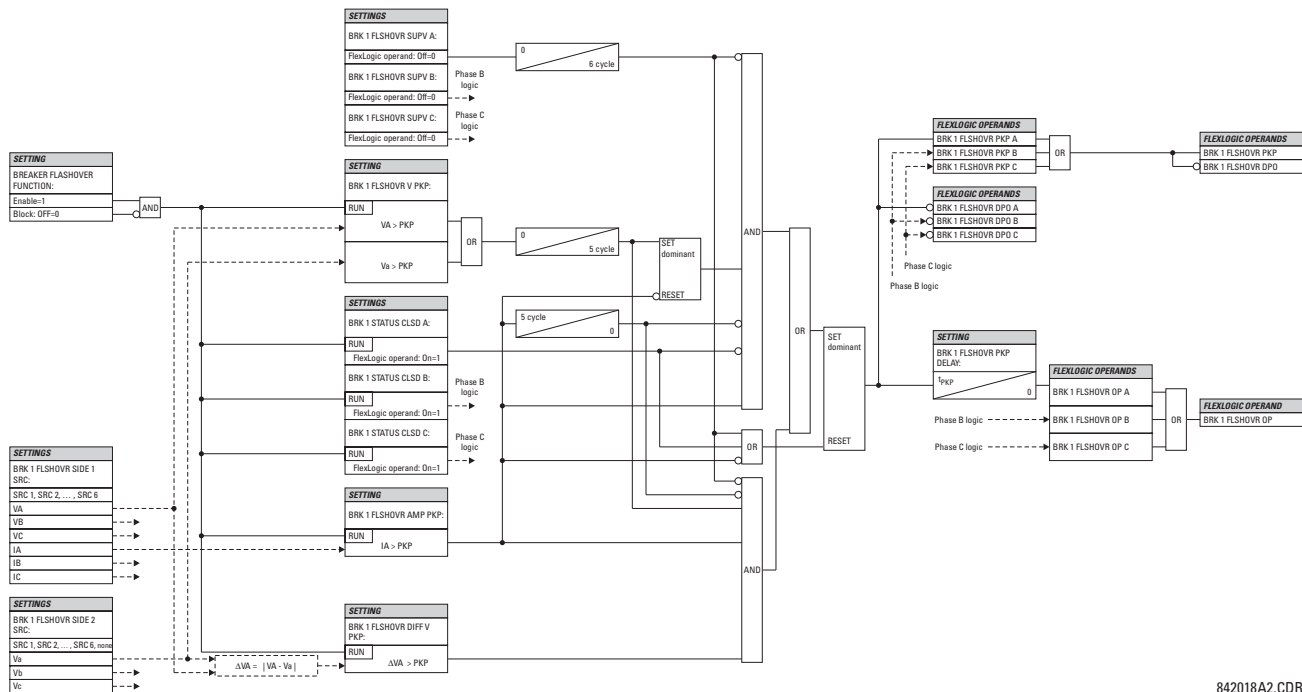

The element is operational only when phase-to-ground voltages are connected to relay terminals. The flashover element will not operate if delta voltages are applied.

The breaker flashover settings are described below.

- **BRK 1 FLSHOVR SIDE 1 SRC:** This setting specifies a signal source used to provide three-phase voltages and three-phase currents from one side of the current breaker. The source selected as a setting and must be configured with breaker phase voltages and currents, even if only three (3) VTs are available across the breaker.
- **BRK 1 FLSHOVR SIDE 2 SRC:** This setting specifies a signal source used to provide another set of three phase voltages whenever six (6) VTs are available across the breaker.
- **BRK 1 STATUS CLSD A to BRK 1 STATUS CLSD C:** These settings specify FlexLogic operands to indicate the open status of the breaker. A separate FlexLogic operand can be selected to detect individual breaker pole status and provide flashover detection. The recommended setting is 52a breaker contact or another operand defining the breaker poles open status.
- **BRK 1 FLSHOVR V PKP:** This setting specifies a pickup level for the phase voltages from both sides of the breaker. If six VTs are available, opening the breaker leads to two possible combinations – live voltages from only one side of the breaker, or live voltages from both sides of the breaker. Either case will set the scheme ready for flashover detection upon detection of voltage above the selected value. Set **BRK FLSHOVR V PKP** to 85 to 90% of the nominal voltage.
- **BRK 1 FLSHOVR DIFF V PKP:** This setting specifies a pickup level for the phase voltage difference when two VTs per phase are available across the breaker. The pickup voltage difference should be below the monitored voltage difference when close or open breaker resistors are left in service. The setting is selected as primary volts difference between the sources.
- **BRK 1 FLSHOVR AMP PKP:** This setting specifies the normal load current which can flow through the breaker. Depending on the flashover protection application, the flashover current can vary from levels of the charging current when the line is de-energized (all line breakers open), to well above the maximum line (feeder) load (line/feeder connected to load).
- **BRK 1 FLSHOVR SPV A to BRK 1 FLSHOVR SPV C:** These settings specify FlexLogic operands (per breaker pole) that supervise the operation of the element per phase. Supervision can be provided by operation of other protection

elements, breaker failure, and close and trip commands. A six-cycle time delay applies after the selected FlexLogic operand resets.

- **BRK FLSHOVR PKP DELAY:** This setting specifies the time delay to operate after a pickup condition is detected.

According to IEEE standard C37.100: *IEEE Standard Definitions for Power Switchgear*, restrike is defined as “a resumption of current between the contacts of a switching device during an opening operation after an interval of zero current of ¼ cycle at normal frequency or longer”.

Figure 5-151: TYPICAL RESTRIKE WAVEFORM AND DETECTION FLAG

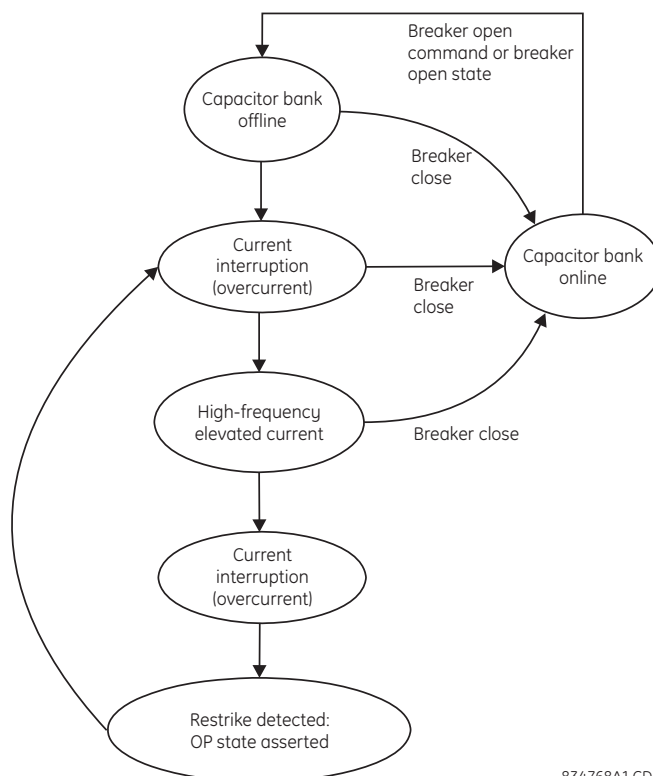

The breaker restrike algorithm responds to a successful interruption of the phase current following a declaration of capacitor bank offline as per the breaker pole indication. If a high-frequency current with a magnitude greater than the threshold is resumed at least ¼ of a cycle later than the phase current interruption, then a breaker restrike condition is declared in the corresponding phase and the BRK RESTRIKE 1 OP operand is asserted for a short period of time. The user can add counters and other logic to facilitate the decision making process as to the appropriate actions upon detecting a single restrike or a series of consecutive restrikes.

A restrike event (FlexLogic operand) is declared if all of the following hold:

- The current is initially interrupted.

- The breaker status is open.
- An elevated high frequency current condition occurs and the current subsequently drops out again.

The algorithm is illustrated in the state machine diagram shown below.

834768A1.CDR

Figure 5–152: ALGORITHM ILLUSTRATION – STATE MACHINE TO DETECT RESTRIKE

In this way, a distinction is made between a self-extinguishing restrike and permanent breaker failure condition. The latter can be detected by the breaker failure function or a regular instantaneous overcurrent element. Also, a fast succession of restrikes will be picked up by breaker failure or instantaneous overcurrent protection.

The following settings are available for each element.

- **BREAKER RESTRIKE 1 FUNCTION:** This setting enable and disables operation of the breaker restrike detection element.
- **BRK RSTR 1 BLOCK:** This setting is used to block operation of the breaker restrike detection element.
- **BREAKER RESTRIKE 1 SOURCE:** This setting selects the source of the current for this element. This source must have a valid CT bank assigned.
- **BREAKER RESTRIKE 1 PICKUP:** This setting specifies the pickup level of the overcurrent detector in per-unit values of CT nominal current.
- **BREAKER RESTRIKE 1 RESET DELAY:** This setting specifies the reset delay for this element. When set to “0 ms”, then FlexLogic operand will be picked up for only 1/8th of the power cycle.
- **BRK RSTR 1 BRK OPEN:** This setting assigns a FlexLogic operand indicating the open position of the breaker. It must be logic “1” when breaker is open.
- **BRK RSTR 1 OPEN CMD:** This setting assigns a FlexLogic operand indicating a breaker open command. It must be logic “1” when breaker is opened, either manually or from protection logic.
- **BRK RSTR 1 CLS CMD:** This setting assigns a FlexLogic operand indicating a breaker close command. It must be logic “1” when breaker is closed.

The continuous monitor logic is intended to detect the operation of any tripping element that has operated under normal load conditions; that is, when the disturbance detector has not operated. Because all tripping is supervised by the disturbance detector function, no trip will be issued under these conditions. This could occur when an element is incorrectly set so that it may misoperate under load. The continuous monitor can detect this state and issue an alarm and/or block the tripping of the relay.

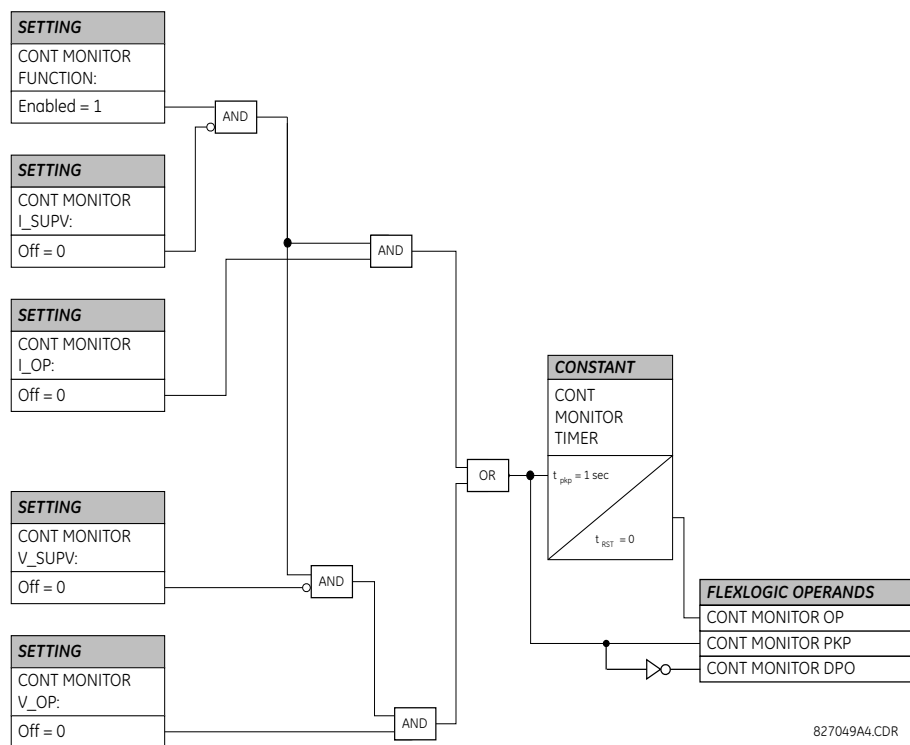

Figure 5-154: CONTINUOUS MONITOR SCHEME LOGIC

f) CT FAILURE DETECTOR

	MESSAGE	CT FAIL EVENTS: Disabled	Range: Disabled, Enabled

The CT failure function is designed to detect problems with system current transformers used to supply current to the relay. This logic detects the presence of a zero-sequence current at the supervised source of current without a simultaneous zero-sequence current at another source, zero-sequence voltage, or some protection element condition.

The CT failure logic (see below) is based on the presence of the zero-sequence current in the supervised CT source and the absence of one of three or all of the three following conditions.

1. Zero-sequence current at different source current (may be different set of CTs or different CT core of the same CT).
2. Zero-sequence voltage at the assigned source.
3. Appropriate protection element or remote signal.

The CT failure settings are described below.

- **CT FAIL FUNCTION:** This setting enables or disables operation of the CT failure element.
- **CT FAIL BLOCK:** This setting selects a FlexLogic operand to block operation of the element during some condition (for example, an open pole in process of the single pole tripping-reclosing) when CT fail should be blocked. Local signals or remote signals representing operation of some remote current protection elements via communication channels can also be chosen.
- **CT FAIL 3I0 INPUT 1:** This setting selects the current source for input 1. The most critical protection element should also be assigned to the same source.
- **CT FAIL 3I0 INPUT 1 PICKUP:** This setting selects the 3I₀ pickup value for input 1 (the main supervised CT source).
- **CT FAIL 3I0 INPUT 2:** This setting selects the current source for input 2. Input 2 should use a different set of CTs or a different CT core of the same CT. If 3I₀ does not exist at source 2, then a CT failure is declared.
- **CT FAIL 3I0 INPUT 2 PICKUP:** This setting selects the 3I₀ pickup value for input 2 (different CT input) of the relay.
- **CT FAIL 3V0 INPUT:** This setting selects the voltage source.

- **CT FAIL 3V0 INPUT PICKUP:** This setting specifies the pickup value for the 3V_0 source.
- **CT FAIL PICKUP DELAY:** This setting specifies the pickup delay of the CT failure element.

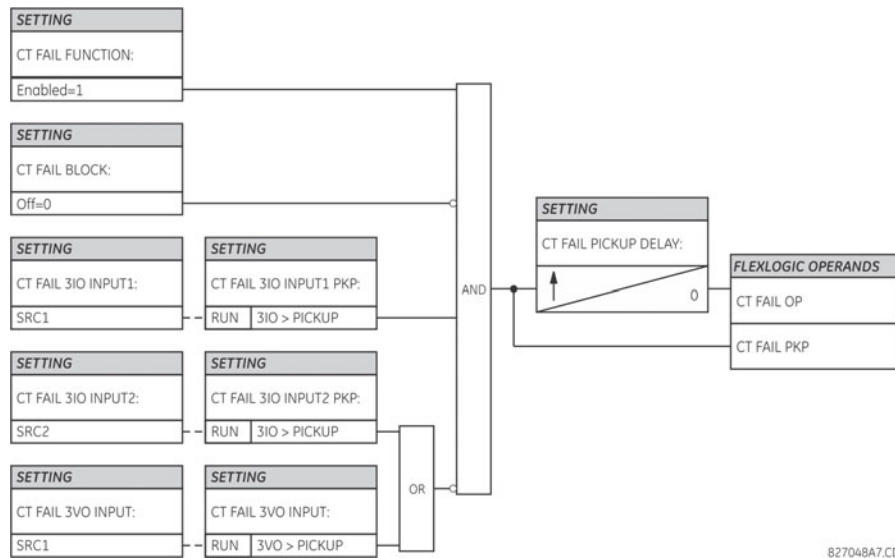

Figure 5-155: CT FAILURE DETECTOR SCHEME LOGIC

g) VT FUSE FAILURE

PATH: SETTINGS ⇨ CONTROL ELEMENTS ⇨ MONITORING ELEMENTS ⇨ VT FUSE FAILURE 1(4)

■ VT FUSE FAILURE 1	◀▶	VT FUSE FAILURE 1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE	▲▼	■ NEUTRAL WIRE OPEN 1 ■ DETECTION: Disabled	Range: Disabled, Enabled
MESSAGE	▲▼	■ NEUTRAL WIRE OPEN 1 ■ 3 HARM PKP: 0.100	0.000 to 3.000 pu in steps of 0.001

Every signal source includes a fuse failure scheme.

The VT fuse failure detector can be used to raise an alarm and/or block elements that may operate incorrectly for a full or partial loss of AC potential caused by one or more blown fuses. Some elements that might be blocked (via the BLOCK input) are distance, voltage restrained overcurrent, and directional current.

There are two classes of fuse failure that occur:

- Class A: loss of one or two phases.
- Class B: loss of all three phases.

Different means of detection are required for each class. An indication of class A failures is a significant level of negative-sequence voltage, whereas an indication of class B failures is when positive sequence current is present and there is an insignificant amount of positive sequence voltage. Also rapid decrease in the phase voltages magnitude from a healthy voltage level without disturbance in current can indicate a VT fuse fail conditions. These noted indications of fuse failure can also be present when faults are present on the system, so a means of detecting faults and inhibiting fuse failure declarations during these events is provided.

Once the fuse failure condition is declared, it is sealed-in until the cause that generated it disappears.

An additional condition is introduced to inhibit a fuse failure declaration when the monitored circuit is de-energized; positive-sequence voltage and current are both below threshold levels.

The **VT FUSE FAILURE 1 FUNCTION** setting enables and disables the fuse failure feature for each source.

The VT NEU WIRE OPEN 1 FUNCTION setting enables and disables the VT neutral wire open detection function. When the VT is connected in Delta, do not enable this function because there is no neutral wire for Delta connected VT.

The VT NEU WIRE OPEN 1 3 HARM PKP setting specifies the pickup level of 3rd harmonic of 3V0 signal for the VT NEU WIRE OPEN detection logic to pick up.

Figure 5-156: VT FUSE FAIL SCHEME LOGIC

Base voltage for this element is PHASE VT SECONDARY setting in the case of WYE VTs and $(\text{PHASE VT SECONDARY})/\sqrt{3}$ in case of DELTA VTs.

The open pole detector is intended to identify an open pole of the line circuit breaker. The scheme monitors the breakers auxiliary contacts, current in the circuit and optionally voltage on the line. The scheme generates output operands used to block the phase selector and some specific protection elements, thus preventing maloperation during the dead time of a single-pole autoreclose cycle or any other open pole conditions.

The scheme declares an open pole at the moment a single-pole trip is issued.

In two-breaker and breaker-and-a-half applications, an open pole condition is declared when one or more of the following hold:

- Both breakers have an open pole on the same phase.
- The current on the line drops below a threshold.
- The current and voltage on the line drop below a threshold.

The open pole feature uses signals defined by the **GROUPED ELEMENTS ⇒ SETTING GROUP 1(6) ⇒ DISTANCE ⇒ DISTANCE SOURCE** setting. Voltage supervision can be used only with wye VTs on the line side of the breaker.

The **OPEN POLE CURRENT PICKUP** setting establishes the current threshold below which an open pole is declared.

The **OPEN POLE LINE XC1** setting specifies positive-sequence reactance of the entire line. If shunt reactors are applied, this value should be a net capacitive reactance of the line and the reactors installed between the line breakers. The value is entered in secondary ohms. This setting is relevant if open pole condition at the remote end of the line is to be sensed and utilized by the relay.

The **OPEN POLE LINE XC0** setting specifies zero-sequence reactance of the entire line. If shunt reactors are applied, this value should be a net capacitive reactance of the line and the reactors installed between the line breakers. The value shall be entered in secondary ohms. This setting is relevant if open pole condition at the remote end of the line is to be sensed and utilized by the relay (OPEN POLE REM OP FlexLogic operand).

The **OPEN POLE REM CURR PKP** setting specifies pickup level for the remote-end current estimated by the relay as the local current compensated by the calculated charging current. The latter is calculated based on the local voltages and the capacitive reactances of the line. This setting is relevant if open pole condition at the remote end of the line is to be sensed and utilized by the relay (OPEN POLE REM OP FlexLogic operand).

The **OPEN POLE MODE** setting selects the mode of operation of the open pole function. When the “Accelerated” mode is chosen, an open pole will be declared $\frac{1}{2}$ cycle after trip output operation and before the breaker pole opens. This blocks distance loops involved in the faulted phase and phase selector, and arms the trip output to produce three-pole trip for the next fault. If the fault evolves into multi-phase fault before breaker pole opens for the first fault, the remaining in-service distance loops would initiate a three-pole trip. When the “Traditional” mode is selected, then an open pole is declared only after the breaker opens and current disappears. If the fault evolves into a multi-phase fault before the circuit breaker pole opens for the first fault, the phase selector will change the fault type from a single-line-to-ground fault to a multi-phase fault, thereby initiating a three-pole trip.

The **OPEN POLE DETECTION** setting selects the signals used to detect an open pole condition. When “I AND V AND CBaux” value is selected, the breaker 52 contacts and the current with optional voltage signals are used to determine open pole conditions. For the “I AND V only” selection, only the current with optional voltage signals are used.

For convenience, the position of the breaker poles defined in the breaker control feature and available as FlexLogic operand BREAKER 1 Φ A CLSD through BREAKER 1 Φ C CLSD and BREAKER 1 OOS are used by the open pole feature if the “I AND V AND CBaux” detection value is selected.

For correct operation of the open pole detector, the breaker control, trip output, and single-pole autoreclose features must be enabled and configured properly. When used in configuration with only one breaker, the **BREAKER 2 FUNCTION** should be “Enabled” and the **BREAKER 2 OUT OF SV** setting should be “On” (refer to the *Breaker Control* section earlier in this chapter for additional details).

MESSAGE	<div>⏮ ⏭</div> <div>BROKEN CONDUCT 1</div> <div>EVENTS: Disabled</div>	<div>Range: Disabled, Enabled</div>

Two broken conductor detection elements are provided.

The broken conductor function will detect a transmission line broken conductor condition or a single-pole breaker malfunction condition through checking the phase current input signals and the I_2 / I_1 ratio. The intention of this function is to detect a single-phase broken conductor only. As such two-phase or three-phase broken conductors cannot be detected.

To distinguish between single-phase disappearance and system disturbance in all three phases (such as load change, switching, etc.), the broken conductor element monitors the change in all three phase currents at the present instance and at four cycles previous. It also monitors changes in the I_2 / I_1 ratio, I_1 minimum, and I_1 maximum.

The broken conductor function should not be used to respond to fault transients and single-pole tripping/reclosing conditions. Therefore, the time delay should be programmed to a sufficient length to ensure coordination with the breaker dead time of the recloser function.

- **BROKEN CONDUCTOR 1 FUNCTION:** This setting enables and disables the broken conductor function.
- **BROKEN CONDUCTOR 1 SOURCE:** This setting selects a signal source used to provide three-phase current inputs to this function.
- **BROKEN CONDUCTOR 1 I2/I1 RATIO:** This setting specifies the ratio of negative-sequence current to positive-sequence current. When one phase conductor is broken, the I_2 / I_1 ratio with a balanced remaining two phases is 50%. So normally this setting should be set below 50% (for example, to 30%).
- **BROKEN CONDUCTOR 1 I1 MIN:** This setting specifies the minimum positive-sequence current supervision level. Ensure this setting is programmed to a sufficient level to prevent I_2 / I_1 from erratic pickup due to a low I_1 signal. However, this setting should not be set too high, since the broken conductor condition cannot be detected under light load conditions when I_1 is less than the value specified by this setting.
- **BROKEN CONDUCTOR 1 I1 MAX:** This setting specifies the maximum I_1 level allowed for the broken conductor function to operate. When I_1 exceeds this setting, this it is considered a fault. This broken conductor function should not respond to any fault conditions, so normally this setting is programmed to less than the maximum load current.
- **BROKEN CONDUCTOR 1 PKP DELAY:** This setting specifies the pickup time delay for this function to operate after assertion of the broken conductor pickup FlexLogic operand.

The thermal overload protection element corresponds to the IEC 255-8 standard and is used to detect thermal overload conditions in protected power system elements. Choosing an appropriate time constant element can be used to protect different elements of the power system. The cold curve characteristic is applied when the previous averaged load current over the last 5 cycles is less than 10% of the base current. If this current is greater or equal than 10% than the base current, then the hot curve characteristic is applied.

The IEC255-8 cold curve is defined as follows:

$$t_{op} = \tau_{op} \times \ln \left(\frac{I^2}{I^2 - (kI_B)^2} \right) \quad (\text{EQ 5.34})$$

The IEC255-8 hot curve is defined as follows:

$$t_{op} = \tau_{op} \times \ln \left(\frac{I^2 - I_p^2}{I^2 - (kI_B)^2} \right) \quad (\text{EQ 5.35})$$

In the above equations,

- t_{op} = time to operate.
- τ_{op} = thermal protection trip time constant.
- I = measured overload RMS current.
- I_p = measured load RMS current before overload occurs.
- k = IEC 255-8 k-factor applied to I_B , defining maximum permissible current above nominal current.
- I_B = protected element base (nominal) current.

The reset time of the thermal overload protection element is also time delayed using following formula:

$$t_{rst} = \tau_{rst} \times \ln \left(\frac{(kI_B)^2}{I^2 - (kI_B)^2} \right) + T_{min} \quad (\text{EQ 5.36})$$

In the above equation,

- τ_{rst} = thermal protection trip time constant.
- T_{min} is a minimum reset time setting

Figure 5-160: IEC 255-8 SAMPLE OPERATE AND RESET CURVES

The thermal overload protection element estimates accumulated thermal energy E using the following equations calculated each power cycle. When current is greater than the pickup level, $I_n > k \times I_B$, element starts increasing the thermal energy:

$$E_n = E_{n-1} + \frac{\Delta t}{t_{op}(I_n)} \quad (\text{EQ 5.37})$$

When current is less than the dropout level, $I_n > 0.97 \times k \times I_B$, the element starts decreasing the thermal energy:

(EQ 5.38)

- Δt is the power cycle duration.
- n is the power cycle index.
- $t_{op(In)}$ is the trip time calculated at index n as per the IEC255-8 cold curve or hot curve equations.
- $t_{rst(In)}$ is the reset time calculated at index n as per the reset time equation.
- I_n is the measured overload RMS current at index n .
- E_n is the accumulated energy at index n .
- E_{n-1} is the accumulated energy at index $n - 1$.

Table 5-31: TYPICAL TIME CONSTANTS

PROTECTED EQUIPMENT	TIME CONSTANT	MINIMUM RESET TIME
Capacitor bank	10 minutes	30 minutes
Overhead line	10 minutes	20 minutes
Air-core reactor	40 minutes	30 minutes
Busbar	60 minutes	20 minutes
Underground cable	20 to 60 minutes	60 minutes

MESSAGE	▲	DUTT SCHEME EVENTS: Disabled	Range: Disabled, Enabled

This scheme uses an under-reaching Zone 1 distance element to key a transfer trip signal(s) to the remote end(s), where on receipt, the DUTT pilot scheme operates without additional protection supervision. For proper operation of the scheme the Zone 1 phase and ground distance elements must be enabled, configured, and set per rules of distance relaying.

In single-pole tripping applications, the scheme uses local fault type identification provided by the Phase Selector together with information received from the remote terminal(s). The latter may be coded into one, two or four bits over the communications channel.

The scheme generates output operands (DUTT TX1 through DUTT TX4) that are used to transmit the direct under-reaching signals to the remote end(s). Choices of communications channel include remote inputs/outputs and telecommunications interfaces. When used with telecommunications facilities the output operands should be assigned to operate output contacts connected to assert the individual bits at the interface.

To make the scheme a fully operational stand-alone feature, the scheme output operands must be configured to interface with other relay functions, output contacts in particular. Typically, the output operands should be programmed to initiate a trip, breaker fail, and autoreclose, and drive a user-programmable LED as per user application. When used in conjunction with the trip output element, the scheme is pre-configured to initiate trip, breaker fail, and single-pole autoreclose actions.

- **DUTT SCHEME BLOCK:** This setting allows the user to assign any FlexLogic operand to block the scheme. Contact inputs from a pilot cut-out switch are typically used for this purpose.
- **DUTT SEAL-IN DELAY:** The output FlexLogic operand (DUTT OP) is produced according to the DUTT scheme logic. A seal-in time delay is applied to this operand for coping with noisy communication channels such as a power line carrier. The **DUTT SEAL-IN DELAY** is a minimum guaranteed duration of the DUTT OP pulse. As this operand activates the Trip Table of the DUTT scheme, the trip operands DUTT TRIP A, B, C and 3P are sealed-in for the same period of time.
- **DUTT NO OF COMM BITS:** This setting specifies the number of bits available on the communications channel. With only one bit available, the scheme sends the direct under-reaching transfer trip command on bit no.1 (DUTT TX1 operand) and responds to the direct trip command received on bit no. 1 (**DUTT RX1** setting). The scheme uses only local fault type identification provided by the Phase Selector to assert the output operands DUTT TRIP A, B, C and 3P (see Chapter 8: Theory of Operation for details on the use of communication channels).
- **DUTT RX1 through DUTT RX4:** These settings allow the user to select the FlexLogic operands that represent the receive signals for the scheme. Typically input contacts interfacing with a signaling system are used.

The DUTT scheme requires a secure and dependable signaling system. For this reason, a series/parallel combination of receive signal “contacts” is often used. This is accomplished by using a multi-bit communications system to transmit redundant copies of the TX signal (often via different paths) and building appropriate security logic (such as series (AND gate) or 2-out-of-3 voting logic) with FlexLogic. The **DUTT RX1(4)** settings should be associated with the final (secure) TX signals.

In single-bit applications, **DUTT RX1** must be used. In two-bit applications, **DUTT RX1** and **DUTT RX2** must be used. In four-bit applications, **DUTT RX1**, **DUTT RX2**, **DUTT RX3**, and **DUTT RX4** must be used. In multi-terminal applications, the RX signals from two or more remote terminals should be connected through OR gates in the FlexLogic and the resulting signals should be configured as the DUTT RX inputs.

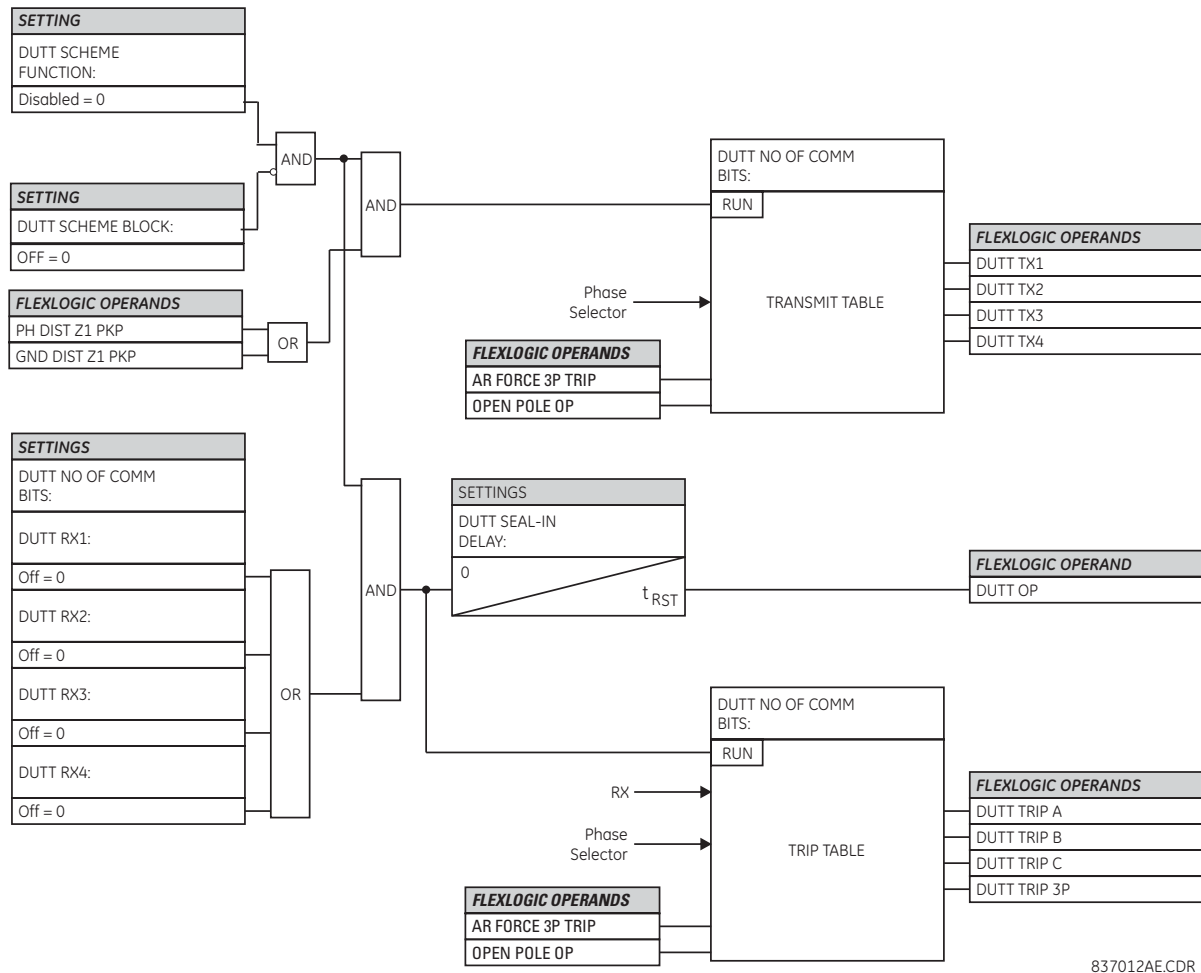

Figure 5-162: DUTT SCHEME LOGIC

c) PERMISSIVE UNDER-REACHING TRANSFER TRIP (PUTT)

PATH: SETTINGS ⇌ CONTROL ELEMENTS ⇌ PILOT SCHEMES ⇌ PUTT SCHEME

<input checked="" type="checkbox"/> PUTT SCHEME		PUTT SCHEME FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE		PUTT SCHEME BLOCK: Off	Range: FlexLogic operand
MESSAGE		PUTT RX PICKUP DELAY: 0.000 s	Range: 0.000 to 65.535 s in steps of 0.001
MESSAGE		PUTT SEAL-IN DELAY: 0.010 s	Range: 0.000 to 65.535 s in steps of 0.001
MESSAGE		PUTT NO OF COMM BITS: 1	Range: 1, 2, or 4
MESSAGE		PUTT RX1: Off	Range: FlexLogic operand
MESSAGE		PUTT RX2: Off	Range: FlexLogic operand
MESSAGE		PUTT RX3: Off	Range: FlexLogic operand
MESSAGE		PUTT RX4: Off	Range: FlexLogic operand
MESSAGE		PUTT SCHEME TARGET: Self-Reset	Range: Self-Reset, Latched, Disabled
MESSAGE		PUTT SCHEME EVENTS: Disabled	Range: Disabled, Enabled

This scheme uses an under-reaching zone 1 distance element to key a transfer trip signal(s) to the remote terminal(s) where it is supervised by an over-reaching zone 2 distance element. For proper operation, the zone 1 and 2 phase and ground distance elements must be enabled, configured, and set per rules of distance relaying.

In single-pole tripping applications, the scheme uses local fault type identification provided by the phase selector together with information received from the remote terminal(s). The scheme generates output operands (PUTT TX1 through PUTT TX4) that are used to transmit the signal to the remote end(s). Choices of communications channel include remote inputs/outputs and telecommunications interfaces. When used with telecommunications facilities the output operands should be assigned to operate output contacts connected to assert the individual bits at the interface.

To make the scheme a fully operational stand-alone feature, the scheme output operands must be configured to interface with other relay functions, output contacts in particular. Typically, the output operands should be programmed to initiate a trip, breaker fail, and autoreclose, and drive a user-programmable LED as per user application. When used in conjunction with the Trip Output element, the scheme is pre-configured to initiate trip, breaker fail and single-pole autoreclose actions.

- **PUTT SCHEME BLOCK:** This setting allows the user to assign any FlexLogic operand to block the scheme. Contact inputs from a pilot cut-out switch are typically used for this purpose.
- **PUTT RX PICKUP DELAY:** This setting enables the relay to cope with spurious receive signals. This delay should be set longer than the longest spurious TX signal that can be received simultaneously with the zone 1 pickup. The selected delay will increase the response time of the scheme.
- **PUTT SEAL-IN DELAY:** The output FlexLogic operand (PUTT OP) is produced according to the PUTT scheme logic. A seal-in time delay is applied to this operand for coping with noisy communication channels such as a power line carrier. The **PUTT SEAL-IN DELAY** is a minimum guaranteed duration of the PUTT OP pulse. As this operand activates the trip table of the PUTT scheme, the trip operands PUTT TRIP A, B, C and 3P are sealed-in for the same period of time.
- **PUTT NO OF COMM BITS:** This setting specifies the number of bits of the communications channel available for the scheme. The transmit codes and trip table of the PUTT scheme are identical as those for the direct under-reaching transfer trip scheme. Please refer to Chapter 8: Theory of Operation for more information.

- PUTT RX1 through PUTT RX4:** These settings allow the user to select the FlexLogic operands that represent the receive signals for the scheme. Typically input contacts interfacing with a signaling system are used. In single-bit applications, **PUTT RX1** must be used. In two-bit applications, **PUTT RX1** and **PUTT RX2** must be used. In four-bit applications, **PUTT RX1**, **PUTT RX2**, **PUTT RX3**, and **PUTT RX4** must be used. In multi-terminal applications, the RX signals from two or more remote terminals should be connected through OR gates in the FlexLogic and the resulting signals should be configured as the PUTT RX inputs.

5

GE Multilin

For proper operation, the Zone 2 phase and ground distance elements must be enabled, configured and set per rules of distance relaying. The Line Pickup element should be enabled, configured and set properly to detect line-end-open/weak-infeed conditions. If used by this scheme, the selected ground directional overcurrent function(s) must be enabled, configured and set accordingly.

In single-pole tripping applications, the scheme uses local fault type identification provided by the Phase Selector together with information received from the remote terminal. The scheme generates output operands (POTT TX1 through POTT TX4) that are used to transmit the signal to the remote end. Choices of communications channel include remote inputs/outputs and telecommunications interfaces. When used with telecommunications facilities the output operands should be assigned to operate output contacts connected to assert the individual bits at the interface.

To make the scheme fully operational as a stand-alone feature, the scheme output operands must be configured to interface with other relay functions, output contacts in particular. Typically, the output operands should be programmed to initiate a trip, breaker fail, and autoreclose, and drive a user-programmable LED as per user application.

When used in conjunction with the Trip Output element, the scheme is pre-configured to initiate trip, breaker fail, and single-pole autoreclose actions.

- **POTT SCHEME BLOCK:** This setting allows the user to assign any FlexLogic operand to block the scheme. Contact inputs from a pilot cut-out switch are typically used for this purpose.
- **POTT PERMISSIVE ECHO:** If this setting is set to “Enabled”, the scheme sends a permissive echo signal to the remote end(s) using a pre-programmed logic (see the following logic diagram). If set to “Custom”, the echo signal is sent if a condition selected via the **POTT ECHO COND** setting is satisfied. The echo is sent only once and then the logic locks out for the time specified by the **ECHO LOCKOUT**. The duration of the echo pulse is settable as **ECHO DURATION**. Operation of the overreaching protection elements (Distance Zone 2 or **GND DIR O/C FWD** setting) inhibits the echo.
- **POTT ECHO COND:** This setting specifies a user-selected echo condition and applies only if the **HYB POTT PERMISSIVE ECHO** is set to “Custom”.
- **POTT RX PICKUP DELAY:** This setting enables the relay to cope with spurious receive signals. The delay should be set longer than the longest spurious TX signal that can be received simultaneously with the Zone 2 pickup. The selected delay will increase the response time of the scheme.
- **TRANS BLOCK PICKUP DELAY:** This setting defines a transient blocking mechanism embedded in the POTT scheme for coping with the exposure of a ground directional overcurrent function (if used) to current reversal conditions. The transient blocking mechanism applies to the ground overcurrent path only as the reach settings for the Zone 2 distance functions is not expected to be long for two-terminal applications, and the security of the distance functions is not endangered by the current reversal conditions.

Upon receiving the **POTT RX** signal, the transient blocking mechanism allows the RX signal to be passed and aligned with the **GND DIR O/C FWD** indication only for a period of time set by **TRANS BLOCK PICKUP DELAY**. After that the ground directional overcurrent path will be virtually disabled for a period of time specified as **TRANS BLOCK RESET DELAY**.

The **TRANS BLOCK PICKUP DELAY** should be long enough to give the selected ground directional overcurrent function time to operate, but not longer than the fastest possible operation time of the protection system that can create current reversal conditions within the reach of the selected ground directional overcurrent function.

This setting should take into account the **POTT RX PICKUP DELAY**. The POTT RX signal is shaped for aligning with the ground directional indication as follows: the original RX signal is delayed by the **POTT RX PICKUP DELAY**, then terminated at **TRANS BLOCK PICKUP DELAY** after the pickup of the original POTT TX signal, and eventually locked-out for **TRANS BLOCK RESET DELAY**.

- **TRANS BLOCK RESET DELAY:** This setting defines a transient blocking mechanism embedded in the POTT scheme for coping with the exposure of a ground directional overcurrent function (if used) to current reversal conditions (see the **TRANS BLOCK PICKUP DELAY**). This delay should be selected long enough to cope with transient conditions including not only current reversals but also spurious negative- and zero-sequence currents occurring during breaker operations. The breaker failure time of the surrounding protection systems within the reach of the ground directional function used by the POTT scheme may be considered to make sure that the ground directional function is not jeopardized during delayed breaker operations.
- **ECHO DURATION:** This setting defines the guaranteed and exact duration of the echo pulse. The duration does not depend on the duration and shape of the received RX signal. This setting enables the relay to avoid a permanent lock-up of the transmit/receive loop.
- **ECHO LOCKOUT:** This setting defines the lockout period for the echo logic after sending the echo pulse.

- **LINE END OPEN PICKUP DELAY:** This setting defines the pickup value for validation of the line end open conditions as detected by the Line Pickup logic through the LINE PICKUP LEO PKP FlexLogic operand. The validated line end open condition is a requirement for the POTT scheme to return a received echo signal (if the echo feature is enabled). This value should take into account the principle of operation and settings of the Line Pickup element.
- **POTT SEAL-IN DELAY:** The output FlexLogic operand (POTT OP) is produced according to the POTT scheme logic. A seal-in time delay is applied to this operand for coping with noisy communication channels. The **POTT SEAL-IN DELAY** defines a minimum guaranteed duration of the POTT OP pulse. As this operand activates the trip table of the POTT scheme, the trip operands POTT TRIP A, B, C and 3P are sealed-in for the same period of time.
- **GND DIR O/C FWD:** This setting defines the FlexLogic operand (if any) of a protection element that is used in addition to the Zone 2 for identifying faults on the protected line, and thus, for keying the communication channel and initiating operation of the scheme. Good directional integrity is the key requirement for an over-reaching forward-looking protection element used as **GND DIR O/C FWD**. Even though any FlexLogic operand could be used as **GND DIR O/C FWD** allowing the user to combine responses of various protection elements, or to apply extra conditions through FlexLogic equations, this extra signal is primarily meant to be the output operand from either the negative-sequence directional overcurrent or neutral directional overcurrent. Both of these elements have separate forward (FWD) and reverse (REV) output operands. The forward indication should be used (**NEG SEQ DIR OC1 FWD** or **NEUTRAL DIR OC1 FWD**). For greater security and to overcome spurious directional element operation during transients, adding at least 0.5 cycles of pickup delay to the forward directional element is recommended.
- **POTT NO OF COMM BITS:** This setting specifies the number of bits of the communications channel available for the scheme. The transmit codes and trip tables of the POTT scheme are the same as those for the permissive under-reaching transfer trip scheme. Please refer to the description of the POTT scheme for more information.
- **POTT RX1 through POTT RX4:** These settings allow the user to select the FlexLogic operands that represent the receive signals for the scheme. Typically input contacts interfacing with a signaling system are used. In single-bit applications, **POTT RX1** must be used. In two-bit applications, **POTT RX1** and **POTT RX2** must be used. In four-bit applications, **POTT RX1**, **POTT RX2**, **POTT RX3**, and **POTT RX4** must be used.

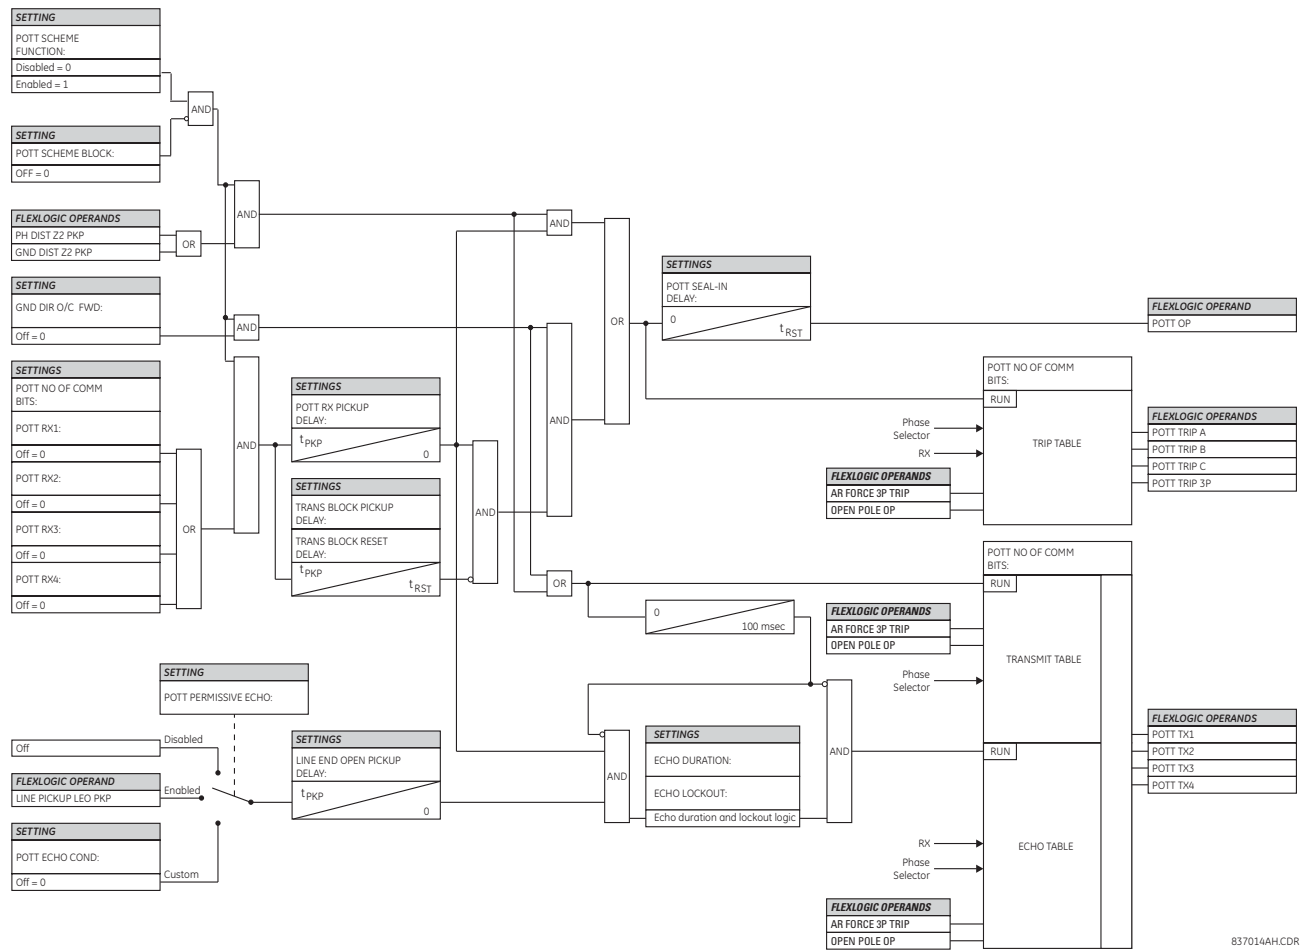

Figure 5-164: POTT SCHEME LOGIC

PATH: SETTINGS ⇒↓ CONTROL ELEMENTS ⇒↓ PILOT SCHEMES ⇒↓ POTT1 SCHEME

5

The POTT1 pilot scheme operates the same way as the regular POTT scheme, except hard-coded connections to phase and ground distance elements are removed to allow the user to choose directional elements, for example ground OC directional elements. This allows a user to apply the POTT1 scheme using solely directional elements to achieve better coordination, rather than mixing up distance and ground OC directional elements together.

The settings and application guidance for the POTT scheme applies to the POTT1 scheme. See the POTT section.

- DIR FWD1..3:** This setting defines the FlexLogic operand of a protection element used for keying the communication channel and initiating operation of the scheme. Good directional integrity is the key requirement for an over-reaching forward-looking protection element used as DIR FWD. Even though any FlexLogic operand can be used as DIR FWD allowing the user to combine responses of various protection elements, or to apply extra security conditions through FlexLogic equations, this signal is primarily meant to be the output operand from either the Negative-Sequence Directional IOC or Neutral Directional IOC. Both of these elements have separate forward (FWD) and reverse (REV) output operands. The forward indication is used (NEG SEQ DIR OC1 FWD or NEUTRAL DIR OC1 FWD).

Generally, this scheme uses an overreaching zone 2 distance element to essentially compare the direction to a fault at all terminals of the line. Ground directional overcurrent functions available in the L90 can be used in conjunction with the zone 2 distance element to key the scheme and initiate operation. This increases the coverage for high-resistance faults.

The scheme is intended for three-terminal and two-terminal applications with weak-infeed conditions. As a long reach of the overreaching distance element may be required for three-terminal applications, transient blocking logic is provided for both distance and ground directional overcurrent elements. In order to cope with weak-infeed conditions an echo feature is made available.

By default the scheme uses the reverse-looking zone 4 distance element to identify reverse faults. Additionally, reverse-looking ground directional overcurrent functions can be used in conjunction with the zone 4.

For proper operation, the zone 2 and 4 phase and ground distance elements must be enabled, configured and set per rules of distance relaying. The line pickup element should be enabled, configured and set properly to detect line-end-open/weak-infeed and undervoltage conditions. If used by the scheme, the selected ground directional overcurrent function(s) must be enabled, configured, and set accordingly.

In single-pole tripping applications, the scheme uses local fault type identification provided by the phase selector together with information received from the remote terminal. The scheme generates output operands (HYBRID POTT TX1 through HYBRID POTT TX4) that are used to transmit the signal to the remote terminal(s). Choices of communications channel include remote inputs/outputs and telecommunications interfaces. When used with telecommunications facilities the output operand should be assigned to operate an output contact connected to key the transmitter at the interface. When used with telecommunications facilities the output operands should be assigned to operate output contacts connected to assert the individual bits at the interface.

To make the scheme fully operational as a stand-alone feature, the scheme output operands must be configured to interface with other relay functions, output contacts in particular. Typically, the output operands should be programmed to initiate a trip, breaker fail, and autoreclose, and drive a user-programmable LED as per user application.

When used in conjunction with the trip output element, the scheme is pre-configured to initiate trip, breaker fail and single-pole autoreclose actions.

- **HYB POTT BLOCK:** This setting allows the user to assign any FlexLogic operand to block the scheme. Contact inputs from a pilot cut-out switch are typically used for this purpose.
- **HYB POTT PERMISSIVE ECHO:** If set to “Enabled”, the scheme sends a permissive echo signal to the remote end(s) using a pre-programmed logic (refer to the logic diagram below). If set to “Custom”, the echo signal is sent if a condition selected via the **HYB POTT ECHO COND** setting is satisfied. The echo is sent only once and then the logic locks out for the time specified by the **ECHO LOCKOUT** setting. The duration of the echo pulse is settable as **ECHO DURATION**. Operation of the overreaching protection elements (distance zone 2 or **GND DIR O/C FWD** setting) inhibits the echo.
- **HYB POTT ECHO COND:** This setting specifies a user-selected echo condition and applies only if the **HYB POTT PERMISSIVE ECHO** is set to “Custom”.
- **HYB POTT WEAK INFEED:** If this setting is set to “Enabled”, the scheme activates both the keying and operating paths using a pre-programmed weak infeed logic (refer to the logic diagram below). If this setting is set to “Custom”, the weak infeed condition is to be specified by the user via the **HYB POTT W/I COND** setting.
- **HYB POTT W/I COND:** This setting specifies user-selected weak infeed condition and applies only if the **HYB POTT WEAK INFEED** is set to “Custom”.
- **HYB POTT RX PICKUP DELAY:** This setting enables the relay to cope with spurious received signals. The delay should be set longer than the longest spurious TX signal that can be received simultaneously with the zone 2 pickup. The selected delay will increase the response time of the scheme.
- **TRANS BLOCK PICKUP DELAY:** This setting defines a transient blocking mechanism embedded in the hybrid POTT scheme for coping with the exposure of both the over-reaching zone 2 and ground directional overcurrent function to current reversal conditions.

The transient blocking logic applies to both operate (trip) and send (transmit) paths. Identifying the fault as a reverse fault prevents the scheme from both operating and keying the channel. If the reverse fault condition prevails for **TRANS BLOCK PICKUP DELAY**, the blocking operation will be extended by the transient blocking timer for **TRANS BLOCK RESET DELAY**. This allows riding through current reversal conditions.

However, if distance zone 1 picks up during the transient blocking condition, the blocking action is removed. This is to cope with evolving faults when an external fault is followed by an internal fault. Without the zone 1 feedback, the trip would be delayed unnecessarily.

The **TRANS BLOCK PICKUP DELAY** should not be longer than the fastest possible trip time for faults on an adjacent line so that extended blocking action could be established. This should take into account the pickup time of the reverse-looking elements of the scheme.

The delay defined by this setting should not be too short in order to avoid locking up a spurious reverse fault indication that can occur during internal fault conditions.

- **TRANS BLOCK RESET DELAY:** This setting defines a transient blocking mechanism embedded in the hybrid POTT scheme for coping with the exposure of the overreaching protection functions to current reversal conditions (see also the **TRANS BLOCK PICKUP DELAY**).

This delay should be selected long enough to cope with transient conditions including not only current reversals but also spurious negative and zero-sequence currents occurring during breaker operations (in the case when neutral directional overcurrent or negative-sequence directional overcurrent functions are used). The breaker failure time of the surrounding protection systems within the reach of the ground directional function used by the hybrid POTT scheme should be considered to make sure that the ground directional function is not jeopardized during delayed breaker operations.

- **ECHO DURATION:** This setting defines the guaranteed and exact duration of the echo pulse. The duration is not dependent on the duration and shape of received RX signals. This setting enables the relay to avoid a permanent lock-up of the transmit/receive loop.
- **ECHO LOCKOUT:** This setting defines the lockout period for the echo logic after sending the echo pulse. This enables the relay to avoid oscillations of the echo pulses during an autoreclosure dead-time after clearing an internal fault.
- **HYB POTT SEAL-IN DELAY:** The output FlexLogic operand (HYB POTT OP) is produced according to the hybrid POTT scheme logic. The **HYB POTT SEAL-IN DELAY** defines a minimum guaranteed duration of the HYB POTT OP pulse. As this operand runs the trip table of the hybrid POTT scheme, the trip operands HYB POTT TRIP A, B, C and 3P are sealed-in for the same period of time.
- **GND DIR O/C FWD:** This setting defines the FlexLogic operand (if any) of a protection element that is used in addition to zone 2 for identifying faults on the protected line, and thus, for keying the communication channel and initiating operation of the scheme (both through the transient blocking logic). Good directional integrity is the key requirement for an over-reaching forward-looking protection element used as **GND DIR O/C FWD**.

Even though any FlexLogic operand could be used as **GND DIR O/C FWD** enabling the user to combine responses of various protection elements or to apply extra conditions through FlexLogic equations, this extra signal is primarily meant to be the output operand from either the negative-sequence directional or neutral directional overcurrent elements. Both these elements have separate forward (FWD) and reverse (REV) output operands. The forward indication should be used (**NEG SEQ DIR OC1 FWD** or **NEUTRAL DIR OC1 FWD**).

The selected protection element (or elements in combination) should be coordinated with the selection of **GND DIR O/C REV**. For all the forward external faults seen by an element used as **GND DIR O/C FWD** at one end of the line, the reverse-looking element used as **GND DIR O/C REV** at the other end should pickup and provide a blocking signal. For greater security and to overcome spurious directional element operation during transients, adding at least 0.5 cycles of pickup delay to the forward directional element is recommended.

- **GND DIR O/C REV:** This setting defines the FlexLogic operand (if any) of a protection element used in addition to zone 4 for identifying reverse faults, and thus, for stopping the transmit signal and initiating the transient blocking timer. Good directional integrity is the key requirement for a reverse-looking protection element used as **GND DIR O/C REV**.

Even though any FlexLogic operand could be used as **GND DIR O/C REV** enabling the user to combine responses of various protection elements or to apply extra conditions through FlexLogic equations, this extra signal is primarily meant to be the output operand from either the negative sequence directional or neutral directional overcurrent element. Both these elements have separate forward (FWD) and reverse (REV) output operands. The reverse indication should be used (**NEG SEQ DIR OC1 REV** or **NEUTRAL DIR OC1 REV**).

The selected protection element (or elements in combination) should be coordinated with the selection of **GND DIR O/C FWD**. For all the forward external faults seen by an element used as **GND DIR O/C FWD** at one end of the line, the reverse-looking element used as **GND DIR O/C REV** at the other end should pickup and provide a blocking signal. For greater security and to overcome spurious directional element operation during transients, adding a pickup delay greater than the pilot channel delay to the reverse directional element is recommended.

- **HYB POTT NO OF COMM BITS:** This setting specifies the number of bits of the communications channel available for the scheme. The transmit codes and trip table of the hybrid POTT scheme are the same as those for the permissive under-reaching transfer trip scheme. Please refer to the description of the POTT scheme for more information.

- HYB POTT RX1 through HYB POTT RX4:** These settings allow the user to select the FlexLogic operands that represent the receive signals for the scheme. Typically input contacts interfacing with a signaling system are used. In single-bit applications, **HYB POTT RX1** must be used. In two-bit applications, **HYB POTT RX1** and **HYB POTT RX2** must be used. In four-bit applications, **HYB POTT RX1**, **HYB POTT RX2**, **HYB POTT RX3**, and **HYB POTT RX4** must be used.

MESSAGE	▲▼	BLOCK SCHEME TARGET: Self-Reset	Range: Self-Reset, Latched, Disabled
MESSAGE	▲	BLOCK SCHEME EVENT: Disabled	Range: Disabled, Enabled

Generally, the scheme compares the direction to a fault at all terminals of the line. Unlike the permissive schemes, the absence of a blocking signal permits operation of the scheme. Consequently, the scheme is biased toward dependability and requires an "on/off" type of signaling.

By default this scheme uses only a forward-looking over-reaching zone 2 distance element to identify forward faults. Ground directional overcurrent functions available in the relay can be used in conjunction with the zone 2 distance element to increase the coverage for high-resistance faults. Also by default, only a reverse-looking zone 4 distance element to identify reverse faults. Ground directional overcurrent functions available in the relay can be used in conjunction with the zone 4 distance element for better time and sensitivity coordination.

For proper operation, the zone 2 and 4 phase and ground distance elements must be enabled, configured and set per rules of distance relaying. If used by this scheme, the selected ground directional overcurrent functions must be enabled, configured, and programmed accordingly.

In single-pole tripping applications, the scheme uses local fault type identification provided by the phase selector together with information received from the remote terminal.

The scheme generates output operands (DIR BLOCK TX INIT and DIR BLOCK TX1 STOP through DIR BLOCK TX4 STOP) that control the transmission of signals to the remote end(s). When used with telecommunications facilities the output operands should be assigned to operate output contacts connected to key the transmitter at the interface.

The output operands from the scheme (DIR BLOCK A, B, C and 3P) must be configured to interface with other relay functions, output contacts in particular, in order to make the scheme fully operational. Typically, the output operand should be programmed to initiate a trip, breaker fail, and autoreclose, and drive a user-programmable LED as per user application.

When used in conjunction with the trip output element, the scheme is pre-configured to initiate trip, breaker fail, and single-pole autoreclose actions.

- **BLOCK SCHEME BLOCK:** This setting allows the user to assign any FlexLogic operand to block the scheme. Contact inputs from a pilot cut-out switch are typically used for this purpose.
- **BLOCK RX CO-ORD PKP DELAY:** This setting defines a delay for the forward-looking protection elements used by the scheme for coordination with the blocking response from the remote end(s). This setting should include both the response time of the protection elements used to establish a blocking signal and the total transmission time of that signal including the relay communications equipment interfacing and the communications channel itself.
- **TRANS BLOCK PICKUP DELAY:** This setting defines a transient blocking mechanism embedded in the blocking scheme for coping with the exposure of both the over-reaching zone 2 and ground directional overcurrent function to current reversal conditions.

The transient blocking logic applies to the send path only. Identifying the fault as a reverse fault establishes the blocking signal. If the reverse fault condition prevails for **TRANS BLOCK PICKUP DELAY**, the blocking operation will be extended by the transient blocking timer for **TRANS BLOCK RESET DELAY**. This allows riding through current reversal conditions. However, if zone 1 picks up during the transient blocking condition, the blocking action is removed. This is done to cope with evolving faults when an external fault is followed by an internal fault. Without the zone 1 feedback, the trip would be unnecessarily delayed.

The **TRANS BLOCK PICKUP DELAY** should not be longer than the fastest possible trip time for faults on an adjacent line so that the extended blocking action could be established. This should take into account the pickup time of the reverse-looking elements of the scheme. The delay defined by this setting should not be too short in order to avoid locking up a spurious reverse fault indication that can occur during internal fault conditions.

- **TRANS BLOCK RESET DELAY:** This setting defines a transient blocking mechanism embedded in the blocking scheme for coping with the exposure of the overreaching protection functions to current reversal conditions (see also the **TRANS BLOCK PICKUP DELAY**).

This delay should be selected long enough to cope with transient conditions including not only current reversals but also spurious negative and zero-sequence currents occurring during breaker operations (in the case when neutral directional or negative-sequence directional overcurrent functions are used). Breaker failure time of the surrounding protection systems within the reach of the ground directional function used by the blocking scheme should be considered to make sure that the ground directional function is not jeopardized during delayed breaker operations.

- **BLOCK SCHEME SEAL-IN DELAY:** The output FlexLogic operand (DIR BLOCK OP) is produced according to the Blocking scheme logic. The **BLOCK SCHEME SEAL-IN DELAY** defines a minimum guaranteed duration of the DIR BLOCK OP pulse. As this operand runs the Trip Table of the Blocking scheme, the trip operands DIR BLOCK TRIP A, B, C and 3P are sealed-in for the same period of time.
- **GND DIR O/C FWD:** This setting defines the FlexLogic operand (if any) of a protection element used in addition to zone 2 for identifying faults on the protected line, and thus, for initiating operation of the scheme. Good directional integrity is the key requirement for an over-reaching forward-looking protection element used as **GND DIR O/C FWD**.

Even though any FlexLogic operand could be used as **GND DIR O/C FWD** enabling the user to combine responses of various protection elements or to apply extra conditions through FlexLogic equations, this extra signal is primarily meant to be the output operand from either the negative-sequence directional or neutral directional overcurrent elements. Both these elements have separate forward (FWD) and reverse (REV) output operands.

The forward indication should be used (**NEG SEQ DIR OC1 FWD** or **NEUTRAL DIR OC1 FWD**). The selected protection element (or elements in combination) should be coordinated with the selection of **GND DIR O/C REV**. For all the forward external faults seen by an element used as **GND DIR O/C FWD** at one end of the line, the reverse-looking element used as **GND DIR O/C REV** at the other end should pickup and provide a blocking signal. For greater security and to overcome spurious directional element operation during transients, adding at least 0.5 cycles of pickup delay to the forward directional element is recommended.

- **GND DIR O/C REV:** This setting defines the FlexLogic operand (if any) of a protection element that is used in addition to zone 4 for identifying reverse faults, and thus, for initiating the blocking signal. Either reverse-looking directional or non-directional overcurrent protection element may be used as **GND DIR O/C REV**.

Even though any FlexLogic operand could be used as **GND DIR O/C REV**, enabling the user to combine responses of various protection elements or to apply extra conditions through FlexLogic equations, this extra signal is primarily meant to be the output operand from either the negative-sequence directional, neutral directional, or a non-directional instantaneous overcurrent element.

The selected protection element (or elements in combination) should be coordinated with the selection of **GND DIR O/C FWD**. For all the forward external faults seen by an element used as **GND DIR O/C FWD** at one end of the line, the reverse-looking element used as **GND DIR O/C REV** at the other end should pickup and provide a blocking signal. For greater security and to overcome spurious directional element operation during transients, adding a pickup delay greater than the pilot channel delay to the reverse directional element is recommended.

- **BLOCK SCHEME NO OF COMM BITS:** This setting specifies the number of bits of the communications channel available for the scheme. With only one bit available, the scheme sends the blocking signal by asserting the DIR BLOCK TX INIT FlexLogic operand. This operand should be used to start the channel (set the blocking signal). On internal faults, the scheme removes the blocking signal by asserting the DIR BLOCK TX1 FlexLogic operand.

For tripping the scheme responds to lack of the blocking signal on bit 1 (**BLOCK SCHEME RX1** setting). The scheme uses only local fault type identification provided by the phase selector to assert the output operands DIR BLOCK TRIP A, B, C and 3P. Please refer to the *Theory of operation* chapter for more information on communications.

To take advantage of the four-bit blocking scheme, the blocking signals should be initiated from a disturbance detector. This can be accomplished by using both 50DD and DIR BLOCK TX INIT to assert the blocking signal. Subsequently, specific bits will be de-asserted by the scheme based on the phase selection providing the peer relay with more information on the fault type. Otherwise, the peer relay issues a three-pole trip upon receiving the bit pattern (0, 0, 0, 0).

- **BLOCK SCHEME RX1 through BLOCK SCHEME RX4:** These settings allow the user to select the FlexLogic operands that represent the receive signals for the scheme. Typically input contacts interfacing with a signaling system are used. In single-bit applications, **BLOCK SCHEME RX1** must be used. In two-bit applications, **BLOCK SCHEME RX1** and **BLOCK SCHEME RX2** must be used. In four-bit applications, **BLOCK SCHEME RX1**, **BLOCK SCHEME RX2**, **BLOCK SCHEME RX3**, and **BLOCK SCHEME RX4** must be used.

This menu allows selecting and setting up protection signaling of the directional comparison unblocking scheme. This scheme is available for single-pole tripping applications and can be used with one, two, or four bit communications channels. Choices of communications channel include remote inputs/outputs and telecommunications interfaces.

Generally, this scheme uses an over-reaching zone 2 distance element to compare the direction to a fault at all terminals of the line. Ground directional overcurrent functions available in the relay can be used in conjunction with the zone 2 distance element to key the scheme and initiate its operation. This increases the coverage for high-resistance faults.

The scheme is intended for two or three-terminal applications. As a long reach of the overreaching distance element may be required for three-terminal applications, transient blocking logic is provided for both distance and ground directional overcurrent elements. An echo feature is made available to cope with line open conditions.

By default the scheme uses the reverse-looking zone 4 distance element to identify reverse faults. Additionally, reverse-looking ground directional overcurrent functions can be used in conjunction with the zone 4.

For proper operation of the scheme the zone 2 and 4 phase and ground distance elements must be enabled, configured and set per rules of distance relaying. The line pickup element should be enabled, configured and set properly to detect line-end-open conditions. If used by this scheme, the selected ground directional overcurrent function(s) must be enabled, configured and set accordingly.

In single-pole tripping applications, the scheme uses local fault type identification provided by the phase selector together with information received from the remote terminal. The scheme generates output operands (DCUB TX1 through DCUB TX4) that are used to transmit the signal to the remote terminal(s). The directional comparison unblocking scheme was developed for use with frequency shift keying communications channels, though different telecommunications interfaces can be used (for example, digital communication channels utilizing the L90 teleprotection input/outputs).

To make the scheme fully operational as a stand-alone feature, the scheme output operands must be configured to interface with other relay functions, output contacts in particular. Typically, the output operands should be programmed to initiate a trip, breaker fail, and autoreclose, and drive a user-programmable LED as per the intended application.

When used in conjunction with the trip output element, the scheme is pre-configured to initiate trip, breaker fail and autoreclose actions.

- **DCUB BLOCK:** This setting allows the user to assign any FlexLogic operand to block the scheme. Contact inputs from a pilot cut-out switch are typically used for this purpose.
- **DCUB PERMISSIVE ECHO:** Enabling this setting will send a permissive echo signal to the remote end(s) under certain conditions (see the logic diagram for details). If set to "Custom", the echo signal is sent if a condition selected with the **DCUB ECHO COND** setting is satisfied. The echo is sent only once and then the echo logic locks out for the time specified by the **ECHO LOCKOUT** setting. The duration of the echo pulse is programmable by the **ECHO DURATION** setting. The echo is returned only if no overreaching and reverse protection elements operate.
- **DCUB ECHO COND:** This setting specifies a user-selected echo condition and applies only if the **DCUB PERMISSIVE ECHO** setting is "Custom".
- **GND DIR O/C FWD:** This setting defines the FlexLogic operand (if any) of a protection element used in addition to zone 2 for identifying faults on the protected line, and thus, for keying the communication channel(s) and initiating operation of the scheme (both through the transient blocking logic).

Good directional integrity is the key requirement for an over-reaching forward-looking protection element set as **GND DIR O/C FWD**. Even though any FlexLogic operand could be set as **GND DIR O/C FWD**, thereby enabling the user to combine responses of various protection elements or to apply extra conditions through FlexLogic equations, this extra sig-

nal is primarily meant to be the output operand from either the negative-sequence directional or neutral directional overcurrent elements. As both these elements have separate forward and reverse output operands, the forward indication should be used (that is, NEG SEQ DIR OC1 FWD or NEUTRAL DIR OC1 FWD).

The selected protection element (or elements in combination) should be coordinated with the selection of **GND DIR O/C REV**. For all forward external faults seen by an element set as **GND DIR O/C FWD** at one end of the line, the reverse-looking element set as **GND DIR O/C REV** at the other end should pickup and provide a blocking signal. For greater security and to overcome spurious directional element operation during transients, adding at least 0.5 cycles of pickup delay to the forward directional element is recommended.

- **GND DIR O/C REV:** This setting defines the FlexLogic operand (if any) of a protection element used in addition to zone 4 for identifying reverse faults, and thus, for stopping the transmit signal and initiating the transient blocking timer.

Good directional integrity is the key requirement for a reverse-looking protection element set as **GND DIR O/C REV**. Even though any FlexLogic operand could be set as **GND DIR O/C REV**, thereby enabling the user to combine responses of various protection elements or to apply extra conditions through FlexLogic equations, this extra signal is primarily meant to be the output operand from either the negative-sequence directional or neutral directional overcurrent element. As both these elements have separate forward and reverse output operands, the reverse indication should be used (that is, NEG SEQ DIR OC1 REV or NEUTRAL DIR OC1 REV).

The selected protection element (or elements in combination) should be coordinated with the selection of **GND DIR O/C FWD**. For all the forward external faults seen by an element set as **GND DIR O/C FWD** at one end of the line, the reverse-looking element set as **GND DIR O/C REV** at the other end should pickup and provide a blocking signal. For greater security and to overcome spurious directional element operation during transients, adding a pickup delay greater than the pilot channel delay to the reverse directional element is recommended.

- **TRANS BLOCK PICKUP DELAY:** This setting defines a transient blocking mechanism embedded in the directional comparison unblocking scheme for coping with the exposure of both the over-reaching zone 2 and ground directional overcurrent function to current reversal conditions.

The transient blocking logic applies to both operate (trip) and send (transmit) paths. Identifying the fault as a reverse fault prevents the scheme from both operating and keying the channel. If the reverse fault condition prevails for **TRANS BLOCK PICKUP DELAY** value, the blocking operation will be extended by the transient blocking timer for the **TRANS BLOCK RESET DELAY** value. This allows riding through current reversal conditions.

However, if distance zone 1 picks up during the transient blocking condition, the blocking action is removed. This is to cope with evolving faults when an external fault is followed by an internal fault. Without the zone 1 feedback, the trip would be delayed unnecessarily.

The **TRANS BLOCK PICKUP DELAY** should not be longer than the fastest possible trip time for faults on an adjacent line so that extended blocking action could be established. This should take into account the pickup time of the reverse-looking elements of the scheme. To avoid locking up a spurious reverse fault indication that can occur during internal fault conditions, the delay defined by this setting should not be too short.

- **TRANS BLOCK RESET DELAY:** This setting defines a transient blocking mechanism embedded in the directional comparison unblocking scheme for coping with the exposure of the overreaching protection functions to current reversal conditions (see also the **TRANS BLOCK PICKUP DELAY** setting above).

This delay should be selected long enough to cope with transient conditions including not only current reversals but also spurious negative and zero-sequence currents occurring during breaker operations (in the case when neutral directional or negative-sequence directional overcurrent functions are used). The breaker failure time of the surrounding protection systems within the reach of the ground directional function used by the directional comparison unblocking scheme should be considered to make sure that the ground directional function is not jeopardized during delayed breaker operations.

- **ECHO DURATION:** This setting defines the guaranteed and exact duration of the echo pulse. The duration does not depend on the duration and shape of the received RX signals. This setting enables the relay to avoid a permanent lock-up of the transmit/receive loop.
- **ECHO LOCKOUT:** This setting defines the lockout period for the echo logic after sending the echo pulse. This setting enables the relay to avoid oscillations of the echo pulses during an autoreclosure dead-time after clearing an internal fault.
- **LINE END OPEN PICKUP DELAY:** This setting defines the pickup value for validation of the line end open conditions as detected by the line pickup logic via the LINE PICKUP LEO PKP FlexLogic operand. The validated line end open con-

dition is a requirement for the directional comparison unblocking scheme to return a received echo signal (if the echo feature is enabled).

The value of this setting should take into account the principle of operation and settings of the line pickup element, which should thus be enabled.

- **DCUB LOG PICKUP DELAY:** This setting represents the directional comparison unblocking duration time delay, and is the amount of time that the loss-of-guard without receipt of permissive trip must be present before the logic provides permission to operate if a forward fault is detected. It is set relatively short, but long enough to ride through the transition period of loss-of-guard with the receipt of a permissive signal that occurs with a normal trip. Typical setting values are from 4 to 32 ms. For most cases, a value of 8 ms may be used.

The tripping or unblocking window for loss-of-guard without permission is the difference between the **DCUB LOG TRIP WINDOW** and **DCUB LOG PICKUP DELAY** timers. For the default settings, this difference is $150 - 8 = 142$ ms and occurs 8 ms after loss-of-guard was received, when the **DCUB LOG PICKUP DELAY** timer has timed out. During this interval, the scheme has permission to operate if a forward fault is sensed, and no reverse faults or transient blocking.

- **GUARD HEALTHY RESET DELAY:** This setting represents the guard healthy security time delay, and is the time after the channel is restored that the guard signal must be present before the directional comparison unblocking scheme is put back in service. This reset timer allows the scheme to ride through any chattering in the channel. Typical values are from 100 to 500 ms, with a value of 150 ms commonly used.
- **DCUB LOG TRIP WINDOW:** This setting represents the directional comparison unblocking lockout time delay, and is the amount of time from when any loss-of-guard signal is received until the directional comparison unblocking scheme is locked out without the presence of any RX1 to RX4 receive signal or any forward element. This timer seals-in when it expires, creating a blocking signal for all scheme functions and disabling the scheme until the guard signal is restored and the **GUARD HEALTHY RESET DELAY** timer expires. Typical values for this setting are from 160 to 180 ms; for most cases, a setting of about 150 ms may be used.
- **DCUB SEAL-IN DELAY:** The output FlexLogic operand (DCUB OP) is produced according to the directional comparison unblocking scheme logic. The **DCUB SEAL-IN DELAY** defines a minimum guaranteed duration of the DCUB OP pulse. As this operand runs the trip table of the directional comparison unblocking scheme, the DCUB TRIP A, DCUB TRIP B, DCUB TRIP C, and DCUB TRIP 3P trip operands are sealed-in for the same period of time.
- **DCUB NO OF COMM BITS:** This setting specifies the number of bits available on the communications channel for the scheme. With only one bit available, the scheme sends the direct under-reaching transfer trip command on bit 1 (DCUB TX1 operand) and responds to the direct trip command received on bit 1 (**DCUB RX1** setting). The scheme uses only local fault type identification provided by the phase selector to assert the DCUB TRIP A, DCUB TRIP B, DCUB TRIP C and DCUB TRIP 3P output operands (see Chapter 8: *Theory of Operation* for details on the use of communication channels).
- **DCUB RX1 through DCUB RX4:** These settings allow the user to select the FlexLogic operands to represent the permission receive signals for the scheme. Contact inputs interfacing with a signaling system(s) are typically used. These settings must be used in conjunction with the loss-of-guard signals, otherwise the scheme will not unblock and thus fail to operate.

In single-bit applications, **DCUB RX1** must be used. In two-bit applications, **DCUB RX1** and **DCUB RX2** must be used. In four-bit applications, **DCUB RX1**, **DCUB RX2**, **DCUB RX3**, and **DCUB RX4** must be used.

- **DCUB LOG1 through DCUB LOG4:** These settings allow the user to select the FlexLogic operands to represent the loss-of-guard receive signals for the scheme. Contact inputs interfacing with a signaling system(s) are typically used. Each loss-of-guard signal must correspond to the same receive signal from the same communications channel (that is, RX1 and LOG1 must be from the same communications channel, and the same for channels 2, 3 and 4, if used).

In single-bit applications, **DCUB RX1** and **DCUB LOG1** must be used. In two-bit applications, **DCUB RX1** with **DCUB LOG1** and **DCUB RX2** with **DCUB LOG2** must be used. In four-bit applications, all receive and loss-of-guard signals must be used.

The autoreclose scheme is intended for use on transmission lines with circuit breakers operated in both the single pole and three pole modes, in one or two breaker arrangements. The autoreclose scheme provides four programs with different operating cycles, depending on the fault type. Each of the four programs can be set to trigger up to four reclosing attempts. The second, third, and fourth attempts always perform three-pole reclosing and have independent dead time delays.

When used in two breaker applications, the reclosing sequence is selectable. The reclose signal can be sent to one selected breaker only, to both breakers simultaneously or to both breakers in sequence (one breaker first and then, after a delay to check that the reclose was successful, to the second breaker). When reclosing in sequence, the first breaker should reclose with either the single-pole or three-pole dead time according to the fault type and reclose mode; the second breaker should follow the successful reclosure of the first breaker. When reclosing simultaneously, for the first shot both breakers should reclose with either the single-pole or three-pole dead time, according to the fault type and the reclose mode.

The signal used to initiate the autoreclose scheme is the trip output from protection. This signal can be single pole tripping for single phase faults and three phase tripping for multi-phase faults. The autoreclose scheme has five operating states.

STATE	CHARACTERISTICS
Enabled	Scheme is permitted to operate
Disabled	Scheme is not permitted to operate
Reset	Scheme is permitted to operate and shot count is reset to 0
Reclose in progress	Scheme has been initiated but the reclose cycle is not finished (successful or not)
Lockout	Scheme is not permitted to operate until reset received

AR PROGRAMS:

The autorecloser provides four programs that can cause from one to four reclose attempts (shots). After the first shot, all subsequent recloses are always be three-pole. If the maximum number of shots selected is “1” (only one reclose attempt) and the fault is persistent, after the first reclose the scheme goes to lockout upon another Initiate signal.

For the 3-pole reclose programs (modes 3 and 4), an AR FORCE 3-P FlexLogic operand is set. This operand can be used in connection with the tripping logic to cause a three-pole trip for single-phase faults.

Table 5–32: AUTORECLOSE PROGRAMS

MODE	AR MODE	FIRST SHOT		SECOND SHOT		THIRD SHOT		FOURTH SHOT	
		SINGLE-PHASE FAULT	MULTI-PHASE FAULT	SINGLE-PHASE FAULT	MULTI-PHASE FAULT	SINGLE-PHASE FAULT	MULTI-PHASE FAULT	SINGLE-PHASE FAULT	MULTI-PHASE FAULT
1	1 & 3 POLE	1 POLE	3 POLE	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO
2	1 POLE	1 POLE	LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO
3	3 POLE-A	3 POLE	LO	3 POLE or LO	LO	3 POLE or LO	LO	3 POLE or LO	LO
4	3 POLE-B	3 POLE	3 POLE	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO

The four autoreclose modes are described as follows.

1. “1 & 3 Pole”: In this mode, the autorecloser starts the **AR 1-P DEAD TIME** timer for the first shot if the autoreclose is single-phase initiated, the **AR 3-P DEAD TIME 1** timer if the autoreclose is three-pole initiated, and the **AR 3-P DEAD TIME 2** timer if the autoreclose is three-phase time delay initiated. If two or more shots are enabled, the second, third, and fourth shots are always three-pole and start the **AR 3-P DEAD TIME 2(4)** timers.
2. “1 Pole”: In this mode, the autorecloser starts the **AR 1-P DEAD TIME** for the first shot if the fault is single phase. If the fault is three-phase or a *three-pole trip on the breaker occurred during the single-pole initiation*, the scheme goes to lockout without reclosing. If two or more shots are enabled, the second, third, and fourth shots are always three-pole and start the **AR 3-P DEAD TIME 2(4)** timers.
3. “3 Pole-A”: In this mode, the autorecloser is initiated only for single phase faults, although the trip is three pole. The autorecloser uses the **AR 3-P DEAD TIME 1** for the first shot if the fault is single phase. If the fault is multi phase the scheme will go to Lockout without reclosing. If two or more shots are enabled, the second, third, and fourth shots are always three-phase and start the **AR 3-P DEAD TIME 2(4)** timers.
4. “3 Pole-B”: In this mode, the autorecloser is initiated for any type of fault and starts the **AR 3-P DEAD TIME 1** for the first shot. If the initiating signal is **AR 3P TD INIT** the scheme starts **AR 3-P DEAD TIME 2** for the first shot. If two or more shots are enabled, the second, third, and fourth shots are always three-phase and start the **AR 3-P DEAD TIME 2(4)** timers.

BASIC RECLOSING OPERATION:

Reclosing operation is determined primarily by the **AR MODE** and **AR BKR SEQUENCE** settings. The reclosing sequences are started by the initiate inputs. A reclose initiate signal sends the scheme into the reclose-in-progress (RIP) state, asserting the AR RIP FlexLogic operand. The scheme is latched into the RIP state and resets only when an AR CLS BKR 1 (autoreclose breaker 1) or AR CLS BKR 2 (autoreclose breaker 2) operand is generated or the scheme goes to the Lockout state.

The dead time for the initial reclose operation is determined by either the **AR 1-P DEAD TIME**, **AR 3-P DEAD TIME 1**, or **AR 3-P DEAD TIME 2** setting, depending on the fault type and the mode selected. After the dead time interval the scheme asserts the AR CLOSE BKR 1 or AR CLOSE BKR 2 operands, as determined by the sequence selected. These operands are latched until the breaker closes or the scheme goes to Reset or Lockout.

There are three initiate programs: single pole initiate, three pole initiate and three pole, time delay initiate. Any of these reclose initiate signals start the reclose cycle and set the reclose-in-progress (AR RIP) operand. The reclose-in-progress operand is sealed-in until the Lockout or Reset signal appears.

The three-pole initiate and three-pole time delay initiate signals are latched until the CLOSE BKR1 OR BKR2 or Lockout or Reset signal appears.

AR PAUSE:

The pause input offers the possibility of freezing the autoreclose cycle until the pause signal disappears. This can be done when a trip occurs and simultaneously or previously, some conditions are detected such as out-of step or loss of guard frequency, or a remote transfer trip signal is received. The pause signal freezes all four dead timers. When the 'pause' signal disappears the autoreclose cycle is resumed by continuing the shot timer it was left at when paused.

This feature can be also used when a transformer is tapped from the protected line and a reclose is not desirable until the transformer is removed from the line. In this case, the reclose scheme is 'paused' until the transformer is disconnected. The **AR PAUSE** input will force a three-pole trip through the **3-P DEADTIME 2** path.

EVOLVING FAULTS:

1.25 cycles after the single pole dead time has been initiated, the AR FORCE 3P TRIP operand is set and it will be reset only when the scheme is reset or goes to Lockout. This will ensure that when a fault on one phase evolves to include another phase during the single pole dead time of the auto-recloser the scheme will force a 3 pole trip and reclose.

RECLOSING SCHEME OPERATION FOR ONE BREAKER:

- **Permanent Fault:** Consider Mode 1, which calls for 1-Pole or 3-Pole Time Delay 1 for the first reclosure and 3-Pole Time Delay 2 for the second reclosure, and assume a permanent fault on the line. Also assume the scheme is in the Reset state. For the first single-phase fault the **AR 1-P DEAD TIME** timer will be started, while for the first multi-phase fault the **AR 3-P DEAD TIME 1** timer will be started. If the **AR 3P TD INIT** signal is high, the **AR 3-P DEAD TIME 2** will be started for the first shot.

If **AR MAX NO OF SHOTS** is set to "1", upon the first reclose the shot counter is set to 1. Upon reclosing, the fault is again detected by protection and reclose is initiated. The breaker is tripped three-pole through the AR SHOT COUNT >0 operand and that will set the AR FORCE 3P operand. Because the shot counter has reached the maximum number of shots permitted the scheme is sent to the Lockout state.

If **AR MAX NO OF SHOTS** is set to "2", upon the first reclose the shot counter is set to 1. Upon reclosing, the fault is again detected by protection and reclose is initiated. The breaker is tripped three-pole through the AR SHOT COUNT >0 operand and that will set the AR FORCE 3P operand. After the second reclose the shot counter is set to 2. Upon reclosing, the fault is again detected by protection, the breaker is tripped three-pole, and reclose is initiated again. Because the shot counter has reached the maximum number of shots permitted the scheme is sent to the lockout state.

- **Transient Fault:** When a reclose output signal is sent to close the breaker the reset timer is started. If the reclosure sequence is successful (there is no initiating signal and the breaker is closed) the reset timer will time out returning the scheme to the reset state with the shot counter set to "0" making it ready for a new reclose cycle.

RECLOSING SCHEME OPERATION FOR TWO BREAKERS:

- **Permanent Fault:** The general method of operation is the same as that outlined for the one breaker applications except for the following description, which assumes **AR BKR SEQUENCE** is "1-2" (reclose Breaker 1 before Breaker 2). The signal output from the dead time timers passes through the breaker selection logic to initiate reclosing of Breaker 1. The Close Breaker 1 signal will initiate the Transfer Timer. After the reclose of the first breaker the fault is again detected by the protection, the breaker is tripped three pole and the autoreclose scheme is initiated. The Initiate signal will stop the transfer timer. After the 3-P dead time times out the Close Breaker 1 signal will close first breaker again

and will start the transfer timer. Since the fault is permanent the protection will trip again initiating the autoreclose scheme that will be sent to Lockout by the SHOT COUNT = MAX signal.

- **Transient Fault:** When the first reclose output signal is sent to close Breaker 1, the reset timer is started. The close Breaker 1 signal initiates the transfer timer that times out and sends the close signal to the second breaker. If the reclosure sequence is successful (both breakers closed and there is no initiating signal) the reset timer will time out, returning the scheme to the reset state with the shot counter set to 0. The scheme will be ready for a new reclose cycle.

AR BKR1(2) RECLS FAIL:

If the selected sequence is “1–2” or “2–1” and after the first or second reclose attempt the breaker fails to close, there are two options. If the **AR BKR 1(2) FAIL OPTION** is set to “Lockout”, the scheme will go to lockout state. If the **AR BKR 1(2) FAIL OPTION** is set to “Continue”, the reclose process will continue with Breaker 2. At the same time the shot counter will be decreased (since the closing process was not completed).

SCHEME RESET AFTER RECLOSURE:

When a reclose output signal is sent to close either breaker 1 or 2 the reset timer is started. If the reclosure sequence is successful (there is no initiating signal and the breakers are closed) the reset timer will time out, returning the scheme to the reset state, with the shot counter set to 0, making it ready for a new reclose cycle.

In two breaker schemes, if one breaker is in the out-of-service state and the other is closed at the end of the reset time, the scheme will also reset. If at the end of the reset time at least one breaker, which is not in the out-of-service state, is open the scheme will be sent to Lockout.

The reset timer is stopped if the reclosure sequence is not successful: an initiating signal present or the scheme is in Lockout state. The reset timer is also stopped if the breaker is manually closed or the scheme is otherwise reset from lockout.

LOCKOUT:

When a reclose sequence is started by an initiate signal the scheme moves into the reclose-in-progress state and starts the incomplete sequence timer. The setting of this timer determines the maximum time interval allowed for a single reclose shot. If a close breaker 1 or 2 signal is not present before this time expires, the scheme goes to “Lockout”.

There are four other conditions that can take the scheme to the Lockout state, as shown below:

- Receipt of ‘Block’ input while in the reclose-in-progress state
- The reclosing program logic: when a 3P Initiate is present and the autoreclose mode is either 1 Pole or 3Pole-A (3 pole autoreclose for single pole faults only)
- Initiation of the scheme when the count is at the maximum allowed
- If at the end of the reset time at least one breaker, which is not in the out-of-service state, is open the scheme will be sent to Lockout. The scheme will be also sent to Lockout if one breaker fails to reclose and the setting **AR BKR FAIL OPTION** is set to “Lockout”.

Once the Lockout state is set it will be latched until one or more of the following occurs:

- The scheme is intentionally reset from Lockout, employing the Reset setting of the Autorecloser;
- The Breaker(s) is(are) manually closed from panel switch, SCADA or other remote control through the **AR BRK MAN CLOSE** setting;
- 10 seconds after breaker control detects that breaker(s) were closed.

BREAKER OPEN BEFORE FAULT:

A logic circuit is provided that inhibits the close breaker 1 and close breaker 2 outputs if a reclose initiate (RIP) indicator is not present within 30 ms of the Breaker Any Phase Open input. This feature is intended to prevent reclosing if one of the breakers was open in advance of a reclose initiate input to the recloser. This logic circuit resets when the breaker is closed.

TRANSFER RECLOSE WHEN BREAKER IS BLOCKED:

1. When the reclosing sequence 1-2 is selected and Breaker 1 is blocked (AR BKR1 BLK operand is set) the reclose signal can be transferred direct to the Breaker 2 if **AR TRANSFER 1 TO 2** is set to “Yes”. If set to “No”, the scheme will be sent to Lockout by the incomplete sequence timer.
2. When the reclosing sequence 2-1 is selected and Breaker 2 is blocked (AR BKR2 BLK operand is set) the reclose signal can be transferred direct to the Breaker 1 if **AR TRANSFER 2 TO 1** is set to “Yes”. If set to “No” the scheme will be sent to Lockout by the incomplete sequence timer.

FORCE 3-POLE TRIPPING:

The reclosing scheme contains logic that is used to signal trip logic that three-pole tripping is required for certain conditions. This signal is activated by any of the following:

- Autoreclose scheme is paused after it was initiated.
- Autoreclose scheme is in the lockout state.
- Autoreclose mode is programmed for three-pole operation
- The shot counter is not at 0; that is, the scheme is not in the reset state. This ensures a second trip will be three-pole when reclosing onto a permanent single phase fault.
- 1.25 cycles after the single-pole reclose is initiated by the AR 1P INIT signal.

ZONE 1 EXTENT:

The zone 1 extension philosophy here is to apply an overreaching zone permanently as long as the relay is ready to reclose, and reduce the reach when reclosing. Another zone 1 extension approach is to operate normally from an underreaching zone, and use an overreaching distance zone when reclosing the line with the other line end open. This philosophy could be programmed via the line pickup scheme.

The "Extended Zone 1" is 0 when autoreclose is in lockout or disabled and 1 when autoreclose is in reset.

1. When "Extended Zone 1" is 0, the distance functions shall be set to normal underreach Zone 1 setting.
2. When "Extended Zone 1" is 1, the distance functions may be set to Extended Zone 1 Reach, which is an overreaching setting.
3. During a reclose cycle, "Extended Zone 1" goes to 0 as soon as the first CLOSE BREAKER signal is issued (AR SHOT COUNT > 0) and remains 0 until the recloser goes back to reset.

USE OF SETTINGS:

The single-phase autoreclose settings are described here.

- **AR MODE:** This setting selects the Autoreclose operating mode from the four available reclose modes (Mode 1: 1 & 3 Pole, Mode 2: 1 Pole, Mode 3: 3 Pole-A and Mode 4: 3 Pole-B), which functions in conjunction with signals received at the initiation inputs as described previously. The autorecloser runs in this mode until a different mode is activated through the AR Mode Activation inputs explained as follows.
- **MODE 1 to MODE 4 ACTIVATION:** This setting selects an operand for activating the corresponding AR mode in run-time. Mode change via activation input takes place when only one of the four activation inputs is high and the AR RIP operand is low (that is, reclose is not in progress) and also the mode to be activated is different from the existing mode, otherwise the activation input is ignored and the existing mode continues to be used. See details in the Mode Control Logic diagram.
- **AR MAX NUMBER OF SHOTS:** This setting specifies the number of reclosures that can be attempted before reclosure goes to lockout when the fault is permanent.
- **AR INITIATE MODE:** This setting selects the autoreclose initiation mode. When selected as "Protection AND CB", the autoreclose element is initiated by protection operation and begins incrementing the autoreclose dead time timer when a circuit breaker is open. Breaker status is determined from breaker auxiliary contacts which should be correctly configured in breaker settings. In "Protection only" initiation mode, the autoreclose element is initiated by protection operation and begins incrementing the dead time when protection resets, without the need of breaker auxiliary contacts.
- **AR BLOCK BKR1:** This input selects an operand that will block the reclose command for breaker 1. This condition can be for example: breaker low air pressure, reclose in progress on another line (for the central breaker in a breaker and a half arrangement), or a sum of conditions combined in FlexLogic.
- **AR CLOSE TIME BKR1:** This setting represents the closing time for the breaker 1 from the moment the "Close" command is sent to the moment the contacts are closed.
- **AR BKR MAN CLOSE:** This setting selects a FlexLogic operand that represents manual close command to a breaker associated with the autoreclose scheme.
- **AR BLK TIME UPON MAN CLS:** The autoreclose scheme can be disabled for a programmable time delay after an associated circuit breaker is manually commanded to close, preventing reclosing onto an existing fault such as grounds on the line. This delay must be longer than the slowest expected trip from any protection not blocked after

manual closing. If the autoreclose scheme is not initiated after a manual close and this time expires the autoreclose scheme is set to the reset state.

- **AR 1P INIT:** This setting selects a FlexLogic operand that is intended to initiate single-pole autoreclosure.
- **AR 3P INIT:** This setting selects a FlexLogic operand that is intended to initiate three-pole autoreclosure, first timer (**AR 3P DEAD TIME 1**) that can be used for a high-speed autoreclosure.
- **AR 3P TD INIT:** This setting selects a FlexLogic operand intended to initiate three-pole autoreclosure. second timer (**AR 3P DEAD TIME 2**) can be used for a time-delay autoreclosure. If the operand assigned to this setting and the **AR 3P INIT** setting are asserted simultaneously, then autoreclose will not activate the first and second shot timers at the same time. Instead, the priority is given to the **AR 3P INIT** operand.
- **AR MULTI-P FAULT:** This setting selects a FlexLogic operand that indicates a multi-phase fault. The operand value should be zero for single-phase to ground faults.
- **BKR ONE POLE OPEN:** This setting selects a FlexLogic operand which indicates that the breaker has opened correctly following a single phase to ground fault and the autoreclose scheme can start timing the single pole dead time (for 1-2 reclose sequence for example, breaker 1 should trip single pole and breaker 2 should trip 3 pole).

The scheme has a pre-wired input that indicates breaker status.

- **BKR 3 POLE OPEN:** This setting selects a FlexLogic operand which indicates that the breaker has opened three pole and the autoreclose scheme can start timing the three pole dead time. The scheme has a pre-wired input that indicates breaker status.
- **AR 3-P DEAD TIME 1:** This is the dead time following the first three pole trip. This intentional delay can be used for a high-speed three-pole autoreclose. However, it should be set longer than the estimated de-ionizing time following the three-pole trip.
- **AR 3-P DEAD TIME 2:** This is the dead time following the second three-pole trip or initiated by the **AR 3P TD INIT** input. This intentional delay is typically used for a time delayed three-pole autoreclose (as opposed to high speed three-pole autoreclose).
- **AR 3-P DEAD TIME 3:** This setting represents the dead time following the third three-pole trip.
- **AR 3-P DEAD TIME 4:** This setting represents the dead time following the third three-pole trip.
- **AR EXTEND DEAD T 1:** This setting selects an operand that will adapt the duration of the dead time for the first shot to the possibility of non-simultaneous tripping at the two line ends. Typically this is the operand set when the communication channel is out of service
- **AR DEAD TIME 1 EXTENSION:** This timer is used to set the length of the dead time 1 extension for possible non-simultaneous tripping of the two ends of the line.
- **AR RESET:** This setting selects the operand that forces the autoreclose scheme from any state to reset. Typically this is a manual reset from lockout, local or remote.
- **AR RESET TIME:** A reset timer output resets the recloser following a successful reclosure sequence. The setting is based on the breaker time which is the minimum time required between successive reclose sequences.
- **AR BKR CLOSED:** This setting selects an operand that indicates that the breakers are closed at the end of the reset time and the scheme can reset.
- **AR BLOCK:** This setting selects the operand that blocks the autoreclose scheme (it can be a sum of conditions such as: time delayed tripping, breaker failure, bus differential protection, etc.). If the block signal is present before autoreclose scheme initiation the **AR DISABLED** FlexLogic operand will be set. If the block signal occurs when the scheme is in the **RIP** state the scheme will be sent to lockout.
- **AR PAUSE:** The pause input offers the ability to freeze the autoreclose cycle until the pause signal disappears. This may be done when a trip occurs and simultaneously or previously, some conditions are detected such as out-of step or loss of guard frequency, or a remote transfer trip signal is received. When the *pause signal* disappears the autoreclose cycle is resumed. This feature can also be used when a transformer is tapped from the protected line and a reclose is not desirable until it is disconnected from the line. In this situation, the reclose scheme is *paused* until the transformer is disconnected.
- **AR INCOMPLETE SEQ TIME:** This timer is used to set the maximum time interval allowed for a single reclose shot. It is started whenever a reclosure is initiated and is active until the **CLOSE BKR1** or **CLOSE BKR2** signal is sent. If all conditions allowing a breaker closure are not satisfied when this time expires, the scheme goes to "Lockout". The mini-

imum permissible setting is established by the **AR 3-P DEAD TIME 2** timer setting. Settings beyond this will determine the *wait time* for the breaker to open so that the reclose cycle can continue and/or for the AR PAUSE signal to reset and allow the reclose cycle to continue and/or for the AR BKR1 BLK signal to disappear and allow the AR CLOSE BKR1 signal to be sent.

- **AR BLOCK BKR2:** This input selects an operand that will block the reclose command for breaker 2. This condition can be for example: breaker low air pressure, reclose in progress on another line (for the central breaker in a breaker and a half arrangement), or a sum of conditions combined in FlexLogic.
- **AR CLOSE TIME BKR2:** This setting represents the closing time for the breaker 2 from the moment the 'Close' command is sent to the moment the contacts are closed.
- **AR TRANSFER 1 TO 2:** This setting establishes how the scheme performs when the breaker closing sequence is 1-2 and breaker 1 is blocked. When set to "Yes" the closing command will be transferred direct to breaker 2 without waiting the transfer time. When set to "No" the closing command will be blocked by the AR BKR1 BLK signal and the scheme will be sent to lockout by the incomplete sequence timer.
- **AR TRANSFER 2 TO 1:** This setting establishes how the scheme performs when the breaker closing sequence is 2-1 and breaker 2 is blocked. When set to "Yes" the closing command will be transferred direct to breaker 1 without waiting the transfer time. When set to "No", the closing command will be blocked by the AR BKR2 BLK signal and the scheme will be sent to lockout by the incomplete sequence timer.
- **AR BKR1 FAIL OPTION:** This setting establishes how the scheme performs when the breaker closing sequence is 1-2 and Breaker 1 has failed to close. When set to "Continue" the closing command will be transferred to breaker 2 which will continue the reclosing cycle until successful (the scheme will reset) or unsuccessful (the scheme will go to Lockout). When set to "Lockout" the scheme will go to lockout without attempting to reclose breaker 2.
- **AR BKR2 FAIL OPTION:** This setting establishes how the scheme performs when the breaker closing sequence is 2-1 and Breaker 2 has failed to close. When set to "Continue" the closing command will be transferred to breaker 1 which will continue the reclosing cycle until successful (the scheme will reset) or unsuccessful (the scheme will go to Lockout). When set to "Lockout" the scheme will go to lockout without attempting to reclose breaker 1.
- **AR 1-P DEAD TIME:** Set this intentional delay longer than the estimated de-ionizing time after the first single-pole trip.
- **AR BREAKER SEQUENCE:** This setting selects the breakers reclose sequence: Select "1" for reclose breaker 1 only, "2" for reclose breaker 2 only, "1&2" for reclose both breakers simultaneously, "1-2" for reclose breakers sequentially; Breaker 1 first, and "2-1" for reclose breakers sequentially; Breaker 2 first.
- **AR TRANSFER TIME:** The transfer time is used only for breaker closing sequence 1-2 or 2-1, when the two breakers are reclosed sequentially. The transfer timer is initiated by a close signal to the first breaker. The transfer timer transfers the reclose signal from the breaker selected to close first to the second breaker. The time delay setting is based on the maximum time interval between the autoreclose signal and the protection trip contact closure assuming a permanent fault (unsuccessful reclose). Therefore, the minimum setting is equal to the maximum breaker closing time plus the maximum line protection operating time plus a suitable margin. This setting will prevent the autoreclose scheme from transferring the close signal to the second breaker unless a successful reclose of the first breaker occurs.
- **AR BUS FLT INIT:** This setting is used in breaker-and-a-half applications to allow the autoreclose control function to perform reclosing with only *one* breaker previously opened by bus protection. For line faults, both breakers must open for the autoreclose reclosing cycles to take effect.

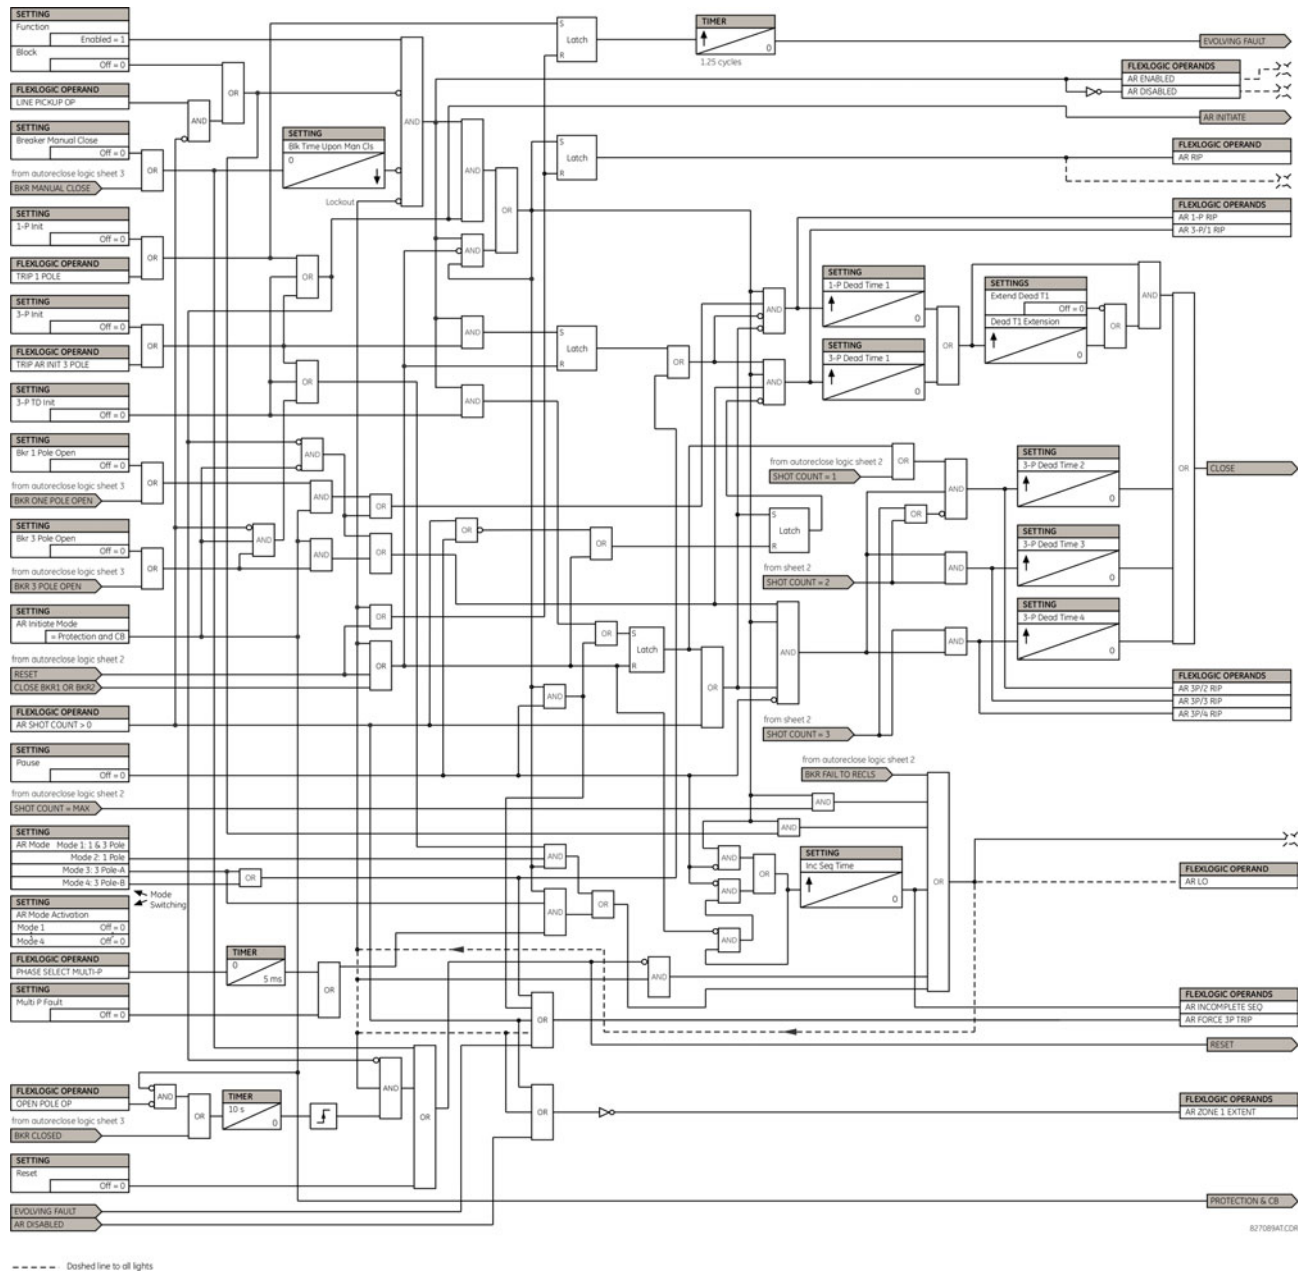

Figure 5-169: SINGLE-POLE AUTORECLOSE LOGIC (Sheet 1 of 3)

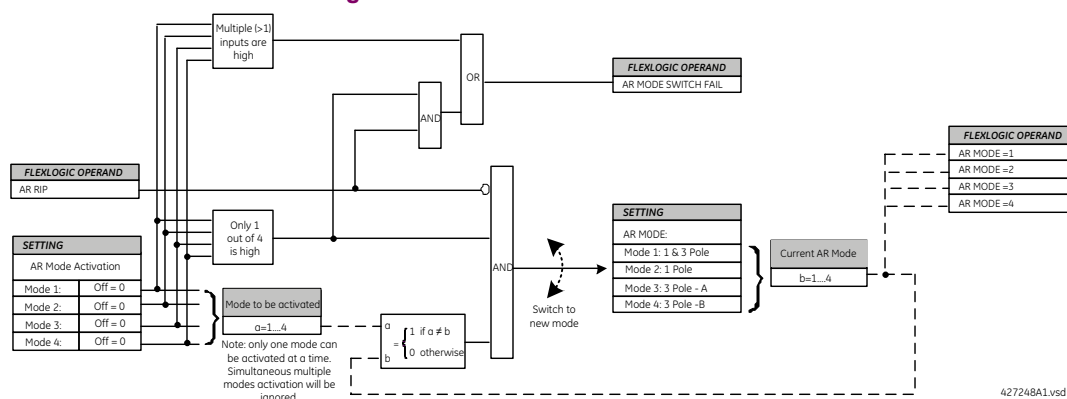

In runtime, AR mode can be changed through the mode control logic as shown in the following diagram. Initially, the autorecloser runs in the mode as per AR MODE setting. Then the relay checks the AR activation inputs in each protection pass. The AR mode is switched to the new mode when

- Only one of four activation inputs is high, and
- AP RIP operand is low, and
- The mode to be activated is different from the current AR mode

The logic allows activation of one mode at a time. Simultaneous multiple activations are ignored and mode switching does not happen. However, a FlexLogic operand, AR MODE SWITCH FAIL, is asserted if either simultaneous multiple activations are initiated, or a single activation is initiated but recloser is already in progress.

The active AR mode is memorized (latched) on power cycling. This means that the relay uses the last-used mode on power-up. The AR mode resets to the default mode (specified by the AR MODE setting) when any settings in the autore-close function are changed.

Figure 5-170: MODE CONTROL LOGIC

In addition, the current AR mode is available as FlexLogic Operands because AR Mode equals to 1, 2, 3, and 4 respectively so that it can be monitored and logged.

5.8.1 CONTACT INPUTS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ CONTACT INPUTS

The contact inputs menu contains configuration settings for each contact input as well as voltage thresholds for each group of four contact inputs. Upon startup, the relay processor determines (from an assessment of the installed modules) which contact inputs are available and then display settings for only those inputs.

An alphanumeric ID may be assigned to a contact input for diagnostic, setting, and event recording purposes. The CONTACT IP X On" (Logic 1) FlexLogic operand corresponds to contact input "X" being closed, while CONTACT IP X Off corresponds to contact input "X" being open. The **CONTACT INPUT DEBNCE TIME** defines the time required for the contact to overcome 'contact bouncing' conditions. As this time differs for different contact types and manufacturers, set it as a maximum contact debounce time (per manufacturer specifications) plus some margin to ensure proper operation. If **CONTACT INPUT EVENTS** is set to "Enabled", every change in the contact input state will trigger an event.

A raw status is scanned for all Contact Inputs synchronously at the constant rate of 0.5 ms as shown in the figure below. The DC input voltage is compared to a user-settable threshold. A new contact input state must be maintained for a user-settable debounce time in order for the L90 to validate the new contact state. In the figure below, the debounce time is set at 2.5 ms; thus the 6th sample in a row validates the change of state (mark no. 1 in the diagram). Once validated (debounced), the contact input asserts a corresponding FlexLogic operand and logs an event as per user setting.

A time stamp of the first sample in the sequence that validates the new state is used when logging the change of the contact input into the Event Recorder (mark no. 2 in the diagram).

Protection and control elements, as well as FlexLogic equations and timers, are executed eight times in a power system cycle. The protection pass duration is controlled by the frequency tracking mechanism. The FlexLogic operand reflecting the debounced state of the contact is updated at the protection pass following the validation (marks no. 3 and 4 on the figure below). The update is performed at the beginning of the protection pass so all protection and control functions, as well as FlexLogic equations, are fed with the updated states of the contact inputs.

The FlexLogic operand response time to the contact input change is equal to the debounce time setting plus up to one protection pass (variable and depending on system frequency if frequency tracking enabled). If the change of state occurs just after a protection pass, the recognition is delayed until the subsequent protection pass; that is, by the entire duration of the protection pass. If the change occurs just prior to a protection pass, the state is recognized immediately. Statistically a delay of half the protection pass is expected. Owing to the 0.5 ms scan rate, the time resolution for the input contact is below 1msec.

For example, 8 protection passes per cycle on a 60 Hz system correspond to a protection pass every 2.1 ms. With a contact debounce time setting of 3.0 ms, the FlexLogic operand-assert time limits are: $3.0 + 0.0 = 3.0$ ms and $3.0 + 2.1 = 5.1$ ms. These time limits depend on how soon the protection pass runs after the debouncing time.

Regardless of the contact debounce time setting, the contact input event is time-stamped with a 1 μ s accuracy using the time of the first scan corresponding to the new state (mark no. 2 below). Therefore, the time stamp reflects a change in the DC voltage across the contact input terminals that was not accidental as it was subsequently validated using the debounce timer. Keep in mind that the associated FlexLogic operand is asserted/de-asserted later, after validating the change.

The debounce algorithm is symmetrical: the same procedure and debounce time are used to filter the LOW-HIGH (marks no. 1, 2, 3, and 4 in the figure below) and HIGH-LOW (marks no. 5, 6, 7, and 8 below) transitions.

Figure 5-174: INPUT CONTACT DEBOUNCING MECHANISM AND TIME-STAMPING SAMPLE TIMING

Contact inputs are isolated in groups of four to allow connection of wet contacts from different voltage sources for each group. The **CONTACT INPUT THRESHOLDS** determine the minimum voltage required to detect a closed contact input. This value should be selected according to the following criteria: 17 for 24 V sources, 33 for 48 V sources, 84 for 110 to 125 V sources and 166 for 250 V sources.

For example, to use contact input H5a as a status input from the breaker 52b contact to seal-in the trip relay and record it in the Event Records menu, make the following settings changes:

CONTACT INPUT H5A ID: "Breaker Closed (52b)"
CONTACT INPUT H5A EVENTS: "Enabled"

Note that the 52b contact is closed when the breaker is open and open when the breaker is closed.

5.8.2 VIRTUAL INPUTS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ VIRTUAL INPUTS ⇒ VIRTUAL INPUT 1(64)

VIRTUAL INPUT 1		VIRTUAL INPUT 1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE		VIRTUAL INPUT 1 ID: Virt Ip 1	Range: Up to 12 alphanumeric characters
MESSAGE		VIRTUAL INPUT 1 TYPE: Latched	Range: Self-Reset, Latched
MESSAGE		VIRTUAL INPUT 1 EVENTS: Disabled	Range: Disabled, Enabled

There are 64 virtual inputs that can be individually programmed to respond to input signals from the keypad (via the **COM-MANDS** menu) and communications protocols. All virtual input operands are defaulted to “Off” (logic 0) unless the appropriate input signal is received.

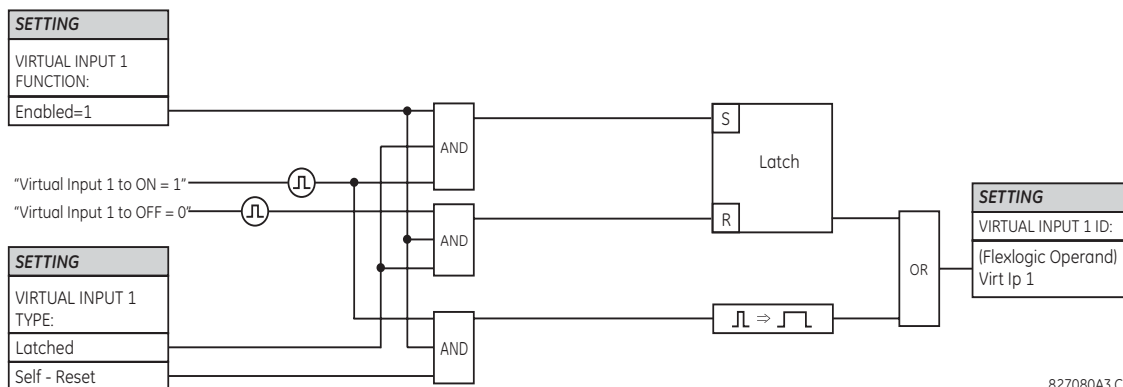

If the **VIRTUAL INPUT x FUNCTION** is to “Disabled”, the input will be forced to off (logic 0) regardless of any attempt to alter the input. If set to “Enabled”, the input operates as shown on the logic diagram and generates output FlexLogic operands in response to received input signals and the applied settings.

There are two types of operation: self-reset and latched. If **VIRTUAL INPUT x TYPE** is “Self-Reset”, when the input signal transits from off to on, the output operand will be set to on for only one evaluation of the FlexLogic equations and then return to off. If set to “Latched”, the virtual input sets the state of the output operand to the same state as the most recent received input.

5

The self-reset operating mode generates the output operand for a single evaluation of the FlexLogic equations. If the operand is to be used anywhere other than internally in a FlexLogic equation, it will likely have to be lengthened in time. A FlexLogic timer with a delayed reset can perform this function.

827080A3.CDR

Figure 5-175: VIRTUAL INPUTS SCHEME LOGIC

5.8.3 CONTACT OUTPUTS

a) DIGITAL OUTPUTS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ CONTACT OUTPUTS ⇒ CONTACT OUTPUT H1

■ CONTACT OUTPUT H1	◀▶	CONTACT OUTPUT H1 ID Cont Op 1	Range: Up to 12 alphanumeric characters
MESSAGE	▲▼	OUTPUT H1 OPERATE: Off	Range: FlexLogic operand
MESSAGE	▲▼	OUTPUT H1 SEAL-IN: Off	Range: FlexLogic operand
MESSAGE	▲	CONTACT OUTPUT H1 EVENTS: Enabled	Range: Disabled, Enabled

Upon startup of the relay, the main processor will determine from an assessment of the modules installed in the chassis which contact outputs are available and present the settings for only these outputs.

An ID may be assigned to each contact output. The signal that can **OPERATE** a contact output may be any FlexLogic operand (virtual output, element state, contact input, or virtual input). An additional FlexLogic operand may be used to **SEAL-IN** the relay. Any change of state of a contact output can be logged as an Event if programmed to do so.

For example, the trip circuit current is monitored by providing a current threshold detector in series with some Form-A contacts (see the trip circuit example in the *Digital elements* section). The monitor will set a flag (see the specifications for Form-A). The name of the FlexLogic operand set by the monitor, consists of the output relay designation, followed by the name of the flag; for example, CONT OP 1 ION.

In most breaker control circuits, the trip coil is connected in series with a breaker auxiliary contact used to interrupt current flow after the breaker has tripped, to prevent damage to the less robust initiating contact. This can be done by monitoring an auxiliary contact on the breaker which opens when the breaker has tripped, but this scheme is subject to incorrect operation caused by differences in timing between breaker auxiliary contact change-of-state and interruption of current in the trip circuit. The most dependable protection of the initiating contact is provided by directly measuring current in the tripping circuit, and using this parameter to control resetting of the initiating relay. This scheme is often called *trip seal-in*.

This can be realized in the L90 using the CONT OP 1 ION FlexLogic operand to seal-in the contact output as follows:

CONTACT OUTPUT H1 ID: "Cont Op 1"
 OUTPUT H1 OPERATE: *any suitable FlexLogic operand*
 OUTPUT H1 SEAL-IN: "Cont Op 1 IOn"
 CONTACT OUTPUT H1 EVENTS: "Enabled"

b) LATCHING OUTPUTS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ CONTACT OUTPUTS ⇒ CONTACT OUTPUT H1a

■ CONTACT OUTPUT H1a	◀▶	OUTPUT H1a ID L-Cont Op 1	Range: Up to 12 alphanumeric characters
MESSAGE	▲▼	OUTPUT H1a OPERATE: Off	Range: FlexLogic operand
MESSAGE	▲▼	OUTPUT H1a RESET: Off	Range: FlexLogic operand
MESSAGE	▲▼	OUTPUT H1a TYPE: Operate-dominant	Range: Operate-dominant, Reset-dominant
MESSAGE	▲	OUTPUT H1a EVENTS: Disabled	Range: Disabled, Enabled

The L90 latching output contacts are mechanically bi-stable and controlled by two separate (open and close) coils. As such they retain their position even if the relay is not powered up. The relay recognizes all latching output contact cards and populates the setting menu accordingly. On power up, the relay reads positions of the latching contacts from the hardware before executing any other functions of the relay (such as protection and control features or FlexLogic).

The latching output modules, either as a part of the relay or as individual modules, are shipped from the factory with all latching contacts opened. It is highly recommended to double-check the programming and positions of the latching contacts when replacing a module.

Since the relay asserts the output contact and reads back its position, it is possible to incorporate self-monitoring capabilities for the latching outputs. If any latching outputs exhibits a discrepancy, the **LATCHING OUTPUT ERROR** self-test error is declared. The error is signaled by the LATCHING OUT ERROR FlexLogic operand, event, and target message.

- **OUTPUT H1a OPERATE:** This setting specifies a FlexLogic operand to operate the ‘close coil’ of the contact. The relay will seal-in this input to safely close the contact. Once the contact is closed and the **RESET** input is logic 0 (off), any activity of the **OPERATE** input, such as subsequent chattering, will not have any effect. With both the **OPERATE** and **RESET** inputs active (logic 1), the response of the latching contact is specified by the **OUTPUT H1A TYPE** setting.
- **OUTPUT H1a RESET:** This setting specifies a FlexLogic operand to operate the ‘trip coil’ of the contact. The relay will seal-in this input to safely open the contact. Once the contact is opened and the **OPERATE** input is logic 0 (off), any activity of the **RESET** input, such as subsequent chattering, will not have any effect. With both the **OPERATE** and **RESET** inputs active (logic 1), the response of the latching contact is specified by the **OUTPUT H1A TYPE** setting.
- **OUTPUT H1a TYPE:** This setting specifies the contact response under conflicting control inputs; that is, when both the **OPERATE** and **RESET** signals are applied. With both control inputs applied simultaneously, the contact will close if set to “Operate-dominant” and will open if set to “Reset-dominant”.

Application Example 1:

A latching output contact H1a is to be controlled from two user-programmable pushbuttons (buttons number 1 and 2). The following settings should be applied.

Program the Latching Outputs by making the following changes in the **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **CONTACT OUTPUTS** ⇒ **CONTACT OUTPUT H1a** menu (assuming an H4L module):

OUTPUT H1a OPERATE: “PUSHBUTTON 1 ON”

OUTPUT H1a RESET: “PUSHBUTTON 2 ON”

Program the pushbuttons by making the following changes in the **PRODUCT SETUP** ⇒ **USER-PROGRAMMABLE PUSHBUTTONS** ⇒ **USER PUSHBUTTON 1** and **USER PUSHBUTTON 2** menus:

PUSHBUTTON 1 FUNCTION: “Self-reset”

PUSHBTN 1 DROP-OUT TIME: “0.00 s”

PUSHBUTTON 2 FUNCTION: “Self-reset”

PUSHBTN 2 DROP-OUT TIME: “0.00 s”

Application Example 2:

A relay, having two latching contacts H1a and H1c, is to be programmed. The H1a contact is to be a Type-a contact, while the H1c contact is to be a Type-b contact (Type-a means closed after exercising the operate input; Type-b means closed after exercising the reset input). The relay is to be controlled from virtual outputs: VO1 to operate and VO2 to reset.

Program the Latching Outputs by making the following changes in the **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **CONTACT OUTPUTS** ⇒ **CONTACT OUTPUT H1a** and **CONTACT OUTPUT H1c** menus (assuming an H4L module):

OUTPUT H1a OPERATE: “VO1”

OUTPUT H1a RESET: “VO2”

OUTPUT H1c OPERATE: “VO2”

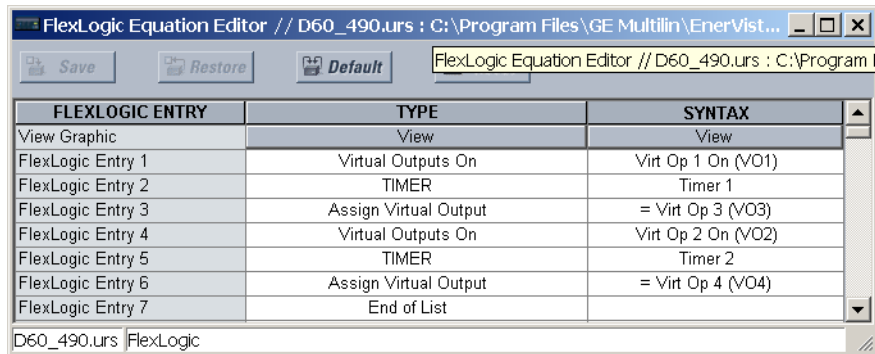

OUTPUT H1c RESET: “VO1”

Since the two physical contacts in this example are mechanically separated and have individual control inputs, they will not operate at exactly the same time. A discrepancy in the range of a fraction of a maximum operating time may occur. Therefore, a pair of contacts programmed to be a multi-contact relay will not guarantee any specific sequence of operation (such as make before break). If required, the sequence of operation must be programmed explicitly by delaying some of the control inputs as shown in the next application example.

Application Example 3:

A make before break functionality must be added to the preceding example. An overlap of 20 ms is required to implement this functionality as described below:

Write the following FlexLogic equation (EnerVista UR Setup example shown):

FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Virtual Outputs On	Virt Op 1 On (VO1)
FlexLogic Entry 2	TIMER	Timer 1
FlexLogic Entry 3	Assign Virtual Output	= Virt Op 3 (VO3)
FlexLogic Entry 4	Virtual Outputs On	Virt Op 2 On (VO2)
FlexLogic Entry 5	TIMER	Timer 2
FlexLogic Entry 6	Assign Virtual Output	= Virt Op 4 (VO4)
FlexLogic Entry 7	End of List	

Both timers (Timer 1 and Timer 2) should be set to 20 ms pickup and 0 ms dropout.

Program the Latching Outputs by making the following changes in the **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **CONTACT OUTPUTS** ⇒ **CONTACT OUTPUT H1a** and **CONTACT OUTPUT H1c** menus (assuming an H4L module):

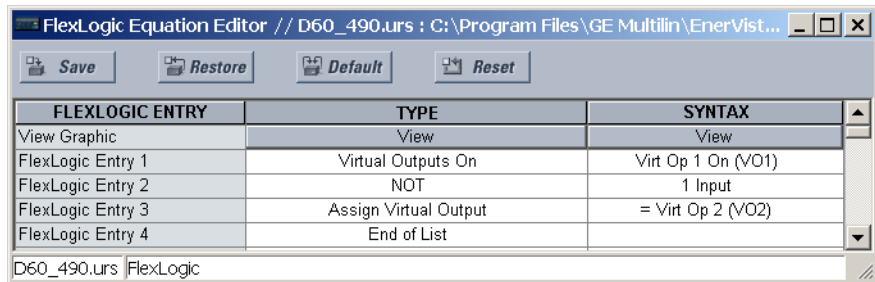

OUTPUT H1a OPERATE: "VO1"
OUTPUT H1a RESET: "VO4"

OUTPUT H1c OPERATE: "VO2"
OUTPUT H1c RESET: "VO3"

Application Example 4:

A latching contact H1a is to be controlled from a single virtual output VO1. The contact should stay closed as long as VO1 is high, and should stay opened when VO1 is low. Program the relay as follows.

Write the following FlexLogic equation (EnerVista UR Setup example shown):

FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Virtual Outputs On	Virt Op 1 On (VO1)
FlexLogic Entry 2	NOT	1 Input
FlexLogic Entry 3	Assign Virtual Output	= Virt Op 2 (VO2)
FlexLogic Entry 4	End of List	

Program the Latching Outputs by making the following changes in the **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **CONTACT OUTPUTS** ⇒ **CONTACT OUTPUT H1a** menu (assuming an H4L module):

OUTPUT H1a OPERATE: "VO1"
OUTPUT H1a RESET: "VO2"

5.8.4 VIRTUAL OUTPUTS

PATH: **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **VIRTUAL OUTPUTS** ⇒ **VIRTUAL OUTPUT 1(96)**

VIRTUAL OUTPUT 1	◀▶	VIRTUAL OUTPUT 1 ID Virt Op 1	Range: Up to 12 alphanumeric characters
MESSAGE	▲	VIRTUAL OUTPUT 1 EVENTS: Disabled	Range: Disabled, Enabled

There are 96 virtual outputs that may be assigned via FlexLogic. If not assigned, the output will be forced to 'OFF' (Logic 0). An ID may be assigned to each virtual output. Virtual outputs are resolved in each pass through the evaluation of the FlexLogic equations. Any change of state of a virtual output can be logged as an event if programmed to do so.

For example, if Virtual Output 1 is the trip signal from FlexLogic and the trip relay is used to signal events, the settings would be programmed as follows:

VIRTUAL OUTPUT 1 ID: "Trip"
 VIRTUAL OUTPUT 1 EVENTS: "Disabled"

5.8.5 REMOTE DEVICES

a) REMOTE INPUTS/OUTPUTS OVERVIEW

Remote inputs and outputs provide a means of exchanging digital state information between Ethernet-networked devices. The IEC 61850 GSSE (Generic Substation State Event) and GOOSE (Generic Object Oriented Substation Event) standards are used.

The sharing of digital point state information between GSSE/GOOSE equipped relays is essentially an extension to Flex-Logic, allowing distributed FlexLogic by making operands available to/from devices on a common communications network. In addition to digital point states, GSSE/GOOSE messages identify the originator of the message and provide other information required by the communication specification. All devices listen to network messages and capture data only from messages that have originated in selected devices.

IEC 61850 GSSE messages are compatible with UCA GOOSE messages and contain a fixed set of digital points. IEC 61850 GOOSE messages can, in general, contain any configurable data items. When used by the remote input/output feature, IEC 61850 GOOSE messages contain the same data as GSSE messages.

Both GSSE and GOOSE messages are designed to be short, reliable, and high priority. GOOSE messages have additional advantages over GSSE messages due to their support of VLAN (virtual LAN) and Ethernet priority tagging functionality. The GSSE message structure contains space for 128 bit pairs representing digital point state information. The IEC 61850 specification provides 32 "DNA" bit pairs that represent the state of two pre-defined events and 30 user-defined events. All remaining bit pairs are "UserSt" bit pairs, which are status bits representing user-definable events. The L90 implementation provides 32 of the 96 available UserSt bit pairs.

The IEC 61850 specification includes features that are used to cope with the loss of communication between transmitting and receiving devices. Each transmitting device will send a GSSE/GOOSE message upon a successful power-up, when the state of any included point changes, or after a specified interval (the *default update* time) if a change-of-state has not occurred. The transmitting device also sends a 'hold time' which is set greater than four times the programmed default time required by the receiving device.

Receiving devices are constantly monitoring the communications network for messages they require, as recognized by the identification of the originating device carried in the message. Messages received from remote devices include the message *time allowed to live*. The receiving relay sets a timer assigned to the originating device to this time interval, and if it has not received another message from this device at time-out, the remote device is declared to be non-communicating, so it will use the programmed default state for all points from that specific remote device. If a message is received from a remote device before the *time allowed to live* expires, all points for that device are updated to the states contained in the message and the hold timer is restarted. The status of a remote device, where "Offline" indicates non-communicating, can be displayed.

The remote input/output facility provides for 32 remote inputs and 64 remote outputs.

The L90 provides an additional method of sharing digital point state information among different relays: direct messages. Direct messages are only used between UR-series relays inter-connected via dedicated type 7X communications modules, usually between substations. The digital state data conveyed by direct messages are direct inputs and direct outputs.

b) DIRECT MESSAGES

Direct messages are only used between UR-series relays containing the type 7X UR communications module. These messages are transmitted every one-half of the power frequency cycle (10 ms for 50 Hz and 8.33 ms for 60 Hz). This facility is of particular value for pilot schemes and transfer tripping. Direct messaging is available on both single channel and dual channel communications modules. The inputs and outputs on communications channel 1 are numbered 1-1 through 1-8, and the inputs and outputs on communications channel 2 are numbered 2-1 through 2-8.

Settings associated with direct messages are automatically presented in accordance with the number of channels provided in the communications module in a specific relay.

c) LOCAL DEVICES: DEVICE ID FOR TRANSMITTING GSSE MESSAGES

In a L90 relay, the device ID that represents the IEC 61850 GOOSE application ID (GoID) name string sent as part of each GOOSE message is programmed in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION** ⇒ **TRANSMISSION** ⇒ **FIXED GOOSE** ⇒ **GOOSE ID** setting.

Likewise, the device ID that represents the IEC 61850 GSSE application ID name string sent as part of each GSSE message is programmed in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION** ⇒ **TRANSMISSION** ⇒ **GSSE** ⇒ **GSSE ID** setting.

In L90 releases previous to 5.0x, these name strings were represented by the **RELAY NAME** setting.

d) REMOTE DEVICES: ID OF DEVICE FOR RECEIVING GSSE/GOOSE MESSAGES

PATH: **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **REMOTE DEVICES** ⇒ **REMOTE DEVICE 1(16)**

<div> <div>■ REMOTE DEVICE 1</div> <div>■</div> </div>	<div>◀▶</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div>	REMOTE DEVICE 1 ID: Remote Device 1	Range: up to 20 alphanumeric characters
		REMOTE DEVICE 1 ETypes APPID: 0	Range: 0 to 16383 in steps of 1
		REMOTE DEVICE 1 DATASET: Fixed	Range: Fixed, GOOSE 1 through GOOSE 16

Remote devices are available for setting purposes. A receiving relay must be programmed to capture messages from only those originating remote devices of interest. This setting is used to select specific remote devices by entering (bottom row) the exact identification (ID) assigned to those devices.

The **REMOTE DEVICE 1 ETYPES APPID** setting is only used with GOOSE messages; they are not applicable to GSSE messages. This setting identifies the Ethernet application identification in the GOOSE message. It should match the corresponding settings on the sending device.

The **REMOTE DEVICE 1 DATASET** setting provides for the choice of the L90 fixed (DNA/UserSt) dataset (that is, containing DNA and UserSt bit pairs), or one of the configurable datasets.

Note that the dataset for the received data items must be made up of existing items in an existing logical node. For this reason, logical node GGIO3 is instantiated to hold the incoming data items. GGIO3 is not necessary to make use of the received data. The remote input data item mapping takes care of the mapping of the inputs to remote input FlexLogic operands. However, GGIO3 data can be read by IEC 61850 clients.

5

5.8.6 REMOTE INPUTS

PATH: **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **REMOTE INPUTS** ⇒ **REMOTE INPUT 1(32)**

<div> <div>■ REMOTE INPUT 1</div> <div>■</div> </div>	<div>◀▶</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div>	REMOTE INPUT 1 ID: Remote Ip 1	Range: up to 12 alphanumeric characters
		REMOTE IN 1 DEVICE: Remote Device 1	Range: Remote Device 1 to Remote device 16
		REMOTE IN 1 ITEM: None	Range: None, DNA-1 to DNA-32, UserSt-1 to UserSt-32, Config Item 1 to Config Item 32
		REMOTE IN 1 DEFAULT STATE: Off	Range: On, Off, Latest/On, Latest/Off
		REMOTE IN 1 EVENTS: Disabled	Range: Disabled, Enabled

Remote Inputs that create FlexLogic operands at the receiving relay are extracted from GSSE/GOOSE messages originating in remote devices. Each remote input can be selected from a list consisting of: DNA-1 through DNA-32, UserSt-1 through UserSt-32, and Dataset Item 1 through Dataset Item 32. The function of DNA inputs is defined in the IEC 61850 specification and is presented in the IEC 61850 DNA Assignments table in the *Remote outputs* section. The function of UserSt inputs is defined by the user selection of the FlexLogic operand whose state is represented in the GSSE/GOOSE message. A user must program a DNA point from the appropriate FlexLogic operand.

Remote input 1 must be programmed to replicate the logic state of a specific signal from a specific remote device for local use. This programming is performed via the three settings shown above.

The **REMOTE INPUT 1 ID** setting allows the user to assign descriptive text to the remote input. The **REMOTE IN 1 DEVICE** setting selects the remote device which originates the required signal, as previously assigned to the remote device via the setting **REMOTE DEVICE (16) ID** (see the *Remote devices* section). The **REMOTE IN 1 ITEM** setting selects the specific bits of the GSSE/GOOSE message required.

The **REMOTE IN 1 DEFAULT STATE** setting selects the logic state for this point if the local relay has just completed startup or the remote device sending the point is declared to be non-communicating. The following choices are available:

- Setting **REMOTE IN 1 DEFAULT STATE** to “On” value defaults the input to logic 1.
- Setting **REMOTE IN 1 DEFAULT STATE** to “Off” value defaults the input to logic 0.
- Setting **REMOTE IN 1 DEFAULT STATE** to “Latest/On” freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to logic 1. When communication resumes, the input becomes fully operational.
- Setting **REMOTE IN 1 DEFAULT STATE** to “Latest/Off” freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to logic 0. When communication resumes, the input becomes fully operational.

For additional information on GSSE/GOOSE messaging, refer to the Remote Devices section in this chapter.

5.8.7 REMOTE DOUBLE-POINT STATUS INPUTS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ REMOTE DPS INPUTS ⇒ REMOTE DPS INPUT 1(5)

<div>5</div> <div>REMOTE DPS INPUT 1</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div>	<div>REM DPS IN 1 ID:</div> <div>RemDPS Ip 1</div>	Range: up to 12 alphanumeric characters
	<div>REM DPS IN 1 DEV:</div> <div>Remote Device 1</div>	Range: Remote Device 1 to Remote device 16
	<div>REM DPS IN 1 ITEM:</div> <div>None</div>	Range: None, Dataset Item 1 to Dataset Item 32
	<div>REM DPS IN 1</div> <div>EVENTS: Disabled</div>	Range: Enabled, Disabled

Remote double-point status inputs are extracted from GOOSE messages originating in the remote device. Each remote double point status input must be programmed to replicate the logic state of a specific signal from a specific remote device for local use. This functionality is accomplished with the five remote double-point status input settings.

- REM DPS IN 1 ID:** This setting assigns descriptive text to the remote double-point status input.
- REM DPS IN 1 DEV:** This setting selects a remote device ID to indicate the origin of a GOOSE message. The range is selected from the remote device IDs specified in the *Remote devices* section.
- REM DPS IN 1 ITEM:** This setting specifies the required bits of the GOOSE message.

The configurable GOOSE dataset items must be changed to accept a double-point status item from a GOOSE dataset (changes are made in the **SETTINGS ⇒ COMMUNICATION ⇒ IEC 61850 PROTOCOL ⇒ GSSE/GOOSE CONFIGURATION ⇒ RECEPTION ⇒ CONFIGURABLE GOOSE ⇒ CONFIGURABLE GOOSE 1(16) ⇒ CONFIG GSE 1 DATASET ITEMS** menus). Dataset items configured to receive any of “GGIO3.ST.IndPos1.stV” to “GGIO3.ST.IndPos5.stV” will accept double-point status information that will be decoded by the remote double-point status inputs configured to this dataset item.

The remote double point status is recovered from the received IEC 61850 dataset and is available as through the RemDPS Ip 1 BAD, RemDPS Ip 1 INTERM, RemDPS Ip 1 OFF, and RemDPS Ip 1 ON FlexLogic operands. These operands can then be used in breaker or disconnect control schemes.

5.8.8 REMOTE OUTPUTS

a) DNA BIT PAIRS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ REMOTE OUTPUTS DNA BIT PAIRS ⇒ REMOTE OUTPUTS DNA- 1(32) BIT PAIR

<input checked="" type="checkbox"/> REMOTE OUTPUTS <input checked="" type="checkbox"/> DNA- 1 BIT PAIR		DNA- 1 OPERAND: Off	Range: FlexLogic operand
MESSAGE		DNA- 1 EVENTS: Disabled	Range: Disabled, Enabled

Remote outputs (1 to 32) are FlexLogic operands inserted into GSSE/GOOSE messages that are transmitted to remote devices on a LAN. Each digital point in the message must be programmed to carry the state of a specific FlexLogic operand. The above operand setting represents a specific DNA function (as shown in the following table) to be transmitted.

Table 5–33: IEC 61850 DNA ASSIGNMENTS

DNA	IEC 61850 DEFINITION	FLEXLOGIC OPERAND
1	Test	IEC 61850 TEST MODE
2	ConfRev	IEC 61850 CONF REV

b) USERST BIT PAIRS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ REMOTE OUTPUTS UserSt BIT PAIRS ⇒ REMOTE OUTPUTS UserSt- 1(32) BIT PAIR

<input checked="" type="checkbox"/> REMOTE OUTPUTS <input checked="" type="checkbox"/> UserSt- 1 BIT PAIR		UserSt- 1 OPERAND: Off	Range: FlexLogic operand
MESSAGE		UserSt- 1 EVENTS: Disabled	Range: Disabled, Enabled

Remote outputs 1 to 32 originate as GSSE/GOOSE messages to be transmitted to remote devices. Each digital point in the message must be programmed to carry the state of a specific FlexLogic operand. The setting above is used to select the operand which represents a specific UserSt function (as selected by the user) to be transmitted.

For more information on GSSE/GOOSE messaging, refer to Remote Inputs/Outputs Overview in the Remote Devices section.

5.8.9 DIRECT INPUTS/OUTPUTS

a) DESCRIPTION

The relay provides eight direct inputs conveyed on communications channel 1 (numbered 1-1 through 1-8) and eight direct inputs conveyed on communications channel 2 (on three-terminal systems only, numbered 2-1 through 2-8). The user must program the remote relay connected to channels 1 and 2 of the local relay by assigning the desired FlexLogic operand to be sent via the selected communications channel.

This relay allows the user to create distributed protection and control schemes via dedicated communications channels. Some examples are directional comparison pilot schemes and transfer tripping. It should be noted that failures of communications channels will affect direct input/output functionality. The 87L function must be enabled to utilize the direct inputs.

Direct input and output FlexLogic operands to be used at the local relay are assigned as follows:

- Direct input/output 1-1 through direct input/output 1-8 for communications channel 1.
- Direct input/output 2-1 through direct input/output 2-8 for communications channel 2 (three-terminal systems only).

On the two-terminal, two channel system (redundant channel), direct outputs 1-1 to 1-8 are sent over both channels simultaneously and are received separately as direct inputs 1-1 to 1-8 at channel 1 and direct inputs 2-1 to 2-8 at channel 2. Therefore, to take advantage of redundancy, the respective operands from channel 1 and 2 can be ORed with FlexLogic or mapped separately.

b) DIRECT INPUTS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ DIRECT ⇒ DIRECT INPUTS

<input checked="" type="checkbox"/> DIRECT INPUTS		DIRECT INPUT 1-1 DEFAULT: Off	Range: Off, On
	MESSAGE	DIRECT INPUT 1-2 DEFAULT: Off	Range: Off, On
		↓	
	MESSAGE	DIRECT INPUT 1-8 DEFAULT: Off	Range: Off, On
	MESSAGE	DIRECT INPUT 2-1 DEFAULT: Off	Range: Off, On
	MESSAGE	DIRECT INPUT 2-2 DEFAULT: Off	Range: Off, On
		↓	
	MESSAGE	DIRECT INPUT 2-8 DEFAULT: Off	Range: Off, On

The **DIRECT INPUT 1-1(8) DEFAULT** setting selects the logic state of this particular bit used for this point if the local relay has just completed startup or the local communications channel is declared to have failed. Setting **DIRECT INPUT 1-1(8) DEFAULT** to “On” means that the corresponding local FlexLogic operand (DIRECT I/P 1-1(8)) will have logic state “1” on relay startup or during communications channel failure. When the channel is restored, the operand logic state reflects the actual state of the corresponding remote direct output.

c) DIRECT OUTPUTS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ DIRECT ⇒ DIRECT OUTPUTS

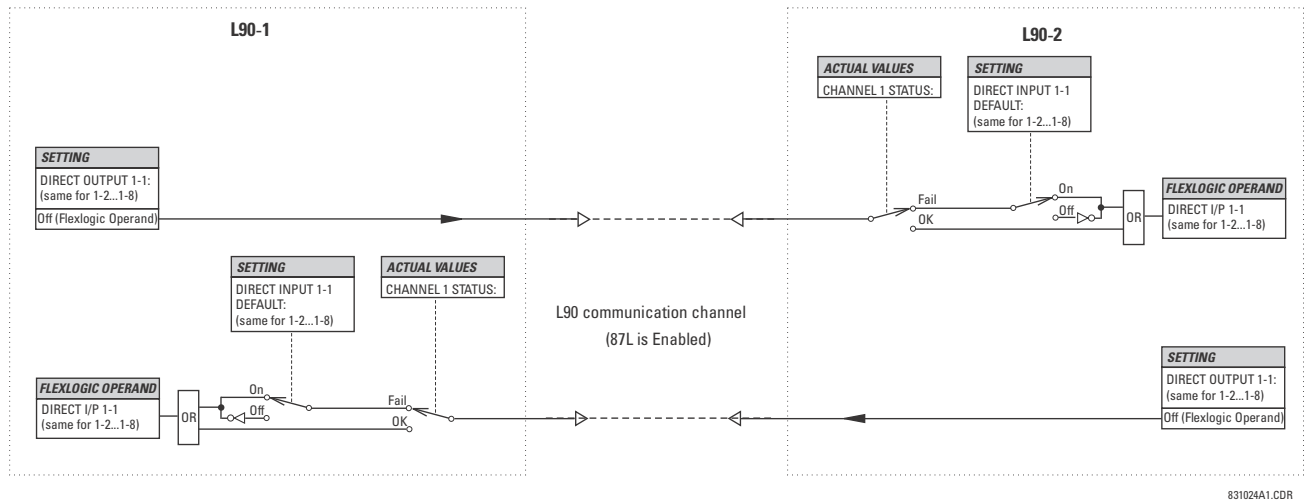

<input checked="" type="checkbox"/> DIRECT OUTPUTS		DIRECT OUTPUT 1-1: Off	Range: FlexLogic operand
	MESSAGE	DIRECT OUTPUT 1-2: Off	Range: FlexLogic operand
		↓	
	MESSAGE	DIRECT OUTPUT 1-8: Off	Range: FlexLogic operand
	MESSAGE	DIRECT OUTPUT 2-1: Off	Range: FlexLogic operand
	MESSAGE	DIRECT OUTPUT 2-2: Off	Range: FlexLogic operand
		↓	
	MESSAGE	DIRECT OUTPUT 2-8: Off	Range: FlexLogic operand

The relay provides eight direct outputs that are conveyed on communications channel 1 (numbered 1-1 through 1-8) and eight direct outputs that are conveyed on communications channel 2 (numbered 2-1 through 2-8). Each digital point in the message must be programmed to carry the state of a specific FlexLogic operand. The setting above is used to select the operand which represents a specific function (as selected by the user) to be transmitted.

Direct outputs 2-1 to 2-8 are only functional on three-terminal systems.

NOTE

831024A1.CDR

Figure 5-176: DIRECT INPUTS/OUTPUTS LOGIC

5.8.10 RESETTING

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ RESETTING

<div>RESETTING</div> <div></div>	◀▶	<div>RESET OPERAND:</div> <div>Off</div>	Range: FlexLogic operand
----------------------------------	----	--	--------------------------

Some events can be programmed to latch the faceplate LED event indicators and the target message on the display. Once set, the latching mechanism will hold all of the latched indicators or messages in the set state after the initiating condition has cleared until a RESET command is received to return these latches (not including FlexLogic latches) to the reset state. The RESET command can be sent from the faceplate Reset button, a remote device via a communications channel, or any programmed operand.

When the RESET command is received by the relay, two FlexLogic operands are created. These operands, which are stored as events, reset the latches if the initiating condition has cleared. The three sources of RESET commands each create the RESET OP FlexLogic operand. Each individual source of a RESET command also creates its individual operand RESET OP (PUSHBUTTON), RESET OP (COMMS) or RESET OP (OPERAND) to identify the source of the command. The setting shown above selects the operand that will create the RESET OP (OPERAND) operand.

5.8.11 IEC 61850 GOOSE ANALOGS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ IEC 61850 GOOSE ANALOGS ⇒ GOOSE ANALOG INPUT 1(32)

<div>GOOSE ANALOG</div> <div>INPUT 1</div>	◀▶	<div>ANALOG 1 DEFAULT:</div> <div>1000.000</div>	Range: -1000000.000 to 1000000.000 in steps of 0.001
	MESSAGE ▲▼	<div>ANALOG 1 DEFAULT</div> <div>MODE: Default Value</div>	Range: Default Value, Last Known
	MESSAGE ▲▼	<div>GOOSE ANALOG 1</div> <div>UNITS:</div>	Range: up to 4 alphanumeric characters
	MESSAGE ▲▼	<div>GOOSE ANALOG 1 PU:</div> <div>1.000</div>	Range: 0.000 to 1000000000.000 in steps of 0.001

The IEC 61850 GOOSE analog inputs feature allows the transmission of analog values between any two UR-series devices. The following settings are available for each GOOSE analog input.

- **ANALOG 1 DEFAULT:** This setting specifies the value of the GOOSE analog input when the sending device is offline and the **ANALOG 1 DEFAULT MODE** is set to "Default Value". This setting is stored as an IEEE 754 / IEC 60559 floating point number. Because of the large range of this setting, not all possible values can be stored. Some values may be rounded to the closest possible floating point number.
- **ANALOG 1 DEFAULT MODE:** When the sending device is offline and this setting is "Last Known", the value of the GOOSE analog input remains at the last received value. When the sending device is offline and this setting value is "Default Value", then the value of the GOOSE analog input is defined by the **ANALOG 1 DEFAULT** setting.
- **GOOSE ANALOG 1 UNITS:** This setting specifies a four-character alphanumeric string that can be used in the actual values display of the corresponding GOOSE analog input value.
- **GOOSE ANALOG 1 PU:** This setting specifies the per-unit base factor when using the GOOSE analog input FlexAnalog values in other L90 features, such as FlexElements. The base factor is applied to the GOOSE analog input FlexAnalog quantity to normalize it to a per-unit quantity. The base units are described in the following table.

Table 5–34: GOOSE ANALOG INPUT BASE UNITS

ELEMENT	BASE UNITS
87L SIGNALS (Local IA Mag, IB, and IC) (Diff Curr IA Mag, IB, and IC) (Terminal 1 IA Mag, IB, and IC) (Terminal 2 IA Mag, IB and IC)	I_{BASE} = maximum primary RMS value of the +IN and –IN inputs (CT primary for source currents, and 87L source primary current for line differential currents)
87L SIGNALS (Op Square Curr IA, IB, and IC) (Rest Square Curr IA, IB, and IC)	BASE = Squared CT secondary of the 87L source
BREAKER ARCING AMPS (Brk X Arc Amp A, B, and C)	BASE = $2000 \text{ kA}^2 \times \text{cycle}$
dcmA	BASE = maximum value of the DCMA INPUT MAX setting for the two transducers configured under the +IN and –IN inputs.
FREQUENCY	f_{BASE} = 1 Hz
PHASE ANGLE	Φ_{BASE} = 360 degrees (see the UR angle referencing convention)
POWER FACTOR	PF_{BASE} = 1.00
RTDs	BASE = 100°C
SOURCE CURRENT	I_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SOURCE ENERGY (Positive and Negative Watthours, Positive and Negative Varhours)	E_{BASE} = 10000 MWh or MVAh, respectively
SOURCE POWER	P_{BASE} = maximum value of $V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs
SOURCE VOLTAGE	V_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SYNCHROCHECK (Max Delta Volts)	V_{BASE} = maximum primary RMS value of all the sources related to the +IN and –IN inputs

The GOOSE analog input FlexAnalog values are available for use in other L90 functions that use FlexAnalog values.

5.8.12 IEC 61850 GOOSE INTEGERS

PATH: SETTINGS ⇒ INPUTS/OUTPUTS ⇒ IEC 61850 GOOSE UINTEGERS ⇒ GOOSE UINTEGER INPUT 1(16)

<ul style="list-style-type: none"> GOOSE UINTEGER INPUT 1 	 	UINTEGER 1 DEFAULT: 1000	<i>Range: 0 to 429496295 in steps of 1</i>
MESSAGE		UINTEGER 1 DEFAULT MODE: Default Value	<i>Range: Default Value, Last Known</i>

The IEC 61850 GOOSE uinteger inputs feature allows the transmission of FlexInteger values between any two UR-series devices. The following settings are available for each GOOSE uinteger input.

- **UIINTEGER 1 DEFAULT:** This setting specifies the value of the GOOSE uinteger input when the sending device is offline and the **UIINTEGER 1 DEFAULT MODE** is set to “Default Value”. This setting is stored as a 32-bit unsigned integer number.
- **UIINTEGER 1 DEFAULT MODE:** When the sending device is offline and this setting is “Last Known”, the value of the GOOSE uinteger input remains at the last received value. When the sending device is offline and this setting value is “Default Value”, then the value of the GOOSE uinteger input is defined by the **UIINTEGER 1 DEFAULT** setting.

The GOOSE integer input FlexInteger values are available for use in other L90 functions that use FlexInteger values.

5.9.1 DCMA INPUTS

PATH: SETTINGS ⇒ TRANSDUCER I/O ⇒ DCMA INPUTS ⇒ DCMA INPUT H1(U8)

■ DCMA INPUT H1	◀▶	DCMA INPUT H1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE	▲▼	DCMA INPUT H1 ID: DCMA Ip 1	Range: up to 20 alphanumeric characters
MESSAGE	▲▼	DCMA INPUT H1 UNITS: μ A	Range: 6 alphanumeric characters
MESSAGE	▲▼	DCMA INPUT H1 RANGE: 0 to -1 mA	Range: 0 to -1 mA, 0 to +1 mA, -1 to +1 mA, 0 to 5 mA, 0 to 10mA, 0 to 20 mA, 4 to 20 mA
MESSAGE	▲▼	DCMA INPUT H1 MIN VALUE: 0.000	Range: -9999.999 to +9999.999 in steps of 0.001
MESSAGE	▲▼	DCMA INPUT H1 MAX VALUE: 0.000	Range: -9999.999 to +9999.999 in steps of 0.001

Hardware and software is provided to receive signals from external transducers and convert these signals into a digital format for use as required. The relay will accept inputs in the range of -1 to +20 mA DC, suitable for use with most common transducer output ranges; all inputs are assumed to be linear over the complete range. Specific hardware details are contained in chapter 3.

5

Before the dcma input signal can be used, the value of the signal measured by the relay must be converted to the range and quantity of the external transducer primary input parameter, such as DC voltage or temperature. The relay simplifies this process by internally scaling the output from the external transducer and displaying the actual primary parameter.

dcma input channels are arranged in a manner similar to CT and VT channels. The user configures individual channels with the settings shown here.

The channels are arranged in sub-modules of two channels, numbered from 1 through 8 from top to bottom. On power-up, the relay will automatically generate configuration settings for every channel, based on the order code, in the same general manner that is used for CTs and VTs. Each channel is assigned a slot letter followed by the row number, 1 through 8 inclusive, which is used as the channel number. The relay generates an actual value for each available input channel.

Settings are automatically generated for every channel available in the specific relay as shown above for the first channel of a type 5F transducer module installed in slot H.

The function of the channel may be either "Enabled" or "Disabled". If "Disabled", no actual values are created for the channel. An alphanumeric "ID" is assigned to each channel; this ID will be included in the channel actual value, along with the programmed units associated with the parameter measured by the transducer, such as volts, °C, megawatts, etc. This ID is also used to reference the channel as the input parameter to features designed to measure this type of parameter. The **DCMA INPUT H1 RANGE** setting specifies the mA DC range of the transducer connected to the input channel.

The **DCMA INPUT H1 MIN VALUE** and **DCMA INPUT H1 MAX VALUE** settings are used to program the span of the transducer in primary units. For example, a temperature transducer might have a span from 0 to 250°C; in this case the **DCMA INPUT H1 MIN VALUE** value is "0" and the **DCMA INPUT H1 MAX VALUE** value is "250". Another example would be a watts transducer with a span from -20 to +180 MW; in this case the **DCMA INPUT H1 MIN VALUE** value would be "-20" and the **DCMA INPUT H1 MAX VALUE** value "180". Intermediate values between the min and max values are scaled linearly.

5.9.2 RTD INPUTS

PATH: SETTINGS ⇒ ⚙ TRANSDUCER I/O ⇒ ⚙ RTD INPUTS ⇒ RTD INPUT H1(U8)

■ RTD INPUT H1	⏪ ⏩	RTD INPUT H1 FUNCTION: Disabled	Range: Disabled, Enabled
MESSAGE	⬆ ⬇ ⬆	RTD INPUT H1 ID: RTD Ip 1	Range: Up to 20 alphanumeric characters
MESSAGE	⬆ ⬇ ⬆	RTD INPUT H1 TYPE: 100Ω Nickel	Range: 100Ω Nickel, 10Ω Copper, 100Ω Platinum, 120Ω Nickel

Hardware and software is provided to receive signals from external resistance temperature detectors and convert these signals into a digital format for use as required. These channels are intended to be connected to any of the RTD types in common use. Specific hardware details are contained in chapter 3.

RTD input channels are arranged in a manner similar to CT and VT channels. The user configures individual channels with the settings shown here.

The channels are arranged in sub-modules of two channels, numbered from 1 through 8 from top to bottom. On power-up, the relay will automatically generate configuration settings for every channel, based on the order code, in the same general manner that is used for CTs and VTs. Each channel is assigned a slot letter followed by the row number, 1 through 8 inclusive, which is used as the channel number. The relay generates an actual value for each available input channel.

Settings are automatically generated for every channel available in the specific relay as shown above for the first channel of a type 5C transducer module installed in the first available slot.

The function of the channel may be either “Enabled” or “Disabled”. If “Disabled”, there will not be an actual value created for the channel. An alphanumeric ID is assigned to the channel; this ID will be included in the channel actual values. It is also used to reference the channel as the input parameter to features designed to measure this type of parameter. Selecting the type of RTD connected to the channel configures the channel.

Actions based on RTD overtemperature, such as trips or alarms, are done in conjunction with the FlexElements feature. In FlexElements, the operate level is scaled to a base of 100°C. For example, a trip level of 150°C is achieved by setting the operate level at 1.5 pu. FlexElement operands are available to FlexLogic for further interlocking or to operate an output contact directly.

Refer to the following table for reference temperature values for each RTD type.

Table 5–35: RTD TEMPERATURE VS. RESISTANCE

TEMPERATURE		RESISTANCE (IN OHMS)			
°C	°F	100 Ω PT (DIN 43760)	120 Ω NI	100 Ω NI	10 Ω CU
–50	–58	80.31	86.17	71.81	7.10

5.9.3 DCMA OUTPUTS

PATH: SETTINGS ⇒ TRANSDUCER I/O ⇒ DCMA OUTPUTS ⇒ DCMA OUTPUT H1(U8)

■ DCMA OUTPUT H1	DCMA OUTPUT H1 SOURCE: Off	Range: Off, any analog actual value parameter
MESSAGE	DCMA OUTPUT H1 RANGE: -1 to 1 mA	Range: -1 to 1 mA, 0 to 1 mA, 4 to 20 mA
MESSAGE	DCMA OUTPUT H1 MIN VAL: 0.000 pu	Range: -90.000 to 90.000 pu in steps of 0.001
MESSAGE	DCMA OUTPUT H1 MAX VAL: 1.000 pu	Range: -90.000 to 90.000 pu in steps of 0.001

Hardware and software is provided to generate dcmA signals that allow interfacing with external equipment. Specific hardware details are contained in chapter 3. The dcmA output channels are arranged in a manner similar to transducer input or CT and VT channels. The user configures individual channels with the settings shown below.

The channels are arranged in sub-modules of two channels, numbered 1 through 8 from top to bottom. On power-up, the relay automatically generates configuration settings for every channel, based on the order code, in the same manner used for CTs and VTs. Each channel is assigned a slot letter followed by the row number, 1 through 8 inclusive, which is used as the channel number.

Both the output range and a signal driving a given output are user-programmable via the following settings menu (an example for channel M5 is shown).

The relay checks the driving signal (x in equations below) for the minimum and maximum limits, and subsequently re-scales so the limits defined as **MIN VAL** and **MAX VAL** match the output range of the hardware defined as **RANGE**. The following equation is applied:

$$I_{out} = \begin{cases} I_{min} & \text{if } x < \text{MIN VAL} \\ I_{max} & \text{if } x > \text{MAX VAL} \\ k(x - \text{MIN VAL}) + I_{min} & \text{otherwise} \end{cases} \quad (\text{EQ 5.39})$$

where: x is a driving signal specified by the **SOURCE** setting

I_{min} and I_{max} are defined by the **RANGE** setting

k is a scaling constant calculated as:

$$k = \frac{I_{max} - I_{min}}{\text{MAX VAL} - \text{MIN VAL}} \quad (\text{EQ 5.40})$$

The feature is intentionally inhibited if the **MAX VAL** and **MIN VAL** settings are entered incorrectly, e.g. when **MAX VAL** – **MIN VAL** < 0.1 pu. The resulting characteristic is illustrated in the following figure.

Figure 5-177: DCMA OUTPUT CHARACTERISTIC

The dcmA output settings are described below.

- **DCMA OUTPUT H1 SOURCE:** This setting specifies an internal analog value to drive the analog output. Actual values (FlexAnalog parameters) such as power, current amplitude, voltage amplitude, power factor, etc. can be configured as sources driving dcmA outputs. Refer to Appendix A for a complete list of FlexAnalog parameters.
- **DCMA OUTPUT H1 RANGE:** This setting allows selection of the output range. Each dcmA channel may be set independently to work with different ranges. The three most commonly used output ranges are available.
- **DCMA OUTPUT H1 MIN VAL:** This setting allows setting the minimum limit for the signal that drives the output. This setting is used to control the mapping between an internal analog value and the output current. The setting is entered in per-unit values. The base units are defined in the same manner as the FlexElement base units.
- **DCMA OUTPUT H1 MAX VAL:** This setting allows setting the maximum limit for the signal that drives the output. This setting is used to control the mapping between an internal analog value and the output current. The setting is entered in per-unit values. The base units are defined in the same manner as the FlexElement base units.

The **DCMA OUTPUT H1 MIN VAL** and **DCMA OUTPUT H1 MAX VAL** settings are ignored for power factor base units (i.e. if the **DCMA OUTPUT H1 SOURCE** is set to FlexAnalog value based on power factor measurement).

Three application examples are described below.

EXAMPLE: POWER MONITORING

A three phase active power on a 13.8 kV system measured via UR-series relay source 1 is to be monitored by the dcmA H1 output of the range of –1 to 1 mA. The following settings are applied on the relay: CT ratio = 1200:5, VT secondary 115, VT connection is delta, and VT ratio = 120. The nominal current is 800 A primary and the nominal power factor is 0.90. The power is to be monitored in both importing and exporting directions and allow for 20% overload compared to the nominal.

The nominal three-phase power is:

$$P = \sqrt{3} \times 13.8 \text{ kV} \times 0.8 \text{ kA} \times 0.9 = 17.21 \text{ MW} \quad (\text{EQ 5.41})$$

The three-phase power with 20% overload margin is:

$$P_{max} = 1.2 \times 17.21 \text{ MW} = 20.65 \text{ MW} \quad (\text{EQ 5.42})$$

The base unit for power (refer to the FlexElements section in this chapter for additional details) is:

$$P_{BASE} = 115 \text{ V} \times 120 \times 1.2 \text{ kA} = 16.56 \text{ MW} \quad (\text{EQ 5.43})$$

The minimum and maximum power values to be monitored (in pu) are:

$$\text{minimum power} = \frac{-20.65 \text{ MW}}{16.56 \text{ MW}} = -1.247 \text{ pu}, \quad \text{maximum power} = \frac{20.65 \text{ MW}}{16.56 \text{ MW}} = 1.247 \text{ pu} \quad (\text{EQ 5.44})$$

The following settings should be entered:

DCMA OUTPUT H1 SOURCE: "SRC 1 P"
DCMA OUTPUT H1 RANGE: "–1 to 1 mA"
DCMA OUTPUT H1 MIN VAL: "–1.247 pu"
DCMA OUTPUT H1 MAX VAL: "1.247 pu"

With the above settings, the output will represent the power with the scale of 1 mA per 20.65 MW. The worst-case error for this application can be calculated by superimposing the following two sources of error:

- $\pm 0.5\%$ of the full scale for the analog output module, or $\pm 0.005 \times (1 - (-1)) \times 20.65 \text{ MW} = \pm 0.207 \text{ MW}$
- $\pm 1\%$ of reading error for the active power at power factor of 0.9

For example at the reading of 20 MW, the worst-case error is $0.01 \times 20 \text{ MW} + 0.207 \text{ MW} = 0.407 \text{ MW}$.

EXAMPLE: CURRENT MONITORING

The phase A current (true RMS value) is to be monitored via the H2 current output working with the range from 4 to 20 mA. The CT ratio is 5000:5 and the maximum load current is 4200 A. The current should be monitored from 0 A upwards, allowing for 50% overload.

The phase current with the 50% overload margin is:

$$I_{max} = 1.5 \times 4.2 \text{ kA} = 6.3 \text{ kA} \quad (\text{EQ 5.45})$$

The base unit for current (refer to the *FlexElements* section in this chapter for additional details) is:

$$I_{BASE} = 5 \text{ kA} \quad (\text{EQ 5.46})$$

The minimum and maximum power values to be monitored (in pu) are:

$$\text{minimum current} = \frac{0 \text{ kA}}{5 \text{ kA}} = 0 \text{ pu}, \quad \text{maximum current} = \frac{6.3 \text{ kA}}{5 \text{ kA}} = 1.26 \text{ pu} \quad (\text{EQ 5.47})$$

The following settings should be entered:

DCMA OUTPUT H2 SOURCE: "SRC 1 Ia RMS"

DCMA OUTPUT H2 RANGE: "4 to 20 mA"

DCMA OUTPUT H2 MIN VAL: "0.000 pu"

DCMA OUTPUT H2 MAX VAL: "1.260 pu"

The worst-case error for this application could be calculated by superimposing the following two sources of error:

- $\pm 0.5\%$ of the full scale for the analog output module, or $\pm 0.005 \times (20 - 4) \times 6.3 \text{ kA} = \pm 0.504 \text{ kA}$
- $\pm 0.25\%$ of reading or $\pm 0.1\%$ of rated (whichever is greater) for currents between 0.1 and 2.0 of nominal

For example, at the reading of 4.2 kA, the worst-case error is $\max(0.0025 \times 4.2 \text{ kA}, 0.001 \times 5 \text{ kA}) + 0.504 \text{ kA} = 0.515 \text{ kA}$.

EXAMPLE: VOLTAGE MONITORING

A positive-sequence voltage on a 400 kV system measured via source 2 is to be monitored by the dcmA H3 output with a range of 0 to 1 mA. The VT secondary setting is 66.4 V, the VT ratio setting is 6024, and the VT connection setting is "Delta". The voltage should be monitored in the range from 70% to 110% of nominal.

The minimum and maximum positive-sequence voltages to be monitored are:

$$V_{min} = 0.7 \times \frac{400 \text{ kV}}{\sqrt{3}} = 161.66 \text{ kV}, \quad V_{max} = 1.1 \times \frac{400 \text{ kV}}{\sqrt{3}} = 254.03 \text{ kV} \quad (\text{EQ 5.48})$$

The base unit for voltage (refer to the *FlexElements* section in this chapter for additional details) is:

$$V_{BASE} = 0.0664 \text{ kV} \times 6024 = 400 \text{ kV} \quad (\text{EQ 5.49})$$

The minimum and maximum voltage values to be monitored (in pu) are:

$$\text{minimum voltage} = \frac{161.66 \text{ kV}}{400 \text{ kV}} = 0.404 \text{ pu}, \quad \text{maximum voltage} = \frac{254.03 \text{ kV}}{400 \text{ kV}} = 0.635 \text{ pu} \quad (\text{EQ 5.50})$$

The following settings should be entered:

DCMA OUTPUT H3 SOURCE: "SRC 2 V₁ mag"

DCMA OUTPUT H3 RANGE: "0 to 1 mA"

DCMA OUTPUT H3 MIN VAL: "0.404 pu"

DCMA OUTPUT H3 MAX VAL: "0.635 pu"

The limit settings differ from the expected 0.7 pu and 1.1 pu because the relay calculates the positive-sequence quantities scaled to the phase-to-ground voltages, even if the VTs are connected in "Delta" (refer to the *Metering conventions* section in chapter 6), while at the same time the VT nominal voltage is 1 pu for the settings. Consequently the settings required in this example differ from naturally expected by the factor of $\sqrt{3}$.

The worst-case error for this application could be calculated by superimposing the following two sources of error:

- $\pm 0.5\%$ of the full scale for the analog output module, or $\pm 0.005 \times (1 - 0) \times 254.03 \text{ kV} = \pm 1.27 \text{ kV}$
- $\pm 0.5\%$ of reading

For example, under nominal conditions, the positive-sequence reads 230.94 kV and the worst-case error is $0.005 \times 230.94 \text{ kV} + 1.27 \text{ kV} = 2.42 \text{ kV}$.

5.10.1 TEST MODE

PATH: SETTINGS ⇌ TESTING ⇌ TEST MODE

The L90 provides a test facility to verify the functionality of contact inputs and outputs, some communication channels and the phasor measurement unit (where applicable), using simulated conditions. The test mode is indicated on the relay faceplate by a Test Mode LED indicator.

The test mode may be in any of three states: disabled, isolated, or forcible.

In the “Disabled” mode, L90 operation is normal and all test features are disabled.

In the “Isolated” mode, the L90 is prevented from performing certain control actions, including tripping via contact outputs. All relay contact outputs, including latching outputs, are disabled. Channel tests and phasor measurement unit tests remain usable on applicable UR-series models.

In the “Forcible” mode, the operand selected by the **TEST MODE FORCING** setting controls the relay inputs and outputs. If the test mode is forcible, and the operand assigned to the **TEST MODE FORCING** setting is “Off”, the L90 inputs and outputs operate normally. If the test mode is forcible, and the operand assigned to the **TEST MODE FORCING** setting is “On”, the L90 contact inputs and outputs are forced to the values specified in the following sections. Forcing may be controlled by manually changing the operand selected by the **TEST MODE FORCING** setting between on and off, or by selecting a user-programmable pushbutton, contact input, or communication-based input operand. Channel tests and phasor measurement unit tests remain usable on applicable UR-series models.

Communications based inputs and outputs remain fully operational in test mode. If a control action is programmed using direct inputs and outputs or remote inputs and outputs, then the test procedure must take this into account.

When in “Forcible” mode, the operand selected by the **TEST MODE FORCING** setting dictates further response of the L90 to testing conditions. To force contact inputs and outputs through relay settings, set **TEST MODE FORCING** to “On”. To force contact inputs and outputs through a user-programmable condition, such as FlexLogic operand (pushbutton, digital input, communication-based input, or a combination of these), set **TEST MODE FORCING** to the desired operand. The contact input or output is forced when the selected operand assumes a logic 1 state.

The L90 remains fully operational in test mode, allowing for various testing procedures. In particular, the protection and control elements, FlexLogic, and communication-based inputs and outputs function normally.

The only difference between the normal operation and the test mode is the behavior of the input and output contacts. The contact inputs can be forced to report as open or closed or remain fully operational, whereas the contact outputs can be forced to open, close, freeze, or remain fully operational. The response of the digital input and output contacts to the test mode is programmed individually for each input and output using the force contact inputs and force contact outputs test functions described in the following sections.

The test mode state is indicated on the relay faceplate by a combination of the Test Mode LED indicator, the In-Service LED indicator, and by the critical fail relay, as shown in the following table.

Table 5–36: TEST MODE OPERATION

TEST MODE FUNCTION	TEST MODE FORCING OPERAND	IN-SERVICE LED	TEST MODE LED	CRITICAL FAIL RELAY	INPUT AND OUTPUT BEHAVIOR
Disabled	No effect	Unaffected	Off	Unaffected	Contact outputs and inputs are under normal operation. Channel tests and PMU tests not operational (where applicable).
Isolated	No effect	Off	On	De-energized	Contact outputs are disabled and contact inputs are operational. Channel tests and PMU tests are also operational (where applicable).
Forcible	On (logic 1)	Off	Flashing	De-energized	Contact inputs and outputs are controlled by the force contact input and force contact output functions. Channel tests and PMU tests are operational (where applicable).
	Off (logic 0)	Off	Flashing	De-energized	Contact outputs and inputs are under normal operation. Channel tests and PMU tests are also operational (where applicable).

The **TEST MODE FUNCTION** setting can only be changed by a direct user command. Following a restart, power up, settings upload, or firmware upgrade, the test mode will remain at the last programmed value. This allows a L90 that has been placed in isolated mode to remain isolated during testing and maintenance activities. On restart, the **TEST MODE FORCING** setting and the force contact input and force contact output settings all revert to their default states.

5.10.2 FORCE CONTACT INPUTS

PATH: SETTINGS ⇒ TESTING ⇒ FORCE CONTACT INPUTS

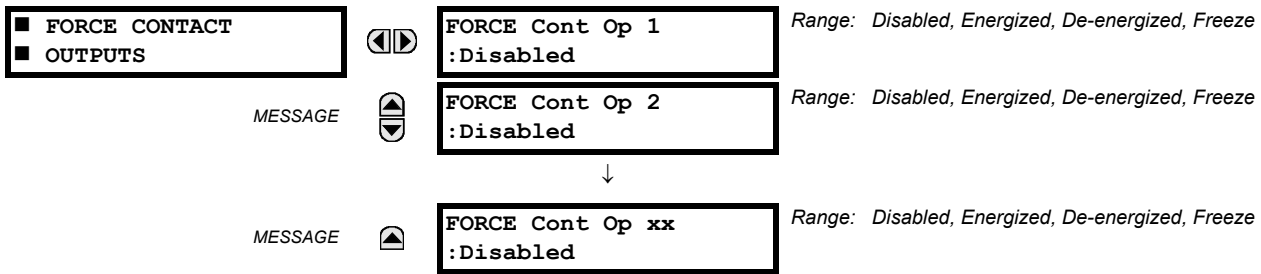

The relay digital inputs (contact inputs) could be pre-programmed to respond to the test mode in the following ways:

- If set to “Disabled”, the input remains fully operational. It is controlled by the voltage across its input terminals and can be turned on and off by external circuitry. This value should be selected if a given input must be operational during the test. This includes, for example, an input initiating the test, or being a part of a user pre-programmed test sequence.
- If set to “Open”, the input is forced to report as opened (Logic 0) for the entire duration of the test mode regardless of the voltage across the input terminals.
- If set to “Closed”, the input is forced to report as closed (Logic 1) for the entire duration of the test mode regardless of the voltage across the input terminals.

The force contact inputs feature provides a method of performing checks on the function of all contact inputs. Once enabled, the relay is placed into test mode, allowing this feature to override the normal function of contact inputs. The Test Mode LED will be on, indicating that the relay is in test mode. The state of each contact input may be programmed as “Disabled”, “Open”, or “Closed”. All contact input operations return to normal when all settings for this feature are disabled.

5.10.3 FORCE CONTACT OUTPUTS

PATH: SETTINGS ⇒ TESTING ⇒ FORCE CONTACT OUTPUTS

The relay contact outputs can be pre-programmed to respond to the test mode.

If set to “Disabled”, the contact output remains fully operational. It operates when its control operand is logic 1 and resets when its control operand is logic 0. If set to “Energized”, the output will close and remain closed for the entire duration of the test mode, regardless of the status of the operand configured to control the output contact. If set to “De-energized”, the output will open and remain opened for the entire duration of the test mode regardless of the status of the operand configured to control the output contact. If set to “Freeze”, the output retains its position from before entering the test mode, regardless of the status of the operand configured to control the output contact.

These settings are applied two ways. First, external circuits may be tested by energizing or de-energizing contacts. Second, by controlling the output contact state, relay logic may be tested and undesirable effects on external circuits avoided.

Example 1: Initiating test mode through user-programmable pushbutton 1

For example, the test mode can be initiated from user-programmable pushbutton 1. The pushbutton will be programmed as “Latched” (pushbutton pressed to initiate the test, and pressed again to terminate the test). During the test, digital input 1 should remain operational, digital inputs 2 and 3 should open, and digital input 4 should close. Also, contact output 1 should freeze, contact output 2 should open, contact output 3 should close, and contact output 4 should remain fully operational. The required settings are shown below.

To enable user-programmable pushbutton 1 to initiate the test mode, make the following changes in the **SETTINGS ⇒ TESTING ⇒ TEST MODE** menu: **TEST MODE FUNCTION**: “Enabled” and **TEST MODE INITIATE**: “PUSHBUTTON 1 ON”

Make the following changes to configure the contact inputs and outputs. In the **SETTINGS ⇒ TESTING ⇒ FORCE CONTACT INPUTS** and **FORCE CONTACT OUTPUTS** menus, set:

FORCE Cont Ip 1: “Disabled”, **FORCE Cont Ip 2**: “Open”, **FORCE Cont Ip 3**: “Open”, and **FORCE Cont Ip 4**: “Closed”
FORCE Cont Op 1: “Freeze”, **FORCE Cont Op 2**: “De-energized”, **FORCE Cont Op 3**: “Energized”,
 and **FORCE Cont Op 4**: “Disabled”

Example 2: Initiating a test from user-programmable pushbutton 1 or through remote input 1

In this example, the test can be initiated locally from user-programmable pushbutton 1 or remotely through remote input 1. Both the pushbutton and the remote input will be programmed as “Latched”. Write the following FlexLogic equation:

FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Remote Inputs On	Remote I/P 1 ON
FlexLogic Entry 2	Protection Element	PUSHBUTTON 1 ON
FlexLogic Entry 3	OR	2 Input
FlexLogic Entry 4	Assign Virtual Output	= Virt Op 1 (VO1)
FlexLogic Entry 5	End of List	

Set the user-programmable pushbutton as latching by changing **SETTINGS ⇒ PRODUCT SETUP ⇒ USER-PROGRAMMABLE PUSHBUTTONS ⇒ USER PUSHBUTTON 1 ⇒ PUSHBUTTON 1 FUNCTION** to “Latched”. To enable either pushbutton 1 or remote input 1 to initiate the Test mode, make the following changes in the **SETTINGS ⇒ TESTING ⇒ TEST MODE** menu:

TEST MODE FUNCTION: “Enabled” and **TEST MODE INITIATE**: “VO1”

5.10.4 CHANNEL TESTS

The relay must be in test mode to use the PMU test mode. That is, the **TESTING** ⇨ **TEST MODE FUNCTION** setting must be “Enabled” and the **TESTING** ⇨ **TEST MODE INITIATE** initiating signal must be “On”.

During the PMU test mode, the physical channels (VA, VB, VC, VX, IA, IB, IC, and IG), frequency, and rate of change of frequency are substituted with user values, while the symmetrical components are calculated from the physical channels. The test values are not explicitly marked in the outgoing data frames. When required, it is recommended to use the user-programmable digital channels to signal the C37.118 client that test values are being sent in place of the real measurements.

The UR Synchrophasor Implementation defines a test mode which sends a pre-defined set of Synchrophasors out over the communication channel when the test mode function setting is enabled. In test mode, the following actions take place:

- The Data Invalid / Test Mode bit (bit 15 in the STAT word) is set.
- The Sim bit in all output datasets is set.

 For status reporting, ‘On’ represents Logic 1 and ‘Off’ represents Logic 0.

6.2.1 CONTACT INPUTS

PATH: ACTUAL VALUES ⇒ STATUS ⇒ CONTACT INPUTS

The present status of the contact inputs is shown here. The first line of a message display indicates the ID of the contact input. For example, ‘Cont Ip 1’ refers to the contact input in terms of the default name-array index. The second line of the display indicates the logic state of the contact input.

6.2.2 VIRTUAL INPUTS

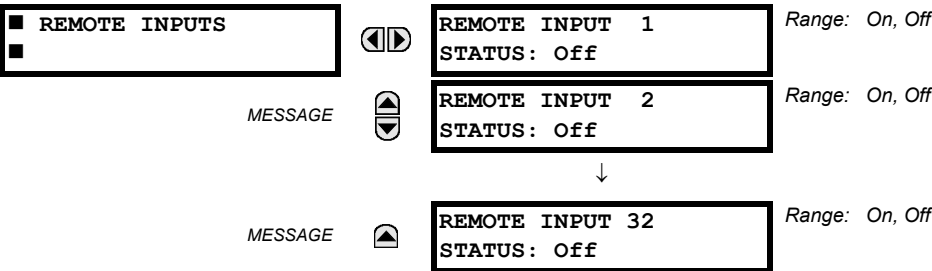

PATH: ACTUAL VALUES ⇒ STATUS ⇒ VIRTUAL INPUTS

The present status of the 64 virtual inputs is shown here. The first line of a message display indicates the ID of the virtual input. For example, ‘Virt Ip 1’ refers to the virtual input in terms of the default name. The second line of the display indicates the logic state of the virtual input.

6.2.3 REMOTE INPUTS

PATH: ACTUAL VALUES ⇒ STATUS ⇒ REMOTE INPUTS

The present state of the 32 remote inputs is shown here.

The state displayed will be that of the remote point unless the remote device has been established to be “Offline” in which case the value shown is the programmed default state for the remote input.

6.2.4 REMOTE DOUBLE-POINT STATUS INPUTS

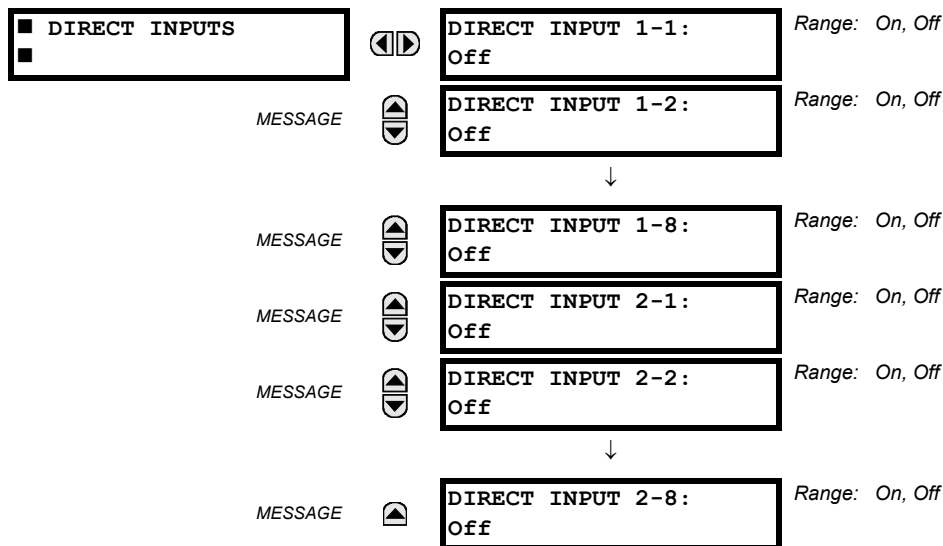

PATH: ACTUAL VALUES ⇒ STATUS ⇒ REMOTE DPS INPUTS

The present state of the remote double-point status inputs is shown here. The actual values indicate if the remote double-point status inputs are in the on (close), off (open), intermediate, or bad state.

6.2.5 DIRECT INPUTS

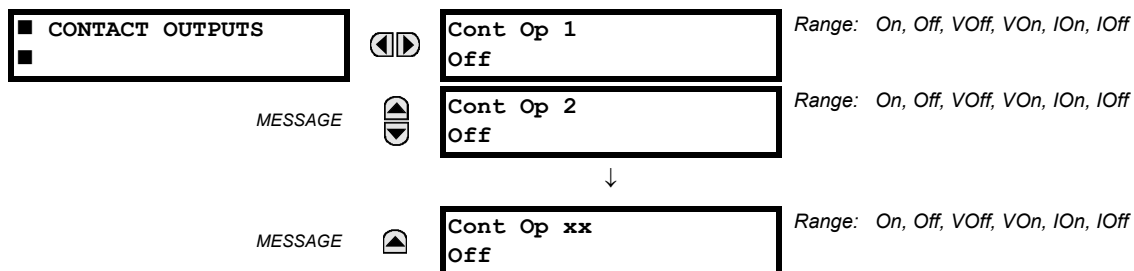

PATH: ACTUAL VALUES ⇒ STATUS ⇒ DIRECT INPUTS

The present state of the direct inputs from communications channels 1 and 2 are shown here. The state displayed will be that of the remote point unless channel 1 or 2 has been declared to have “failed”, in which case the value shown is the programmed default state defined in the **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **DIRECT** ⇒ **DIRECT INPUTS** menu.

6.2.6 CONTACT OUTPUTS

PATH: ACTUAL VALUES ⇒ STATUS ⇒ CONTACT OUTPUTS

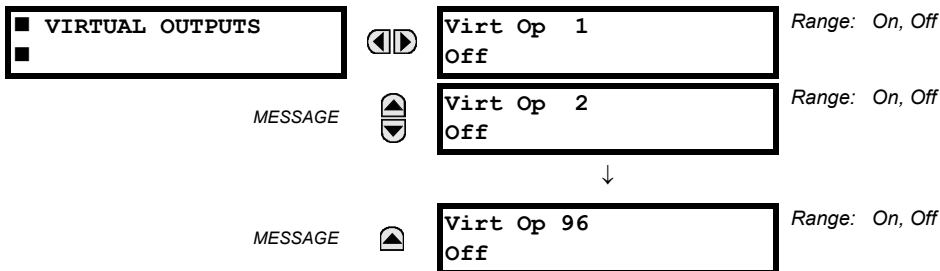

The present state of the contact outputs is shown here. The first line of a message display indicates the ID of the contact output. For example, 'Cont Op 1' refers to the contact output in terms of the default name-array index. The second line of the display indicates the logic state of the contact output.

For form-A contact outputs, the state of the voltage and current detectors is displayed as Off, VOff, IOff, On, IOn, and VOn. For form-C contact outputs, the state is displayed as Off or On.

6.2.7 VIRTUAL OUTPUTS

PATH: ACTUAL VALUES ⇒ STATUS ⇒ ↓ VIRTUAL OUTPUTS

The present state of up to 96 virtual outputs is shown here. The first line of a message display indicates the ID of the virtual output. For example, 'Virt Op 1' refers to the virtual output in terms of the default name-array index. The second line of the display indicates the logic state of the virtual output, as calculated by the FlexLogic equation for that output.

6.2.8 AUTORECLOSE

PATH: ACTUAL VALUES ⇒ STATUS ⇒ ↓ AUTORECLOSE

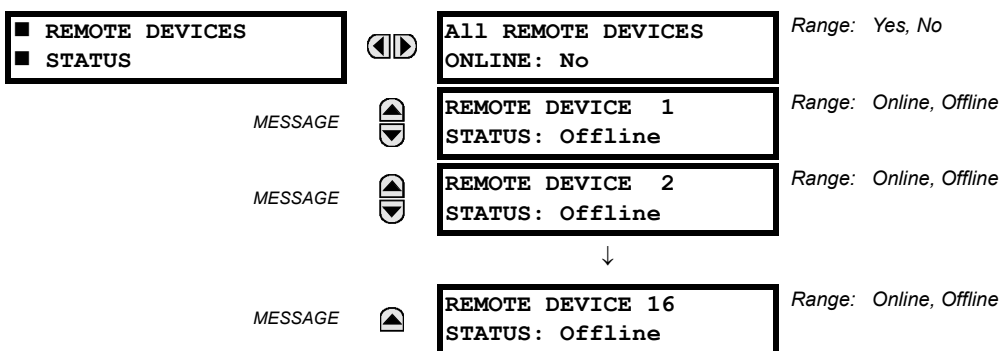

The automatic reclosure shot count is shown here.

6.2.9 REMOTE DEVICES

a) STATUS

PATH: ACTUAL VALUES ⇒ STATUS ⇒ ↓ REMOTE DEVICES STATUS

The present state of the programmed remote devices is shown here. The **ALL REMOTE DEVICES ONLINE** message indicates whether or not all programmed remote devices are online. If the corresponding state is "No", then at least one required remote device is not online.

b) STATISTICS

PATH: ACTUAL VALUES ⇒ STATUS ⇒ REMOTE DEVICES STATISTICS ⇒ REMOTE DEVICE 1(16)

■ REMOTE DEVICE 1	◀▶	REMOTE DEVICE 1 StNum: 0
MESSAGE ▲	▲▼	REMOTE DEVICE 1 SqNum: 0

Statistical data (two types) for up to 16 programmed remote devices is shown here.

The **STNUM** number is obtained from the indicated remote device and increments whenever a change of state of at least one item occurs in the GSSE/GOOSE message. The **SQNUM** number is obtained from the indicated remote device and increments whenever a GSSE/GOOSE message, without a state change, is sent. When the GSSE/GOOSE message transmits a state change, the **SQNUM** resets to 0. This number rolls over to zero when a count of 4,294,967,295 is incremented.

6.2.10 CHANNEL TESTS

PATH: ACTUAL VALUES ⇒ STATUS ⇒ CHANNEL TESTS

■ CHANNEL TESTS	◀▶	CHANNEL 1 STATUS: n/a	Range: n/a, FAIL, OK
MESSAGE ▲	▲▼	CHANNEL 1 LOST PACKETS: 0	Range: 0 to 65535 in steps of 1. Reset count to 0 through the COMMANDS ⇒ CLEAR RECORDS menu.
MESSAGE ▲	▲▼	CHANNEL 1 LOCAL LOOPBCK STATUS: n/a	Range: n/a, FAIL, OK
MESSAGE ▲	▲▼	CHANNEL 1 REMOTE LOOPBCK STATUS: n/a	Range: n/a, FAIL, OK
MESSAGE ▲	▲▼	CHANNEL 1 LOOP DELAY: 0.0 ms	
MESSAGE ▲	▲▼	CHANNEL 1 ASYMMETRY: +0.0 ms	Range: -10 to 10 ms in steps of 0.1
MESSAGE ▲	▲▼	CHANNEL 2 STATUS: n/a	Range: n/a, FAIL, OK
MESSAGE ▲	▲▼	CHANNEL 2 LOST PACKETS: 0	Range: 0 to 65535 in steps of 1. Reset count to 0 through the COMMANDS ⇒ CLEAR RECORDS menu.
MESSAGE ▲	▲▼	CHANNEL 2 LOCAL LOOPBCK STATUS: n/a	Range: n/a, FAIL, OK
MESSAGE ▲	▲▼	CHANNEL 2 REMOTE LOOPBCK STATUS: n/a	Range: n/a, FAIL, OK
MESSAGE ▲	▲▼	CHANNEL 2 LOOP DELAY: 0.0 ms	
MESSAGE ▲	▲▼	CHANNEL 2 ASYMMETRY: +0.0 ms	Range: -10 to 10 ms in steps of 0.1
MESSAGE ▲	▲▼	VALIDITY OF CHANNEL CONFIGURATION: n/a	Range: n/a, FAIL, OK
MESSAGE ▲	▲▼	PFULL STATUS: n/a	Range: n/a, FAIL, OK

The status information for two channels is shown here. A brief description of each actual value is below:

- **CHANNEL 1(2) STATUS:** This represents the receiver status of each channel. If the value is “OK”, the 87L current differential element is enabled and data is being received from the remote terminal; If the value is “FAIL”, the 87L element is enabled and data is not being received from the remote terminal. If “n/a”, the 87L element is disabled.
- **CHANNEL 1(2) LOST PACKETS:** Current, timing, and control data is transmitted to the remote terminals in data packets at a rate of two packets per cycle. The number of lost packets represents data packets lost in transmission; this count can be reset through the **COMMANDS** ⇒ **↓ CLEAR RECORDS** menu.
- **CHANNEL 1(2) LOCAL LOOPBACK STATUS:** The result of the local loopback test is displayed here.
- **CHANNEL 1(2) REMOTE LOOPBACK STATUS:** The result of the remote loopback test is displayed here.
- **CHANNEL 1(2) LOOP DELAY:** Displays the round trip channel delay (including loopback processing time of the remote relay) computed during a remote loopback test under normal relay operation, in milliseconds (ms).
- **CHANNEL 1(2) ASYMMETRY:** The result of channel asymmetry calculations derived from GPS signal is being displayed here for both channels if **CHANNEL ASYMMETRY** is “Enabled”. A positive “+” sign indicates the transit delay in the transmitting direction is less than the delay in the receiving direction; a negative “-” sign indicates the transit delay in the transmitting direction is more than the delay in the receiving direction. A displayed value of “0.0” indicates that either asymmetry is not present or can not be estimated due to failure with local/remote GPS clock source.
- **VALIDITY OF CHANNEL CONFIGURATION:** The current state of the communications channel identification check, and hence validity, is displayed here. If a remote relay ID number does not match the programmed number at the local relay, the “FAIL” value is displayed. The “n/a” value appears if the local relay ID is set to a default value of “0” or if the 87L element is disabled. Refer to **SETTINGS** ⇒ **↓ SYSTEM SETUP** ⇒ **↓ L90 POWER SYSTEM** section for more information
- **PFLL STATUS:** This value represents the status of the phase and frequency locked loop (PFLL) filter which uses timing information from local and remote terminals to synchronize the clocks of all terminals. If **PFLL STATUS** is “OK”, the clocks of all terminals are synchronized and 87L protection is enabled. If it is “FAIL”, the clocks of all terminals are not synchronized and 87L protection is disabled. If “n/a”, then PFLL is disabled.

At startup, the clocks of all terminals are not synchronized and the PFLL status displayed is “FAIL”. It takes up to 8 seconds after startup for the value displayed to change from “FAIL” to “OK”.

6.2.11 DIGITAL COUNTERS

PATH: ACTUAL VALUES ⇒ STATUS ⇒ ↓ DIGITAL COUNTERS ⇒ DIGITAL COUNTERS Counter 1(8)

DIGITAL COUNTERS Counter 1		Counter 1 ACCUM: 0
MESSAGE	Counter 1 FROZEN: 0	
MESSAGE	Counter 1 FROZEN: YYYY/MM/DD HH:MM:SS	
MESSAGE	Counter 1 MICROS: 0	

The present status of the eight digital counters is shown here. The status of each counter, with the user-defined counter name, includes the accumulated and frozen counts (the count units label will also appear). Also included, is the date and time stamp for the frozen count. The **COUNTER 1 MICROS** value refers to the microsecond portion of the time stamp.

6.2.12 SELECTOR SWITCHES

PATH: ACTUAL VALUES ⇒ STATUS ⇒ ↓ SELECTOR SWITCHES

SELECTOR SWITCHES Selector Switch 1		Selector Switch 1 POSITION: 0/7	Range: Current Position / 7
MESSAGE	Selector Switch 2 POSITION: 0/7		Range: Current Position / 7

The display shows both the current position and the full range. The current position only (an integer from 0 through 7) is the actual value.

6.2.13 FLEX STATES

PATH: ACTUAL VALUES ⇒ STATUS ⇒ FLEX STATES

There are 256 FlexState™ bits available. The second line value indicates the state of the given FlexState bit.

6.2.14 ETHERNET

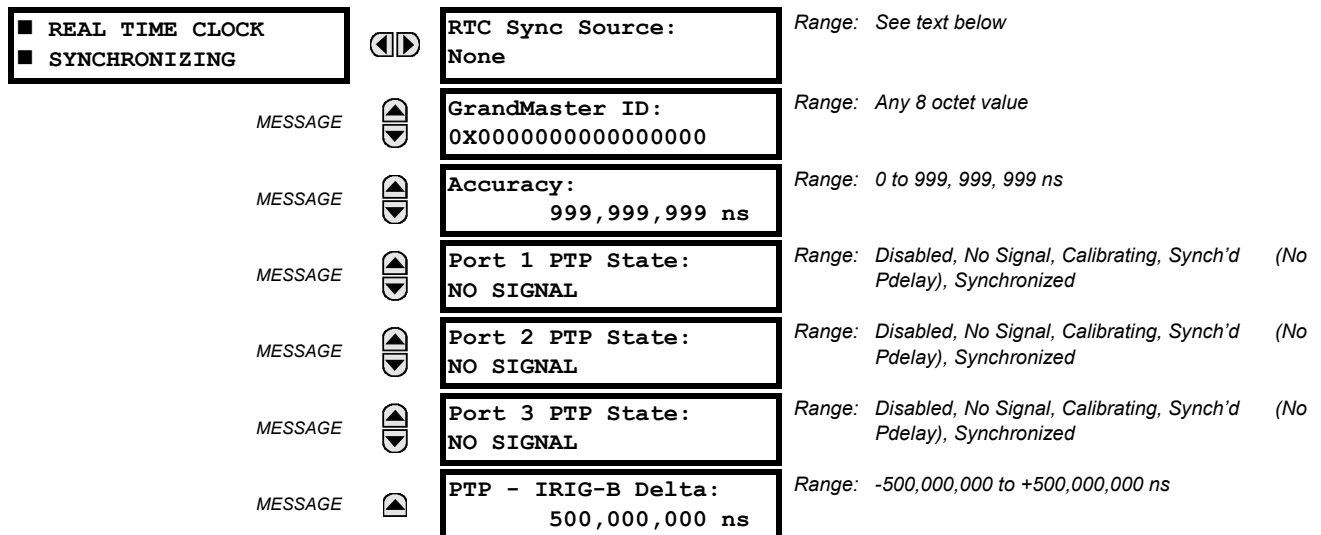

PATH: ACTUAL VALUES ⇒ STATUS ⇒ ETHERNET

These values indicate the status of the first, second, and third Ethernet links.

6.2.15 REAL TIME CLOCK SYNCHRONIZING

PATH: ACTUAL VALUES ⇒ STATUS ⇒ REAL TIME CLOCK SYNCHRONIZING

The RTC Sync Source actual value is the time synchronizing source the relay is using at present. Possible sources are: Port 1 PTP Clock, Port 2 PTP Clock, Port 3 PTP Clock, IRIG-B, SNTP, and None.

The Grandmaster ID is the grandmasterIdentity code being received from the present PTP grandmaster, if any. When the relay is not using any PTP grandmaster, this actual value is zero. The grandmasterIdentity code is specified by PTP to be globally unique, so one can always know which clock is grandmaster in a system with multiple grandmaster-capable clocks.

Accuracy is the estimated maximum time error at present in the RTC, considering the quality information imbedded in the received time signal. The value 999,999,999 indicates that the magnitude of the estimated error is one second or more, or that the error cannot be estimated.

PORT 1...3 PTP STATE is the present state of the port's PTP clock. The PTP clock state is:

- **DISABLED** if the port's function setting is Disabled,
- **NO SIGNAL** if enabled but no signal from an active master has been found and selected,
- **CALIBRATING** if an active master has been selected but lock is not at present established,
- **SYNCH'D (NO PDELAY)** if the port is synchronized, but the peer delay mechanism is non-operational, and
- **SYNCHRONIZED** if synchronized.

PTP—IRIG-B DELTA is the time difference, measured in nanoseconds, between the fractional seconds portion of the time being received via PTP and that being received via IRIG-B. A positive value indicates that PTP time is fast compared to IRIG-B time.

6.2.16 IEC 61850 GOOSE INTEGERS

PMU TCP (max 4)
4

Range: 0 to 4

These values specify the remaining number of TCP connections still available for each protocol. Every time a connection is used, the remaining number of connections decrements. When released, the remaining number of connections increments. If no connection is made over the specific protocol, the number equals the maximum number available for the specific protocol.

For example, the maximum number of Modbus TCP connections is 4. Once an EnerVista session is opened on a computer connected to the UR over Ethernet, the Modbus TCP status shows 3. If the EnerVista application is closed, the Modbus TCP status shows 4.

Note that the maximum number of PMU TCP connections matches the number of aggregators.

6.2.18 PARALLEL REDUNDANCY PROTOCOL (PRP)

The Parallel Redundancy Protocol (PRP) defines a redundancy protocol for high availability in substation automation networks.

PATH: ACTUAL VALUES ⇒ STATUS ⇒ PRP

<div>■ PRP</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div>	<div>◀▶</div>	Total Rx Port A:	Range: 0 to 4G, blank if PRP disabled
	<div>▲▼</div>	Total Rx Port B:	Range: 0 to 4G, blank if PRP disabled
	<div>▲▼</div>	Total Errors:	Range: 0 to 4G, blank if PRP disabled
	<div>▲▼</div>	Mismatches Port A:	Range: 0 to 4G, blank if PRP disabled
	<div>▲▼</div>	Mismatches Port B:	Range: 0 to 4G, blank if PRP disabled

TOTAL RECEIVED PORT A is a counter for total messages received (either from DANPs or from SANs) on Port A.

TOTAL RECEIVED PORT B is a counter for total messages received (either from DANPs or from SANs) on Port B.

TOTAL ERRORS is a counter for total messages received with an error (bad port code, frame length too short).

MISMATCHES PORT A is a counter for total messages received with an error on Port A (PRP frame, but port received through and LAN ID in the frame do not match).

MISMATCHES PORT B is a counter for total messages received with an error on Port B (PRP frame, but port received through and LAN ID in the frame do not match).

6.3.1 METERING CONVENTIONS

a) UR CONVENTION FOR MEASURING POWER AND ENERGY

The following figure illustrates the conventions established for use in UR-series relays.

Figure 6-1: FLOW DIRECTION OF SIGNED VALUES FOR WATTS AND VARS

b) UR CONVENTION FOR MEASURING PHASE ANGLES

All phasors calculated by UR-series relays and used for protection, control and metering functions are rotating phasors that maintain the correct phase angle relationships with each other at all times.

For display and oscillography purposes, all phasor angles in a given relay are referred to an AC input channel pre-selected by the **SETTINGS** ⇒ **SYSTEM SETUP** ⇒ **POWER SYSTEM** ⇒ **FREQUENCY AND PHASE REFERENCE** setting. This setting defines a particular AC signal source to be used as the reference.

The relay will first determine if any “Phase VT” bank is indicated in the source. If it is, voltage channel VA of that bank is used as the angle reference. Otherwise, the relay determines if any “Aux VT” bank is indicated; if it is, the auxiliary voltage channel of that bank is used as the angle reference. If neither of the two conditions is satisfied, then two more steps of this hierarchical procedure to determine the reference signal include “Phase CT” bank and “Ground CT” bank.

If the AC signal pre-selected by the relay upon configuration is not measurable, the phase angles are not referenced. The phase angles are assigned as positive in the leading direction, and are presented as negative in the lagging direction, to more closely align with power system metering conventions. This is illustrated below.

Figure 6-2: UR PHASE ANGLE MEASUREMENT CONVENTION

c) UR CONVENTION FOR MEASURING SYMMETRICAL COMPONENTS

The UR-series of relays calculate voltage symmetrical components for the power system phase A line-to-neutral voltage, and symmetrical components of the currents for the power system phase A current. Owing to the above definition, phase angle relations between the symmetrical currents and voltages stay the same irrespective of the connection of instrument transformers. This is important for setting directional protection elements that use symmetrical voltages.

For display and oscillography purposes the phase angles of symmetrical components are referenced to a common reference as described in the previous sub-section.

WYE-CONNECTED INSTRUMENT TRANSFORMERS:

- ABC phase rotation:

$$V_{-0} = \frac{1}{3}(V_{AG} + V_{BG} + V_{CG})$$

$$V_{-1} = \frac{1}{3}(V_{AG} + aV_{BG} + a^2V_{CG})$$

$$V_{-2} = \frac{1}{3}(V_{AG} + a^2V_{BG} + aV_{CG})$$

- ACB phase rotation:

$$V_{-0} = \frac{1}{3}(V_{AG} + V_{BG} + V_{CG})$$

$$V_{-1} = \frac{1}{3}(V_{AG} + a^2V_{BG} + aV_{CG})$$

$$V_{-2} = \frac{1}{3}(V_{AG} + aV_{BG} + a^2V_{CG})$$

The above equations apply to currents as well.

DELTA-CONNECTED INSTRUMENT TRANSFORMERS:

- ABC phase rotation:

$$V_0 = N/A$$

$$V_1 = \frac{1\angle-30^\circ}{3\sqrt{3}}(V_{AB} + aV_{BC} + a^2V_{CA})$$

$$V_2 = \frac{1\angle30^\circ}{3\sqrt{3}}(V_{AB} + a^2V_{BC} + aV_{CA})$$

- ACB phase rotation:

$$V_0 = N/A$$

$$V_1 = \frac{1\angle30^\circ}{3\sqrt{3}}(V_{AB} + a^2V_{BC} + aV_{CA})$$

$$V_2 = \frac{1\angle-30^\circ}{3\sqrt{3}}(V_{AB} + aV_{BC} + a^2V_{CA})$$

The zero-sequence voltage is not measurable under the Delta connection of instrument transformers and is defaulted to zero. The table below shows an example of symmetrical components calculations for the ABC phase rotation.

Table 6-1: SYMMETRICAL COMPONENTS CALCULATION EXAMPLE

SYSTEM VOLTAGES, SEC. V *						VT CONN.	RELAY INPUTS, SEC. V			SYMM. COMP, SEC. V

UNKNOWN (only V ₁ and V ₂ can be determined)			84.9 ∠0°	138.3 ∠-144°	85.4 ∠-288°	DELTA	84.9 ∠0°	138.3 ∠-144°	85.4 ∠-288°	N/A	56.5 ∠-54°	23.3 ∠-234°

- * The power system voltages are phase-referenced – for simplicity – to V_{AG} and V_{AB}, respectively. This, however, is a relative matter. It is important to remember that the L90 displays are always referenced as specified under **SETTINGS**
⇒ **SYSTEM SETUP** ⇒ **POWER SYSTEM** ⇒ **FREQUENCY AND PHASE REFERENCE**.

The example above is illustrated in the following figure.

Figure 6-3: MEASUREMENT CONVENTION FOR SYMMETRICAL COMPONENTS

6.3.2 DIFFERENTIAL CURRENT

PATH: ACTUAL VALUES ⇒ METERING ⇒ 87L DIFFERENTIAL CURRENT

<div> <div>■ 87L DIFFERENTIAL</div> <div>■ CURRENT</div> </div>		<div> <div>◀▶</div> <div>LOCAL IA:</div> <div>0.000 A 0.0°</div> </div>

MESSAGE	<div> <div>▲▼</div> <div>IG DIFF. CURRENT:</div> <div>0.000 A 0.0°</div> </div>	
MESSAGE	<div> <div>▲</div> <div>IG RESTR. CURRENT:</div> <div>0.000 A</div> </div>	

The metered current values are displayed for all line terminals in fundamental phasor form. All angles are shown with respect to the reference common for all L90 devices; that is, frequency, source currents, and voltages. The metered primary differential and restraint currents are displayed for the local relay.

NOTE

Terminal 1 refers to the communication channel 1 interface to a remote L90 at terminal 1. Terminal 2 refers to the communication channel 2 interface to a remote L90 at terminal 2.

6.3.3 SOURCES

a) MAIN MENU

PATH: ACTUAL VALUES ⇒ METERING ⇒ SOURCE SRC1

■ SOURCE SRC 1	◀▶	■ PHASE CURRENT ■ SRC 1	See page 6-16.
MESSAGE	▲▼	■ GROUND CURRENT ■ SRC 1	See page 6-17.
MESSAGE	▲▼	■ PHASE VOLTAGE ■ SRC 1	See page 6-17.
MESSAGE	▲▼	■ AUXILIARY VOLTAGE ■ SRC 1	See page 6-18.
MESSAGE	▲▼	■ POWER ■ SRC 1	See page 6-18.
MESSAGE	▲▼	■ ENERGY ■ SRC 1	See page 6-19.
MESSAGE	▲▼	■ DEMAND ■ SRC 1	See page 6-19.
MESSAGE	▲	■ FREQUENCY ■ SRC 1	See page 6-20.

This menu displays the metered values available for each source.

Metered values presented for each source depend on the phase and auxiliary VTs and phase and ground CTs assignments for this particular source. For example, if no phase VT is assigned to this source, then any voltage, energy, and power values will be unavailable.

6

b) PHASE CURRENT METERING

PATH: ACTUAL VALUES ⇒ METERING ⇒ SOURCE SRC 1 ⇒ PHASE CURRENT

■ PHASE CURRENT ■ SRC 1	◀▶	SRC 1 RMS Ia: 0.000 b: 0.000 c: 0.000 A
MESSAGE	▲▼	SRC 1 RMS Ia: 0.000 A
MESSAGE	▲▼	SRC 1 RMS Ib: 0.000 A
MESSAGE	▲▼	SRC 1 RMS Ic: 0.000 A
MESSAGE	▲▼	SRC 1 RMS In: 0.000 A
MESSAGE	▲▼	SRC 1 PHASOR Ia: 0.000 A 0.0°

MESSAGE		SRC 1 REACTIVE PWR φc: 0.000 var
MESSAGE		SRC 1 APPARENT PWR 3φ: 0.000 VA
MESSAGE		SRC 1 APPARENT PWR φa: 0.000 VA
MESSAGE		SRC 1 APPARENT PWR φb: 0.000 VA

MESSAGE		SRC 1 APPARENT PWR ϕ_c : 0.000 VA
MESSAGE		SRC 1 POWER FACTOR 3 ϕ : 1.000
MESSAGE		SRC 1 POWER FACTOR ϕ_a : 1.000
MESSAGE		SRC 1 POWER FACTOR ϕ_b : 1.000
MESSAGE		SRC 1 POWER FACTOR ϕ_c : 1.000

The metered values for real, reactive, and apparent power, as well as power factor, are displayed in this menu. The "SRC 1" text will be replaced by whatever name was programmed by the user for the associated source (see **SETTINGS** \Rightarrow **SYSTEM SETUP** \Rightarrow **SIGNAL SOURCES**).

g) ENERGY METERING

PATH: ACTUAL VALUES \Rightarrow METERING \Rightarrow SOURCE SRC 1 \Rightarrow ENERGY

<input checked="" type="checkbox"/> ENERGY <input checked="" type="checkbox"/> SRC 1		SRC 1 POS WATTHOUR: 0.000 Wh
MESSAGE		SRC 1 NEG WATTHOUR: 0.000 Wh
MESSAGE		SRC 1 POS VARHOUR: 0.000 varh
MESSAGE		SRC 1 NEG VARHOUR: 0.000 varh

The metered values for real and reactive energy are displayed in this menu. The "SRC 1" text will be replaced by whatever name was programmed by the user for the associated source (see **SETTINGS** \Rightarrow **SYSTEM SETUP** \Rightarrow **SIGNAL SOURCES**). Because energy values are accumulated, these values should be recorded and then reset immediately prior to changing CT or VT characteristics.

h) DEMAND METERING

PATH: ACTUAL VALUES \Rightarrow METERING \Rightarrow SOURCE SRC 1 \Rightarrow DEMAND

<input checked="" type="checkbox"/> DEMAND <input checked="" type="checkbox"/> SRC 1		SRC 1 DMD IA: 0.000 A
MESSAGE		SRC 1 DMD IA MAX: 0.000 A
MESSAGE		SRC 1 DMD IA DATE: 2001/07/31 16:30:07
MESSAGE		SRC 1 DMD IB: 0.000 A
MESSAGE		SRC 1 DMD IB MAX: 0.000 A
MESSAGE		SRC 1 DMD IB DATE: 2001/07/31 16:30:07
MESSAGE		SRC 1 DMD IC: 0.000 A

MESSAGE	▲▼	SRC 1 DMD IC MAX: 0.000 A
MESSAGE	▲▼	SRC 1 DMD IC DATE: 2001/07/31 16:30:07
MESSAGE	▲▼	SRC 1 DMD W: 0.000 W
MESSAGE	▲▼	SRC 1 DMD W MAX: 0.000 W
MESSAGE	▲▼	SRC 1 DMD W DATE: 2001/07/31 16:30:07
MESSAGE	▲▼	SRC 1 DMD VAR: 0.000 var
MESSAGE	▲▼	SRC 1 DMD VAR MAX: 0.000 var
MESSAGE	▲▼	SRC 1 DMD VAR DATE: 2001/07/31 16:30:07
MESSAGE	▲▼	SRC 1 DMD VA: 0.000 VA
MESSAGE	▲▼	SRC 1 DMD VA MAX: 0.000 VA
MESSAGE	▲	SRC 1 DMD VA DATE: 2001/07/31 16:30:07

The metered values for current and power demand are displayed in this menu. The "SRC 1" text will be replaced by whatever name was programmed by the user for the associated source (see **SETTINGS** ⇒ **SYSTEM SETUP** ⇒ **SIGNAL SOURCES**).

The relay measures (absolute values only) the source demand on each phase and average three phase demand for real, reactive, and apparent power. These parameters can be monitored to reduce supplier demand penalties or for statistical metering purposes. Demand calculations are based on the measurement type selected in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **DEMAND** menu. For each quantity, the relay displays the demand over the most recent demand time interval, the maximum demand since the last maximum demand reset, and the time and date stamp of this maximum demand value. Maximum demand quantities can be reset to zero with the **CLEAR RECORDS** ⇒ **CLEAR DEMAND RECORDS** command.

i) FREQUENCY METERING

PATH: ACTUAL VALUES ⇒ **METERING** ⇒ **SOURCE SRC 1** ⇒ **FREQUENCY**

■ FREQUENCY	◀▶	SRC 1 FREQUENCY:
■ SRC 1		0.00 Hz

The metered frequency values are displayed in this menu. The "SRC 1" text will be replaced by whatever name was programmed by the user for the associated source (see **SETTINGS** ⇒ **SYSTEM SETUP** ⇒ **SIGNAL SOURCES**).

SOURCE FREQUENCY is measured via software-implemented zero-crossing detection of an AC signal. The signal is either a Clarke transformation of three-phase voltages or currents, auxiliary voltage, or ground current as per source configuration (see the **SYSTEM SETUP** ⇒ **POWER SYSTEM** settings). The signal used for frequency estimation is low-pass filtered. The final frequency measurement is passed through a validation filter that eliminates false readings due to signal distortions and transients.

If the 87L function is enabled, then dedicated 87L frequency tracking is engaged. In this case, the relay uses the **METERING** ⇒ **TRACKING FREQUENCY** ⇒ **TRACKING FREQUENCY** value for all computations, overriding the **SOURCE FREQUENCY** value.

6.3.4 SENSITIVE DIRECTIONAL POWER

PATH: ACTUAL VALUES ⇒ METERING ⇒ SENSITIVE DIRECTIONAL POWER

<input checked="" type="checkbox"/> SENSITIVE <input checked="" type="checkbox"/> DIRECTIONAL POWER		DIRECTIONAL POWER 1 3Φ: 0.000 W
MESSAGE		DIRECTIONAL POWER 2 3Φ: 0.000 W

The effective operating quantities of the sensitive directional power elements are displayed here. The display may be useful to calibrate the feature by compensating the angular errors of the CTs and VTs with the use of the **RCA** and **CALIBRATION** settings.

6.3.5 SYNCHROCHECK

PATH: ACTUAL VALUES ⇒ METERING ⇒ SYNCHROCHECK ⇒ SYNCHROCHECK 1(2)

<input checked="" type="checkbox"/> SYNCHROCHECK 1 <input type="checkbox"/>		SYNCHROCHECK 1 DELTA VOLT: 0.000 V
MESSAGE		SYNCHROCHECK 1 DELTA PHASE: 0.0°
MESSAGE		SYNCHROCHECK 1 DELTA FREQ: 0.00 Hz

The actual values menu for synchrocheck 2 is identical to that of synchrocheck 1. If a synchrocheck function setting is "Disabled", the corresponding actual values menu item will not be displayed.

6.3.6 TRACKING FREQUENCY

PATH: ACTUAL VALUES ⇒ METERING ⇒ TRACKING FREQUENCY

<input checked="" type="checkbox"/> TRACKING FREQUENCY <input type="checkbox"/>		TRACKING FREQUENCY: 60.00 Hz
--	---	---------------------------------

The tracking frequency is displayed here. The frequency is tracked based on configuration of the reference source. The **TRACKING FREQUENCY** is based upon positive sequence current phasors from all line terminals and is synchronously adjusted at all terminals. If currents are below 0.125 pu, then the **NOMINAL FREQUENCY** is used.

6.3.7 FREQUENCY RATE OF CHANGE

PATH: ACTUAL VALUES ⇒ METERING ⇒ FREQUENCY RATE OF CHANGE

<input checked="" type="checkbox"/> FREQUENCY RATE <input checked="" type="checkbox"/> OF CHANGE		FREQUENCY RATE OF CHANGE 1: 0.00 Hz/s
MESSAGE		FREQUENCY RATE OF CHANGE 2: 0.00 Hz/s
MESSAGE		FREQUENCY RATE OF CHANGE 3: 0.00 Hz/s
MESSAGE		FREQUENCY RATE OF CHANGE 4: 0.00 Hz/s

The metered frequency rate of change for the frequency rate of change elements is shown here.

6.3.8 FLEXELEMENTS™

PATH: ACTUAL VALUES ⇒ METERING ⇒ FLEXELEMENTS ⇒ FLEXELEMENT 1(8)

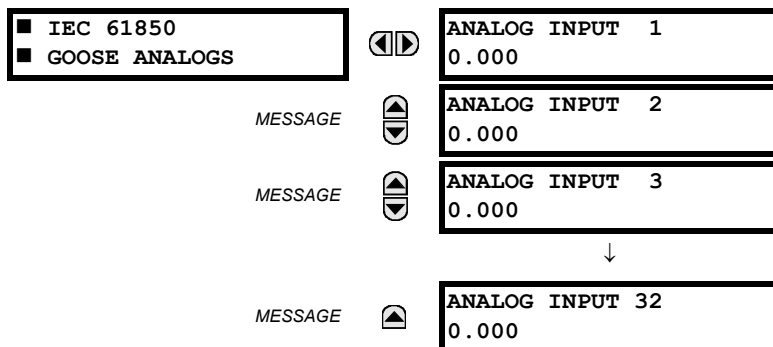

The operating signals for the FlexElements are displayed in pu values using the following definitions of the base units.

Table 6–2: FLEXELEMENT BASE UNITS

87L SIGNALS (Local IA Mag, IB, and IC) (Diff Curr IA Mag, IB, and IC) (Terminal 1 IA Mag, IB, and IC) (Terminal 2 IA Mag, IB and IC)	I_{BASE} = maximum primary RMS value of the +IN and –IN inputs (CT primary for source currents, and 87L source primary current for line differential currents)
87L SIGNALS (Op Square Curr IA, IB, and IC) (Rest Square Curr IA, IB, and IC)	BASE = Squared CT secondary of the 87L source
BREAKER ARCING AMPS (Brk X Arc Amp A, B, and C)	BASE = $2000 \text{ kA}^2 \times \text{cycle}$
dcmA	BASE = maximum value of the DCMA INPUT MAX setting for the two transducers configured under the +IN and –IN inputs.
FREQUENCY	$f_{BASE} = 1 \text{ Hz}$
PHASE ANGLE	$\Phi_{BASE} = 360 \text{ degrees}$ (see the UR angle referencing convention)
POWER FACTOR	$PF_{BASE} = 1.00$
RTDs	BASE = 100°C
SOURCE CURRENT	I_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SOURCE ENERGY (Positive and Negative Watthours, Positive and Negative Varhours)	$E_{BASE} = 10000 \text{ MWh or MVAh, respectively}$
SOURCE POWER	P_{BASE} = maximum value of $V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs
SOURCE VOLTAGE	V_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SYNCHROCHECK (Max Delta Volts)	V_{BASE} = maximum primary RMS value of all the sources related to the +IN and –IN inputs

6.3.9 IEC 61850 GOOSE ANALOG VALUES

PATH: ACTUAL VALUES ⇒ METERING ⇒ IEC 61850 GOOSE ANALOGS

The L90 Line Current Differential System is provided with optional IEC 61850 communications capability. This feature is specified as a software option at the time of ordering. Refer to the *Ordering* section of chapter 2 for additional details.

The IEC 61850 GGIO3 analog input data points are displayed in this menu. The GGIO3 analog data values are received via IEC 61850 GOOSE messages sent from other devices.

6.3.10 WATTMETRIC GROUND FAULT

PATH: ACTUAL VALUES ⇒ METERING ⇒ WATTMETRIC GROUND FAULT 1(2)

<input checked="" type="checkbox"/> WATTMETRIC <input checked="" type="checkbox"/> GROUND FAULT 1	<div>◀▶</div> <div>WATT GND FLT 1: 0.000 W</div>
--	--

This menu displays the wattmetric zero-sequence directional element operating power values.

6.3.11 PHASOR MEASUREMENT UNIT

PATH: ACTUAL VALUES ⇒ METERING ⇒ PHASOR MEASUREMENT UNIT ⇒ PMU 1(4)

<input checked="" type="checkbox"/> PMU 1 <input type="checkbox"/>	<div>◀▶</div> <div>PMU 1 VA: 0.0000 kV, 0.00°</div>	Range: Va or Vab per VT bank connection

MESSAGE	<div>▲▼</div> <div>PMU 1 I2: 0.0000 kA, 0.00°</div>	
MESSAGE	<div>▲▼</div> <div>PMU 1 I0: 0.0000 kA, 0.00°</div>	
MESSAGE	<div>▲▼</div> <div>PMU 1 FREQUENCY: 0.0000 Hz</div>	
MESSAGE	<div>▲▼</div> <div>PMU 1 df/dt: 0.0000 Hz/s</div>	

MESSAGE  **PMU 1 CONFIG CHANGE** *Range: 0 to 65535*
COUNTER: 0

The above actual values are displayed without the corresponding time stamp as they become available per the recording rate setting. Also, the recording post-filtering setting is applied to these values.

6.3.12 PMU AGGREGATOR

PATH: ACTUAL VALUES ⇒ METERING ⇒ PHASOR MEASUREMENT UNIT ⇒ PMU AGGREGATOR 1

PMU AGGREGATOR 1  **PMU AGGREGATOR 1**
PDU SIZE: 0

Actual values for the IEC 61850-90-5 PDU size are provided. These values allow you to know the approximate Ethernet frame size for the data streams from each aggregator. This can help to estimate network loading. The PDU size shown in the displays does not include the Ethernet, UDP, or IP layers. PDU sizes approaching approximately 1500 bytes result in fragmented data frames, causing increased network traffic.

6.3.13 RESTRICTED GROUND FAULT

PATH: ACTUAL VALUES ⇒ METERING ⇒ RESTRICTED GROUND FAULT CURRENTS ⇒ RESTRICTED GROUND FAULT 1(4)

RESTRICTED  **RGF 1 DIFF Ig_d:**
GROUND FAULT 1 **0.000 A**

MESSAGE  **RGF 1 RESTR Ig_r:**
0.000 A

The differential and restraint current values for the restricted ground fault element are displayed in this menu.

6.3.14 TRANSDUCER INPUTS AND OUTPUTS

PATH: ACTUAL VALUES ⇒ METERING ⇒ TRANSDUCER I/O DCMA INPUTS ⇒ DCMA INPUT xx

DCMA INPUT xx  **DCMA INPUT xx**
0.000 mA

Actual values for each dcma input channel that is enabled are displayed with the top line as the programmed channel ID and the bottom line as the value followed by the programmed units.

PATH: ACTUAL VALUES ⇒ METERING ⇒ TRANSDUCER I/O RTD INPUTS ⇒ RTD INPUT xx

RTD INPUT xx  **RTD INPUT xx**
-50 °C

Actual values for each RTD input channel that is enabled are displayed with the top line as the programmed channel ID and the bottom line as the value.

6.4.1 FAULT REPORTS

PATH: ACTUAL VALUES ⇒ RECORDS ⇒ FAULT REPORTS ⇒ FAULT REPORT 1(15)

NO FAULTS TO REPORT			
or			
■ FAULT REPORT 1	◀▶	FAULT 1 LINE ID: SRC 1	Range: SRC 1, SRC 2, SRC 3, SRC 4
MESSAGE ▲▼	▲▼	FAULT 1 DATE: 2000/08/11	Range: YYYY/MM/DD
MESSAGE ▲▼	▲▼	FAULT 1 TIME: 00:00:00.000000	Range: HH:MM:SS.ssssss
MESSAGE ▲▼	▲▼	FAULT 1 TYPE: ABG	Range: not available if the source VTs are in the "Delta" configuration
MESSAGE ▲▼	▲▼	FAULT 1 LOCATION 00.0 km	Range: not available if the source VTs are in the "Delta" configuration
MESSAGE ▲▼	▲▼	FAULT 1 FAULTED SEGMENT: Local	Range: N/A, Local (two-terminal configuration and local section for three-terminal), Remote 1, Remote 2 (three-terminal configuration only)
MESSAGE ▲	▲	FAULT 1 RECLOSE SHOT: 0	Range: where applicable

The latest 15 fault reports can be stored. The most recent fault location calculation (when applicable) is displayed in this menu, along with the date and time stamp of the event which triggered the calculation. See the **SETTINGS ⇒ PRODUCT SETUP ⇒ FAULT REPORTS** menu for assigning the source and trigger for fault calculations. Refer to the **COMMANDS ⇒ CLEAR RECORDS** menu for manual clearing of the fault reports and to the **SETTINGS ⇒ PRODUCT SETUP ⇒ CLEAR RELAY RECORDS** menu for automated clearing of the fault reports.

The faulted segment of the line is indicated when the synchronized voltage and currents method is used. When the faulted segment can be determined, the **FAULT 1 FAULTED SEGMENT** value displays "N/A". For three-terminal lines, the fault location (distance to the fault) is reported as seen from the terminal adjacent to the fault.

6.4.2 EVENT RECORDS

PATH: ACTUAL VALUES ⇒ RECORDS ⇒ EVENT RECORDS

■ EVENT RECORDS	◀▶	EVENT: XXXX RESET OP (PUSHBUTTON)	
	↓		
MESSAGE ▲▼	▲▼	EVENT: 3 POWER ON	◀▶
MESSAGE ▲▼	▲▼	EVENT: 2 POWER OFF	
MESSAGE ▲	▲	EVENT: 1 EVENTS CLEARED	

▼	EVENT 3 DATE: 2000/07/14
▲	EVENT 3 TIME: 14:53:00.03405
Date and Time Stamps	

The event records menu shows the contextual data associated with up to the last 1024 events, listed in chronological order from most recent to oldest. If all 1024 event records have been filled, the oldest record will be removed as a new record is added. Each event record shows the event identifier/sequence number, cause, and date/time stamp associated with the event trigger. Refer to the **COMMANDS ⇒ CLEAR RECORDS** menu for clearing event records.

6.4.3 OSCILLOGRAPHY

PATH: ACTUAL VALUES ⇒ RECORDS ⇒ OSCILLOGRAPHY

<div> <div>OSCILLOGRAPHY</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> </div>	<div> <div>◀▶</div> <div>FORCE TRIGGER?</div> <div>No</div> </div>	Range: No, Yes
	<div> <div>▲▼</div> <div>NUMBER OF TRIGGERS:</div> <div>0</div> </div>	
	<div> <div>▲▼</div> <div>AVAILABLE RECORDS:</div> <div>0</div> </div>	
	<div> <div>▲▼</div> <div>CYCLES PER RECORD:</div> <div>0.0</div> </div>	
	<div> <div>▲</div> <div>LAST CLEARED DATE:</div> <div>2000/07/14 15:40:16</div> </div>	

This menu allows the user to view the number of triggers involved and number of oscillography traces available. The **CYCLES PER RECORD** value is calculated to account for the fixed amount of data storage for oscillography. See the *Oscillography* section of chapter 5 for additional details.

A trigger can be forced here at any time by setting “Yes” to the **FORCE TRIGGER?** command. Refer to the **COMMANDS ⇒ CLEAR RECORDS** menu for information on clearing the oscillography records.

6.4.4 DATA LOGGER

PATH: ACTUAL VALUES ⇒ RECORDS ⇒ DATA LOGGER

<div> <div>DATA LOGGER</div> <div>MESSAGE</div> </div>	<div> <div>◀▶</div> <div>OLDEST SAMPLE TIME:</div> <div>2000/01/14 13:45:51</div> </div>
	<div> <div>▲</div> <div>NEWEST SAMPLE TIME:</div> <div>2000/01/14 15:21:19</div> </div>

The **OLDEST SAMPLE TIME** represents the time at which the oldest available samples were taken. It will be static until the log gets full, at which time it will start counting at the defined sampling rate. The **NEWEST SAMPLE TIME** represents the time the most recent samples were taken. It counts up at the defined sampling rate. If the data logger channels are defined, then both values are static.

Refer to the **COMMANDS ⇒ CLEAR RECORDS** menu for clearing data logger records.

6.4.5 PHASOR MEASUREMENT UNIT RECORDS

PATH: ACTUAL VALUES ⇒ RECORDS ⇒ PMU RECORDS

<div> <div>PMU</div> <div>RECORDS</div> </div>	<div> <div>◀▶</div> <div>NUMBER OF TRIGGERS:</div> <div>0</div> </div>	Range: 0 to 65535 in steps of 1
	<div> <div>▲</div> <div> <div>PMU 1</div> <div>RECORDING</div> </div> </div>	See below.

The number of triggers applicable to the phasor measurement unit recorder is indicated by the **NUMBER OF TRIGGERS** value. The status of the phasor measurement unit recorder is indicated as follows:

PATH: ACTUAL VALUES ⇒ RECORDS ⇒ PMU RECORDS ⇒ PMU 1 RECORDING

■ PMU 1	<div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div>	<div>PMU 1 FORCE TRIGGER:</div> <div>Yes</div>	Range: No, Yes
■ RECORDING		<div>PUM 1 AVAILABLE RECORDS:</div> <div>0</div>	Range: 0 to 65535 in steps of 1
		<div>PUM 1 SECONDS PER RECORD:</div> <div>0.0</div>	Range: 0 to 6553.5 in steps of 0.1
		<div>PUM 1 LAST CLEARED:</div> <div>2005/07/14 015:40:16</div>	Range: date and time in format shown

6.4.6 BREAKER MAINTENANCE

PATH: ACTUAL VALUES ⇒ RECORDS ⇒ MAINTENANCE ⇒ BREAKER 1(4)

■ BREAKER 1	<div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div>	<div>BKR 1 ARCING AMP ϕA:</div> <div>0.00 kA²-cyc</div>
		<div>BKR 1 ARCING AMP ϕB:</div> <div>0.00 kA²-cyc</div>
		<div>BKR 1 ARCING AMP ϕC:</div> <div>0.00 kA²-cyc</div>
		<div>BKR 1 OPERATING TIME ϕA:</div> <div>0 ms</div>
		<div>BKR 1 OPERATING TIME ϕB:</div> <div>0 ms</div>
		<div>BKR 1 OPERATING TIME ϕC:</div> <div>0 ms</div>
		<div>BKR 1 OPERATING TIME:</div> <div>0 ms</div>

There is an identical menu for each of the breakers. The **BKR 1 ARCING AMP** values are in units of kA²-cycles. Refer to the **COMMANDS ⇒ CLEAR RECORDS** menu for clearing breaker arcing current records. The **BREAKER OPERATING TIME** is defined as the slowest operating time of breaker poles that were initiated to open.

6.5.1 MODEL INFORMATION

PATH: ACTUAL VALUES ⇒ ↓ PRODUCT INFO ⇒ MODEL INFORMATION

<div> <div>MODEL INFORMATION</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> </div>	<div> <div>◀▶</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div> <div>▲</div> </div>	ORDER CODE LINE 1: L90-E00-HCH-F8F-H6A	Range: standard GE Multilin order code format; example order code shown
		ORDER CODE LINE 2:	Range: standard GE Multilin order code format
		ORDER CODE LINE 3:	Range: standard GE Multilin order code format
		ORDER CODE LINE 4:	Range: standard GE Multilin order code format
		SERIAL NUMBER:	Range: standard GE Multilin serial number format
		ETHERNET MAC ADDRESS 000000000000	Range: standard Ethernet MAC address format
		MANUFACTURING DATE: 0	Range: YYYY/MM/DD HH:MM:SS
		PMU FEATURE ACTIVE: No	Range: Yes, No
		CT/ VT ADVANCED DIAG ACTIVE: No	Range: Yes, No
		OPERATING TIME: 0:00:00	Range: operating time in HH:MM:SS
		LAST SETTING CHANGE: 1970/01/01 23:11:19	Range: YYYY/MM/DD HH:MM:SS

The order code, serial number, Ethernet MAC address, date and time of manufacture, and operating time are shown here.

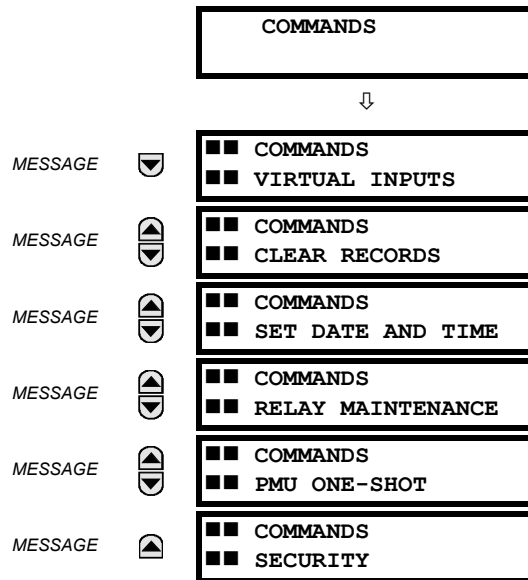

6.5.2 FIRMWARE REVISIONS

PATH: ACTUAL VALUES ⇒ ↓ PRODUCT INFO ⇒ ↓ FIRMWARE REVISIONS

<div> <div>FIRMWARE REVISIONS</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> <div>MESSAGE</div> </div>	<div> <div>◀▶</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div> <div>▲▼</div> <div>▲</div> </div>	UR Relay REVISION: 7.1x	Range: 0.00 to 655.35 Revision number of the application firmware.
		MODIFICATION FILE NUMBER: 0	Range: 0 to 65535 (ID of the MOD FILE) Value is 0 for each standard firmware release.
		BOOT PROGRAM REVISION: 3.01	Range: 0.00 to 655.35 Revision number of the boot program firmware.
		FRONT PANEL PROGRAM REVISION: 0.08	Range: 0.00 to 655.35 Revision number of faceplate program firmware.
		COMPILE DATE: 2004/09/15 04:55:16	Range: Any valid date and time. Date and time when product firmware was built.
		BOOT DATE: 2004/09/15 16:41:32	Range: Any valid date and time. Date and time when the boot program was built.

The shown data is illustrative only. A modification file number of 0 indicates that, currently, no modifications have been installed.

7.1.1 COMMANDS MENU

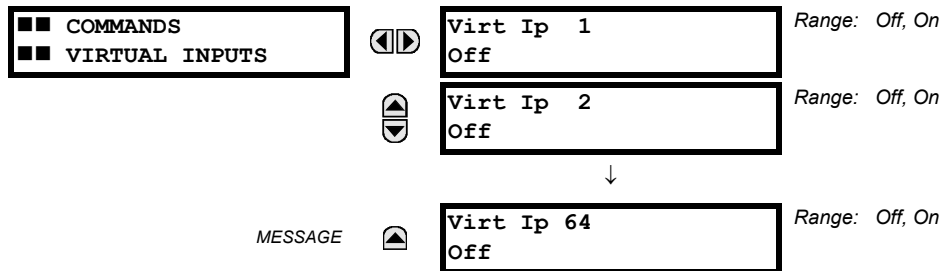

The commands menu contains relay directives intended for operations personnel. All commands can be protected from unauthorized access via the command password; see the *Security* section of chapter 5 for details. The following flash message appears after successfully command entry:

COMMAND
EXECUTED

7.1.2 VIRTUAL INPUTS

PATH: COMMANDS ⇒ VIRTUAL INPUTS

The states of up to 64 virtual inputs are changed here. The first line of the display indicates the ID of the virtual input. The second line indicates the current or selected status of the virtual input. This status will be a state off (logic 0) or on (logic 1).

7.1.3 CLEAR RECORDS

PATH: COMMANDS ⇒ CLEAR RECORDS

■ ■ COMMANDS	◀▶	CLEAR FAULT REPORTS?	Range: No, Yes
■ ■ CLEAR RECORDS	▲▼	No	
	▲▼	CLEAR EVENT RECORDS?	Range: No, Yes
	▲▼	No	
	▲▼	CLEAR OSCILLOGRAPHY?	Range: No, Yes
	▲▼	No	
	▲▼	CLEAR DATA LOGGER?	Range: No, Yes
	▲▼	No	
	▲▼	CLEAR BREAKER 1	Range: No, Yes
	▲▼	ARCING AMPS? No	
	▲▼	CLEAR BREAKER 2	Range: No, Yes
	▲▼	ARCING AMPS? No	
	▲▼	CLEAR DEMAND	Range: No, Yes
	▲▼	RECORDS?: No	
	▲▼	CLEAR CHANNEL TEST	Range: No, Yes
	▲▼	RECORDS? No	
	▲▼	CLEAR ENERGY?	Range: No, Yes
	▲▼	No	
	▲▼	CLEAR UNAUTHORIZED	Range: No, Yes
	▲▼	ACCESS? No	
	▲▼	CLEAR PMU 1 RECORDS?	Range: No, Yes
	▲▼	No	
	▲▼	CLEAR PMU 1 CONFIG	Range: No, Yes
	▲▼	CHANGE COUNTER? No	
	▲	CLEAR ALL RELAY	Range: No, Yes
	▲	RECORDS? No	

7

This menu contains commands for clearing historical data such as the event records. Data is cleared by changing a command setting to “Yes” and pressing the ENTER key. After clearing data, the command setting automatically reverts to “No”.

7.1.4 SET DATE AND TIME

PATH: COMMANDS ⇒ SET DATE AND TIME

■ ■ COMMANDS	◀▶	SET DATE AND TIME:	(YYYY/MM/DD HH:MM:SS)
■ ■ SET DATE AND TIME		2000/01/14 13:47:03	

The date and time can be entered here via the faceplate keypad, but if the relay is synchronizing to an external time source such as PTP, IRIGB or SNTP, the manually entered time will be quickly over-written. The time setting is based on the 24-hour clock. The complete date, as a minimum, must be entered to allow execution of this command. The new time (if entered) and date will take effect at the moment the ENTER key is clicked.

The timescale of the entered time should be **local time**, including daylight time where and when applicable.

7.1.5 RELAY MAINTENANCE

PATH: COMMANDS ⇒ RELAY MAINTENANCE

<div> <div>COMMANDS</div> <div>RELAY MAINTENANCE</div> </div>	◀▶	PERFORM LAMPTTEST? No	Range: No, Yes
	▲▼	UPDATE ORDER CODE? No	Range: No, Yes
	▲▼	REBOOT RELAY? No	Range: No, Yes
	▲	SERVICE COMMAND: 0	Range: 0, 101

This menu contains commands for relay maintenance purposes. Commands for the lamp test and order code are activated by changing a command setting to “Yes” and pressing the ENTER key. The command setting will then automatically revert to “No”. The service command is activated by entering a numerical code and pressing the ENTER key.

The **PERFORM LAMPTTEST** command turns on all faceplate LEDs and display pixels for a short duration. The **UPDATE ORDER CODE** command causes the relay to scan the backplane for the hardware modules and update the order code to match. If an update occurs, the following message is shown.

UPDATING . . .
 PLEASE WAIT

There is no impact if there have been no changes to the hardware modules. When an update does not occur, the **ORDER CODE NOT UPDATED** message will be shown.

The **SERVICE COMMAND** is used to perform specific L90 service actions. Presently, there is only one service action available. Code “101” is used to clear factory diagnostic information stored in the non-volatile memory. If a code other than “101” is entered, the command will be ignored and no actions will be taken. Various self-checking diagnostics are performed in the background while the L90 is running, and diagnostic information is stored on the non-volatile memory from time to time based on the self-checking result. Although the diagnostic information is cleared before the L90 is shipped from the factory, the user may want to clear the diagnostic information for themselves under certain circumstances. For example, it may be desirable to clear diagnostic information after replacement of hardware. Once the diagnostic information is cleared, all self-checking variables are reset to their initial state and diagnostics will restart from scratch.

The **REBOOT RELAY COMMAND** reboots the relay so that changes to configuration settings can take effect. In most cases, if changes are made to the configuration settings these changes do not take effect unless the relay is rebooted.

With the CyberSentry option, the Administrator or Operator role can initiate the Reboot Relay command.

NOTE

7.1.6 PHASOR MEASUREMENT UNIT ONE-SHOT

PATH: COMMANDS ⇒ PMU ONE-SHOT

<div> <div>COMMANDS</div> <div>PMU ONE-SHOT</div> </div>	◀▶	PMU ONE-SHOT FUNCTION: Disabled	Range: Enabled, Disabled
	▲▼	PMU ONE-SHOT SEQUENCE NUMBER: 0	Range: 0 to nominal frequency – 1 in steps of 1
	▲	PMU ONE-SHOT TIME: 2005/06/14 7:58:35	Range: 24h time format

This feature allows pre-scheduling a PMU measurement at a specific point in time. This functionality can be used to test for accuracy of the PMU, and for manual collection of synchronized measurements through the system, as explained below.

When enabled, the function continuously compares the present time with the pre-set **PMU ONE-SHOT TIME**. When the two times match, the function compares the present sequence number of the measured synchrophasors with the pre-set **PMU ONE-SHOT SEQUENCE NUMBER**. When the two numbers match, the function freezes the synchrophasor actual values and the corresponding protocol data items for 30 seconds. This allows manual read-out of the synchrophasor values for the

pre-set time and pre-set sequence number (via the faceplate display, supported communication protocols such as Modbus or DNP, and the EnerVista UR Setup software).

When freezing the actual values the function also asserts a PMU ONE-SHOT OP FlexLogic operand. This operand may be configured to drive an output contact and trigger an external measuring device such as a digital scope with the intent to verify the accuracy of the PMU under test.

With reference to the figure below, the PMU one-shot function (when enabled) controls three FlexLogic operands:

- The PMU ONE-SHOT EXPIRED operand indicates that the one-shot operation has been executed, and the present time is at least 30 seconds past the scheduled one-shot time.
- The PMU ONE-SHOT PENDING operand indicates that the one-shot operation is pending; that is, the present time is before the scheduled one-shot time.
- The PMU ONE-SHOT OP operand indicates the one-shot operation and remains asserted for 30 seconds afterwards.

When the function is disabled, all three operands are de-asserted. The one-shot function applies to all logical PMUs of a given L90 relay.

Figure 7–1: PMU ONE-SHOT FLEXLOGIC OPERANDS

TESTING ACCURACY OF THE PMU:

The one-shot feature can be used to test accuracy of the synchrophasor measurement. GPS-synchronized test sets perform a similar function to PMUs: instead of measuring the phasor from physical signals with respect to the externally provided time reference, they produce the physical signals with respect to the externally provided time reference, given the desired phasor values. Therefore the GPS-synchronized test sets cannot be automatically assumed more accurate than the PMUs under test. This calls for a method to verify both the measuring device (PMU) and the source of signal (test set).

With reference to the figure below, the one-shot feature could be configured to trigger a high-accuracy scope to capture both the time reference signal (rising edge of the 1 pps signal of the IRIG-B time reference), and the measured waveform. The high-accuracy high-sampling rate record of the two signals captured by the scope can be processed using digital tools to verify the magnitude and phase angle with respect to the time reference signal. As both the time reference and the measured signals are raw inputs to the PMU under test, their independently captured record, processed using third-party software, is a good reference point for accuracy calculations. Such a record proves useful when discussing the test results, and should be retained as a part of the testing documentation.

Note that the PMU under such test does not have to be connected to a real GPS receiver as the accuracy is measured with respect to the timing reference provided to the PMU and not to the absolute UTC time. Therefore a simple IRIG-B generator could be used instead. Also, the test set does not have to support GPS synchronization. Any stable signal source can

be used. If both the PMU under test and the test set use the timing reference, they should be driven from the same IRIG-B signal: either the same GPS receiver or IRIG-B generator. Otherwise, the setpoints of the test set and the PMU measurements should not be compared as they are referenced to different time scales.

Figure 7-2: USING THE PMU ONE-SHOT FEATURE TO TEST SYNCHROPHASOR MEASUREMENT ACCURACY

COLLECTING SYNCHRONIZED MEASUREMENTS AD HOC:

The one-shot feature can be used for ad hoc collection of synchronized measurements in the network. Two or more PMU can be pre-scheduled to freeze their measurements at the same time. When frozen the measurements could be collected using EnerVista UR Setup or a protocol client.

7.1.7 SECURITY

iPATH: COMMANDS ⇌ SECURITY

■ ■ SECURITY	◀ ▶	ADMINISTRATOR LOGOFF: No	Range: Yes, No Default: No
	▲ ▼	ENGINEER LOGOFF: No	Range: Yes, No Default: No
	▲ ▼	OPERATOR LOGOFF: No	Range: Yes, No Default: No
	▲	CLEAR SECURITY DATA:	Range: Yes, No Default: No

With the CyberSentry option, this setting is available to enable or disable the following commands:

- **Administrator Logoff:** Selecting 'Yes' allows the Supervisor to forcefully logoff an administrator session.
- **Engineer Logoff:** Selecting 'Yes' allows the Supervisor to forcefully logoff an engineer session.
- **Operator Logoff:** Selecting 'Yes' allows the Supervisor to forcefully logoff an operator session.
- **Clear Security Data:** Selecting 'Yes' allows the Supervisor to forcefully clear all the security logs and clears all the operands associated with the self-tests.

7.2.1 TARGETS MENU

The status of any active targets will be displayed in the targets menu. If no targets are active, the display will read **NO ACTIVE TARGETS**:

7.2.2 TARGET MESSAGES

When there are no active targets, the first target to become active will cause the display to immediately default to that message. If there are active targets and the user is navigating through other messages, and when the default message timer times out (i.e. the keypad has not been used for a determined period of time), the display will again default back to the target message.

The range of variables for the target messages is described below. Phase information will be included if applicable. If a target message status changes, the status with the highest priority will be displayed.

Table 7–1: TARGET MESSAGE PRIORITY STATUS

PRIORITY	ACTIVE STATUS	DESCRIPTION
1	OP	element operated and still picked up
2	PKP	element picked up and timed out
3	LATCHED	element had operated but has dropped out

If a self test error is detected, a message appears indicating the cause of the error. For example **UNIT NOT PROGRAMMED** indicates that the minimal relay settings have not been programmed.

7.2.3 RELAY SELF-TESTS

a) DESCRIPTION

The relay performs a number of self-test diagnostic checks to ensure device integrity. The two types of self-tests (major and minor) are listed in the tables below. When either type of self-test error occurs, the Trouble LED Indicator will turn on and a target message displayed. All errors record an event in the event recorder. Latched errors can be cleared by pressing the RESET key, providing the condition is no longer present.

Major self-test errors also result in the following:

- The critical fail relay on the power supply module is de-energized.
- All other output relays are de-energized and are prevented from further operation.
- The faceplate In Service LED indicator is turned off.
- A RELAY OUT OF SERVICE event is recorded.

b) MAJOR SELF-TEST ERROR MESSAGES

The major self-test errors are outlined in this section.

MODULE FAILURE_____:
Contact Factory (xxx)

- *Latched target message:* Yes.
- *Description of problem:* Module hardware failure detected.
- *How often the test is performed:* Module dependent.
- *What to do:* Contact the factory and supply the failure code noted in the display. The “xxx” text identifies the failed module (for example, F8L).

INCOMPATIBLE H/W:
Contact Factory (xxx)

- *Latched target message:* Yes.
- *Description of problem:* One or more installed hardware modules is not compatible with the L90 order code.
- *How often the test is performed:* Module dependent.
- *What to do:* Contact the factory and supply the failure code noted in the display. The “xxx” text identifies the failed module (for example, F8L).

EQUIPMENT MISMATCH:
with 2nd line detail

- *Latched target message:* No.
- *Description of problem:* The configuration of modules does not match the order code stored in the L90.
- *How often the test is performed:* On power up. Afterwards, the backplane is checked for missing cards every five seconds.
- *What to do:* Check all modules against the order code, ensure they are inserted properly, and cycle control power. If the problem persists, contact the factory.

FLEXLOGIC ERROR:
with 2nd line detail

- *Latched target message:* No.
- *Description of problem:* A FlexLogic equation is incorrect.
- *How often the test is performed:* The test is event driven, performed whenever FlexLogic equations are modified.
- *What to do:* Finish all equation editing and use self tests to debug any errors.

UNIT NOT PROGRAMMED:
Check Settings

- *Latched target message:* No.
- *Description of problem:* The **PRODUCT SETUP** ⇒ **INSTALLATION** ⇒ **RELAY SETTINGS** setting indicates the L90 is not programmed.
- *How often the test is performed:* On power up and whenever the **PRODUCT SETUP** ⇒ **INSTALLATION** ⇒ **RELAY SETTINGS** setting is altered.
- *What to do:* Program all settings and then set **PRODUCT SETUP** ⇒ **INSTALLATION** ⇒ **RELAY SETTINGS** to “Programmed”.

c) MINOR SELF-TEST ERROR MESSAGES

Most of the minor self-test errors can be disabled. Refer to the settings in the *User-programmable self-tests* section in the *Settings* chapter for additional details.

**IEC 61850 DATA SET:
LLN0 GOOSE# Error**

- *Latched target message:* No.
- *Description of problem:* A data item in a configurable GOOSE data set is not supported by the L90 order code.
- *How often the test is performed:* On power up.
- *What to do:* Verify that all the items in the GOOSE data set are supported by the L90. The EnerVista UR Setup software will list the valid items. An IEC61850 client will also show which nodes are available for the L90.

**IEC 61850 DATA SET:
LLN0 BR# Error**

- *Latched target message:* No.
- *Description of problem:* A data item in a configurable report data set is not supported by the L90 order code.
- *How often the test is performed:* On power up.
- *What to do:* Verify that all the items in the configurable report data set are supported by the L90. The EnerVista UR Setup software will list the valid items. An IEC61850 client will also show which nodes are available for the L90.

**MAINTENANCE ALERT:
Replace Battery**

- *Latched target message:* Yes.
- *Description of problem:* The battery is not functioning.
- *How often the test is performed:* The battery is monitored every five seconds. The error message displays after 60 seconds if the problem persists.
- *What to do:* Replace the battery as outlined in the Maintenance chapter.

**MAINTENANCE ALERT:
Direct I/O Ring Break**

- *Latched target message:* No.
- *Description of problem:* Direct input and output settings are configured for a ring, but the connection is not in a ring.
- *How often the test is performed:* Every second.
- *What to do:* Check direct input and output configuration and wiring.

**MAINTENANCE ALERT:
ENET PORT # OFFLINE**

- *Latched target message:* No.
- *Description of problem:* The Ethernet connection has failed for the specified port.
- *How often the test is performed:* Every five seconds.
- *What to do:* Check the Ethernet port connection on the switch.

**MAINTENANCE ALERT:
Bad IRIG-B Signal**

- *Latched target message:* No.
- *Description of problem:* A bad IRIG-B input signal has been detected.
- *How often the test is performed:* Monitored whenever an IRIG-B signal is received.
- *What to do:* Ensure the following:
 - The IRIG-B cable is properly connected.
 - Proper cable functionality (that is, check for physical damage or perform a continuity test).
 - The IRIG-B receiver is functioning.
 - Check the input signal level (it may be less than specification).
 If none of these apply, then contact the factory.

MAINTENANCE ALERT:
****Bad PTP Signal****

- *Latched target message:* No.
- *Description of problem:* No PTP enabled port has good PTP signal input.
- *How often the test is performed:* Activated when no acceptable signal is being received.
- *What to do:* Ensure the following:
 - The Ethernet cable(s) are properly connected.
 - At least one PTP grandmaster-capable clock is functioning.
 - If strict PP is enabled, that entire network is PP compliant.
 - The network is delivering PTP messages to the relay.

MAINTENANCE ALERT:
Port ## Failure

- *Latched target message:* No.
- *Description of problem:* An Ethernet connection has failed.
- *How often the test is performed:* Monitored every five seconds.
- *What to do:* Check Ethernet connections. Port 1 is the primary port and port 2 is the secondary port.

MAINTENANCE ALERT:
SNTP Failure

- *Latched target message:* No.
- *Description of problem:* The SNTP server is not responding.
- *How often the test is performed:* Every 10 to 60 seconds.
- *What to do:* Check SNTP configuration and network connections.

MAINTENANCE ALERT:
4L Discrepancy

- *Latched target message:* No.
- *Description of problem:* A discrepancy has been detected between the actual and desired state of a latching contact output of an installed type “4L” module.
- *How often the test is performed:* Upon initiation of a contact output state change.
- *What to do:* Verify the state of the output contact and contact the factory if the problem persists.

MAINTENANCE ALERT:
GGIO Ind xxx oscill

- *Latched target message:* No.
- *Description of problem:* A data item in a configurable GOOSE data set is oscillating.
- *How often the test is performed:* Upon scanning of each configurable GOOSE data set.
- *What to do:* The “xxx” text denotes the data item that has been detected as oscillating. Evaluate all logic pertaining to this item.

DIRECT I/O FAILURE:
COMM Path Incomplete

- *Latched target message:* No.
- *Description of problem:* A direct device is configured but not connected.
- *How often the test is performed:* Every second.
- *What to do:* Check direct input and output configuration and wiring.

REMOTE DEVICE FAIL:
COMM Path Incomplete

- *Latched target message:* No.
- *Description of problem:* One or more GOOSE devices are not responding.
- *How often the test is performed:* Event driven. The test is performed when a device programmed to receive GOOSE messages stops receiving. This can be from 1 to 60 seconds, depending on GOOSE packets.
- *What to do:* Check GOOSE setup.

TEMP MONITOR:
OVER TEMPERATURE

- *Latched target message:* Yes.
- *Description of problem:* The ambient temperature is greater than the maximum operating temperature (+80°C).
- *How often the test is performed:* Every hour.
- *What to do:* Remove the L90 from service and install in a location that meets operating temperature standards.

UNEXPECTED RESTART:
Press “RESET” key

- *Latched target message:* Yes.
- *Description of problem:* Abnormal restart from modules being removed or inserted while the L90 is powered-up, when there is an abnormal DC supply, or as a result of internal relay failure.
- *How often the test is performed:* Event driven.
- *What to do:* Contact the factory.

FIRST ETHERNET FAIL

SECOND ETHERNET FAIL

THIRD ETHERNET FAIL

- *Latched target message:* Yes.
- *Description of problem:* A link loss detection on an Ethernet port. The link loss is due to unplugging the cable or the switch port being down.
- *How often the test is performed:*
- *What to do:* Check the connection.

d) WRONG TRANSCEIVER MESSAGES

Description: The type of SFP does not match the CPU type.

T-type CPU = All ports support fiber SFPs only

Type: minor

Target: latched

Message: "WRONG TRANSCEIVER"

A webpage "SFP Transceiver Information" is provided. This page displays the type of the SFP in it. This data is to be used with the CPU type to know the cause of the problem.

e) SFP X MODULE FAIL MESSAGES

Description: A faulty SFP or unplugging the SFP would generate this self test.

Type: minor

Target: self reset

Message: SFP MODULE x FAIL

The webpage "SFP Transceiver Information" described in the previous section applies for this self test as well. The "SFP Module Fail" has higher priority and it suppresses the "Ethernet Fail" target message. The "SFP MODULE FAIL FUNCTION" setting enables/disables this self test. The target for this self test is priority-based, with the third one being the highest priority. For example, if all three SFP modules fail, then the third SFP target is activated. If the third SFP module failure resolves, then the second SFP target is activated.

HARDFIBER SELF-TEST ERROR MESSAGES

In addition to those provided by the standard UR-series devices, the UR devices implement HardFiber self-tests. These are listed below. Any abnormal diagnostic condition indicated by the LEDs or the critical failure relay also results in a self-test message, so troubleshooting is described here. For other relays, such as the B95^{Plus}, see that product's instruction manual.

Equipment Mismatch Major Self-Test

Description: The number or type of installed hardware modules does not match the order code stored in the CPU. The standard UR-series Equipment Mismatch self-test is extended to cover the possible presence of a Process Card.

Severity: Protection is not available and all contact outputs and shared outputs are de-asserted.

If this message appears, check all modules against the order code. Ensure they are inserted properly, and cycle the control power. If a module has intentionally been added or removed use the [Update Order Code](#) command to notify the relay that the current module configuration is correct.

Module Failure Major Self-Test

Description: UR-series device module hardware failure detected.

Severity: Protection is not available and all contact outputs and shared outputs are de-asserted.

If this message appears, contact the factory and supply the failure code noted in the display. Text in the message identifies the failed module (for example, H81). If operated on a Process Card failure, the Module Fail self-test seals-in (latches) till the UR-series device is restarted.

Process Bus Failure Major Self-test

Description: Mission critical data is not available via the process bus. An AC quantity is considered critical if both AC bank origins and the crosschecking settings are other than none. This self-test is also initiated by an AC input discrepancy being detected. See the description of the crosschecking setting in this manual for further information. In addition, this self-test can be initiated by user logic responding to loss of critical contact input/output or other data using the **Process Bus Failure Operand** user-programmable self-test setting. This setting is located in the **Settings > Product Setup > User-Programmable Self Test** menu.

Severity: Protection is not available and all contact outputs and shared outputs are de-asserted.

If this message appears, first rectify any Process Bus Trouble and Brick Trouble self-test errors. Check the actual value of the operand referenced by the **Process Bus Failure Operand** setting, and if “On”, determine the cause and rectify.

Should the problem persist with the foregoing all clear, the cause must be an AC input discrepancy, which is typically the result of problems in the input signals to the Bricks, or faults in the Brick input conditioning hardware. If the error was annunciated the first time significant signal was encountered, suspect the former cause and check the copper connections external to the Brick. Where multiple UR-series devices have self-test errors, look for common causes.

To further isolate AC input discrepancy errors, put the relay in test-isolated mode, then one by one, temporally change an AC bank crosschecking setting to none, until the Process Bus Failure clears. Once the problem AC bank has been identified, the values from each of the two Bricks can be examined individually by temporarily mapping each to an AC bank with a single origin.

Process Bus Trouble Minor Self-Test

Description: Communications problems with one or more Bricks. The text of the message identifies the affected field units. This self-test is initiated by low received signal levels at either the Brick or Process Card end, and by the sustained failure to receive poll responses from the proper Brick.

Severity: This self-test error does not directly inhibit protection. However, the affected Brick inputs/outputs may not be available to the UR-series device.

If this message appears, check the field unit actual values. An indication of equipment mismatch means that messages are being received from a Brick, but there is a discrepancy between the settings and the actual Brick serial number, order code, and/or core number. Check that the correct core on the correct Brick is patched through to the correct Process Card port, and that the field unit settings are correct. An indication of communications loss means that no messages are being received. Check that the patching is correct, and that the Brick has power. If that is not the problem, use a professional optical fiber connector cleaning kit to clean both sides of all optical fiber connections from the Process Card through to the affected Brick. If the problem continues after cleaning, consult the factory.

Brick Trouble Minor Self-Test

Description: Brick internal self-testing has detected a trouble internal to the Brick.

Severity: This self-test error does not directly inhibit protection. However, some or all of the affected Brick inputs/outputs may not be available to the UR-series device.

If this message appears, check the Brick environment for over/under temperatures and the voltage of its power source. If the ambient temperature and supply voltage are within Brick specifications, consult the factory. Troubles resulting from a Brick output failing to respond to an output command can only be detected while the command is active, and so in this case the target is latched. A latched target can be unlatched by pressing the faceplate reset key if the command has ended, however the output may still be non-functional.

8.1.1 L90 DESIGN

All differential techniques rely on the fact that under normal conditions, the sum of the currents entering each phase of a transmission line from all connected terminals is equal to the charging current for that phase. Beyond the fundamental differential principle, the three most important technical considerations are; data consolidation, restraint characteristic, and sampling synchronization. The L90 uses new and unique concepts in these areas.

Data consolidation refers to the extraction of appropriate parameters to be transmitted from raw samples of transmission line phase currents. By employing data consolidation, a balance is achieved between transient response and bandwidth requirements. Consolidation is possible along two dimensions: time and phases. Time consolidation consists of combining a time sequence of samples to reduce the required bandwidth. Phase consolidation consists of combining information from three phases and neutral. Although phase consolidation is possible, it is generally not employed in digital schemes, because it is desired to detect which phase is faulted. The L90 relay transmits data for all three phases.

Time consolidation reduces communications bandwidth requirements. Time consolidation also improves security by eliminating the possibility of falsely interpreting a single corrupted data sample as a fault.

The L90 relay system uses a new consolidation technique called “phaselets”. Phaselets are partial sums of the terms involved in a complete phasor computation. The use of phaselets in the L90 design improves the transient response performance without increasing the bandwidth requirements.

Phaselets themselves are not the same as phasors, but they can be combined into phasors over any time window that is aligned with an integral number of phaselets (see the Phaselet Computation section in this chapter for details). The number of phaselets that must be transmitted per cycle per phase is the number of samples per cycle divided by the number of samples per phaselet. The L90 design uses 64 samples per cycle and 32 samples per phaselet, leading to a phaselet communication bandwidth requirement of 2 phaselets per cycle. Two phaselets per cycle fits comfortably within a communications bandwidth of 64 Kbaud, and can be used to detect faults within a half cycle plus channel delay.

The second major technical consideration is the restraint characteristic, which is the decision boundary between situations that are declared to be a fault and those that are not. The L90 uses an innovative adaptive decision process based on an on-line computation of the sources of measurement error. In this adaptive approach, the restraint region is an ellipse with variable major axis, minor axis, and orientation. Parameters of the ellipse vary with time to make best use of the accuracy of current measurements.

The third major element of L90 design is sampling synchronization. In order for a differential scheme to work, the data being compared must be taken at the same time. This creates a challenge when data is taken at remote locations.

The GE approach to clock synchronization relies upon distributed synchronization. Distributed synchronization is accomplished by synchronizing the clocks to each other rather than to a master clock. Clocks are phase synchronized to each other and frequency synchronized to the power system frequency. Each relay compares the phase of its clock to the phase of the other clocks and compares the frequency of its clock to the power system frequency and makes appropriate adjustments. As long as there are enough channels operating to provide protection, the clocks will be synchronized.

8.1.2 L90 ARCHITECTURE

The L90 system uses a peer to peer architecture in which the relays at every terminal are identical. Each relay computes differential current and clocks are synchronized to each other in a distributed fashion. The peer to peer architecture is based on two main concepts that reduce the dependence of the system on the communication channels: replication of protection and distributed synchronization.

Replication of protection means that each relay is designed to be able to provide protection for the entire system, and does so whenever it has enough information. Thus a relay provides protection whenever it is able to communicate directly with all other relays. For a multi-terminal system, the degree of replication is determined by the extent of communication interconnection. If there is a channel between every pair of relays, every relay provides protection. If channels are not provided between every pair of relays, only those relays that are connected to all other relays provide protection.

Each L90 relay measures three phase currents 64 times per cycle. Synchronization in sampling is maintained throughout the system via the distributed synchronization technique.

The next step is the removal of any decaying offset from each phase current measurement. This is done using a digital simulation of the so-called “mimic circuit” (based on the differential equation of the inductive circuit that generates the offset). Next, phaselets are computed by each L90 for each phase from the outputs of the mimic calculation, and transmitted to the

other relay terminals. Also, the sum of the squares of the raw data samples is computed for each phase, and transmitted with the phaselets.

At the receiving relay, the received phaselets are combined into phasors. Also, ground current is reconstructed from phase information. An elliptical restraint region is computed by combining sources of measurement error. In addition to the restraint region, a separate disturbance detector is used to enhance security.

The possibility of a fault is indicated by the detection of a disturbance as well as the sum of the current phasors falling outside of the elliptical restraint region. The statistical distance from the phasor to the restraint region is an indication of the severity of the fault. To provide speed of response that is commensurate with fault severity, the distance is filtered. For mild faults, filtering improves measurement precision at the expense of a slight delay, on the order of one cycle. Severe faults are detected within a single phaselet. Whenever the sum of phasors falls within the elliptical restraint region, the system assumes there is no fault, and uses whatever information is available for fine adjustment of the clocks.

8.1.3 REMOVAL OF DECAYING OFFSET

The inductive behavior of power system transmission lines gives rise to decaying exponential offsets during transient conditions, which could lead to errors and interfere with the determination of how well measured current fits a sine wave.

The current signals are pre-filtered using an improved digital MIMIC filter. The filter removes effectively the DC component(s) guaranteeing transient overshoot below 2% regardless of the initial magnitude and time constant of the dc component(s). The filter has significantly better filtering properties for higher frequencies as compared with a classical MIMIC filter. This was possible without introducing any significant phase delay thanks to the high sampling rate used by the relay. The output of the MIMIC calculation is the input for the phaselet computation. The MIMIC computation is applied to the data samples for each phase at each terminal. The equation shown is for one phase at one terminal.

8.1.4 PHASELET COMPUTATION

Phaselets are partial sums in the computation for fitting a sine function to measured samples. Each slave computes phaselets for each phase current and transmits phaselet information to the master for conversion into phasors. Phaselets enable the efficient computation of phasors over sample windows that are not restricted to an integer multiple of a half cycle at the power system frequency. Determining the fundamental power system frequency component of current data samples by minimizing the sum of the squares of the errors gives rise to the first frequency component of the Discrete Fourier Transform (DFT). In the case of a data window that is a multiple of a half cycle, the computation is simply sine and cosine weighted sums of the data samples. In the case of a window that is not a multiple of a half-cycle, there is an additional correction that results from the sine and cosine functions not being orthogonal over such a window. However, the computation can be expressed as a two by two matrix multiplication of the sine and cosine weighted sums.

Phaselets and sum of squares are computed for each phase at each terminal as follows. For the real part, we have:

$$I_{1_Re_A(k)} = \frac{4}{N} \sum_{p=0}^{N/2-1} i_{1_f_A(k-p)} \cdot \cos\left(\frac{2\pi(p+1/2)}{N}\right) \quad (\text{EQ 8.1})$$

For the imaginary part, we have:

$$I_{1_Im_A(k)} = -\frac{4}{N} \sum_{p=0}^{N/2-1} i_{1_f_A(k-p)} \cdot \sin\left(\frac{2\pi(p+1/2)}{N}\right) \quad (\text{EQ 8.2})$$

where: k is the present phaselet index,
 N is the number of samples per cycle, and
 p is the present sample index

The computation of phaselets and sum of squares is basically a consolidation process. The phaselet sums are converted into stationary phasors by multiplying by a precomputed matrix. Phaselets and partial sums of squares are computed and time stamped at each relay and communicated to the remote relay terminals, where they are added and the matrix multiplication is performed. Since the sampling clocks are synchronized, the time stamp is simply a sequence number.

8.1.5 DISTURBANCE DETECTION

A disturbance detection algorithm is used to enhance security and to improve transient response. Conditions to detect a disturbance include the magnitude of zero-sequence current, the magnitude of negative-sequence current, and changes in positive, negative, or zero-sequence current. Normally, differential protection is performed using a full-cycle Fourier transform. Continuous use of a full-cycle Fourier means that some pre-fault data is also used for computation – this may lead to a slowdown in the operation of the differential function. To improve operating time, the window is resized to the half-cycle Fourier once a disturbance is detected, thus removing pre-fault data.

8.1.6 FAULT DETECTION

Normally, the sum of the current phasors from all terminals is zero for each phase at every terminal. A fault is detected for a phase when the sum of the current phasors from each terminal for that phase falls outside of a dynamic elliptical restraint boundary for that phase. The severity of the fault is computed as follows for each phase.

The differential current is calculated as a sum of local and remote currents. The real part is expressed as:

$$I_{DIFF_RE_A} = I_{LOC_PHASOR_RE_A} + I_{REM1_PHASOR_RE_A} + I_{REM2_PHASOR_RE_A} \quad (EQ 8.3)$$

The imaginary part is expressed as:

$$I_{DIFF_IM_A} = I_{LOC_PHASOR_IM_A} + I_{REM1_PHASOR_IM_A} + I_{REM2_PHASOR_IM_A} \quad (EQ 8.4)$$

The differential current is squared for the severity equation:

$$(I_{DIFF_A})^2 = (I_{DIFF_RE_A})^2 + (I_{DIFF_IM_A})^2 \quad (EQ 8.5)$$

The restraint current is composed from two distinctive terms: traditional and adaptive. Each relay calculates local portion of the traditional and restraint current to be used locally and sent to remote peers for use with differential calculations. If more than one CT are connected to the relay (breaker-and-the half applications), then a maximum of all (up to 4) currents is chosen to be processed for traditional restraint:

The current chosen is expressed as:

$$(I_{LOC_TRAD_A})^2 = \max((I_{1_MAG_A})^2, (I_{2_MAG_A})^2, (I_{3_MAG_A})^2, (I_{4_MAG_A})^2, (I_{q_MAG_A})^2) \quad (EQ 8.6)$$

This current is then processed with the slope (S_1 and S_2) and breakpoint (BP) settings to form a traditional part of the restraint term for the local current as follows. For two-terminal systems, we have:

$$\begin{aligned} &\text{If } (I_{LOC_TRAD_A})^2 < BP^2 \\ &\text{then } (I_{LOC_REST_TRAD_A})^2 = 2(S_1 \cdot I_{LOC_TRAD_A})^2 \\ &\text{else } (I_{LOC_REST_TRAD_A})^2 = 2((S_2 \cdot I_{LOC_TRAD_A})^2 - (S_2 \cdot BP)^2) + 2(S_1 \cdot BP)^2 \end{aligned} \quad (EQ 8.7)$$

For three-terminal systems we have

$$\begin{aligned} &\text{If } (I_{LOC_TRAD_A})^2 < BP^2 \\ &\text{then } (I_{LOC_REST_TRAD_A})^2 = \frac{4}{3}(S_1 \cdot I_{LOC_TRAD_A})^2 \\ &\text{else } (I_{LOC_REST_TRAD_A})^2 = \frac{4}{3}((S_2 \cdot I_{LOC_TRAD_A})^2 - (S_2 \cdot BP)^2) + \frac{4}{3}(S_1 \cdot BP)^2 \end{aligned} \quad (EQ 8.8)$$

The final restraint current sent to peers and used locally in differential calculations is as follows:

$$I_{LOC_RESTRAINT_A} = \sqrt{(I_{LOC_REST_TRAD_A})^2 + MULT_A \cdot (I_{LOC_ADA_A})^2} \quad (EQ 8.9)$$

where: $MULT_A$ is a multiplier that increases restraint if CT saturation is detected (see *CT Saturation Detection* for details);
 $I_{LOC_ADA_A}$ is an adaptive restraint term (see *Online Estimate Of Measurement Error* for details)

The squared restraining current is calculated as a sum of squared local and all remote restraints:

$$(I_{\text{REST_A}})^2 = (I_{\text{LOC_PHASOR_RESTRAINT_A}})^2 + (I_{\text{REM1_PHASOR_RESTRAINT_A}})^2 + (I_{\text{REM2_PHASOR_RESTRAINT_A}})^2 \quad (\text{EQ 8.10})$$

The fault severity for each phase is determined by following equation:

$$S_A = (I_{\text{DIFF_A}})^2 - (2P^2 + (I_{\text{REST_A}})^2) \quad (\text{EQ 8.11})$$

where P is the pickup setting.

This equation is based on the adaptive strategy and yields an elliptical restraint characteristic. The elliptical area is the restraint region. When the adaptive portion of the restraint current is small, the restraint region shrinks. When the adaptive portion of the restraint current increases, the restraint region grows to reflect the uncertainty of the measurement. The computed severity increases with the probability that the sum of the measured currents indicates a fault. With the exception of “Restraint”, all quantities are defined in previous sections. “Adaptive Restraint” is a restraint multiplier, analogous to the slope setting of traditional differential approaches, for adjusting the sensitivity of the relay.

Raising the restraint multiplier corresponds to demanding a greater confidence interval, and has the effect of decreasing sensitivity while lowering it is equivalent to relaxing the confidence interval and increases sensitivity. Thus, the restraint multiplier is an application adjustment that is used to achieve the desired balance between sensitivity and security. The computed severity is zero when the operate phasor is on the elliptical boundary, is negative inside the boundary, and positive outside the boundary. Outside of the restraint boundary, the computed severity grows as the square of the fault current. The restraint area grows as the square of the error in the measurements.

8.1.7 GROUND DIFFERENTIAL ELEMENT

The line ground differential function allows sensitive ground protection for single-line to-ground faults, allowing the phase differential element to be set higher (above load) to provide protection for multi-phase faults. The L90 ground differential function calculates ground differential current from all terminal phase currents. The maximum phase current is used for the restraint. The L90 is applied in dual-breaker applications to cope with significant through current at remote terminals that may cause CT errors or saturation.

The line ground differential function uses the same CT matched and time-aligned phasors as the phase-segregated current differential function. The operate signal is calculated for both real and imaginary parts as follows:

$$I_{\text{OP_87G_RE}} = I_{\text{LOC_PHASOR_RE_A}} + I_{\text{LOC_PHASOR_RE_B}} + I_{\text{LOC_PHASOR_RE_C}} + I_{\text{REM1_PHASOR_RE_A}} + I_{\text{REM1_PHASOR_RE_B}} + I_{\text{REM1_PHASOR_RE_C}} + I_{\text{REM2_PHASOR_RE_A}} + I_{\text{REM2_PHASOR_RE_B}} + I_{\text{REM2_PHASOR_RE_C}} \quad (\text{EQ 8.12})$$

$$I_{\text{OP_87G_IM}} = I_{\text{LOC_PHASOR_IM_A}} + I_{\text{LOC_PHASOR_IM_B}} + I_{\text{LOC_PHASOR_IM_C}} + I_{\text{REM1_PHASOR_IM_A}} + I_{\text{REM1_PHASOR_IM_B}} + I_{\text{REM1_PHASOR_IM_C}} + I_{\text{REM2_PHASOR_IM_A}} + I_{\text{REM2_PHASOR_IM_B}} + I_{\text{REM2_PHASOR_IM_C}} \quad (\text{EQ 8.13})$$

The terms for the second remote terminal are omitted in two-terminal applications.

The maximum through current is available locally and re-constructed from the received remote restraint based on the maximum remote restraint current shown in the previous section and as indicated below.

For two-terminal applications:

$$\begin{aligned} \text{If } (I_{\text{REM_REST_A}})^2 < BP^2, \text{ then } (I_{\text{REM_REST_A}})^2 &= \frac{(I_{\text{REM_RESTRAINT_A}})^2}{2S_1^2} \\ \text{else } (I_{\text{REM_REST_A}})^2 &= \frac{(I_{\text{REM_RESTRAINT_A}})^2 - 2(S_1 \times BP)^2}{2S_2^2} + BP^2 \end{aligned} \quad (\text{EQ 8.14})$$

For three-terminal applications:

$$\begin{aligned} \text{If } (I_{\text{REM_REST_A}})^2 < \text{BP}^2, \text{ then } (I_{\text{REM_REST_A}})^2 &= \frac{(I_{\text{REM_RESTRAINT_A}})^2}{\frac{4}{3} \times S_1^2} \\ \text{else } (I_{\text{REM_REST_A}})^2 &= \frac{(I_{\text{REM_RESTRAINT_A}})^2 - \frac{4}{3}(S_1 \times \text{BP})^2}{\frac{4}{3} \times S_2^2} + \text{BP}^2 \end{aligned} \quad (\text{EQ 8.15})$$

The 87G restraining signal is calculated as follows:

$$(I_{\text{RES_87G}})^2 = \max((I_{\text{LOC_REST_A}})^2, (I_{\text{LOC_REST_B}})^2, (I_{\text{LOC_REST_C}})^2, (I_{\text{REM1_REST_A}})^2, (I_{\text{REM1_REST_B}})^2, (I_{\text{REM1_REST_C}})^2, (I_{\text{REM2_REST_A}})^2, (I_{\text{REM2_REST_B}})^2, (I_{\text{REM2_REST_C}})^2) \quad (\text{EQ 8.16})$$

The terms for the second remote terminal are omitted in two-terminal applications.

The operate signal for the ground differential function, $(I_{\text{OP_87G}})^2$, is then calculated as:

$$(I_{\text{OP_87G}})^2 = (I_{\text{OP_87G_RE}})^2 + (I_{\text{OP_87G_IM}})^2 \quad (\text{EQ 8.17})$$

The restraint signal, $(I_{87G})^2$, is calculated as follows for two-terminal applications:

$$(I_{87G})^2 = 2S_{87G}^2 \times (I_{\text{RES_87G}})^2 \quad (\text{EQ 8.18})$$

The restraint signal, $(I_{87G})^2$, is calculated as follows for three-terminal applications:

$$(I_{87G})^2 = \frac{4}{3} \times S_{87G}^2 \times (I_{\text{RES_87G}})^2 \quad (\text{EQ 8.19})$$

where S_{87G} is the slope setting for the ground differential function.

The ground differential element picks up if the following condition holds.

$$((I_{\text{OP_87G}})^2 - (2P_{87G}^2 + (I_{87G})^2) > 0) \text{ and } ((I_{\text{RES_87G}})^2 < (3 \text{ pu})^2) \quad (\text{EQ 8.20})$$

where P_{87G} is the pickup setting for the ground differential function.

In other words, when the squared magnitude of the operating signal is greater than the total restraining squared signal, the element operates. For additional security, the function is blocked if the restraining signal is high, indicating the 87LG function is not required to clear high-current faults, allowing for more sensitive settings to be used for the 87LG function.

8.1.8 CLOCK SYNCHRONIZATION

Synchronization of data sampling clocks is needed in a digital differential protection scheme, because measurements must be made at the same time. Synchronization errors show up as phase angle and transient errors in phasor measurements at the terminals. By phase angle errors, we mean that identical currents produce phasors with different phase angles. By transient errors, we mean that when currents change at the same time, the effect is seen at different times at different measurement points. For best results, samples should be taken simultaneously at all terminals.

In the case of peer to peer architecture, synchronization is accomplished by synchronizing the clocks to each other rather than to a master clock. Each relay compares the phase of its clock to the phase of the other clocks and compares the frequency of its clock to the power system frequency and makes appropriate adjustments. The frequency and phase tracking algorithm keeps the measurements at all relays within a plus or minus 25 microsecond error during normal conditions for a 2 or 3 terminal system. For 4 or more terminals the error may be somewhat higher, depending on the quality of the communications channels. The algorithm is unconditionally stable. In the case of 2 and 3 terminal systems, asymmetric communications channel delay is automatically compensated for. In all cases, an estimate of phase error is computed and used to automatically adapt the restraint region to compensate. Frequency tracking is provided that will accommodate any frequency shift normally encountered in power systems.

8.1.9 FREQUENCY TRACKING AND PHASE LOCKING

Each relay has a digital clock that determines when to take data samples and which is phase synchronized to all other clocks in the system and frequency synchronized to the power system frequency. Phase synchronization drives the relative timing error between clocks to zero, and is needed to control the uncertainty in the phase angle of phasor measurements, which will be held to under 26 microseconds (0.6 degrees). Frequency synchronization to the power system eliminates a source of error in phasor measurements that arises when data samples do not exactly span one cycle.

The block diagram for clock control for a two terminal system is shown in the following figure. Each relay makes a local estimate of the difference between the power system frequency and the clock frequency based on the rotation of phasors. Each relay also makes a local estimate of the time difference between its clock and the other clocks either by exchanging timing information over communications channels or from information that is in the current phasors, depending on which-ever one is more accurate at any given time. A loop filter then uses the frequency and phase angle deviation information to make fine adjustments to the clock frequency. Frequency tracking starts if the current at one or more terminals is above 0.125 pu of nominal; otherwise, the nominal frequency is used.

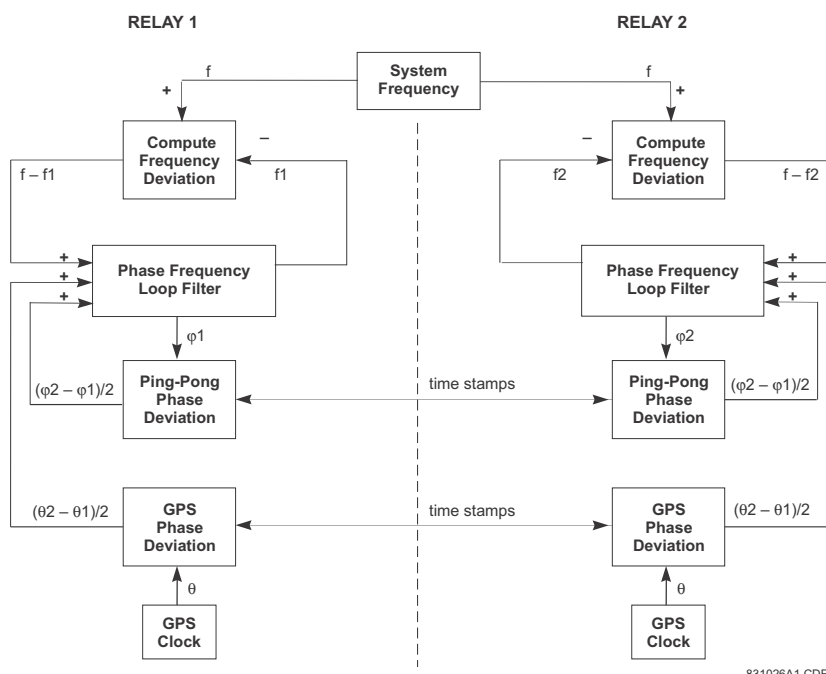

Figure 8-1: BLOCK DIAGRAM FOR CLOCK SYNCHRONIZATION IN A TWO-TERMINAL SYSTEM

The L90 provides sensitive digital current differential protection by computing differential current from current phasors. To improve sensitivity, the clocks are controlling current sampling are closely synchronized via the ping-pong algorithm. However, this algorithm assumes the communication channel delay is identical in each direction. If the delays are not the same, the error between current phasors is equal to half of the transmit-receive time difference. If the error is high enough, the relay perceives the “apparent” differential current and misoperates.

For applications where the communication channel is not symmetric (for example, SONET ring), the L90 allows the use of GPS (Global Positioning System) to compensate for the channel delay asymmetry. This feature requires a GPS receiver to provide a GPS clock signal to the L90. With this option there are two clocks at each terminal: a local sampling clock and a local GPS clock. The sampling clock controls data sampling while the GPS clock provides an accurate, absolute time reference used to measure channel asymmetry. The local sampling clocks are synchronized to each other in phase and to the power system in frequency. The local GPS clocks are synchronized to GPS time using the externally provided GPS time signal.

GPS time stamp is included in the transmitted packet along with the sampling clock time stamp. Both sampling clock deviation and channel asymmetry are computed from the four time-stamps. One half of the channel asymmetry is then subtracted from the computed sampling clock deviation. The compensated deviation drives the phase and frequency lock loop.

(PFLL) as shown on the diagram above. If GPS time reference is lost, the channel asymmetry compensation is not enabled, and the relay clock may start to drift and accumulate differential error. In this case, the 87L function has to be blocked. Refer to Chapter 10: Application of Settings for samples of how to program the relay.

8.1.10 FREQUENCY DETECTION

Estimation of frequency deviation is done locally at each relay based on rotation of positive sequence current, or on rotation of positive sequence voltage, if it is available. The counter clockwise rotation rate is proportional to the difference between the desired clock frequency and the actual clock frequency. With the peer to peer architecture, there is redundant frequency tracking, so it is not necessary that all terminals perform frequency detection.

Normally each relay will detect frequency deviation, but if there is no current flowing nor voltage measurement available at a particular relay, it will not be able to detect frequency deviation. In that case, the frequency deviation input to the loop filter is set to zero and frequency tracking is still achieved because of phase locking to the other clocks. If frequency detection is lost at all terminals because there is no current flowing then the clocks continue to operate at the frequency present at the time of the loss of frequency detection. Tracking will resume as soon as there is current.

The rotational rate of phasors is equal to the difference between the power system frequency and the ratio of the sampling frequency divided by the number of samples per cycle. The correction is computed once per power system cycle at each relay. For conciseness, we use a phasor notation:

$$\begin{aligned}\overline{I(n)} &= \text{Re}(\text{Phasor}_n) + j \cdot \text{Im}(\text{Phasor}_n) \\ \overline{I_{a,k}(n)} &= \overline{I(n)} \quad \text{for phase } a \text{ from the } k\text{th terminal at time step } n \\ \overline{I_{b,k}(n)} &= \overline{I(n)} \quad \text{for phase } b \text{ from the } k\text{th terminal at time step } n \\ \overline{I_{c,k}(n)} &= \overline{I(n)} \quad \text{for phase } c \text{ from the } k\text{th terminal at time step } n\end{aligned}\tag{EQ 8.21}$$

Each terminal computes positive sequence current:

$$\overline{I_{pos,k}(n)} = \frac{1}{3}(\overline{I_{a,k}(n)} + \overline{I_{b,k}(n)} \cdot e^{j2\pi/3} + \overline{I_{c,k}(n)} \cdot e^{j2\pi/3})\tag{EQ 8.22}$$

Each relay computes a quantity derived from the positive sequence current that is indicative of the amount of rotation from one cycle to the next, by computing the product of the positive sequence current times the complex conjugate of the positive sequence current from the previous cycle:

$$\overline{\text{Deviation}_k(n)} = \overline{I_{pos,k}(n)} \times \overline{I_{pos,k}(n-N)}^*\tag{EQ 8.23}$$

The angle of the deviation phasor for each relay is proportional to the frequency deviation at that terminal. Since the clock synchronization method maintains frequency synchronism, the frequency deviation is approximately the same for each relay. The clock deviation frequency is computed from the deviation phasor:

$$\text{FrequencyDeviation} = \frac{\Delta f}{f} = \frac{\tan^{-1}(\text{Im}(\overline{\text{Deviation}})/\text{Re}(\overline{\text{Deviation}}))}{2\pi}\tag{EQ 8.24}$$

Note that a four quadrant arctangent can be computed by taking the imaginary and the real part of the deviation separately for the two arguments of the four quadrant arctangent. Also note that the input to the loop filter is in radian frequency which is two pi times the frequency in cycles per second; that is, $\Delta\omega = 2\pi \cdot \Delta f$.

So the radian frequency deviation can be calculated simply as:

$$\Delta\omega = \Delta f \cdot \tan^{-1}(\text{Im}(\overline{\text{Deviation}})/\text{Re}(\overline{\text{Deviation}}))\tag{EQ 8.25}$$

8.1.11 PHASE DETECTION

There are two separate sources of clock phase information; exchange of time stamps over the communications channels and the current measurements themselves (although voltage measurements can be used to provide frequency information, they cannot be used for phase detection). Current measurements can generally provide the most accurate information, but are not always available and may contain large errors during faults or switching transients. Time stamped messages are

the most reliable source of phase information but suffer from a phase offset due to a difference in the channel delays in each direction between a pair of relays. In some cases, one or both directions may be switched to a different physical path, leading to gross phase error.

The primary source of phase information are CPU time-tagged messages. If GPS compensation is enabled, GPS time stamps are used to compensate for asymmetry. In all cases, frequency deviation information is also used when available. The phase difference between a pair of clocks is computed by an exchange of time stamps. Each relay exchanges time stamps with all other relays that can be reached.

It is not necessary to exchange stamps with every relay, and the method works even with some of the channels failed. For each relay that a given relay can exchange time stamps with, the clock deviation is computed each time a complete set of time stamps arrives. The net deviation is the total deviation divided by the total number of relays involved in the exchange.

For example, in the case of two terminals, each relay computes a single time deviation from time stamps, and divides the result by two. In the case of three terminals, each relay computes two time deviations and divides the result by three. If a channel is lost, the single deviation that remains is divided by two.

Four time stamps are needed to compute round trip delay time and phase deviation. Three stamps are included in the message in each direction. The fourth time stamp is the time when the message is received. Each time a message is received the oldest two stamps of the four time stamps are saved to become the first two time stamps of the next outgoing message. The third time stamp of an outgoing message is the time when the message is transmitted. A fixed time shift is allowed between the stamp values and the actual events, provided the shift for outgoing message time stamps is the same for all relays, and the shift incoming message time stamps is also identical.

To reduce bandwidth requirements, time stamps are spread over 3 messages. In the case of systems with 4 messages per cycle, time stamps are sent out on three of the four messages, so a complete set is sent once per cycle. In the case of systems with 1 message per cycle, three time stamps are sent out each cycle in a single message. The transmit and receive time stamps are based on the first message in the sequence.

One of the strengths of this approach is that it is not necessary to explicitly identify or match time stamp messages. Usually, two of the time stamps in an outgoing message are simply taken from the last incoming message. The third time stamp is the transmittal time. However, there are two circumstances when these time stamps are not available. One situation is when the first message is transmitted by a given relay. The second is when the exchange is broken long enough to invalidate the last received set of time stamps (if the exchange is broken for longer than 66 ms, the time stamps from a given clock could roll over twice, invalidating time difference computations). In either of these situations, the next outgoing set of time stamps is a special start-up set containing transmittal time only. When such a message is received, nothing is computed from it, except the message time stamp and the received time stamp are saved for the next outgoing message (it is neither necessary nor desirable to “reset” the local clock when such a message is received).

Error analysis shows that time stamp requirements are not very stringent because of the smoothing behavior of the phase locked loop. The time stamp can be basically a sample count with enough bits to cover the worst round trip, including channel delay and processing delay. An 8 bit time stamp with 1 bit corresponding to 1/64 of a cycle will accommodate a round trip delay of up to 4 cycles, which should be more than adequate.

The computation of round trip delay and phase offset from four time stamps is as follows:

$$\begin{aligned}
 a &= T_{i-2} - T_{i-3} \\
 b &= T_i - T_{i-1} \\
 \delta_i &= a + b \\
 \theta_i &= \frac{a - b}{2}
 \end{aligned}
 \tag{EQ 8.26}$$

The T s are the time stamps, with T_i the newest. Delta is the round trip delay. Theta is the clock offset, and is the correct sign for the feedback loop. Note that the time stamps are unsigned numbers that wrap around, while a and b can be positive or negative; δ_i must be positive and θ_i can be positive or negative. Some care must be taken in the arithmetic to take into account possible roll over of any of the time stamps. If T_{i-2} is greater than T_{i-1} , there was a roll over in the clock responsible for those two time stamps.

To correct for the roll over, subtract 256 from the round trip and subtract 128 from the phase angle. If T_{i-3} is greater than T_i , add 256 to the round trip and add 128 to the phase angle. Also, if the above equations are computed using integer values of time stamps, a conversion to phase angle in radians is required by multiplying by $\pi / 32$.

Time stamp values are snapshots of the local 256 bit sample counter taken at the time of the transmission or receipt of the first message in a time stamp sequence. This could be done either in software or hardware, provided the jitter is limited to less than plus or minus 130 μ s. A fixed bias in the time stamp is acceptable, provided it is the same for all terminals.

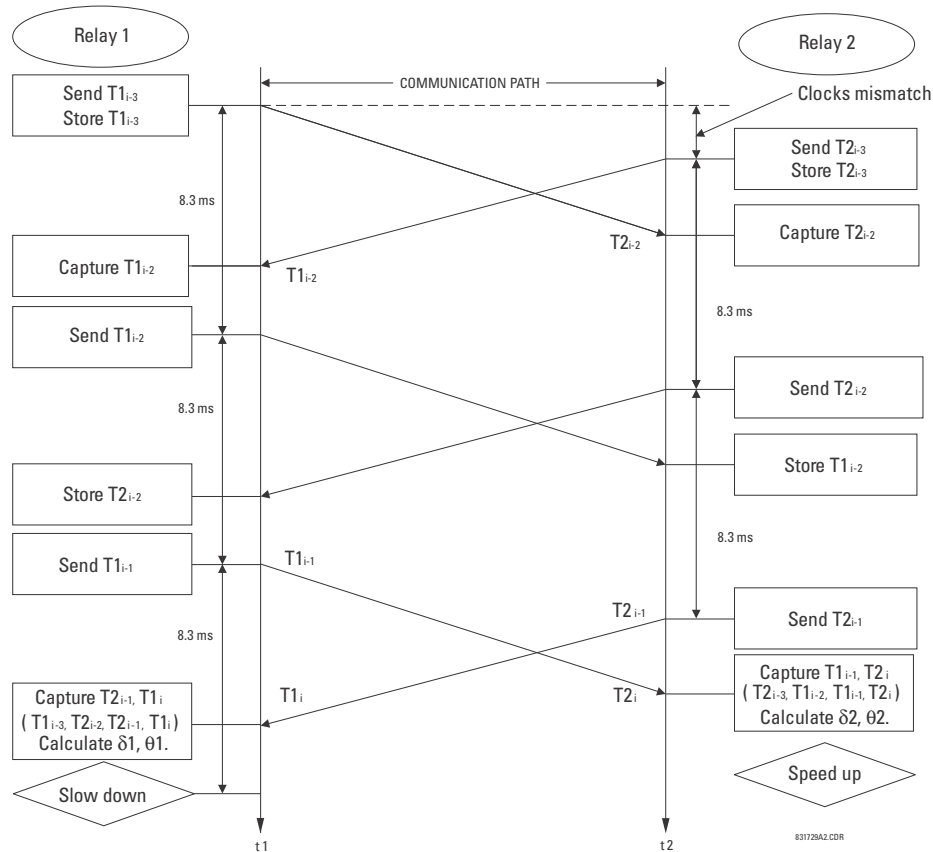

Figure 8–2: ROUND TRIP DELAY AND CLOCK OFFSET COMPUTATION FROM TIME STAMPS

8.1.12 PHASE LOCKING FILTER

Filters are used in the phase locked loop to assure stability, to reduce phase and frequency noise. This is well known technology. The primary feedback mechanism shown in the Loop Block Diagram is phase angle information through the well known proportional plus integral (PI) filter (the Z in the diagram refers to a unit delay, and $1/(Z-1)$ represents a simple digital first order integrator). This loop is used to provide stability and zero steady state error.

A PI filter has two time parameters that determine dynamic behavior: the gain for the proportional term and the gain for the integral. Depending on the gains, the transient behavior of the loop can be underdamped, critically damped, or over damped. For this application, critically damped is a good choice.

This sets a constraint relating the two parameters. A second constraint is derived from the desired time constants of the loop. By considering the effects of both phase and frequency noise in this application it can be shown that optimum behavior results with a certain proportion between phase and frequency constraints.

A secondary input is formed through the frequency deviation input of the filter. Whenever frequency deviation information is available, it is used for this input; otherwise, the input is zero. Because frequency is the derivative of phase information, the appropriate filter for frequency deviation is an integrator, which is combined with the integrator of the PI filter for the phase. It is very important to combine these two integrators into a single function because it can be shown if two separate integrators are used, they can drift in opposite directions into saturation, because the loop would only drive their sum to zero.

In normal operation, frequency tracking at each terminal matches the tracking at all other terminals, because all terminals will measure approximately the same frequency deviation. However, if there is not enough current at a terminal to compute frequency deviation, frequency tracking at that terminal is accomplished indirectly via phase locking to other terminals. A small phase deviation must be present for the tracking to occur.

Also shown in the loop is the clock itself, because it behaves like an integrator. The clock is implemented in hardware and software with a crystal oscillator and a counter.

Figure 8-3: BLOCK DIAGRAM OF LOOP FILTER

There are 4 gains in the filter that must be selected once and for all as part of the design of the system. The gains are determined by the time step of the integrators, and the desired time constants of the system as follows:

$$KI = \frac{T_{repeat}}{T_{phase}^2}, \quad KP = \frac{2}{T_{phase}}, \quad KF = \frac{T_{repeat}}{T_{frequency}} \quad (\text{EQ 8.27})$$

where: T_{repeat} = the time between execution of the filter algorithm
 T_{phase} = time constant for the primary phase locked loop
 $T_{frequency}$ = time constant for the frequency locked loop

8.1.13 MATCHING PHASELETS

An algorithm is needed to match phaselets, detect lost messages, and detect communications channel failure. Channel failure is defined by a sequence of lost messages, where the length of the sequence is a design parameter. In any case, the sequence should be no longer than the maximum sequence number (4 cycles) in order to be able to match up messages when the channel is assumed to be operating normally.

A channel failure can be detected by a watchdog software timer that times the interval between consecutive incoming messages. If the interval exceeds a maximum limit, channel failure is declared and the channel recovery process is initiated.

While the channel is assumed to be operating normally, it is still possible for an occasional message to be lost, in which case fault protection is suspended for the time period that depends on that message, and is resumed on the next occasional message. A lost message is detected simply by looking at the sequence numbers of incoming messages. A lost message will show up as a gap in the sequence.

Sequence numbers are also used to match messages for the protection computation. Whenever a complete set of current measurements from all terminals with matching sequence numbers are available, the differential protection function is computed using that set of measurements.

8.1.14 START-UP

Initialization in our peer-to-peer architecture is done independently at each terminal. Relays can be turned on in any order with the power system either energized or de-energized. Synchronization and protection functions are accomplished automatically whenever enough information is available.

After a relay completes other initialization tasks such as resetting of buffer pointers and determining relay settings, initial values are computed for any state variables in the loop filters or the protection functions. The relay starts its clock at the nominal power system frequency. Phaselet information is computed and transmitted.

- Outgoing messages over a given channel are treated in the same way as during the channel recovery process. The special start-up message is sent each time containing only a single time step value.
- When incoming messages begin arriving over a channel, that channel is placed in service and the loop filters are started up for that channel.
- Whenever the total clock uncertainty is less than a fixed threshold, the phase locking filter is declared locked and differential protection is enabled.

8.1.15 HARDWARE AND COMMUNICATION REQUIREMENTS

The average total channel delay in each direction is not critical, provided the total round trip delay is less than 4 power system cycles. The jitter is important, and should be less than $\pm 130 \mu\text{s}$ in each direction. The effect of a difference in the average delay between one direction and the other depends on the number of terminals. In the case of a 2 or 3 terminal system, the difference is not critical, and can even vary with time. In the case of a 4 or more terminal system, variation in the difference limits the sensitivity of the system.

- The allowable margin of $130 \mu\text{s}$ jitter includes jitter in servicing the interrupt generated by an incoming message. For both incoming and outgoing messages, the important parameter is the jitter between when the time stamp is read and when the message begins to go out or to come in.
- The quality of the crystal driving the clock and software sampling is not critical, because of the compensation provided by the phase and frequency tracking algorithm, unless it is desired to perform under or over frequency protection. From the point of view of current differential protection only, the important parameter is the rate of drift of crystal frequency, which should be less than 100 parts per million per minute.
- A 6 Mhz clock with a 16-bit hardware counter is adequate, provided the method is used for achieving the 32-bit resolution that is described in this document.
- An 8-bit time stamp is adequate provided time stamp messages are exchanged once per cycle.
- A 4-bit message sequence number is adequate.

Depending on the 87L settings, channel asymmetry (the difference in the transmitting and receiving paths channel delay) cannot be higher than 1 to 1.5 ms if channel asymmetry compensation is not used. However, if the relay detects asymmetry higher than 1.5 ms, the 87L DIFF CH ASYM DET FlexLogic™ operand is set high and the event and target are raised (if they are enabled in the **CURRENT DIFFERENTIAL** menu) to provide an indication about potential danger.

8.1.16 ONLINE ESTIMATE OF MEASUREMENT ERRORS

GE's adaptive elliptical restraint characteristic is a good approximation to the cumulative effects of various sources of error in determining phasors. Sources of error include power system noise, transients, inaccuracy in line charging current computation, current sensor gain, phase and saturation error, clock error, and asynchronous sampling. Errors that can be controlled are driven to zero by the system. For errors that cannot be controlled, all relays compute and sum the error for each source of error for each phase. The relay computes the error caused by power system noise, CT saturation, harmonics, and transients. These errors arise because power system currents are not always exactly sinusoidal. The intensity of these errors varies with time; for example, growing during fault conditions, switching operations, or load variations. The system treats these errors as a Gaussian distribution in the real and in the imaginary part of each phasor, with a standard deviation that is estimated from the sum of the squares of the differences between the data samples and the sine function that is used to fit them. This error has a spectrum of frequencies. Current transformer saturation is included with noise and transient error. The error for noise, harmonics, transients, and current transformer saturation is computed as follows. First, the sum of the squares of the errors in the data samples is computed from the sum of squares information for the present phaselet:

$$\text{SumSquares}_{1_A(k)} = \frac{4}{N} \sum_{p=0}^{N/2-1} (i_{1_f_A(k-p)})^2 \quad (\text{EQ 8.28})$$

Then fundamental magnitude is computed as follows for the same phaselet:

$$I_{1_MAG_A} = \sqrt{(I_{1_RE_A})^2 + (I_{1_IM_A})^2} \quad (\text{EQ 8.29})$$

Finally, the local adaptive restraint term is computed as follows, for each local current:

$$(I_{1_ADA_A})^2 = \frac{4}{N} (\text{SumSquares}_{1_A(k)} - (I_{1_MAG_A})^2) \quad (\text{EQ 8.30})$$

Another source of the measurement errors is clock synchronization error, resulting in a clock uncertainty term. The L90 algorithm accounts for two terms of synchronization error corresponding to:

- *Raw clock deviation computed from time stamps.* There are several effects that cause it to not track exactly. First, the ping-pong algorithm inherently produces slightly different estimates of clock deviation at each terminal. Second, because the transmission of time stamps is spread out over several packets, the clock deviation estimate is not up to date with other information it is combined with. Channel asymmetry also contributes to this term. The clock deviation computation is indicated in equation 8.15 as θ_i . If 2 channels are used, clock deviation is computed for both channels and then average of absolute values is computed. If GPS compensation is used, then GPS clock compensation is subtracted from the clock deviation.
- *Startup error.* This term is used to estimate the initial startup transient of PFLs. During startup conditions, a decaying exponential is computed to simulate envelope of the error during startup

The clock uncertainty is expressed as:

$$\text{clock_unc} = \text{clock_dev} + \text{start_up_error} \quad (\text{EQ 8.31})$$

Eventually, the local clock error is computed as:

$$\text{CLOCK}_A = \frac{(\text{clock_unc})^2}{9} \cdot ((I_{\text{LOC_RE_A}})^2 + (I_{\text{LOC_IM_A}})^2) \quad (\text{EQ 8.32})$$

The local squared adaptive restraint is computed from all local current sources (1 to 4) and is obtained as follows:

$$(I_{\text{LOC_ADA_A}})^2 = 18 \cdot ((I_{1_ADA_A})^2 + (I_{2_ADA_A})^2 + (I_{3_ADA_A})^2 + (I_{4_ADA_A})^2 + (I_{q_ADA_A})^2 + \text{CLOCK}_A) \quad (\text{EQ 8.33})$$

8.1.17 CT SATURATION DETECTION

Current differential protection is inherently dependent on adequate CT performance at all terminals of the protected line, especially during external faults. CT saturation, particularly when it happens at only one terminal of the line, introduces a spurious differential current that may cause the differential protection to misoperate.

The L90 applies a dedicated mechanism to cope with CT saturation and ensure security of protection for external faults. The relay dynamically increases the weight of the square of errors (the so-called 'sigma') portion in the total restraint quantity, but for external faults only. The following logic is applied:

- First, the terminal currents are compared against a threshold of 3 pu to detect overcurrent conditions that may be caused by a fault and may lead to CT saturation.
- For all the terminal currents that are above the 3 pu level, the relative angle difference is calculated. If all three terminals see significant current, then all three pairs (1, 2), (2, 3), and (1, 3) are considered and the maximum angle difference is used in further calculations.
- Depending on the angle difference between the terminal currents, the value of sigma used for the adaptive restraint current is increased by the multiple factor of 1, 5, or 2.5 to 5 as shown below. As seen from the figure, a factor of 1 is used for internal faults, and a factor of 2.5 to 5 is used for external faults. This allows the relay to be simultaneously sensitive for internal faults and robust for external faults with a possible CT saturation.

If more than one CT is connected to the relay (breaker-and-the-half applications), the CT saturation mechanism is executed between the maximum local current against the sum of all others, then between the maximum local and remote currents to select the secure multiplier MULT. A Maximum of two (local and remote) is selected and then applied to adaptive restraint.

Figure 8-4: CT SATURATION ADAPTIVE RESTRAINT MULTIPLIER

8.1.18 CHARGING CURRENT COMPENSATION

The basic premise for the operation of differential protection schemes in general, and of the L90 line differential element in particular, is that the sum of the currents entering the protected zone is zero. In the case of a power system transmission line, this is not entirely true because of the capacitive charging current of the line. For short transmission lines the charging current is a small factor and can therefore be treated as an unknown error. In this application the L90 can be deployed without voltage sensors and the line charging current is included as a constant term in the total variance, increasing the differential restraint current. For long transmission lines the charging current is a significant factor, and should be computed to provide increased sensitivity to fault current.

Compensation for charging current requires the voltage at the terminals be supplied to the relays. The algorithm calculates $C \times dv/dt$ for each phase, which is then subtracted from the measured currents at both ends of the line. This is a simple approach that provides adequate compensation of the capacitive current at the fundamental power system frequency. Travelling waves on the transmission line are not compensated for, and contribute to restraint by increasing the measurement of errors in the data set.

The underlying single phase model for compensation for a two and three terminal system are shown below.

Figure 8-5: 2-TERMINAL TRANSMISSION LINE SINGLE PHASE MODEL FOR COMPENSATION

Figure 8-6: 3-TERMINAL TRANSMISSION LINE SINGLE PHASE MODEL FOR COMPENSATION

Apportioning the total capacitance among the terminals is not critical for compensating the fundamental power system frequency charging current as long as the total capacitance is correct. Compensation at other frequencies will be approximate.

If the VTs are connected in wye, the compensation is accurate for both balanced conditions (i.e. all positive, negative and zero sequence components of the charging current are compensated). If the VTs are connected in delta, the compensation is accurate for positive and negative sequence components of the charging current. Since the zero sequence voltage is not available, the L90 cannot compensate for the zero sequence current.

The compensation scheme continues to work with the breakers open, provided the voltages are measured on the line side of the breakers.

For very long lines, the distributed nature of the line leads to the classical transmission line equations which can be solved for voltage and current profiles along the line. What is needed for the compensation model is the effective positive and zero sequence capacitance seen at the line terminals.

Finally, in some applications the effect of shunt reactors needs to be taken into account. With very long lines shunt reactors may be installed to provide some of the charging current required by the line. This reduces the amount of charging current flowing into the line. In this application, the setting for the line capacitance should be the residual capacitance remaining after subtracting the shunt inductive reactance from the total capacitive reactance at the power system frequency.

8.1.19 DIFFERENTIAL ELEMENT CHARACTERISTICS

The differential element is completely dependent on receiving data from the relay at the remote end of the line, therefore, upon startup, the differential element is disabled until the time synchronization system has aligned both relays to a common time base. After synchronization is achieved, the differential is enabled. Should the communications channel delay time increase, such as caused by path switching in a SONET system or failure of the communications power supply, the relay will act as outlined in the next section.

The L90 incorporates an adaptive differential algorithm based on the traditional percent differential principle. In the traditional percent differential scheme, the operating parameter is based on the phasor sum of currents in the zone and the restraint parameter is based on the scalar (or average scalar) sum of the currents in the protected zone - when the operating parameter divided by the restraint parameter is above the slope setting, the relay will operate. During an external fault, the operating parameter is relatively small compared to the restraint parameter, whereas for an internal fault, the operating parameter is relatively large compared to the restraint parameter. Because the traditional scheme is not adaptive, the element settings must allow for the maximum amount of error anticipated during an out-of-zone fault, when CT errors may be high and/or CT saturation may be experienced.

The major difference between the L90 differential scheme and a percent differential scheme is the use of an estimate of errors in the input currents to increase the restraint parameter during faults, permitting the use of more sensitive settings than those used in the traditional scheme. The inclusion of the adaptive feature in the scheme produces element characteristic equations that appear to be different from the traditional scheme, but the differences are minimal during system steady-state conditions. The element equations are shown in the *Operating condition calculations* section.

8.1.20 RELAY SYNCHRONIZATION

On startup of the relays, the channel status will be checked first. If channel status is OK, all relays will send a special "startup" message and the synchronization process will be initiated. It will take about 5 to 7 seconds to declare PFLL status as OK and to start performing current differential calculations. If one of the relays was powered off during the operation, the synchronization process will restart from the beginning. Relays tolerate channel delay (resulting sometimes in step change in communication paths) or interruptions up to four power cycles round trip time (about 66 ms at 60 Hz) without any deterioration in performance. If communications are interrupted for more than four cycles, the following applies:

In two-terminal mode:

1. With second redundant channel, relays will not lose functionality at all if second channel is live.
2. With one channel only, relays have a five second time window. If the channel is restored within this time, it takes about two to three power cycles of valid PFLL calculations (and if estimated error is still within margin) to declare that PFLL is OK. If the channel is restored later than 5 seconds, PFLL at both relays will be declared as failed and the re-synchronization process will be initiated (about 5 to 7 seconds) after channel status becomes OK.

In three-terminal mode:

1. If one of the channels fails, the configuration reverts from master-master to master-slave where the master relay has both channels live. The master relay PFLL keeps the two slave relays in synchronization, and therefore there is no time limit for functionality. The PFLL of the slave relays will be suspended (that is, the 87L function will not be performed at these relays but they can still trip via DTT from the master relay) until the channel is restored. If the estimated error is within margin upon channel restoration and after two to three power cycles of valid PFLL calculations, the PFLL will be declared as OK and the configuration will revert back to master-master.
2. If 2 channels fail, PFLL at all relays will be declared as failed and when the channels are back into service, the re-synchronization process will be initiated (about 5 to 7 seconds) after channel status becomes OK.

Depending on the system configuration (number of terminals and channels), the 87L function operability depends on the status of channel(s), status of synchronization, and status of channel(s) ID validation. All these states are available as FlexLogic™ operands, for viewing in actual values, logged in the event recorder (if events are enabled in 87L menu), and also trigger targets (if targets are enabled in the 87L function). These FlexLogic™ operands can be used to trigger alarms, illuminate LEDs, and be captured in oscillography.

However, the 87L BLOCKED FlexLogic™ operand reflects whether the local current differential function is blocked due to communications or settings problems. The state of this operand is based on the combination of conditions outlined above. As such, it is recommended that it be used to enable backup protection if 87L is not available.

The 87L BLOCKED operand is set when the 87L function is enabled and any of the following three conditions apply:

1. At least one channel failed on a two or three-terminal single-channel system, or both channels failed on a two-terminal two-channel system.
2. PFLL has failed or is suspended,
3. A channel ID failure has been detected on at least one channel in a two-terminal single-channel system or in a three-terminal system, or a channel ID failure has been detected on both channels in a two-terminal dual-channel system.

All L90 communications alarms can be divided by major and minor alarms.

The major alarms are CHANNEL FAIL, PFLL FAIL, and CHANNEL ID FAIL. The relay is blocked automatically if any of these conditions occur. Therefore, there is no need to assign these operands to a current differential block setting.

The minor alarms are CRC FAIL and LOST PACKET, which are indicators of a poor or noisy communications channel. If the relay recognizes that a packet is lost or corrupted, the 87L feature is not processed at that protection pass. Instead, it waits for the next valid packet.

8.2.1 DESCRIPTION

Characteristics of differential elements can be shown in the complex plane. The operating characteristics of the L90 are fundamentally dependant on the relative ratios of the local and remote current phasor magnitudes and the angles of I_{loc} / I_{rem} as shown in the *Restraint Characteristics* figure.

The main factors affecting the trip-restraint decisions are:

1. Difference in angles (+ real represents pure internal fault when currents are essentially in phase, – real represents external fault when currents are 180° apart).
2. The magnitude of remote current.
3. The magnitude of the local current.
4. Dynamically estimated errors in calculations.
5. Settings.

The following figure also shows the relay's capability to handle week-infeed conditions by increasing the restraint ellipse when the remote current is relatively small (1.5 pu). Therefore, uncertainty is greater when compared with higher remote currents (3 pu). The characteristic shown is also dependant on settings. The second graph shows how the relay's trip-restraint calculation is made with respect to the variation in angle difference between local and remote currents. The characteristic for 3 terminal mode is similar where both remote currents are combined together.

Figure 8-7: RESTRAINT CHARACTERISTICS

8.2.2 TRIP DECISION EXAMPLE

Assume the following settings:

- Slope 1: $S_1 = 10\%$
- Slope 2: $S_2 = 10\%$
- Breakpoint: BP = 5 pu secondary
- Pickup: $P = 0.5$ pu

Assume the following local and remote currents:

- Local current: $I_{local} = 4.0$ pu $\angle 0^\circ$
- Remote current: $I_{remote} = 0.8$ pu $\angle 180^\circ$

The assumed condition is a radial line with a high resistance fault, with the source at the local end only, and through a resistive load current. The operating current is:

$$I_{op}^2 = |I_L + I_R|^2 = |4.0 \angle 0^\circ + 0.8 \angle 180^\circ|^2 = 10.24 \quad (\text{EQ 8.34})$$

Since the current at both ends is less than the breakpoint value of 5.0, the equation for two-terminal mode is used to calculate restraint as follows.

$$\begin{aligned} I_{Rest}^2 &= (2 \cdot S_1^2 \cdot |I_L|^2) + (2 \cdot S_2^2 \cdot |I_R|^2) + 2P^2 + \sigma \\ &= (2 \cdot (0.1)^2 \cdot |4|^2) + (2 \cdot (0.1)^2 \cdot |0.8|^2) + 2 \cdot (0.5)^2 + 0 \\ &= 0.8328 \end{aligned} \quad (\text{EQ 8.35})$$

where $\sigma = 0$, assuming a pure sine wave.

8.2.3 TRIP DECISION TEST

The trip condition is shown below.

$$\frac{I_{Op}^2}{I_{Rest}^2} > 1 \Rightarrow \frac{10.24}{0.8328} = 12.3 > 1 \Rightarrow \text{Trip} \quad (\text{EQ 8.36})$$

The use of the **CURRENT DIFF PICKUP**, **CURRENT DIFF RESTRAINT 1**, **CURRENT DIFF RESTRAINT 2**, and **CURRENT DIFF BREAK PT** settings are discussed in the *Current differential* section of chapter 5.

The following figure shows how the L90 settings affect the restraint characteristics. The local and remote currents are 180° apart, which represents an external fault. The breakpoint between the two slopes indicates the point where the restraint area is becoming wider to override uncertainties from CT saturation, fault noise, harmonics, etc. Increasing the slope percentage increases the width of the restraint area.

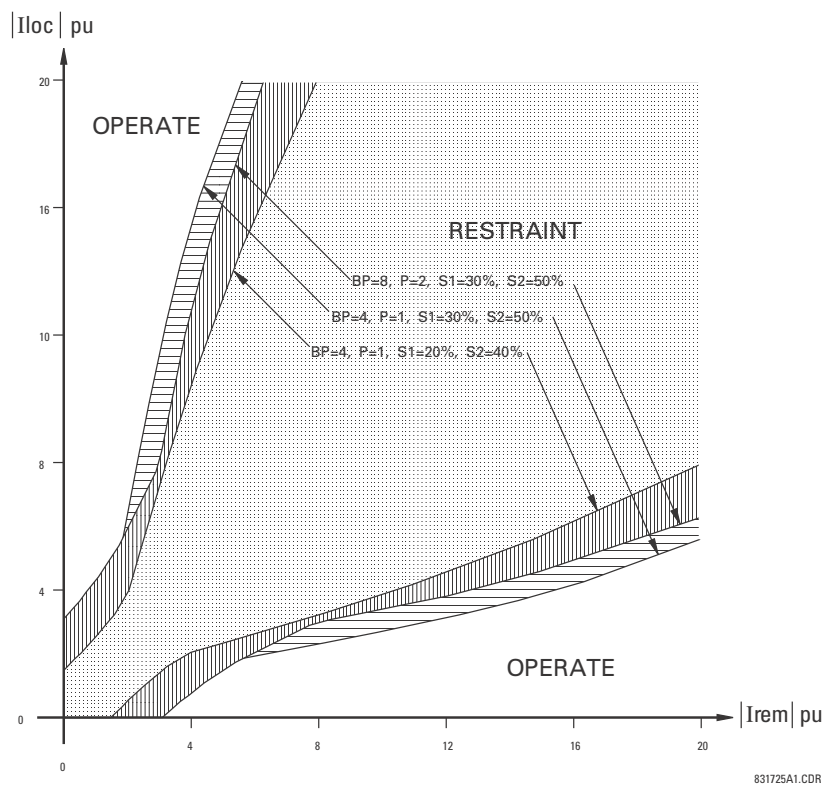

Figure 8-8: SETTINGS IMPACT ON RESTRAINT CHARACTERISTIC

8.3.1 INTRODUCTION

The distance elements use memory voltage for polarization. Additional supervising functions – different for ground and phase distance zones – complement a classical mho characteristic to enhance directional integrity and reach accuracy:

- To avoid overreaching during resistive faults under heavy pre-fault load conditions, the ground distance elements utilize a load-adaptive (zero-sequence polarized) reactance characteristic to supervise the base mho characteristic.
- Both negative and zero-sequence currents are compared with the memory voltage to enhance directional integrity of the ground distance elements.
- It is well known that ground distance elements – as per the principle of distance relaying – may have limited accuracy during double-line-to-ground faults. In order to prevent maloperation in such cases the ground elements are blocked by an extra “fault-type comparator” that utilizes the phase angle between the negative- and zero-sequence currents.
- The phase distance elements use reactance and memory polarized directional characteristics to supervise the mho characteristic.
- Both ground and phase distance elements have the current supervision functions built-in.

The quadrilateral distance characteristic uses the reactance, directional, and current supervising functions as described above. Right and left blinders adjustable as to both the resistive and angular positions complete the characteristic.

More information regarding the distance characteristics is found in the *Distance characteristics* section. An example of analysis of the steady-state operation of the distance elements is found in the *Distance elements analysis* section.

The relay provides five zones of distance protection. All zones are identical in terms of settings. However, zone 1 has extra adaptive mechanisms built-in to enhance the transient reach accuracy even when the voltage signals are supplied from poor quality voltage sources such as capacitive voltage transformers (CVTs). Ground zones 2 through 5, in turn, have an extra zero-sequence directional supervision implemented for their time-delayed operation after the memory expires. Consequently, zone 1 is recommended as an underreaching element, and zones 2 through 5 are recommended as overreaching elements and for time-delayed tripping. The relay uses offset ground directional overcurrent functions as an optional supplement of the ground distance protection for pilot-aided schemes. The elements are described in more details in the *Ground directional overcurrent* section.

The relay provides for an adaptive distance reach control to cope with the overreaching and sub-synchronous oscillations when applied to, or in a near vicinity of series compensated lines. More details can be found in the *Application on series compensated lines* section.

The distance elements use phase angle comparators to shape their characteristics as described in the *Distance characteristics* section. The voltage and current phasors are estimated using optimized techniques as explained in the next section.

8.3.2 PHASOR ESTIMATION

The relay samples its input AC signals at 64 samples per power system cycle. A fast and accurate frequency tracking mechanism ensures accurate filtering and phasor estimation during off-nominal frequency conditions.

The phasor estimation process for both currents and voltages is based on the commonly used Fourier algorithm. Due to a different nature of signal distortions in the current and voltage signals digital pre-filtering algorithms have been, however, designed and optimized separately for the current and voltage channels.

The current signals are pre-filtered using an improved digital MIMIC filter. The filter removes effectively the DC component(s) guaranteeing transient overshoot below 2% regardless of the initial magnitude and time constant of the dc component(s). The filter has significantly better frequency response for higher frequencies as compared with a classical MIMIC filter. This was possible without introducing any significant phase delay thanks to the high sampling rate used by the relay.

The voltage signals are pre-filtered using a special digital filter designed to cope with CVT transients. The patented filter combines filtering and memory actions enabling the relay to cope with CVT noise under high Source Impedance Ratios (SIRs). The filter controls underestimation of the fault voltage magnitude to less than 1% of the nominal and prevents certain phase angle anomalies that can be encountered under heavy CVT noise and high SIRs.

8.3.3 DISTANCE CHARACTERISTICS

a) DEFINITIONS

The relay shapes its distance characteristics using phase angle comparators and voltage and current phasors estimated as described in the previous section.

The following definitions pertain to all of the distance functions:

- I_A, I_B, I_C : phase A, B, and C current phasors.
- I_G : ground current from a parallel line.
- V_A, V_B, V_C : phase A to ground, phase B to ground, and phase C to ground voltage phasors.
- $()_1$: positive-sequence phasor of $()$ derived from the phase quantities.
- $()_2$: negative-sequence phasor of $()$ derived from the phase quantities.
- $()_0$: zero-sequence phasor of $()$ derived from the phase quantities.
- $()M$: memorized value of $()$.
- Z : reach impedance (**REACH** \angle **RCA**).
- Z_{REV} : reverse reach impedance for non-directional applications (**REV REACH** \angle **REV REACH RCA** + 180°).
- Z_D : directional characteristic impedance (**1** \angle **DIR RCA**).
- Z_R : right blinder characteristic impedance: $Z_R = \text{RGT BLD} \times \sin(\text{RGT BLD RCA}) \times 1 \angle (\text{RGT BLD RCA} - 90^\circ)$.
- Z_L : left blinder characteristic impedance: $Z_L = \text{LFT BLD} \times \sin(\text{LFT BLD RCA}) \times 1 \angle (\text{LFT BLD RCA} + 90^\circ)$.
- K_0 : zero-sequence compensating factor: $K_0 = (\text{Z0/Z1 MAG} \angle \text{Z0/Z1 ANG}) - 1$.
- K_{0M} : mutual zero-sequence compensating factor: $K_{0M} = 1/3 \times \text{Z0M/Z1 MAG} \angle \text{Z0M/Z1 ANG}$.
- Θ : non-homogeneity angle setting (**NON-HOMOGEN ANG**).

b) DIRECTIONAL MHO CHARACTERISTIC

The dynamic 100% memory polarized mho characteristic is achieved by checking the angle between:

- AB phase element: $(I_A - I_B) \times Z - (V_A - V_B)$ **and** $(V_A - V_B)_1M$
- BC phase element: $(I_B - I_C) \times Z - (V_B - V_C)$ **and** $(V_B - V_C)_1M$
- CA phase element: $(I_C - I_A) \times Z - (V_C - V_A)$ **and** $(V_C - V_A)_1M$
- A ground element: $I_A \times Z + I_0 \times K_0 \times Z + I_G \times K_{0M} \times Z - V_A$ **and** V_{A_1M}
- B ground element: $I_B \times Z + I_0 \times K_0 \times Z + I_G \times K_{0M} \times Z - V_B$ **and** V_{B_1M}
- C ground element: $I_C \times Z + I_0 \times K_0 \times Z + I_G \times K_{0M} \times Z - V_C$ **and** V_{C_1M}

The limit angle of the comparator is adjustable enabling the user to shape the characteristic as a mho or a lens as shown in the figures below. The memory-polarized mho characteristic has an excellent directional integrity built-in as explained in the *Memory polarization* section.

Figure 8-9: MHO AND LENS CHARACTERISTICS

c) NON-DIRECTIONAL MHO CHARACTERISTIC

The non-directional mho characteristic is achieved by checking the angle between:

- AB phase element: $(I_A - I_B) \times Z - (V_A - V_B)$ and $(V_A - V_B) - (I_A - I_B) \times Z_{REV}$
- BC phase element: $(I_B - I_C) \times Z - (V_B - V_C)$ and $(V_B - V_C) - (I_B - I_C) \times Z_{REV}$
- CA phase element: $(I_C - I_A) \times Z - (V_C - V_A)$ and $(V_C - V_A) - (I_C - I_A) \times Z_{REV}$
- A ground element:
 $I_A \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_A$ and $V_A - (I_A \times Z_{REV} + I_0 \times K0 \times Z_{REV} + I_G \times K0M \times Z_{REV})$
- B ground element:
 $I_B \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_B$ and $V_B - (I_B \times Z_{REV} + I_0 \times K0 \times Z_{REV} + I_G \times K0M \times Z_{REV})$
- C ground element:
 $I_C \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_C$ and $V_C - (I_C \times Z_{REV} + I_0 \times K0 \times Z_{REV} + I_G \times K0M \times Z_{REV})$

d) MHO REACTANCE CHARACTERISTIC FOR DIRECTIONAL APPLICATIONS

The reactance characteristic is achieved by checking the angle between:

- AB phase element: $(I_A - I_B) \times Z - (V_A - V_B)$ and $(I_A - I_B) \times Z$.
- BC phase element: $(I_B - I_C) \times Z - (V_B - V_C)$ and $(I_B - I_C) \times Z$.
- CA phase element: $(I_C - I_A) \times Z - (V_C - V_A)$ and $(I_C - I_A) \times Z$.
- A ground element: $I_A \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_A$ and $I_0 \times Z$.
- B ground element: $I_B \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_B$ and $I_0 \times Z$.
- C ground element: $I_C \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_C$ and $I_0 \times Z$.

If the mho characteristic is selected, the limit angle of the comparator is adjustable concurrently with the limit angle of the mho characteristic, resulting in a tent shape complementing the lens characteristic being effectively applied.

e) QUADRILATERAL REACTANCE CHARACTERISTIC FOR DIRECTIONAL APPLICATIONS

The quadrilateral reactance characteristic is achieved by checking the angle between:

- AB phase element: $(I_A - I_B) \times Z - (V_A - V_B)$ and $(I_A - I_B) \times Z$.
- BC phase element: $(I_B - I_C) \times Z - (V_B - V_C)$ and $(I_B - I_C) \times Z$.
- CA phase element: $(I_C - I_A) \times Z - (V_C - V_A)$ and $(I_C - I_A) \times Z$.
- A ground element: $I_A \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_A$ and $(j \times I_0 \text{ or } j \times I_{2A}) \times e^{j\theta}$.
- B ground element: $I_B \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_B$ and $(j \times I_0 \text{ or } j \times I_{2B}) \times e^{j\theta}$.
- C ground element: $I_C \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_C$ and $(j \times I_0 \text{ or } j \times I_{2C}) \times e^{j\theta}$.

The ground elements are polarized from either zero-sequence or negative-sequence current as per user-settings to maximize performance in non-homogenous systems. The polarizing current is additionally shifted by the user-selectable non-homogeneity correction angle.

f) REVERSE QUADRILATERAL REACTANCE CHARACTERISTIC FOR NON-DIRECTIONAL APPLICATIONS

The reverse quadrilateral reactance characteristic is achieved by checking the angle between:

$$\begin{aligned}
 \text{AB phase element:} & \quad (I_A - I_B) \times Z_{REV} - (V_A - V_B) \quad \text{and} \quad (I_A - I_B) \times Z_{REV} \\
 \text{BC phase element:} & \quad (I_B - I_C) \times Z_{REV} - (V_B - V_C) \quad \text{and} \quad (I_B - I_C) \times Z_{REV} \\
 \text{CA phase element:} & \quad (I_C - I_A) \times Z_{REV} - (V_C - V_A) \quad \text{and} \quad (I_C - I_A) \times Z_{REV} \\
 \text{A ground element:} & \quad I_A \times Z + I_0 \times K0 \times Z_{REV} + I_G \times KOM \times Z_{REV} - V_A \quad \text{and} \quad (j \times I_0 \text{ or } j \times I_{2A}) \times e^{j(180 + \Theta)} \\
 \text{B ground element:} & \quad I_B \times Z + I_0 \times K0 \times Z_{REV} + I_G \times KOM \times Z_{REV} - V_B \quad \text{and} \quad (j \times I_0 \text{ or } j \times I_{2B}) \times e^{j(180 + \Theta)} \\
 \text{C ground element:} & \quad I_C \times Z + I_0 \times K0 \times Z_{REV} + I_G \times KOM \times Z_{REV} - V_C \quad \text{and} \quad (j \times I_0 \text{ or } j \times I_{2C}) \times e^{j(180 + \Theta)}
 \end{aligned}$$

The ground elements are polarized from either zero-sequence or negative-sequence current as per user-settings to maximize performance in non-homogenous systems. The polarizing current is additionally shifted by the user-selectable non-homogeneity correction angle.

g) DIRECTIONAL CHARACTERISTIC

The directional characteristic is achieved by checking the angle between:

$$\begin{aligned}
 \text{AB phase element:} & \quad (I_A - I_B) \times Z_D \quad \text{and} \quad (V_A - V_B)_{1M} \\
 \text{BC phase element:} & \quad (I_B - I_C) \times Z_D \quad \text{and} \quad (V_B - V_C)_{1M} \\
 \text{CA phase element:} & \quad (I_C - I_A) \times Z_D \quad \text{and} \quad (V_C - V_A)_{1M} \\
 \text{A ground element:} & \quad I_0 \times Z_D \quad \text{and} \quad V_{A_{1M}} \\
 & \quad I_{A_{2}} \times Z_D \quad \text{and} \quad V_{A_{1M}} \\
 \text{B ground element:} & \quad I_0 \times Z_D \quad \text{and} \quad V_{B_{1M}} \\
 & \quad I_{B_{2}} \times Z_D \quad \text{and} \quad V_{B_{1M}} \\
 \text{C ground element:} & \quad I_0 \times Z_D \quad \text{and} \quad V_{C_{1M}} \\
 & \quad I_{C_{2}} \times Z_D \quad \text{and} \quad V_{C_{1M}}
 \end{aligned}$$

The characteristic and limit angles of the directional comparator are adjustable independently from the mho and reactance comparators. The directional characteristic improves directional integrity of the distance functions.

h) RIGHT BLINDER

The right blinder characteristic is achieved by checking the angle between the following signals:

$$\begin{aligned}
 \text{AB phase element:} & \quad (I_A - I_B) \times Z_R - (V_A - V_B) \quad \text{and} \quad (I_A - I_B) \times Z_R \\
 \text{BC phase element:} & \quad (I_B - I_C) \times Z_R - (V_B - V_C) \quad \text{and} \quad (I_B - I_C) \times Z_R \\
 \text{CA phase element:} & \quad (I_C - I_A) \times Z_R - (V_C - V_A) \quad \text{and} \quad (I_C - I_A) \times Z_R \\
 \text{A ground element:} & \quad I_A \times Z_R + I_0 \times K0 \times Z_R + I_G \times KOM \times Z_R - V_A \quad \text{and} \quad I_A \times Z_R + I_0 \times K0 \times Z_R + I_G \times KOM \times Z_R \\
 \text{B ground element:} & \quad I_B \times Z_R + I_0 \times K0 \times Z_R + I_G \times KOM \times Z_R - V_B \quad \text{and} \quad I_B \times Z_R + I_0 \times K0 \times Z_R + I_G \times KOM \times Z_R \\
 \text{C ground element:} & \quad I_C \times Z_R + I_0 \times K0 \times Z_R + I_G \times KOM \times Z_R - V_C \quad \text{and} \quad I_C \times Z_R + I_0 \times K0 \times Z_R + I_G \times KOM \times Z_R
 \end{aligned}$$

The blinders apply to the Quad characteristic only.

i) LEFT BLINDER

The left blinder characteristic is achieved by checking the angle between the following signals:

$$\begin{aligned}
 \text{AB phase element:} & \quad (I_A - I_B) \times Z_L - (V_A - V_B) \quad \text{and} \quad (I_A - I_B) \times Z_L \\
 \text{BC phase element:} & \quad (I_B - I_C) \times Z_L - (V_B - V_C) \quad \text{and} \quad (I_B - I_C) \times Z_L \\
 \text{CA phase element:} & \quad (I_C - I_A) \times Z_L - (V_C - V_A) \quad \text{and} \quad (I_C - I_A) \times Z_L \\
 \text{A ground element:} & \quad I_A \times Z_L + I_0 \times K0 \times Z_L + I_G \times KOM \times Z_L - V_A \quad \text{and} \quad I_A \times Z_L + I_0 \times K0 \times Z_L + I_G \times KOM \times Z_L \\
 \text{B ground element:} & \quad I_B \times Z_L + I_0 \times K0 \times Z_L + I_G \times KOM \times Z_L - V_B \quad \text{and} \quad I_B \times Z_L + I_0 \times K0 \times Z_L + I_G \times KOM \times Z_L \\
 \text{C ground element:} & \quad I_C \times Z_L + I_0 \times K0 \times Z_L + I_G \times KOM \times Z_L - V_C \quad \text{and} \quad I_C \times Z_L + I_0 \times K0 \times Z_L + I_G \times KOM \times Z_L
 \end{aligned}$$

The blinders apply to the Quad characteristic only.

j) FAULT-TYPE CHARACTERISTIC

The fault-type characteristic applies to ground elements only and is achieved by checking the angle between:

A ground element: I_0 and I_{A_2} ;

B ground element: I_0 and I_{B_2}

C ground element: I_0 and I_{C_2}

The limit angle of the comparator is not adjustable and equals 50°. The fault-type characteristic is intended to block the ground distance elements during double-line-to-ground faults.

k) ZERO-SEQUENCE DIRECTIONAL CHARACTERISTIC

The extra zero-sequence characteristic applies to ground zones 2 and higher and is achieved by checking angles between:

A ground element: $I_0 \times Z_D$ and $-V_0$

B ground element: $I_0 \times Z_D$ and $-V_0$

C ground element: $I_0 \times Z_D$ and $-V_0$

The limit angle of the comparator is not adjustable and equals 90°. The zero-sequence directional characteristic improves directional integrity for time-delayed operations after the memory expires.

l) OVERCURRENT SUPERVISION

The overcurrent supervision responds to the following currents:

AB phase element: $(I_A - I_B) / \sqrt{3}$

BC phase element: $(I_B - I_C) / \sqrt{3}$

CA phase element: $(I_C - I_A) / \sqrt{3}$

A, B, C ground element: $|3 \times I_0 - 0.05 \times I_{L1}|$

The following tables summarize the characteristics of the distance elements

Table 8–1: DIRECTIONAL MHO PHASE DISTANCE FUNCTIONS

CHARACTERISTIC	COMPARATOR INPUTS		LIMIT ANGLE
Variable mho	$I \times Z - V$	V_{1M}	COMP LIMIT
Reactance	$I \times Z - V$	$I \times Z$	COMP LIMIT
Directional	$I \times Z_D$	V_{1M}	DIR COMP LIMIT

Table 8–2: DIRECTIONAL MHO GROUND DISTANCE FUNCTIONS

CHARACTERISTIC	COMPARATOR INPUTS		LIMIT ANGLE
Variable mho	$I \times Z - V$	V_{1M}	COMP LIMIT
Reactance	$I \times Z - V$	$I_0 \times Z$	COMP LIMIT
Directional	$I_0 \times Z_D$	V_{1M}	DIR COMP LIMIT
Directional	$I_2 \times Z_D$	V_{1M}	DIR COMP LIMIT (removed when $3I_0 > OC \text{ SUPV}$ and $I_2 < CUTOFF$)
Fault-type	I_0	I_2	50°(removed during open pole conditions or when $3I_0 > OC \text{ SUPV}$ and $I_2 < CUTOFF$)
Zero-sequence	$I_0 \times Z_D$	$-V_0$	90° (zones 2 and higher only; removed for zones 2 and higher during open pole conditions)

Table 8–3: DIRECTIONAL QUADRILATERAL PHASE DISTANCE FUNCTIONS

CHARACTERISTIC	COMPARATOR INPUTS		LIMIT ANGLE
Reactance	$I \times Z - V$	$I \times Z$	COMP LIMIT
Directional	$I \times Z_D$	V_{1M}	DIR COMP LIMIT
Right Blinder	$I \times Z_R - V$	$I \times Z_R$	90°
Left Blinder	$I \times Z_L - V$	$I \times Z_L$	90°

Table 8–4: DIRECTIONAL QUADRILATERAL GROUND DISTANCE FUNCTIONS

CHARACTERISTIC	COMPARATOR INPUTS		LIMIT ANGLE
Reactance	$I \times Z - V$	$j \times I_0 \times e^{j\theta}$ or $j \times I_2 \times e^{j\theta}$	COMP LIMIT
Directional	$I_0 \times Z_D$	V_{1M}	DIR COMP LIMIT
Directional	$I_2 \times Z_D$	V_{1M}	DIR COMP LIMIT (removed when $3I_0 > OC \text{ SUPV}$ and $I_2 < CUTOFF$)
Right Blinder	$I \times Z_R - V$	$I \times Z_R$	90°
Left Blinder	$I \times Z_L - V$	$I \times Z_L$	90°
Fault-type	I_0	I_2	50° (removed during open pole conditions or when $3I_0 > OC \text{ SUPV}$ and $I_2 < CUTOFF$)
Zero-sequence	$I_0 \times Z_D$	$-V_0$	90° (zones and higher only; removed for zones 2 and higher during open pole conditions)

CHARACTERISTIC	COMPARATOR INPUTS		LIMIT ANGLE
Forward Reactance	$I \times Z - V$	$j \times I_0 \times e^{j\theta}$ or $j \times I_2 \times e^{j\theta}$	COMP LIMIT
Reverse Reactance	$I \times Z_{REV} - V$	$-j \times I_0 \times e^{j\theta}$ or $-j \times I_2 \times e^{j\theta}$	COMP LIMIT
Right Blinder	$I \times Z_R - V$	$I \times Z_R$	90°
Left Blinder	$I \times Z_L - V$	$I \times Z_L$	90°
Fault-type	I_0	I_2	50° (removed during open pole conditions or when $3I_0 > OC \text{ SUPV}$ and $I_2 < CUTOFF$)

8.3.4 MEMORY POLARIZATION

8

All distance functions use memory polarization. The positive-sequence voltage – either memorized or actual – is used as a polarizing signal. The memory is established when the positive-sequence voltage remains above 80% of its nominal value for five power system cycles. The memory voltage is a three-cycle old voltage.

Once established, the memory is applied for the user-specified time interval. The memory timer is started when the voltage drops below 80% of nominal or when the user-programmable condition is asserted to force memory polarization. After the memory expires, the relay checks the magnitude of the actual positive-sequence voltage. If it is higher than 10% of nominal, the actual voltage is used; if lower, the memory voltage continues to be used.

A provision is added to force self-polarization from any user-programmable condition.

The memory-polarized mho has an extra directional integrity built-in as illustrated below. The self-polarized mho characteristic is shifted in the reverse direction for a forward fault by an amount proportional to the source impedance, and in the forward direction for a reverse fault.

837719A2.CDR

Figure 8–10: DYNAMIC SHIFT OF THE MHO CHARACTERISTIC

The same desirable effect of memory polarization applies to the directional comparator of the quadrilateral characteristic.

837724A1.CDR

Figure 8–11: DYNAMIC SHIFT OF THE MEMORY-POLARIZED DIRECTIONAL CHARACTERISTIC

Mutual zero-sequence compensation may raise concerns regarding directional integrity on reverse faults in the situation when the relay gets 'overcompensated'. This problem does not affect the L90 because its ground distance elements use zero-sequence and negative-sequence currents in extra directional comparators. Both the currents are from the protected line and are not affected by any compensation as the latter applies only to the reach defining comparators: the mho, reactance and blinder characteristics.

8.3.5 DISTANCE ELEMENTS ANALYSIS

8

a) DESCRIPTION

This subsection shows how to analyze the operation of the distance elements in steady states using the results of short circuit studies. All quantities are secondary ohms, volts, and amperes. Ground phase A and phase AB distance elements are analyzed.

Assume the following settings have been entered:

- Phase Rotation: ABC
- Right Blinder Reach: 10 Ω
- Nominal Secondary Voltage: 69.28 V
- Right Blinder RCA: 88°
- Distance Reach: 14 Ω
- Left Blinder Reach: 5 Ω
- Distance RCA: 88°

Left Blinder RCA: 88°
 Polarizing Current: Zero-sequence
 Non-Homogeneity Correction Angle: 3°
 Directional RCA: 88°
 Z0/Z1 Magnitude: 4.55
 Overcurrent supervision: 3 A
 Z0/Z1 Angle: -12°
 Distance Comparator limit angle: 75°
 Z0M/Z1 Magnitude: 0
 Directional Comparator limit angle: 75°

Assume the following signals are injected to the relay:

$V_A = 64.71 \text{ V } \angle 0.0^\circ$ (pre-fault)
 $V_A = 25.43 \text{ V } \angle -19.9^\circ$
 $V_B = 80.22 \text{ V } \angle -133.5^\circ$
 $V_C = 77.33 \text{ V } \angle 135.7^\circ$
 $I_A = 4.47 \text{ A } \angle -107.8^\circ$
 $I_B = 2.92 \text{ A } \angle 68.9^\circ$
 $I_C = 2.93 \text{ A } \angle -51.1^\circ$

Based on the entered setting the relay calculates:

$K0 = 3.58 \angle -15.2^\circ$
 $K0M = 0$
 $Z = 14.00 \Omega \angle 88^\circ$
 $Z_D = 1 \Omega \angle 88^\circ$
 $Z_R = 9.99 \Omega \angle 2^\circ$
 $Z_L = 4.99 \Omega \angle 178^\circ$

For the assumed steady-state injection the relay calculates:

$V_{A_1} = 58.83 \text{ V } \angle -2.1^\circ$
 $V_{A_1M} = 64.71 \text{ V } \angle 0.0^\circ$
 $I_{_0} = 1.37 \text{ A } \angle -68.2^\circ$
 $I_{A_2} = 1.37 \text{ A } \angle -68.1^\circ$
 $-V_{_0} = 29.18 \text{ V } \angle 8.4^\circ$
 $(V_A - V_B)_{_1} = 93.35 \text{ V } \angle 32.0^\circ$
 $(V_A - V_B)_{_1M} = 112.08 \text{ V } \angle 30.0^\circ$
 $I_A - I_B = 7.39 \text{ A } \angle -109.1^\circ$

b) MHO PHASE A TO GROUND ELEMENT (BEFORE MEMORY EXPIRES)

$$I_A \times Z + I_{_0} \times K0 \times Z + I_A \times K0M \times Z - V_A = 103.33 \text{ V } \angle -3.9^\circ$$

$$V_{A_1M} = 64.71 \text{ V } \angle 0.0^\circ$$

$$I_{A_2} \times Z_D = 1.37 \text{ V } \angle 19.8^\circ$$

$$I_{_0} \times Z = 19.11 \text{ V } \angle 19.8^\circ$$

$$I_{_0} \times Z_D = 1.37 \text{ V } \angle 19.8^\circ$$

- Overcurrent supervision: $|3 \times I_{_0}| = 4.09 \text{ A} > 3 \text{ A}$
- Mho difference angle = $|-3.9^\circ - 0^\circ| = 3.9^\circ < 75^\circ$
- Reactance difference angle = $|-3.9^\circ - 19.8^\circ| = 23.7^\circ < 75^\circ$
- Zero-sequence directional difference angle = $|19.8^\circ - 0.0^\circ| = 19.8^\circ < 75^\circ$
- Negative-sequence directional difference angle = $|19.8^\circ - 0.0^\circ| = 19.8^\circ < 75^\circ$
- Fault-type comparator difference angle = $|19.8^\circ - 19.8^\circ| = 0.0^\circ < 50^\circ$

All four comparators and the overcurrent supervision are satisfied.

The MHO phase A ground element will operate for this fault.

c) MHO PHASE A TO GROUND ELEMENT (AFTER MEMORY EXPIRES)

After the memory expires, the relay checks the actual positive-sequence voltage and compares it with 10% of the nominal voltage:

$$|V_{A_1}| = 58.83 \text{ V} > 0.1 \times 69.28 \text{ V}$$

After the memory expires the relay will use the actual voltage for polarization.

$$I_A \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_A = 103.33 \text{ V} \angle -3.9^\circ$$

$$V_{A_1} = 58.83 \text{ V} \angle -2.1^\circ$$

$$I_{A_2} \times Z_D = 1.37 \text{ V} \angle 19.8^\circ$$

$$I_0 \times Z = 19.11 \text{ V} \angle 19.8^\circ$$

$$I_0 \times Z_D = 1.37 \text{ V} \angle 19.8^\circ$$

- Overcurrent supervision: $|3 \times I_0| = 4.09 \text{ A} > 3 \text{ A}$
- Mho difference angle = $|-3.9^\circ - (-2.1^\circ)| = 1.8^\circ < 75^\circ$
- Reactance difference angle = $|-3.9^\circ - 19.8^\circ| = 23.7^\circ < 75^\circ$
- Zero-sequence directional difference angle = $|19.8^\circ - (-2.1^\circ)| = 21.9^\circ < 75^\circ$
- Negative-sequence directional difference angle = $|19.8^\circ - (-2.1^\circ)| = 21.9^\circ < 75^\circ$
- Fault-type comparator difference angle = $|19.8^\circ - 19.8^\circ| = 0.0^\circ < 50^\circ$

All four comparators and the overcurrent supervision are satisfied.

The Zone 1 MHO phase A ground element will operate for this fault.

- Zero-sequence directional difference angle for zones 2 and higher (phase A) = $|19.8^\circ - 8.4^\circ| = 11.4^\circ < 90^\circ$.

Zones 2 and higher phase A ground elements will pick-up, time-out and operate.

d) MHO AB PHASE ELEMENT

$$(I_A - I_B) \times Z - (V_A - V_B) = 88.65 \text{ V} \angle -78.7^\circ$$

$$(V_A - V_B)_{1M} = 112.08 \text{ V} \angle 30.0^\circ$$

$$(I_A - I_B) \times Z = 103.50 \text{ V} \angle -21.2^\circ$$

$$(I_A - I_B) \times Z_D = 7.39 \text{ V} \angle -21.2^\circ$$

- Overcurrent supervision: $|(I_A - I_B) / \sqrt{3}| = 4.27 \text{ A} > 3 \text{ A}$
- Mho difference angle = $|-78.7^\circ - 30.0^\circ| = 108.7^\circ > 75^\circ$
- Reactance difference angle = $|-78.7^\circ - (-21.2^\circ)| = 57.5^\circ < 75^\circ$
- Directional difference angle = $|-21.2^\circ - 30.0^\circ| = 51.2^\circ < 75^\circ$

The mho comparator is not satisfied.

The MHO AB phase element will not operate for this fault.

Repeating the above analysis one concludes that out of the six distance elements only the ground element in phase A will operate for this fault.

e) QUAD PHASE A TO GROUND ELEMENT (BEFORE MEMORY EXPIRES)

$$I_A \times Z + I_0 \times K0 \times Z + I_G \times K0M \times Z - V_A = 103.33 \text{ V} \angle -3.9^\circ$$

$$V_{A_1M} = 64.71 \text{ V} \angle 0.0^\circ$$

$$j \times I_0 \times e^{j3} = 1.37 \text{ A} \angle 24.8^\circ$$

$$I_{A_2} \times Z_D = 1.37 \text{ V} \angle 19.8^\circ$$

$$I_0 \times Z_D = 1.37 \text{ V} \angle 19.8^\circ$$

$$I_A \times Z_R + I_0 \times K0 \times Z_R + I_G \times K0M \times Z_R - V_A = 87.6 \text{ V} \angle -109.2^\circ$$

$$I_A \times Z_R + I_0 \times K0 \times Z_R = 91.5 \text{ V} \angle -93.0^\circ$$

$$I_A \times Z_L + I_0 \times K0 \times Z_L + I_G \times K0M \times Z_L - V_A = 57.0 \text{ V } \angle 108.7^\circ$$

$$I_A \times Z_L + I_0 \times K0 \times Z_L = 45.8 \text{ V } \angle 82.9^\circ$$

- Overcurrent supervision: $|3 \times I_0| = 4.09 \text{ A} > 3 \text{ A}$
- Reactance difference angle = $|-3.9^\circ - 24.8^\circ| = 28.7^\circ < 75^\circ$
- Zero-sequence difference angle = $|-19.8^\circ - 0.0^\circ| = 19.8^\circ < 75^\circ$
- Negative-sequence directional difference angle = $|-19.8^\circ - 0.0^\circ| = 19.8^\circ < 75^\circ$
- Right blinder difference angle = $|-93.0^\circ - (-109.2^\circ)| = 16.2^\circ < 90^\circ$
- Left blinder difference angle = $|82.9^\circ - 108.7^\circ| = 25.8^\circ < 90^\circ$
- Fault-type comparator difference angle = $|19.8^\circ - 19.8^\circ| = 0.0^\circ < 50^\circ$

All six comparators and the overcurrent supervision are satisfied.

The Quad Phase A ground element will operate for this fault.

8.4.1 DESCRIPTION

As a Wye-Delta transformer introduces discontinuity for the zero-sequence circuit, the ground distance protection cannot be applied, except special circumstances, to respond to faults behind the transformer.

The phase distance elements, however, could be developed so that both accurate reach and correct fault phase identification is retained for faults behind the power transformer as seen from the relaying point. Without appropriate compensation, the relay's reach would depend on a type of fault, creating considerable difficulties in applying the relay.

The L90 provides for any location of the VTs and CTs with respect to the involved power transformer and the direction of any given zone.

In the following equations, the VT and CT locations are referenced as "None" if the transformer is not present between the CT/VT and the intended reach point. Otherwise, the location is to be selected as a type of a transformer as seen from the VT/CT position towards the intended reach point. The following figure explains the adopted rules.

APPLICATIONS OF THE "PHS DIST XFMR VOL/CUR CONNECTION" SETTINGS

	CA	$I_{CA_21P} = \frac{1}{\sqrt{3}}(I_B + I_C - 2I_A)$	$V_{CA_21P} = -\sqrt{3}V_A$

Equations from the “Current Transformation” and “Voltage Transformation” columns are used to derive inputs to the three (AB, BC, and CA) phase distance elements. For example, if the CTs are located at the delta side of the Delta-Wye 11 transformer, and a given zone is set to look through the transformer into the system connected to the Wye winding, the CT location setting for that zone shall be set to Dy11 and the relay would use $-\sqrt{3}I_B$ instead of a traditional $I_A - I_B$ for the AB phase distance element.

The current supervision pickup setting applies to the currents specified in the “Current Transformation” columns.

A distance zone originates at the location of the VTs (regardless of the location of the CTs). For more information on settings please refer to Chapter 9: Application of Settings.

8.4.2 EXAMPLE

Consider the system shown below:

Figure 8–12: SAMPLE SYSTEM CONFIGURATION

Normally, in order to respond to the fault shown in the figure, a distance relay shall be applied at the relaying point X. The relay input signals at this location are shown in the following table.

INPUT	PRIMARY	SECONDARY
VA	100.4 kV $\angle -7.32^\circ$	38.25 V $\angle -7.32^\circ$
VB	97.23 kV $\angle -53.4^\circ$	37.04 V $\angle -53.4^\circ$
VC	181.8 kV $\angle -150.0^\circ$	69.26 V $\angle -150.0^\circ$
IA	1.288 kA $\angle -27.6^\circ$	21.47 A $\angle -27.6^\circ$
IB	1.288 kA $\angle 152.4^\circ$	21.47 A $\angle 152.4^\circ$
IC	0	0

If installed at the location X, the relay would use the following input signals for its phase AB distance element:

$$V = V_{AB} = 77.402 \text{ kV } \angle 57.5^\circ \text{ primary or } 29.49 \text{ V } \angle 57.5^\circ \text{ secondary}$$

$$I = I_A - I_B = 2.576 \text{ kA } \angle -27.6^\circ \text{ primary or } 42.93 \text{ A } \angle -27.6^\circ \text{ secondary}$$

And consequently it would see an apparent impedance of:

$$Z_{app} = V / I = 30.05 \Omega \angle 85^\circ \text{ primary or } 0.687 \Omega \angle 85^\circ \text{ secondary}$$

If applied at location H, the relay sees the following input signals:

INPUT	PRIMARY	SECONDARY
VA	7.584 kV $\angle -5.59^\circ$	69.95 V $\angle -5.59^\circ$
VB	6.269 kV $\angle -120.1^\circ$	54.52 V $\angle -120.1^\circ$
VC	7.751 kV $\angle 125.5^\circ$	65.84 V $\angle 125.5^\circ$
IA	16.976 kA $\angle -27.6^\circ$	10.61 A $\angle -27.6^\circ$
IB	33.952 kA $\angle 152.4^\circ$	21.22 A $\angle 152.4^\circ$
IC	16.976 kA $\angle -27.6^\circ$	10.61 A $\angle -27.6^\circ$

The relay is set as follows:

XFMR VOL CONNECTION = "Dy11"
XFMR CUR CONNECTION = "Dy11"

Consequently, the following signals are applied to the phase AB distance element:

$$V = \frac{1}{\sqrt{3}} V_{AB} - V_{BC} = 10.861 \text{ kV } \angle 59.9^\circ \text{ primary or } 94.45 \text{ V } \angle 59.9^\circ \text{ secondary} \quad (\text{EQ 8.37})$$

$$I = -\sqrt{3} I_B = 58.860 \text{ kA } \angle -27.6^\circ \text{ primary or } 36.75 \text{ A } \angle -27.6^\circ \text{ secondary} \quad (\text{EQ 8.38})$$

This results in the following apparent impedance:

$$Z_{app} = \frac{V}{I} = \frac{94.45 \text{ kV } \angle 59.9^\circ}{36.75 \text{ kA } \angle -27.6^\circ} = 2.570 \Omega \angle 87.5^\circ \text{ secondary} \quad (\text{EQ 8.39})$$

The above value is a correct measure of the distance from the VT location to the fault. For relay location 2, this certainly includes the positive-sequence impedance of the transformer:

$$Z_T(\text{at } 13.8 \text{ kV}) = \frac{10}{100} \times \frac{(13.8 \text{ kV})^2}{150 \text{ MVA}} = 0.127 \Omega \angle 90^\circ$$

$$Z_L(\text{at } 13.8 \text{ kV}) = 30.11 \times \left(\frac{13.8}{315} \right)^2 = 0.05779 \Omega \angle 85^\circ \quad (\text{EQ 8.40})$$

Thus, $0.127 \Omega \angle 90^\circ + 0.05779 \Omega \angle 85^\circ = 0.1847 \Omega \angle 88.4^\circ$ primary side or $2.569 \Omega \angle 88.4^\circ$ on the secondary side.

The above example illustrates how the relay maintains correct reach for fault behind power transformers. When installed at X, the relay shall be set to $0.687 \Omega \angle 85^\circ$ secondary in order to reach to the fault shown in the figure. When installed at H, the relay shall be set to $2.569 \Omega \angle 88.4^\circ$ to ensure exactly same coverage.

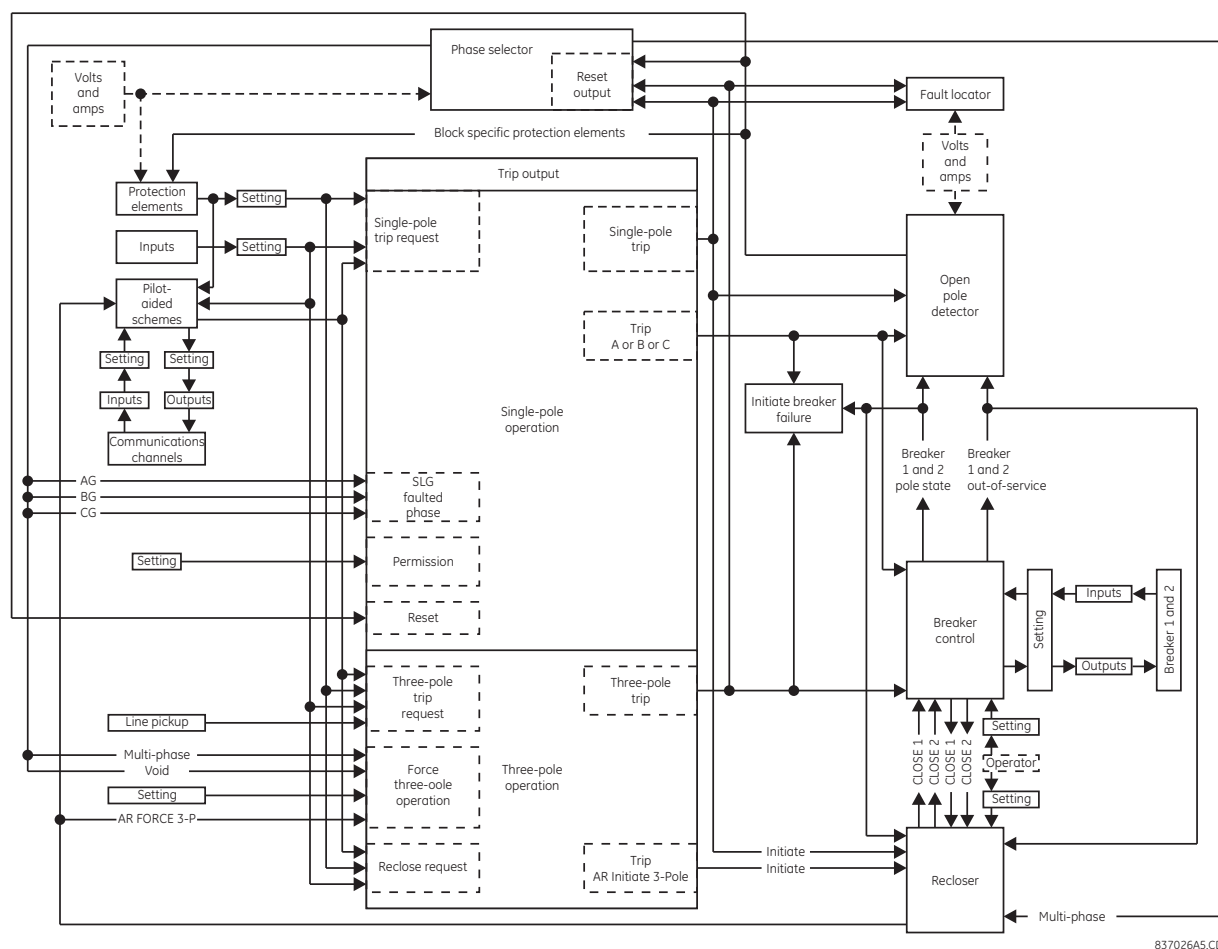

See Chapter 9: Application of Settings for more information on setting calculations.

8.5.1 OVERVIEW

a) INTRODUCTION

Single pole operations make use of many features of the relay. At the minimum, the trip output, recloser, breaker control, open pole detector, and phase selector must be fully programmed and in service; and either protection elements or digital inputs representing fault detection must be available for successful operation. When single pole trip-and-reclose is required overall control within the relay is performed by the trip output element. This element includes interfaces with pilot aided schemes, the line pickup, breaker control, and breaker failure elements.

Single pole operations are based on use of the phase selector to identify the type of the fault, to eliminate incorrect fault identification that can be made by distance elements in some circumstances and to provide trip initiation from elements that are not capable of any fault type identification, such as high-set negative-sequence directional overcurrent element. The scheme is also designed to make use of the advantages provided by communications channels with multiple-bit capacities for fault identification.

837026A5.CDR

Figure 8-13: SINGLE-POLE OPERATION

The trip output element receives requests for single and three pole trips and three pole reclose initiation, which it then processes to generate outputs that are used to:

- Determine whether a single or three pole operation should be performed.
- Initiate tripping of breaker poles A, B and C, either individually or as a group.
- Initiate breaker failure protection for phases A, B and C, either individually or as a group.
- Notify the open pole detector when a single pole operation is imminent.
- Initiate either single or three pole reclosing.

- Notify the phase selector when a trip operation is imminent.

When notified that a single pole operation has been initiated open pole detector will:

- Initiate blocking of protection elements that could potentially maloperate when a breaker pole is open.
- Instruct the phase selector to de-assert all outputs, as an open pole invalidates calculations.

It is assumed for this discussion that the relay features that are shown on *Single pole operation* diagram above have all been programmed for the application and are in service. The description begins with line breakers open at both the local and remote ends, and the operation of the scheme is described in chronological order.

Because the line is de-energized the line pickup element is armed. The recloser is presently enabled. An operator requests that breaker control close the breaker, and it operates output relays to close breaker poles A, B and C. This operator manual close request is also forwarded from breaker control to recloser, which becomes disabled, de-asserting its “Enabled” output. This output is transferred to trip output, where it converts any input request for a single pole operation into a three-pole operation. At the recloser, the **AR1 BLK TIME @ MAN CLOSE** timer is started.

The breaker closes and status monitoring contacts on the breaker poles change state; the new breaker pole states are reported to breaker control, which in turn transfers these states to the recloser, trip output, breaker failure and open pole detector. Because a fault is not detected the **AR1 BLK TIME @ MAN CLOSE** times out and the recloser is enabled, which asserts the “Enabled” output, informing the trip output element that single pole trip operations are now permitted. When normal voltage appears on the line the line pickup element is disarmed. As the local line breaker has not tripped the operator closes the breaker at the remote end of the line, placing the line in service.

Several scenarios are considered below.

b) SLG FAULT

At this moment the request to trip is placed for the trip output. As the fault is recognized as an AG fault, the TRIP PHASE A operand is asserted by the trip output. This signal is passed to the breaker control scheme and results in tripping pole A of the breaker.

Simultaneously with the TRIP PHASE A operand, the TRIP 1-POLE operand is asserted. This operand activates the open pole detector. The latter detector responds to the TRIP PHASE A signal by declaring phase A open by asserting OPEN POLE OP ΦA (even before it is actually opened). The TRIP PHASE A signal resets only after the breaker actually operates as indicated by its auxiliary contact. At this moment the open pole detector responds to the breaker position and continues to indicate phase A opened. This indication results in establishing blocking signals for distance elements (OPEN POLE BLK AB, OPEN POLE BLK CA operands are asserted). If neutral and negative-sequence overcurrent elements are mapped into the trip output to trigger single-pole tripping, they must be blocked with the OPEN POLE BLK N operand, specifically provided for this purpose. The OPEN POLE BLK N operand must be assigned through the block setting of the overcurrent element. The two latter operands block phase distance AB and CA elements, respectively (all zones); the OPEN POLE ΦA OP blocks the ground distance AG elements (all zones). As a result, the Z1 OP and Z2 PKP operands that were picked-up reset immediately. The following distance elements remain operational guarding the line against evolving faults: BG, CG and BC.

The TRIP 1-POLE operand initiates automatically a single-pole autoreclose. The autoreclose is started and asserts the AR RIP operand. This operand keeps blocking the phase selector so that it does not respond to any subsequent events. At the same time the operand removes zero-sequence directional supervision from ground distance zones 2 and 3 so that they could respond to a single-line-to-ground fault during open pole conditions.

The AR FORCE 3-P TRIP operand is asserted 1.25 cycles following autoreclose initiation. This operand acts as an enabler for any existing trip request. In this case none of the protection elements is picked up at this time, therefore no more trips are initiated.

When the recloser dead time interval is complete it signals the breaker control element to close the breaker. The breaker control element operates output relays to close the breaker.

When pole A of the breaker closes this new status is reported to the breaker control element, which transfers this data to the breaker failure, autorecloser, open pole detector and trip output elements. The response at breaker failure is dependent on the programming of that element. The response at the autorecloser is not relevant to this discussion. At the open pole detector, the blocking signals to protection elements are de-asserted.

If the fault was transient the reset time would expire at the autorecloser and the AR FORCE 3-P TRIP and RIP outputs would be de-asserted, returning all features to the state described at the beginning of this description.

If the fault was permanent appropriate protection elements would detect it and place a trip request for the trip output element. As the AR FORCE 3-P TRIP is still asserted, the request is executed as a three-pole trip.

The response of the system from this point is as described above for the second trip, except the autorecloser will go to lock-out upon the next initiation (depending on the number of shots programmed).

c) SLG FAULT EVOLVING INTO LLG

When an AG fault occurs the events unfold initially as in the previous example. If the fault evolves quickly, the phase selector will change its initial assessment from AG to ABG fault and when the trip request is placed either by the zone 1 or the POTT scheme, a three-pole trip will be initiated. If this is the case, all three TRIP PHASE A, B and C operands will be asserted. The command is passed to the breaker control element and results in a three-pole trip. At the same time the recloser is initiated as per settings of the trip output. As the TRIP 3-POLE operand is asserted (not the TRIP 1-POLE operand) the open pole is not activated. Because the AR RIP in progress is asserted, the phase selector is blocked as well.

If the fault evolves slowly, the sequence is different: The relay trips phase A as in the previous example. The phase selector resets, the open pole detector is activated and forces the zone 1 and zone 2 AG, AB, CA and negative-sequence overcurrent elements to reset. If the zone 1 BG element picks up, or the zone 2 BG element picks up resulting in operation of the POTT scheme, no trip command will be issued until the AR FORCE 3-P TRIP is asserted. This happens 1.25 cycles after the first trip. If at this time or any time later a request for trip is placed (due to an evolving fault), a three-pole trip is initiated. The TRIP 1-POLE operand is de-asserted by the TRIP 3-POLE operand, resetting the open pole detector. Shortly all three-poles are opened.

When the dead time expires, the recloser signals the breaker control to close the breaker. At this time all the protection elements are operational, as the open pole detector is not blocking any elements. If the line-side VTs are used, the line pickup element is armed as well. If there is a fault on the line, these elements will pickup the fault and issue next request for trip. This request results in three-pole trip as the AR FORCE 3-P TRIP is still asserted.

The response of the system from this point is as described above for the second trip, except the recloser will go to lockout upon the next initiation (depending on the number of shots programmed).

8.5.2 PHASE SELECTION

The L90 uses phase relations between current symmetrical components for phase selection. First, the algorithm validates if there is enough zero-sequence, positive-sequence, and negative-sequence currents for reliable analysis. The comparison is adaptive; that is, the magnitudes of the three symmetrical components used mutually as restraints confirm if a given component is large enough to be used for phase selection. Once the current magnitudes are validated, the algorithm analyzes phase relations between the negative-sequence and positive-sequence currents and negative-sequence and zero-sequence currents (when applicable) as illustrated below.

Figure 8-14: PHASE SELECTION PRINCIPLE (ABC PHASE ROTATION)

Due to dual comparisons, the algorithm is very secure. For increased accuracy and to facilitate operation in weak systems, the pre-fault components are removed from the analyzed currents. The algorithm is very fast and ensures proper phase selection before any of the correctly set protection elements operates.

Under unusual circumstances such as weak-infeed conditions with the zero-sequence current dominating during any ground fault, or during cross-country faults, the current-based phase selector may not recognize any of the known fault pattern. If this is the case, voltages are used for phase selection. The voltage algorithm is the same as the current-based algorithm; for example, phase angles between the zero-sequence, negative-sequence, and positive-sequence voltages are used. The pre-fault values are subtracted prior to any calculations.

The pre-fault quantities are captured and the calculations start when the disturbance detector (50DD) operates. When an open pole is declared, the phase selector resets all its outputs operands and ignores any subsequent operations of the disturbance detector.

The phase selector runs continuously. When there is no disturbance in the power system, and the disturbance detector (50DD) from the source assigned as the **DISTANCE SOURCE** is reset, then the PHASE SELECT VOID FlexLogic operand is set and all other phase selector operands are reset. All current and voltage sequence components are memorized and continuously updated.

When the disturbance detector (50DD) operates, memory stops being updated and retains two cycles of old current and voltage values. First, purely fault components of current and voltage are calculated by removing the pre-fault (memory) quantities from presently calculated values. A series of conditions are checked with respect to magnitudes and phase angles of current and voltage symmetrical components in order to detect the fault type. Secondly, currents are used to identify the fault type (AG, BG, CG, AB, BC, CA, ABG, BCG or CAG) according to the *Phase selection principle* figure above. If the currents fail to identify the fault type, and voltages are available, then voltages are used. If any of the above types is determined, then the corresponding FlexLogic operand below is asserted.

OPERAND	DESCRIPTION
PHASE SELECT AG	Asserted when a phase A to ground fault is detected.
PHASE SELECT BG	Asserted when a phase B to ground fault is detected.
PHASE SELECT CG	Asserted when a phase C to ground fault is detected.
PHASE SELECT AB	Asserted when a phase A to B fault is detected.
PHASE SELECT BC	Asserted when a phase B to C fault is detected.
PHASE SELECT CA	Asserted when a phase C to A fault is detected.
PHASE SELECT ABG	Asserted when a phase A to B to ground fault is detected.
PHASE SELECT BCG	Asserted when a phase B to C to ground fault is detected.
PHASE SELECT CAG	Asserted when a phase C to A to ground fault is detected.

If none of the fault types indicated above is determined, then three-phase fault conditions are checked to detect the presence of positive-sequence current and the absence of both zero-sequence and negative-sequence current. If these conditions are met, then the PHASE SELECT 3P FlexLogic operand is asserted; otherwise, the PHASE SELECT VOID operand is asserted, indicating that the phase selector failed to identify the fault type.

Finally, the states of the following additional FlexLogic operands are determined.

OPERAND	DESCRIPTION
PHASE SELECT SLG	Asserted if any of PHASE SELECT AG, PHASE SELECT BG, or PHASE SELECT CG operands is active.
PHASE SELECT MULTI-P	Asserted if neither the PHASE SELECT SLG nor PHASE SELECT VOID operands are being asserted.

The phase selector operands are reset $\frac{1}{2}$ cycle after the OPEN POLE OP FlexLogic operand is asserted or 500 ms after the disturbance detector (50DD) initially operated. In the reset state, all phase selector FlexLogic operands are reset until reset conditions are removed and the phase selector is ready for the next operation.

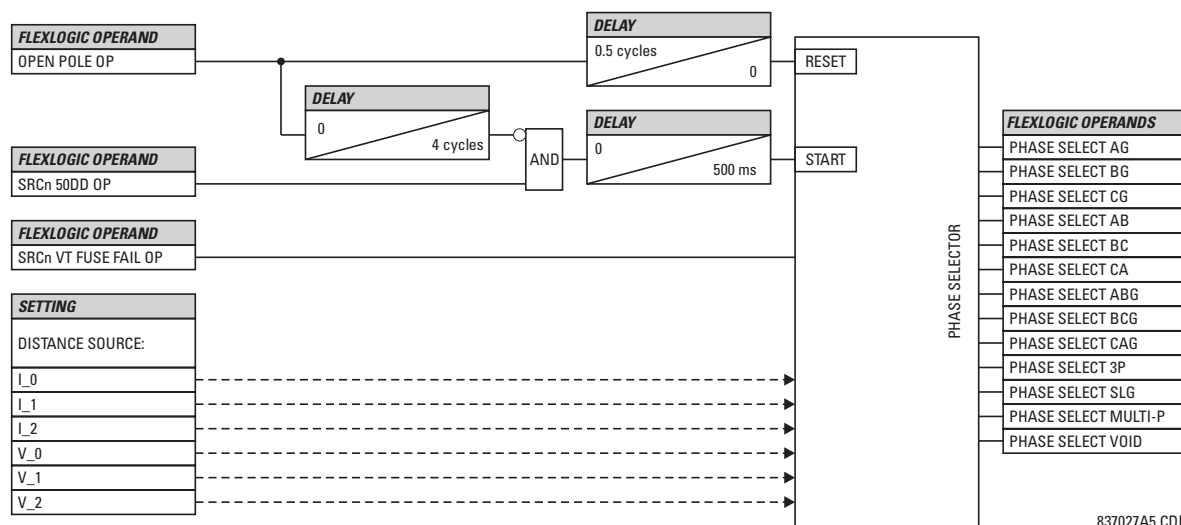

Figure 8-15: PHASE SELECTOR LOGIC

8.5.3 COMMUNICATIONS CHANNELS FOR PILOT-AIDED SCHEMES

a) DESCRIPTION

In the L90 relay pilot-aided schemes transmit a code representing the type of fault determined by the local phase selector according to the scheme logic. At a receiving terminal the local and remote data is combined to determine the action to be performed. Schemes can be used with channels that can carry one, two or four bits. Using a one-bit channel, the schemes at all terminals of the line use their local phase selectors to identify the fault type and initiate appropriate tripping actions. In

single pole operation applications however, a three-pole trip can be performed in the event of an in-line single-phase fault co-incident with a fault on a different phase (cross-country fault) that is within the reach of the local phase selector, which is considerably longer than the line. This possibility can be reduced by using a two-bit channel, and eliminated by using a four-bit channel.

Using two-bit channels, the relays can share limited information about their local phase selection, improving considerably the accuracy of single-pole tripping on cross-country faults. Two-bit channels however can only provide four different messages, one of which must be “no fault has been detected.” With only three messages available it is not possible to transmit sufficient information to eliminate the use of local phase selector data, so a three-pole operation can occur in a cross-country fault condition. Using four-bit channels, the relays share enough information about fault types seen from all the line terminals that local fault selector data can be rejected. In addition, in multiple bit systems the relays do not respond to non-valid bit combinations, making the protection system more immune to communication problems than in a single bit system.

Each scheme within the relay has a setting that specifies the number of bits available on the associated communications channel. This setting defines the input (RX1, RX2, RX3, RX4) and output (TX1, TX2, TX3, TX4 for communications and [Scheme Abbreviation] TRIP A, TRIP B, TRIP C, TRIP 3P for action) operands used by the scheme, the data codes used to convey fault data between terminals, and the method of combining information from the local and remote terminals to produce an output.

b) SINGLE BIT CHANNELS

The TX1 and RX1 operands are used, and fault data is coded per the following tables.

Table 8–11: PERMISSIVE SCHEME TRANSMIT CODES FOR 1-BIT CHANNELS

PHASE SELECTOR DETERMINATION OF FAULT TYPE	BIT PATTERN TRANSMITTED
	TX1
AG, BC, BCG, BG, CA, CAG, CG, AB, ABG, 3P	1
Unrecognized or AR FORCE 3P TRIP	1
None of the above	0

Table 8–12: BLOCKING SCHEME TRANSMIT CODES FOR 1-BIT CHANNELS

PHASE SELECTOR DETERMINATION OF FAULT TYPE	BIT PATTERN TRANSMITTED
	TX1
AG, BC, BCG, BG, CA, CAG, CG, AB, ABG, 3P	0
Unrecognized or AR FORCE 3P TRIP	0
None of the above	1

Table 8–13: UNBLOCKING SCHEME TRANSMIT CODES FOR 1-BIT CHANNELS

PHASE SELECTOR DETERMINATION OF FAULT TYPE	BIT PATTERN TRANSMITTED
	TX1
AG, BC, BCG, BG, CA, CAG, CG, AB, ABG, 3P	1
Unrecognized or AR FORCE 3P TRIP	1
None of the above	0

The action output is generated per the following tables.

Table 8–14: PERMISSIVE SCHEME TRIP TABLE FOR 1-BIT CHANNELS

REMOTE DATA		LOCAL DATA	
BIT PATTERN RECEIVED	REMOTE DETERMINATION OF FAULT TYPE	LOCAL DETERMINATION OF FAULT TYPE	TRIP OUTPUT
RX1			
1	Any	AG Fault	Trip Phase A (A+N/G)
1	Any	BG Fault	Trip Phase B (B+N/G)
1	Any	CG Fault	Trip Phase C (C+N/G)

Table 8–14: PERMISSIVE SCHEME TRIP TABLE FOR 1-BIT CHANNELS

REMOTE DATA		LOCAL DATA	
BIT PATTERN RECEIVED	REMOTE DETERMINATION OF FAULT TYPE	LOCAL DETERMINATION OF FAULT TYPE	TRIP OUTPUT
RX1			
1	Any	AB, ABG, BC, BCG, CA, CAG, 3P, Unrecognized	Trip Three Phases (per local selection, unrecognized and 3P=A+B+C+N/G)

Table 8–15: BLOCKING SCHEME TRIP TABLE FOR 1-BIT CHANNELS

8.5.4 PERMISSIVE ECHO SIGNALING

The “echo” feature can reduce the response time of an over-reaching scheme when a terminal is disconnected from the line. In this condition, a zone 2 element at the terminal that remains in-service can detect a fault, but cannot trip, as a permissive signal is not received from the remote terminal. This feature is provided in the permissive over-reaching transfer trip and hybrid permissive over-reaching transfer trip schemes.

PERMISSIVE OVER-REACHING TRANSFER TRIP SCHEME:

When used this feature will “echo” a reliable received permissive signal back to the originating terminal when a line-end-open condition is identified by the line pickup logic. The permissive echo is programmed as a one-shot logic. The echo is sent only once and then the echo logic locks out for a settable period. The duration of the echo pulse does not depend on the duration or shape of the received Rx signals but is settable.

The echo is sent back only if none of the overreaching protection elements operates.

HYBRID PERMISSIVE OVER-REACHING TRANSFER TRIP PERMISSIVE ECHO:

When used this feature will “echo” a reliable received permissive signal back to the originating terminal if the line-end-open condition is recognized by the line pickup scheme and the fault is not identified as a reverse fault by the zone 4 or the ground directional overcurrent function (if used). The permissive echo is programmed as a one-shot logic. The echo is sent only once and then the echo logic locks out for a settable period. The duration of the echo pulse does not depend on the duration or shape of the received RX signal but is settable as **ECHO DURATION**.

The echo is sent back only if none of the overreaching protection elements operates.

PERMISSIVE ECHO OPERANDS AND TRANSMIT CODES:

In single-pole tripping, single-bit channel applications the signal received on bit no. 1 (Rx1) is echoed back on bit no. 1 (Tx1). In two- and four-bit applications the following echo tables apply.

Table 8–29: ECHO TABLE FOR 2-BIT CHANNELS

LOCAL DETERMINATION OF FAULT TYPE	ECHOED BITS	
	TX1	TX2
AG	1	0
BG	0	1
CG	1	1
AB, ABG, BC, BCG, CA, CAG, 3P, Unrecognized	Send back as received	

Table 8–30: ECHO TABLE FOR 4-BIT CHANNELS

LOCAL DETERMINATION OF FAULT TYPE	ECHOED BITS			
	TX1	TX2	TX3	TX4
AG	1	0	0	0
BG	0	1	0	0
CG	0	0	1	0
AB, ABG, BC, BCG, CA, CAG, 3P, Unrecognized	Send back as received			

For the directional comparison unblocking scheme, the echo is performed in the same manner as the Hybrid POTT echo, but by applying additionally the following logic for both the Rx (received) and LOG (loss-of-guard) for each channel: $ECHO_N = LOG_N$ AND RX_N .

8.5.5 PILOT SCHEME / PHASE SELECTOR COORDINATION

For local fault type identification the pilot schemes use the Phase Selector. The latter may fail to respond to certain fault scenarios. Examples are: simultaneous forward and reverse fault, simultaneous SLG and LL fault involving different phases (e.g. AG and BC) or two simultaneous faults in the same direction but at very different locations. The Phase Selector is optimized to either indicate correctly the forward fault or to assert the Void flag. For example, a combination of AG and BC is not a valid fault type - it is two different simultaneous faults and as such cannot be described by any single fault pattern, therefore, the Phase Selector would assert the Void flag.

The VOID phase selection combined with a local trip request (such as high-set directional overcurrent) will result in three-pole trip as per the Trip Output logic.

The Pilot Schemes, however, try to recover more information from the distance elements. Each scheme uses a forward looking, either underreaching or overreaching, distance zone. A given Pilot Scheme analyzes this zone for fault type identification if the Phase Selector asserts its Void flag: the DUTT scheme uses Z1; all the other schemes use Z2. The schemes analyze all six fault loops of the zone to determine the fault type.

For example, simultaneous forward AG and reverse BG faults may result in the Void indication. The POTT scheme would analyze the Z2 response. As only the AG element is picked up, the local phase selection is determined as AG. This is a correct indication.

Depending on the number of bits used for communications, the accuracy of the overall response will be further improved as illustrated in the next subsection.

This enhanced operation of the pilot-aided schemes is the reason to use a short pilot scheme priority time when setting the Trip Output logic. The timer will force the scheme to wait for a decision from the pilot scheme for a short period of time before accepting any local trip request. The advantage, however, materializes only if more than one-bit communications channels are used, and is important only on parallel lines or when the application requires maximum accuracy of single-pole tripping. In other cases, it is not recommended to delay the local trip decision.

8.5.6 CROSS-COUNTRY FAULT EXAMPLE

Assume a single pole operation application where L90 relays are used to protect a two terminal line, (terminals T1 and T2) using phase and ground distance zone 1, 2 and 3 elements in a permissive over-reaching transfer trip scheme. The performance of the system with one- two and four-bit communications channels is outlined for a mid-line phase A-to-ground fault and a co-incident phase B-to-ground fault just behind terminal T2. Assume also that the reclosers are enabled and reset.

At T1 the following protection elements will pickup:

- Ground Distance Zone 1, 2, and 3 for an AG fault
- Ground Distance Zone 2 and 3 for a BG fault
- Phase Distance Zone 2 and 3 for an AB fault

At T1 the phase selector will determine the fault is type ABG. This response is independent from the distance elements – the Phase Selector sees two forward faults.

At T2 the following protection elements will pickup:

- Ground Distance Zone 1, 2, and 3 for an AG fault

At T2 the phase selector will determine the fault is type AG. The reverse BG fault is likely to be ignored.

If a one-bit channel is used, terminal T1 will trip three poles but terminal T2 will trip phase A only, (see the Tables below) which is undesirable.

TERMINAL	REMOTE DATA		LOCAL DATA	
	BIT PATTERN RECEIVED	REMOTE DETERMINATION OF FAULT TYPE	LOCAL DETERMINATION OF FAULT TYPE	TRIP OUTPUT
	RX1			
T1	1	Any	MULTI-P (ABG)	Trip Three Phases
T2	1	Any	AG	Trip Phase A

If a two-bit channel is used both terminals will trip phase A only, (see the Tables below) which is the desired outcome.

TERMINAL	REMOTE DATA			LOCAL DATA	
	BIT PATTERN RECEIVED			LOCAL DETERMINATION OF FAULT TYPE	TRIP OUTPUT
	RX1	RX2			
T1	1	0	AG	ABG	Trip Phase A
T2	1	1	ABG	AG	Trip Phase A

If a four-bit channel is used both terminals will trip phase A only, (see the Tables below) which is the desired outcome.

TERMINAL	REMOTE DATA				LOCAL DATA	
	BIT PATTERN RECEIVED				LOCAL DETERMINATION OF FAULT TYPE	TRIP OUTPUT
	RX1	RX2	RX3	RX4		
T1	0	0	0	1	AG	ABG
T2	1	0	0	0	ABG	AG

8.6.1 OVERVIEW

The L90 uses two methods to determine fault type and fault location

- A multi-ended fault location algorithm using synchronized currents and voltage measurements from all line terminals.
- A single-ended method based on the measurement from local terminal relay only during channel failures.

8.6.2 MULTI-ENDED FAULT LOCATOR

a) DESCRIPTION

When the L90 ordered has in-zone functionality, it does not support the multi-ended fault locator. This is because the use of the in-zone transformer replaces part of the existing data with in-zone data, which restricts multi-ended fault location.

The multi-ended fault location method is based on synchronized voltage and current measurements at all ends of the transmission line. This method makes it possible to compute the fault location without any assumptions or approximations. A single composite voltage and single composite current signal represent voltage and current measurements at any line terminal. These composite voltage and current signals are non-zero regardless of the fault type. The composite voltage at the fault can be computed from each end of the line by subtracting the line drop to the fault from the voltage at that end.

The multi-ended algorithm executes separately on each terminal. All terminals compute the same fault location, since they use the same equations applied to the same set of data. The algorithm is executed for both two-terminal and three-terminal applications. The three-terminal algorithm executes at each terminal that has information from all three terminals. If there is a communications failure on one channel, it will affect only one of the three terminals, since there are fault phasors from all three terminals to compute the fault location. The three-terminal algorithm has two parts: one part that determines which line segment is faulted, and another part that locates the fault on the faulted segment. Each terminal may report a slightly different fault resistance. The algorithm achieves greater accuracy by removing the line charging current.

The fault location algorithm does not need to explicitly determine the composite voltage at the fault. Instead, it eliminates the fault voltage from the equations for fault location by using other information instead.

For the purpose of fault location, the ABC quantities are represented by a single composite signal using the following base equation.

$$S_{(X)} = \frac{1}{3}(2S_{(A)} - bS_{(B)} - b^*S_{(C)}) \quad (\text{EQ 8.41})$$

In the above equation, b is a complex number defined as:

$$b = 1 + j\tan(\alpha) \quad (\text{EQ 8.42})$$

and b* is the conjugate of b, or mathematically:

$$b^* = 1 - j\tan(\alpha) \quad (\text{EQ 8.43})$$

where $\alpha = 45^\circ$.

The *expanded Clarke transform* shown above is selected to yield non-zero operating signals under balanced and unbalanced conditions. This allows reducing the amount of exchanged information between devices and avoiding phase selection. The above defining equation applies to the wye connection of signals under ABC phase rotation. For delta connections and ACB rotation, there is a small modification in this equation.

The following composite signals in (in per-unit values) are obtained from base equation shown above, taking into account system phase rotation, CT nominal values, and VT nominal values and connections as set under the phase VT bank of the first 87L source.

$$\begin{aligned} I_{LOC(A, B, C)} &\rightarrow I_{LOC(X)}, I_{REM1(A, B, C)} \rightarrow I_{REM1(X)}, I_{REM2(A, B, C)} \rightarrow I_{REM2(X)} \\ V_{LOC(A, B, C)} &\rightarrow V_{LOC(X)} \end{aligned} \quad (\text{EQ 8.44})$$

Composite currents are calculated locally at each terminal locally. Composite voltage is continuously transmitted to remote terminals, where upon receipt it is labeled as $V_{REM1(X)}$ for channel 1 and $V_{REM2(X)}$ for channel 2. The transmitted composite voltage signal is supervised by a VT fuse fail condition of the first source of 87L function. During VT fuse fail conditions, transmitted voltage is substituted with zero, signaling to remote peers that multi-ended fault location should be inhibited.

The impedance for fault location calculation (in per-unit values) is calculated as follows.

$$Z_{pu} = Z_{sec} \times \frac{CT_{sec}}{\sqrt{V_{T_{sec}}}} \text{ for wye-connected VTs} \quad (\text{EQ 8.45})$$

$$Z_{pu} = \sqrt{3} \times Z_{sec} \times \frac{CT_{sec}}{\sqrt{V_{T_{sec}}}} \text{ for delta-connected VTs}$$

Consequently, the positive-sequence line secondary impedance entered under in the fault locator menu yields following signals used for calculation. For two-terminal applications, we have:

$$Z_{1LINE} \rightarrow Z \quad (\text{EQ 8.46})$$

$$L = \text{corresponding line length}$$

For three-terminal applications, we have:

$$Z_{1LINE} \rightarrow Z_{LOC-T}$$

$$Z_{REM1-TAP} \rightarrow Z_{REM1-T}$$

$$Z_{REM2-TAP} \rightarrow Z_{REM2-T} \quad (\text{EQ 8.47})$$

$$L_{LOC-T}, L_{REM1-T}, L_{REM2-T} = \text{corresponding lengths of the three line segments}$$

For two-terminal applications, fault calculations can be executed directly using the signals above. For three-terminal applications, it is first necessary to define the faulted line segment. This is done by estimating the tap voltage as seen from all three line terminals.

$$V_{T(LOC)} = V_{LOC(X)} - Z_{LOC-T} \times I_{LOC(X)}$$

$$V_{T(REM1)} = V_{REM1(X)} - Z_{REM1-T} \times I_{REM1(X)} \quad (\text{EQ 8.48})$$

$$V_{T(REM2)} = V_{REM2(X)} - Z_{REM2-T} \times I_{REM2(X)}$$

The fault current is calculated as follows.

$$I_{FLT(X)} = I_{LOC(X)} + I_{REM1(X)} + I_{REM2(X)} \quad (\text{EQ 8.49})$$

The faulted segment can be found by recognizing that the sum of the voltage drops around a loop through the unfaulted segments is zero. The residual voltage phasors are computed for each loop. The loop with the lowest residual voltage contains the two unfaulted segments. Therefore, the differences between each pair of estimates is calculated as follows.

$$\Delta V_{LOC-REM1} = |V_{T(LOC)} - V_{T(REM1)}|$$

$$\Delta V_{LOC-REM2} = |V_{T(LOC)} - V_{T(REM2)}| \quad (\text{EQ 8.50})$$

$$\Delta V_{REM1-REM2} = |V_{T(REM1)} - V_{T(REM2)}|$$

The faulted segment is selected as follows.

$$\text{If } \Delta V_{LOC-REM1} = \min(\Delta V_{LOC-REM1}, \Delta V_{LOC-REM2}, \Delta V_{REM1-REM2})$$

$$\text{and } \Delta V_{LOC-REM1} < \max(0.025 \times (|V_{T(LOC)}| + |V_{T(REM1)}|), 0.01 \text{ pu}) \quad (\text{EQ 8.51})$$

$$\text{then the fault is between the tap and remote terminal 2}$$

Where:

$$L = L_{REM2-T}$$

$$Z = Z_{REM2-T}$$

$$V_{TAP(X)} = \frac{1}{2}(V_{T(LOC)} + V_{T(REM1)}) \quad (\text{EQ 8.52})$$

$$I_{TAP(X)} = I_{LOC(X)} + I_{REM1(X)}$$

$$V_{1(X)} = V_{REM2(X)}$$

A similar set of equations is applied to determine whether the fault is between the tap and the local terminal or between the tap and remote terminal 1.

Next, having all the data prepared, the following universal equation is used to calculate the fault location.

$$D_{pu} = \operatorname{Re} \left(\frac{\frac{V_{1(X)} - V_{TAP(X)}}{Z} + I_{TAP(X)}}{I_{FLT(X)}} \right) \quad (\text{EQ 8.53})$$

$$D_{units} = D_{pu} \times L$$

For two-terminal applications, the following equalities hold for the above equation.

$$\begin{aligned} V_{1(X)} &= V_{LOC(X)} \\ V_{TAP(X)} &= V_{REM1(X)} \\ I_{TAP(X)} &= I_{REM1(X)} \\ I_{FLT(X)} &= I_{LOC(X)} + I_{REM1(X)} \end{aligned} \quad (\text{EQ 8.54})$$

For two-terminal applications, the distance is reported from the local relay. In three-terminal applications, the distance is reported from the terminal of a given line segment.

Phase rotation must be the same at all line terminals for correct operation of the multi-ended fault locator.

b) EXAMPLE

Consider a three-terminal, 500 kV application with no charging current compensation or zero-sequence removal. The phase rotation is ABC and the following CT and VT data is known.

Table 8–31: CT AND VT APPLICATION DATA FOR MULTI-ENDED EXAMPLE

VALUE	RELAY 1	RELAY 2	RELAY 3
CT primary	1200 A	1000 A	1600 A
CT secondary	5 A	1 A	5 A
VT connection	wye	delta	wye
VT secondary	57.73 V	83.33 V	57.73 V
VT ratio	5000:1	6000:1	5000:1

The tap settings are shown below.

Table 8–32: TAP SETTINGS MULTI-ENDED EXAMPLE

VALUE	RELAY 1	RELAY 2	RELAY 3
CT tap 1 for remote terminal 1	1000 / 1200 = 0.8333	1200 / 1000 = 1.200	1200 / 1600 = 0.750
CT tap 1 for remote terminal 2	1600 / 1200 = 1.3333	1600 / 1000 = 1.600	1000 / 1600 = 0.625

The primary positive-sequence impedances and length for the line are shown below.

Table 8–33: LINE LENGTH AND POSITIVE-SEQUENCE IMPEDANCE FOR MULTI-ENDED EXAMPLE

VALUE	RELAY 1 TO TAP	RELAY 2 TO TAP	RELAY 3 TO TAP
Impedance	21.29 Ω $\angle 80.5^\circ$	36.50 Ω $\angle 80.5^\circ$	16.73 Ω $\angle 80.5^\circ$
Length	70 km	120 km	55 km

The three relays are connected as shown below.

Figure 8–16: RELAY CONNECTIONS FOR MULTI-ENDED FAULT LOCATOR EXAMPLE

The following settings are entered into the relays. These values are calculated in secondary ohms as shown in the following tables.

Table 8–34: LINE IMPEDANCE SETTINGS (ALL ANGLES ARE 80.5°)

VALUE	RELAY 1	RELAY 2	RELAY 3
Local to tap	1.0219 sec. ohms (relay 1 to tap in relay 1 secondary ohms)	6.0833 sec. ohms (relay 2 to tap in relay 2 secondary ohms)	1.0707 sec. ohms (relay 3 to tap in relay 3 secondary ohms)
Remote 1 to tap	1.7520 sec. ohms (relay 2 to tap in relay 1 secondary ohms)	3.5483 sec. ohms (relay 1 to tap in relay 2 secondary ohms)	1.3626 sec. ohms (relay 1 to tap in relay 3 secondary ohms)
Remote 2 to tap	0.8030 sec. ohms (relay 3 to tap in relay 1 secondary ohms)	2.7883 sec. ohms (relay 3 to tap in relay 2 secondary ohms)	2.3360 sec. ohms (relay 2 to tap in relay 3 secondary ohms)

Assume the following signals are measured by the relays when the fault locator was triggered.

Table 8–35: RELAY MEASUREMENTS (PHYSICAL INPUTS)

VALUE	RELAY 1	RELAY 2	RELAY 3
F1	10.64 A $\angle -87.5^\circ$	8.592 A $\angle -88.5^\circ$	9.652 A $\angle -43^\circ$
F2	1.652 A $\angle 88.9^\circ$	1.273 A $\angle 78.6^\circ$	5.201 A $\angle -99^\circ$
F3	1.66 A $\angle -31.2^\circ$	1.614 A $\angle -43^\circ$	6.269 A $\angle 139.3^\circ$
F5	52.71 V $\angle 0.8^\circ$	76.943 V $\angle 24.579^\circ$	49.6 V $\angle 10.1^\circ$
F6	58.21 V $\angle -121.4^\circ$	86.321 V $\angle -98.052^\circ$	57.1 V $\angle -115.6^\circ$
F7	58.93 V $\angle 121.9^\circ$	78.795 V $\angle 137.27^\circ$	59.12 V $\angle 130.8^\circ$

These measurement are shown below in per-unit values of the CT and VT nominal of the 87L source.

Table 8–36: RELAY MEASUREMENTS (PER-UNIT VALUES)

VALUE	RELAY 1	RELAY 2	RELAY 3
IA	2.128 pu $\angle -87.5^\circ$	8.592 pu $\angle -88.5^\circ$	1.9304 pu $\angle -43^\circ$
IB	0.3304 pu $\angle 88.9^\circ$	1.273 pu $\angle 78.6^\circ$	1.0402 pu $\angle -99^\circ$
IC	0.332 pu $\angle -31.2^\circ$	1.614 pu $\angle -43^\circ$	1.2538 pu $\angle 139.3^\circ$
VA (VAB)	0.91304 pu $\angle 0.8^\circ$	0.92335 pu $\angle 24.579^\circ$	0.85917 pu $\angle 10.1^\circ$
VB (VBC)	1.0083 pu $\angle -121.4^\circ$	1.0359 pu $\angle -98.052^\circ$	0.98909 pu $\angle -115.6^\circ$
VC (VCA)	1.0208 pu $\angle 121.9^\circ$	0.94557 pu $\angle 137.27^\circ$	1.0241 pu $\angle 130.8^\circ$

When subjected to the expanded Clarke transform in the previous sub-section, the local currents yield the following values (in relay per-unit values):

- Relay 1: 1.3839 pu $\angle -84.504^\circ$
- Relay 2: 5.4844 pu $\angle -85.236^\circ$
- Relay 3: 1.2775 pu $\angle -56.917^\circ$

When subjected to the expanded Clarke transform in the previous sub-section, the local voltages yield the following values (in per-unit values of the nominal primary phase-to-ground voltage):

- Relay 1: 0.38781 pu $\angle 0.26811^\circ$
- Relay 2: 0.30072 pu $\angle -12.468^\circ$
- Relay 3: 0.37827 pu $\angle 8.9388^\circ$

Since they have a common per-unit base, the composite voltages are used at all locations. The currents are ratio matched using the tap settings.

For example, the composite current at relay 1 is 1.3839 pu of its local CT; that is, $1.3839 \times 1200 \text{ A} = 1.6607 \text{ kA}$. When calculated at relay 2 from the data sent from relay 1 to relay 2, this value is $1.6607 \text{ kA} / 1000 \text{ A} = 1.6607 \text{ pu}$ of the relay 2 CT. This is due to the procedure of applying tap settings to the received phase currents before calculating the composite signal.

As a result, the three relays work with the following signals.

Table 8–37: COMPOSITE SIGNALS AT ALL THREE RELAYS

VALUE	RELAY 1	RELAY 2	RELAY 3
$V_{LOC(X)}$	0.38781 pu $\angle 0.26811^\circ$	0.30072 pu $\angle -12.468^\circ$	0.37827 pu $\angle 8.9388^\circ$
$V_{REM1(X)}$	0.30072 pu $\angle -12.468^\circ$	0.38781 pu $\angle 0.26811^\circ$	0.38781 pu $\angle 0.26811^\circ$
$V_{REM2(X)}$	0.37827 pu $\angle 8.9388^\circ$	0.37827 pu $\angle 8.9388^\circ$	0.30072 pu $\angle -12.468^\circ$
$I_{LOC(X)}$	1.3839 pu $\angle -84.504^\circ$	5.4844 pu $\angle -85.236^\circ$	1.2775 pu $\angle -56.917^\circ$
$I_{REM1(X)}$	4.5704 pu $\angle -85.236^\circ$	1.6607 pu $\angle -84.504^\circ$	1.0379 pu $\angle -84.504^\circ$
$I_{REM2(X)}$	1.7033 pu $\angle -56.917^\circ$	2.0439 pu $\angle -56.917^\circ$	3.4278 pu $\angle -85.236^\circ$

The line impedances entered in secondary ohms are recalculated as follows (refer to the previous sub-section for equations).

Table 8–38: PER-UNIT LINE IMPEDANCE

VALUE	RELAY 1	RELAY 2	RELAY 3
Local to tap	0.088509 pu $\angle 80.5^\circ$	0.12644 pu $\angle 80.5^\circ$	0.092735 pu $\angle 80.5^\circ$
Remote 1 to tap	0.15174 pu $\angle 80.5^\circ$	0.073754 pu $\angle 80.5^\circ$	0.11801 pu $\angle 80.5^\circ$
Remote 2 to tap	0.069551 pu $\angle 80.5^\circ$	0.057957 pu $\angle 80.5^\circ$	0.20232 pu $\angle 80.5^\circ$

Using the data in the previous two tables, the tap voltages are calculated as follows (refer to the previous sub-section for equations).

Table 8–39: CALCULATED TAP VOLTAGES USING TERMINAL DATA

VALUE	RELAY 1	RELAY 2	RELAY 3
$V_{T(LOC)}$	0.26581 pu $\angle 2.2352^\circ$	0.39755 pu $\angle -178.9^\circ$	0.26535 pu $\angle 2.4583^\circ$
$V_{T(REM1)}$	0.39758 pu $\angle -178.9^\circ$	0.26582 pu $\angle 2.2351^\circ$	0.26581 pu $\angle 2.2352^\circ$
$V_{T(REM2)}$	0.26535 pu $\angle 2.4583^\circ$	0.26535 pu $\angle 2.4587^\circ$	0.39758 pu $\angle -178.9^\circ$

From the above table, it is already visible that:

- Looking from relay 1 there is no fault between the tap and the local terminal and between the tap and remote 2 terminal. Therefore, the fault must be between the remote 1 terminal = relay 2 and the tap.
- Looking from relay 2 there is no fault between the tap and the remote 1 terminal, and between the tap and remote 2 terminal. Therefore, the fault must be between the local terminal = relay 2 and the tap.
- Looking from relay 3 there is no fault between the tap and the remote 1 terminal, and between the tap and the local terminal. Therefore, the fault must be between the remote 2 terminal = relay 2 and the tap.

Note that the correct value of the tap voltage is equal for all three relays. This is expected since the per-unit base for the composite voltages is equal for all three relays.

The three relays calculate the differences as follows (refer to the previous sub-section for equations).

Table 8–40: TAP VOLTAGE DIFFERENCES USING TERMINAL DATA

VALUE	RELAY 1	RELAY 2	RELAY 3
LOC-REM1	0.66337 pu	0.66334 pu	0.0011344 pu
LOC-REM2	0.0011344 pu	0.66286 pu	0.66289 pu
REM1-REM2	0.66289 pu	0.001137 pu	0.66337 pu

Applying the results of the table above to the equations in the previous sub-section, the algorithm arrives at the following:

- Relay 1 determines remote 1 to tap.
- Relay 2 determines local to tap.
- Relay 3 determines remote 2 to tap.

As a result, the relays use the following data for further calculations.

Table 8–41: INPUT DATA FOR MAIN FAULT LOCATION

VALUE	RELAY 1	RELAY 2	RELAY 3
Fault segment	2	1	3
L	120 km	120 km	120 km
Z	0.1517 pu $\angle 80.5^\circ$	0.1264 pu $\angle 80.5^\circ$	0.2023 pu $\angle 80.5^\circ$
V_{TAP}	0.26558 pu $\angle 2.3467^\circ$	0.26559 pu $\angle 2.3468^\circ$	0.26558 pu $\angle 2.3467^\circ$
V_1	0.30072 pu $\angle -12.468^\circ$	0.30072 pu $\angle -12.468^\circ$	0.30072 pu $\angle -12.468^\circ$
I_{TAP}	2.9991 pu $\angle -69.256^\circ$	3.599 pu $\angle -69.256^\circ$	2.2494 pu $\angle -69.256^\circ$
I_{FLT}	7.4992 pu $\angle -78.915^\circ$	8.999 pu $\angle -78.915^\circ$	5.6244 pu $\angle -78.915^\circ$

The data above are effectively identical. The difference in current magnitudes results from different per-unit bases at the three relays (1200 A, 1000 A, and 1600 A). The difference in impedances results from different CT and VT ratios at the three relays.

The tap voltage is the actual voltage at the tap ($0.26558 \times 500 \text{ kV} / \sqrt{3} = 76.67 \text{ kV}$). The V_1 voltage is the voltage at relay 2 (0.30072 pu = 86.81 kV).

The tap current is the total feed from the tap towards the fault and is $2.9991 \times 1200 \text{ A} = 3.599 \text{ pu} \times 1000 \text{ A} = 2.2494 \text{ pu} \times 1600 \text{ A} = 3.599 \text{ kA}$. The fault current is $7.4992 \text{ pu} \times 1200 \text{ A} = 8.999 \text{ pu} \times 1000 \text{ A} = 5.6244 \text{ pu} \times 1600 \text{ A} = 8.999 \text{ kA}$.

The data above results in the following fault locations.

- Relay 1 fault location = 0.4173 pu or $0.4173 \times 120 \text{ km} = 50.0704 \text{ km}$ from its remote terminal 1 (relay 2)
- Relay 2 fault location = 0.4172 pu or $0.4172 \times 120 \text{ km} = 50.07 \text{ km}$ from local terminal (relay 2)
- Relay 3 fault location = 0.4173 pu or $0.4173 \times 120 \text{ km} = 50.0704 \text{ km}$ from its remote terminal 2 (relay 2)

The actual fault location in this example was 50.00km from relay 2 as shown below.

**Figure 8–17: ACTUAL FAULT LOCATION**

8.6.3 SINGLE-ENDED FAULT LOCATOR

When the multi-ended fault locator cannot be executed due to communication channel problems or invalid signals from remote terminals, then the single-ended method is used to report fault location.

Fault type determination is required for calculation of fault location – the algorithm uses the angle between the negative and positive sequence components of the relay currents. To improve accuracy and speed of operation, the fault components of the currents are used; that is, the pre-fault phasors are subtracted from the measured current phasors. In addition to the angle relationships, certain extra checks are performed on magnitudes of the negative and zero-sequence currents.

The single-ended fault location method assumes that the fault components of the currents supplied from the local (A) and remote (B) systems are in phase. The figure below shows an equivalent system for fault location.

Figure 8-18: EQUIVALENT SYSTEM FOR FAULT LOCATION

The following equations hold true for this equivalent system.

$$V_A = m \cdot Z \cdot I_A + R_F \cdot (I_A + I_B) \quad (\text{EQ 8.55})$$

where: m = sought pu distance to fault, Z = positive sequence impedance of the line.

The currents from the local and remote systems can be parted between their fault (F) and pre-fault load (pre) components:

$$I_A = I_{AF} + I_{Apre} \quad (\text{EQ 8.56})$$

and neglecting shunt parameters of the line:

$$I_B = I_{BF} - I_{Apre} \quad (\text{EQ 8.57})$$

Inserting the I_A and I_B equations into the V_A equation and solving for the fault resistance yields:

$$R_F = \frac{V_A - m \cdot Z \cdot I_A}{I_{AF} \cdot \left(1 + \frac{I_{BF}}{I_{AF}}\right)} \quad (\text{EQ 8.58})$$

Assuming the fault components of the currents, I_{AF} and I_{BF} are in phase, and observing that the fault resistance, as impedance, does not have any imaginary part gives:

$$\text{Im}\left(\frac{V_A - m \cdot Z \cdot I_A}{I_{AF}}\right) = 0 \quad (\text{EQ 8.59})$$

where: $\text{Im}()$ represents the imaginary part of a complex number. Solving the above equation for the unknown m creates the following fault location algorithm:

$$m = \frac{\text{Im}(V_A \cdot I_{AF}^*)}{\text{Im}(Z \cdot I_A \cdot I_{AF}^*)} \quad (\text{EQ 8.60})$$

where $*$ denotes the complex conjugate and $I_{AF} = I_A - I_{Apre}$.

Depending on the fault type, appropriate voltage and current signals are selected from the phase quantities before applying the two equations above (the superscripts denote phases, the subscripts denote stations).

For AG faults:

$$V_A = V_A^A, \quad I_A = I_A^A + K_0 \cdot I_{0A} \quad (\text{EQ 8.61})$$

For BG faults:

$$V_A = V_A^B, \quad I_A = I_A^B + K_0 \cdot I_{0A} \quad (\text{EQ 8.62})$$

For CG faults:

$$V_A = V_A^C, \quad I_A = I_A^{BC} + K_0 \cdot I_{0A} \quad (\text{EQ 8.63})$$

For AB and ABG faults:

$$V_A = V_A^A - V_A^B, \quad I_A = I_A^A - I_A^B \quad (\text{EQ 8.64})$$

For BC and BCG faults:

$$V_A = V_A^B - V_A^C, \quad I_A = I_A^B - I_A^C \quad (\text{EQ 8.65})$$

For CA and CAG faults:

$$V_A = V_A^C - V_A^A, \quad I_A = I_A^C - I_A^A \quad (\text{EQ 8.66})$$

where K_0 is the zero sequence compensation factor (for the first six equations above)

For ABC faults, all three AB, BC, and CA loops are analyzed and the final result is selected based upon consistency of the results

The element calculates the distance to the fault (with m in miles or kilometers) and the phases involved in the fault.

The relay allows locating faults from delta-connected VTs. If the **FAULT REPORT 1 VT SUBSTITUTION** setting is set to "None", and the VTs are connected in wye, the fault location is performed based on the actual phase to ground voltages. If the VTs are connected in delta, fault location is suspended.

If the **FAULT REPORT 1 VT SUBSTITUTION** setting value is "V0" and the VTs are connected in a wye configuration, the fault location is performed based on the actual phase to ground voltages. If the VTs are connected in a delta configuration, fault location is performed based on the delta voltages and externally supplied neutral voltage:

$$\begin{aligned} V_A &= \frac{1}{3}(V_N + V_{AB} - V_{CA}) \\ V_B &= \frac{1}{3}(V_N + V_{BC} - V_{AB}) \\ V_C &= \frac{1}{3}(V_N + V_{CA} - V_{BC}) \end{aligned} \quad (\text{EQ 8.67})$$

8

If the **FAULT REPORT 1 VT SUBSTITUTION** setting value is "I0" and the VTs are connected in a wye configuration, the fault location is performed based on the actual phase to ground voltages. If the VTs are connected in a delta configuration, fault location is performed based on the delta voltages and zero-sequence voltage approximated based on the zero-sequence current:

$$\begin{aligned} V_A &= \frac{1}{3}(V_{AB} - V_{CA}) - Z_{SYS0}I_0 \\ V_B &= \frac{1}{3}(V_{BC} - V_{AB}) - Z_{SYS0}I_0 \\ V_C &= \frac{1}{3}(V_{CA} - V_{BC}) - Z_{SYS0}I_0 \end{aligned} \quad (\text{EQ 8.68})$$

where Z_{SYS0} is the equivalent zero-sequence impedance behind the relay as entered under the fault report setting menu.

Figure 8-19: FAULT LOCATOR SCHEME

Since the fault locator algorithm is based on the single-end measurement method, in three-terminal configuration the estimation of fault location may not be correct at all three terminals especially if fault occurs behind the line's tap respective to the given relay.

9.1.1 INTRODUCTION

In general, proper CT selection is required to provide both adequate fault sensitivity and prevention of operation on high-current external faults that could result from CT saturation. The use of high-quality CTs (such as class X) improves relay stability during transients and CT saturation and can increase relay sensitivity. A current differential scheme is highly dependent on adequate signals from the source CTs. Ideally, CTs selected for line current differential protection should be based on the criteria described below. If the available CTs do not meet the described criteria, the L90 will still provide good security for CT saturation for external faults. The L90 adaptive restraint characteristics, based on estimates of measurement errors and CT saturation detection, allow the relay to be secure on external faults while maintaining excellent performance for severe internal faults. Where CT characteristics do not meet criteria or where CTs at both ends may have different characteristics, the differential settings should be adjusted as per section 9.2.1.

The capability of the CTs, and the connected burden, should be checked as follows:

1. The CTs should be class TPX or TPY (class TPZ should only be used after discussion with both the manufacturer of the CT and GE Multilin) or IEC class 5P20 or better.
2. The CT primary current rating should be somewhat higher than the maximum continuous current, but not extremely high relative to maximum load because the differential element minimum sensitivity setting is approximately $0.2 \times$ CT rating (the L90 relay allows for different CT ratings at each of the terminals).
3. The VA rating of the CTs should be above the Secondary Burden \times CT Rated Secondary Current. The maximum secondary burden for acceptable performance is:

$$R_b + R_r < \frac{\text{CT Rated VA}}{(\text{CT Secondary } I_{rated})^2} \quad (\text{EQ 9.1})$$

where: R_b = total (two-way) wiring resistance plus any other load
 R_r = relay burden at rated secondary current

4. The CT kneepoint voltage (per the V_k curves from the manufacturer) should be higher than the maximum secondary voltage during a fault. This can be estimated by:

$$V_k > I_{fp} \times \left(\frac{X}{R} + 1 \right) \times (R_{CT} + R_L + R_r) \quad \text{for phase-phase faults}$$

$$V_k > I_{fg} \times \left(\frac{X}{R} + 1 \right) \times (R_{CT} + 2R_L + R_r) \quad \text{for phase-ground faults} \quad (\text{EQ 9.2})$$

where: I_{fp} = maximum secondary phase-phase fault current
 I_{fg} = maximum secondary phase-ground fault current
 X/R = primary system reactance / resistance ratio
 R_{CT} = CT secondary winding resistance
 R_L = AC secondary wiring resistance (one-way)

9.1.2 CALCULATION EXAMPLE 1

This example illustrates how to check the performance of a class C400 ANSI/IEEE CT, ratios 2000/1800/1600/1500 : 5 A connected at 1500:5. The burden and kneepoints are verified in this example.

Given the following values:

- maximum I_{fp} = 14 000 A
- maximum I_{fg} = 12 000 A
- impedance angle of source and line = 78°
- CT secondary leads are 75 m of AWG 10.

The following procedure verifies the burden. ANSI/IEEE class C400 requires that the CT can deliver 1 to 20 times the rated secondary current to a standard B-4 burden (4 ohms or lower) without exceeding a maximum ratio error of 10%.

1. The maximum allowed burden at the 1500/5 tap is $(1500/2000) \times 4 = 3 \Omega$.
2. The R_{CT} , R_r , and R_L values are calculated as:

$$\begin{aligned}
 R_{CT} &= 0.75 \, \Omega \\
 R_r &= \frac{0.2 \, \text{VA}}{(5 \, \text{A})^2} = 0.008 \, \Omega \\
 R_L &= 2 \times 75 \, \text{m} \times \frac{3.75 \, \Omega}{1000 \, \text{m}} = 2 \times 0.26 \, \Omega = 0.528 \, \Omega
 \end{aligned}
 \tag{EQ 9.3}$$

3. This gives a total burden of:

$$\text{Total Burden} = R_{CT} + R_r + R_L = 0.75 \, \Omega + 0.008 \, \Omega + 0.52 \, \Omega = 1.28 \, \Omega. \tag{EQ 9.4}$$

4. This is less than the allowed 3 Ω , which is OK.

The following procedure verifies the kneepoint voltage.

1. The maximum voltage available from the CT = $(1500/2000) \times 400 = 300 \, \text{V}$.
2. The system X/R ratio = $\tan 78^\circ = 4.71$.
3. The CT voltage for maximum phase fault is:

$$V = \frac{14000 \, \text{A}}{\text{ratio of 300:1}} \times (4.71 + 1) \times (0.75 + 0.26 + 0.008 \, \Omega) = 271.26 \, \text{V} (< 300 \, \text{V}, \text{ which is OK}) \tag{EQ 9.5}$$

4. The CT voltage for maximum ground fault is:

$$V = \frac{12000 \, \text{A}}{\text{ratio of 300:1}} \times (4.71 + 1) \times (0.75 + 0.52 + 0.008 \, \Omega) = 291.89 \, \text{V} (< 300 \, \text{V}, \text{ which is OK}) \tag{EQ 9.6}$$

5. The CT will provide acceptable performance in this application.

9.1.3 CALCULATION EXAMPLE 2

To check the performance of an IEC CT of class 5P20, 15 VA, ratio 1500:5 A, assume the following values:

- maximum $I_{fp} = 14\,000 \, \text{A}$
- maximum $I_{fg} = 12\,000 \, \text{A}$
- impedance angle of source and line = 78°
- CT secondary leads are 75 m of AWG 10.

The IEC rating requires the CT deliver up to 20 times the rated secondary current without exceeding a maximum ratio error of 5%, to a burden of:

$$\text{Burden} = \frac{15 \, \text{VA}}{(5 \, \text{A})^2} = 0.6 \, \Omega \text{ at the 5 A rated current} \tag{EQ 9.7}$$

The total Burden = $R_r + R_L = 0.008 + 0.52 = 0.528 \, \Omega$, which is less than the allowed 0.6 Ω , which is OK.

The following procedure verifies the kneepoint voltage.

1. The maximum voltage available from the CT = $(1500/2000) \times 400 = 300 \, \text{V}$.
2. The system X/R ratio = $\tan 78^\circ = 4.71$.
3. The CT voltage for maximum phase fault is:

$$V = \frac{14000 \, \text{A}}{\text{ratio of 300:1}} \times (4.71 + 1) \times (0.75 + 0.26 + 0.008 \, \Omega) = 271.26 \, \text{V} (< 300 \, \text{V}, \text{ which is OK}) \tag{EQ 9.8}$$

4. The CT voltage for maximum ground fault is:

$$V = \frac{12000 \, \text{A}}{\text{ratio of 300:1}} \times (4.71 + 1) \times (0.75 + 0.52 + 0.008 \, \Omega) = 291.89 \, \text{V} (< 300 \, \text{V}, \text{ which is OK}) \tag{EQ 9.9}$$

5. The CT will provide acceptable performance in this application.

9.2.1 INTRODUCTION

Software is available from the GE Digital Energy website that is helpful in selecting settings for the specific application. Checking the performance of selected element settings with respect to known power system fault parameters makes it relatively simple to choose the optimum settings for the application.

This software program is also useful for establishing test parameters. It is strongly recommended this program be downloaded.

The differential characteristic is defined by four settings: **CURRENT DIFF PICKUP**, **CURRENT DIFF RESTRAINT 1**, **CURRENT DIFF RESTRAINT 2**, and **CURRENT DIFF BREAK PT** (breakpoint). As is typical for current-based differential elements, the settings are a trade-off between operation on internal faults against restraint during external faults.

9.2.2 CURRENT DIFFERENTIAL PICKUP

This setting established the sensitivity of the element to high impedance faults, and it is therefore desirable to choose a low level, but this can cause a maloperation for an external fault causing CT saturation. The selection of this setting is influenced by the decision to use charging current compensation. If charging current compensation is Enabled, pickup should be set to a minimum of 150% of the steady-state line charging current, to a lower limit of 10% of CT rating. If charging current compensation is Disabled, pickup should be set to a minimum of 250% of the steady-state line charging current to a lower limit of 10% of CT rating.

If the CT at one terminal can saturate while the CTs at other terminals do not, this setting should be increased by approximately 20 to 50% (depending on how heavily saturated the one CT is while the other CTs are not saturated) of CT rating to prevent operation on a close-in external fault.

9.2.3 CURRENT DIFF RESTRAINT 1

This setting controls the element characteristic when current is below the breakpoint, where CT errors and saturation effects are not expected to be significant. The setting is used to provide sensitivity to high impedance internal faults, or when system configuration limits the fault current to low values. A setting of 10 to 20% is appropriate in most cases, but this should be raised to 30% if the CTs can perform quite differently during faults.

9.2.4 CURRENT DIFF RESTRAINT 2

This setting controls the element characteristic when current is above the breakpoint, where CT errors and saturation effects are expected to be significant. The setting is used to provide security against high current external faults. A setting of 30 to 40% is appropriate in most cases, but this should be raised to 70% if the CTs can perform quite differently during faults.

Assigning the **CURRENT DIFF RESTRAINT 1(2)** settings to the same value reverts dual slope bias characteristics into single slope bias characteristics.

9.2.5 CURRENT DIFF BREAK POINT

This setting controls the threshold where the relay changes from using the restraint 1 to the restraint 2 characteristics. Two approaches can be considered.

1. Program the setting to 150 to 200% of the maximum emergency load current on the line, on the assumption that a maintained current above this level is a fault.
2. Program the setting below the current level where CT saturation and spurious transient differential currents can be expected.

The first approach gives comparatively more security and less sensitivity; the second approach provides less security for more sensitivity.

9.2.6 CT TAP

If the CT ratios at the line terminals are different, the **CURRENT DIFF CT TAP 1(2)** setting must be used to correct the ratios to a common base. In this case, a user should modify the **CURRENT DIFF BREAK PT** and **CURRENT DIFF PICKUP** settings because the local current phasor is used as a reference to determine which differential equation is used, based on the value of local and remote currents. If the setting is not modified, the responses of individual relays, especially during an external fault, can be asymmetrical, as one relay can be below the breakpoint and the other above the breakpoint. There are two methods to overcome this potential problem:

1. Set **CURRENT DIFF RESTRAINT 1** and **CURRENT DIFF RESTRAINT 2** to the same value (e.g. 40% or 50%). This converts the relay characteristics from dual slope into single slope and the breakpoint becomes immaterial. Next, adjust differential pickup at all terminals according to CT ratios, referencing the desired pickup to the line primary current (see below).
2. Set the breakpoints in each relay individually in accordance with the local CT ratio and the **CT TAP** setting. Next, adjust the differential pickup setting according to the terminal CT ratios. The slope value must be identical at all terminals.

Consider a two-terminal configuration with the following CT ratios for relays 1 and 2.

$$\begin{aligned} CT_{ratio}(\text{relay 1}) &= 1000/5 \\ CT_{ratio}(\text{relay 2}) &= 2000/5 \end{aligned} \quad (\text{EQ 9.10})$$

Consequently, we have the following CT tap value for relays 1 and 2.

$$\begin{aligned} CT_{tap}(\text{relay 1}) &= 2.0 \\ CT_{tap}(\text{relay 2}) &= 0.5 \end{aligned} \quad (\text{EQ 9.11})$$

To achieve maximum differential sensitivity, the minimum pickup is set as 0.2 pu at the terminal with the higher CT primary current; in this case 2000:5 for relay 2. The other terminal pickup is adjusted accordingly. The pickup values are set as follows:

$$\begin{aligned} \text{Pickup}(\text{relay 1}) &= 0.4 \\ \text{Pickup}(\text{relay 2}) &= 0.2 \end{aligned} \quad (\text{EQ 9.12})$$

Choosing relay 1 as a reference with a breakpoint of 5.0, the break point at relay 2 is chosen as follows:

$$\begin{aligned} \text{Breakpoint}(\text{relay 2}) &= \text{Breakpoint}(\text{relay 1}) \times \frac{CT_{ratio}(\text{relay 1})}{CT_{ratio}(\text{relay 2})} \\ &= 5.0 \times \frac{1000/5}{2000/5} = 2.5 \end{aligned} \quad (\text{EQ 9.13})$$

Use the following equality to verify the calculated breakpoint:

$$\text{Breakpoint}(\text{relay 1}) \times CT_{ratio}(\text{relay 1}) = \text{Breakpoint}(\text{relay 2}) \times CT_{ratio}(\text{relay 2}) \quad (\text{EQ 9.14})$$

Therefore, we have a breakpoint of 5.0 for relay 1 and 2.5 for relay 2.

Now, consider a three-terminal configuration with the following CT ratios for relays 1, 2, and 3.

$$\begin{aligned} CT_{ratio}(\text{relay 1}) &= 1000/5 \\ CT_{ratio}(\text{relay 2}) &= 2000/5 \\ CT_{ratio}(\text{relay 3}) &= 500/5 \end{aligned} \quad (\text{EQ 9.15})$$

Consequently, we have the following CT tap value for relays 1, 2, and 3.

$$\begin{aligned} CT_{tap1}(\text{relay 1}) &= 2.00 & CT_{tap2}(\text{relay 1}) &= 0.50 \\ CT_{tap1}(\text{relay 2}) &= 0.50 & CT_{tap2}(\text{relay 2}) &= 0.25 \\ CT_{tap1}(\text{relay 3}) &= 2.00 & CT_{tap2}(\text{relay 3}) &= 4.00 \end{aligned} \quad (\text{EQ 9.16})$$

In this case, the relay channels communicate as follows:

- For relay 1, channel 1 communicates to relay 2 and channel 2 communicates to relay 3
- For relay 2, channel 1 communicates to relay 1 and channel 2 communicates to relay 3

- For relay 3, channel 1 communicates to relay 1 and channel 2 communicates to relay 2

Consequently, to achieve the maximum sensitivity of 0.2 pu at the terminal with a CT ratio of 2000/5 (400 amps line primary differential current), the following pickup values are chosen:

$$\begin{aligned}\text{Pickup}(\text{relay } 1) &= 0.4 \\ \text{Pickup}(\text{relay } 2) &= 0.2 \\ \text{Pickup}(\text{relay } 3) &= 0.8\end{aligned}\tag{EQ 9.17}$$

Choosing relay 1 as a reference with a breakpoint value of 5.0 pu, breakpoints for relays 2 and 3 are calculated as follows:

$$\begin{aligned}\text{Breakpoint}(\text{relay } 2) &= \text{Breakpoint}(\text{relay } 1) \times \frac{\text{CT}_{\text{ratio}}(\text{relay } 1)}{\text{CT}_{\text{ratio}}(\text{relay } 2)} \\ &= 5.0 \times \frac{1000/5}{2000/5} = 2.5\end{aligned}\tag{EQ 9.18}$$

$$\begin{aligned}\text{Breakpoint}(\text{relay } 3) &= \text{Breakpoint}(\text{relay } 1) \times \frac{\text{CT}_{\text{ratio}}(\text{relay } 1)}{\text{CT}_{\text{ratio}}(\text{relay } 3)} \\ &= 5.0 \times \frac{1000/5}{500/5} = 10.0\end{aligned}\tag{EQ 9.19}$$

To verify the calculated values, we have:

$$\begin{aligned}\text{Breakpoint}(\text{relay } 1) \times \text{CT}_{\text{ratio}}(\text{relay } 1) &= 5.0 \times 1000/5 = 1000 \\ \text{Breakpoint}(\text{relay } 2) \times \text{CT}_{\text{ratio}}(\text{relay } 2) &= 2.5 \times 2000/5 = 1000 \\ \text{Breakpoint}(\text{relay } 3) \times \text{CT}_{\text{ratio}}(\text{relay } 3) &= 10.0 \times 500/5 = 1000\end{aligned}\tag{EQ 9.20}$$

This satisfies the equality condition indicated earlier.

During on-load tests, the differential current at all terminals should be the same and generally equal to the charging current if the tap and CT ratio settings are chosen correctly.

9.2.7 BREAKER-AND-A-HALF

Assume a breaker-and-the-half configuration shown in the figure below. This section provides guidance on configuring the L90 relay for this application. The L90 is equipped with two CT/VT modules: F8F and L8F.

- CTs and VTs are connected to L90 CT/VT modules as follows:
 - CT1 circuitry is connected to the F1 to F3 terminals of the F8F module (three-phase CT inputs, CT bank “F”).
 - CT2 circuitry is connected to the F1 to F3 terminals of the L8F module (three-phase CT inputs, CT bank “L”).
 - VT1 circuitry is connected to the F8 terminals of the F8F module (single-phase VT for synchrocheck 1, VT bank “F”).
 - VT2 circuitry is connected to the F8 terminals of the L8F module (single-phase VT for synchrocheck 2, VT bank “L”).
 - VT3 circuitry is connected to the F5 to F7 terminals of the F8F modules (three-phase VT for distance, metering, synchrocheck, charging current compensation, etc.; VT bank “F”).

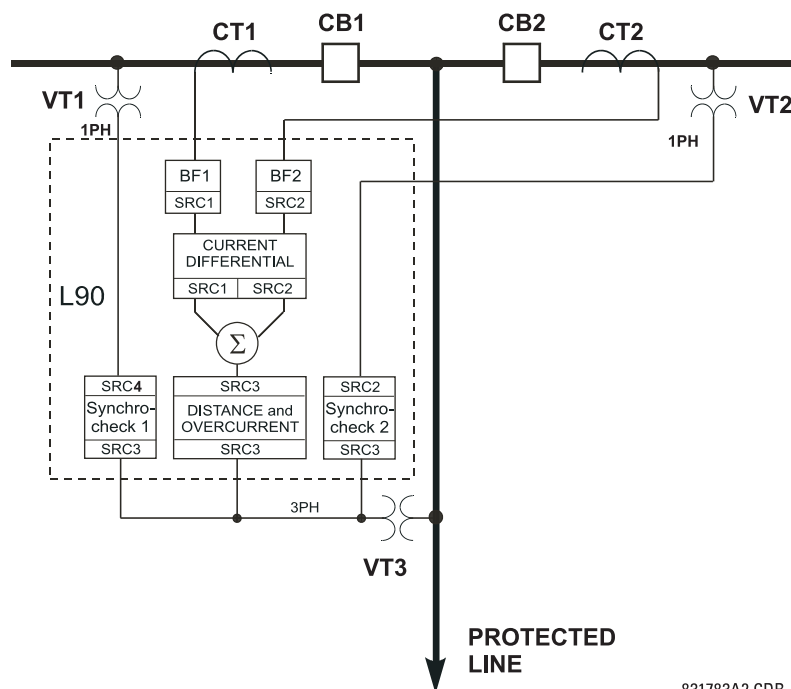

Figure 9-1: BREAKER-AND-A-HALF APPLICATION

- The CTs and VTs are configured according to the following ratios and connections (EnerVista UR Setup example shown):

Current // L90_500.urs : C:\Documents and Settings\All Users...		
Save Restore Default Reset VIEW ALL mode		
PARAMETER	CT F1	CT L1
Phase CT Primary	400 A	400 A
Phase CT Secondary	1 A	1 A
Ground CT Primary	1 A	1 A
Ground CT Secondary	1 A	1 A
L90_500.urs System Setup: AC Inputs		

Voltage // L90_500.urs : C:\Documents and Settings\All Users...		
Save Restore Default Reset VIEW ALL mode		
PARAMETER	VT F5	VT L5
Phase VT Connection	Wye	Wye
Phase VT Secondary	66.4 V	66.4 V
Phase VT Ratio	2000.00 : 1	1.00 : 1
Auxiliary VT Connection	Vag	Vag
Auxiliary VT Secondary	66.4 V	66.4 V
Auxiliary VT Ratio	2000.00 : 1	2000.00 : 1
L90_500.urs System Setup: AC Inputs		

3. The sources are configured as follows:

Source 1: – First current source for current differential,
– voltage source for charging current compensation,
– current source for breaker failure 1

Source 2: – Second current source for current differential,
– current source for breaker failure 2, and
– voltage source for synchrocheck 2.

Source 3: – Current source for distance, backup overcurrent,
– voltage source for distance,
– voltage source for synchrocheck 1 and 2.

Source 4: – Voltage source for synchrocheck 1.

The EnerVista UR Setup configuration is shown below:

PARAMETER	SOURCE 1	SOURCE 2	SOURCE 3	SOURCE 4
Source 1 Name	SRC 1	SRC 2	Sum1&2	SRC 4
Phase CT	F1	L1	F1+L1	None
Ground CT	None	None	None	None
Phase VT	F5	None	F5	None
Aux VT	None	L5	None	F5

4. Sources are assigned accordingly in the specific element menus. For current differential, set **CURRENT DIFF SIGNAL SOURCE 1** to “SRC 1” and **CURRENT DIFF SIGNAL SOURCE 2** to “SRC 2”.

For distance and backup overcurrent, make the following settings changes (EnerVista UR Setup example shown):

SETTING	PARAMETER
Source	Sum1&2 (SRC 3)
Memory Duration	10 cycles
Force Self-Polar	OFF
Force Mem-Polar	OFF

PARAMETER	PHASE TOC1

9.2.8 DISTRIBUTED BUS PROTECTION

In some cases, buses of the same substation are located quite far from each other or even separated by the line. In these cases, it is challenging to apply conventional bus protection because of the CT cable length. In other cases, there are no CTs available on the line side of the line to be protected. Taking full advantage of L90 capability to support up to 4 directly-connected CTs, the relay can be applied to protect both line and buses as shown below. Proper CT/VT modules must be ordered for such applications. The varying CT ratios at the breakers can be compensated locally by using the sources mechanism and with the **CT TAP** settings between remote relays. If more than 4 but less than 8 CTs are to be connected to the L90 at one bus, the 3-terminal system can be applied, provided the user does not exceed a total of 12 CTs.

Figure 9–2: DISTRIBUTED BUS PROTECTION

9.3.1 DESCRIPTION

As indicated in the *Settings* chapter, the L90 provides three basic methods of applying channel asymmetry compensation using GPS. Channel asymmetry can also be monitored with actual values and an indication signalled (FlexLogic operands 87L DIFF 1(2) MAX ASYM asserted) if channel asymmetry exceeds preset values. Depending on the implemented relaying philosophy, the relay can be programmed to perform the following on the loss of the GPS signal:

1. Enable GPS compensation on the loss of the GPS signal at any terminal and continue to operate the 87L element (using the memorized value of the last asymmetry) until a change in the channel round-trip delay is detected.
2. Enable GPS compensation on the loss of the GPS signal at any terminal and block the 87L element after a specified time.
3. Continuously operate the 87L element but only enable GPS compensation when *valid* GPS signals are available. This provides less sensitive protection on the loss of the GPS signal at any terminal and runs with higher pickup and restraint settings.

9.3.2 COMPENSATION METHOD 1

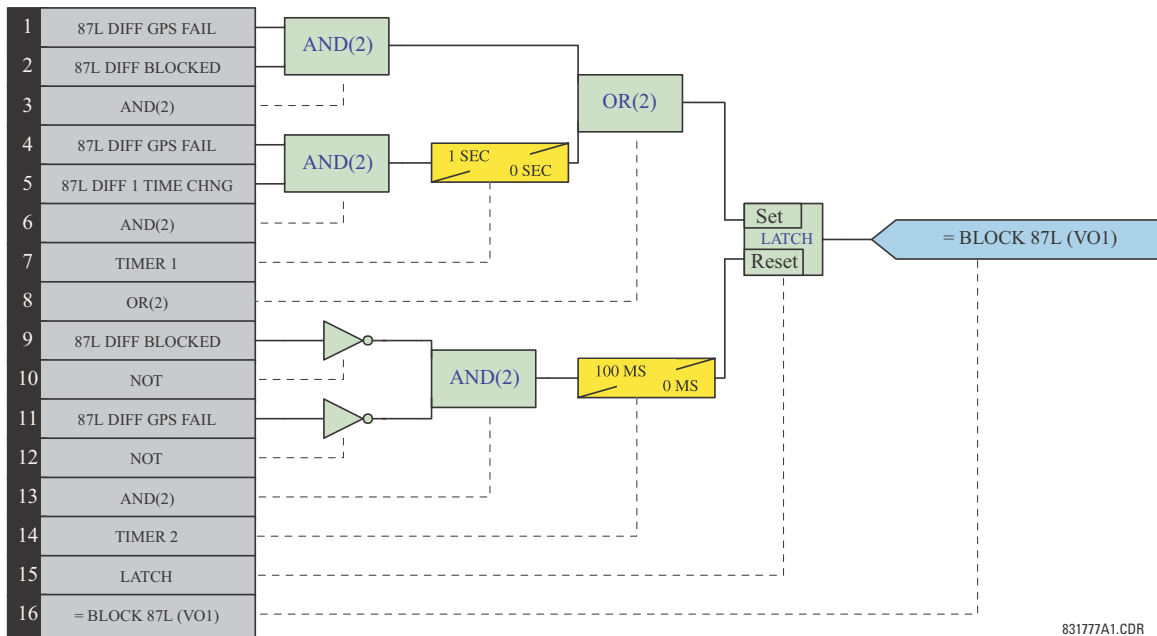

Enable GPS compensation on the loss of the GPS signal at any terminal and continue to operate the 87L element until a change in the channel round-trip delay is detected.

If GPS is enabled at all terminals and the GPS signal is present, the L90 compensates for the channel asymmetry. On the loss of the GPS signal, the L90 stores the last measured value of the channel asymmetry per channel and compensates for the asymmetry until the GPS clock is available. However, if the channel was switched to another physical path during GPS loss conditions, the 87L element must be blocked, since the channel asymmetry cannot be measured and system is no longer accurately synchronized. The value of the step change in the channel is preset in **L90 POWER SYSTEM** settings menu and signaled by the 87L DIFF 1(2) TIME CHNG FlexLogic™ operand. To implement this method, follow the steps below:

1. Enable Channel Asymmetry compensation by setting it to ON. Assign the GPS receiver failsafe alarm contact with the setting Block GPS Time Ref.

2. Create FlexLogic™ similar to that shown below to block the 87L element on GPS loss if step change in the channel delay occurs during GPS loss conditions or on a startup before the GPS signal is valid. For three-terminal systems, the 87L DIFF 1 TIME CHNG operand must be Ored with the 87L DIFF 2 TIME CHNG FlexLogic™ operand. The Block 87L (VO1) output is reset if the GPS signal is restored and the 87L element is ready to operate.

- Assign virtual output BLOCK 87L (VO1) to the 87L Current Differential Block setting. It can be used to enable backup protection, raise an alarm, and perform other functions as per the given protection philosophy.

9.3.3 COMPENSATION METHOD 2

Enable GPS compensation on the loss of the GPS signal at any terminal and block the 87L element after a specified time.

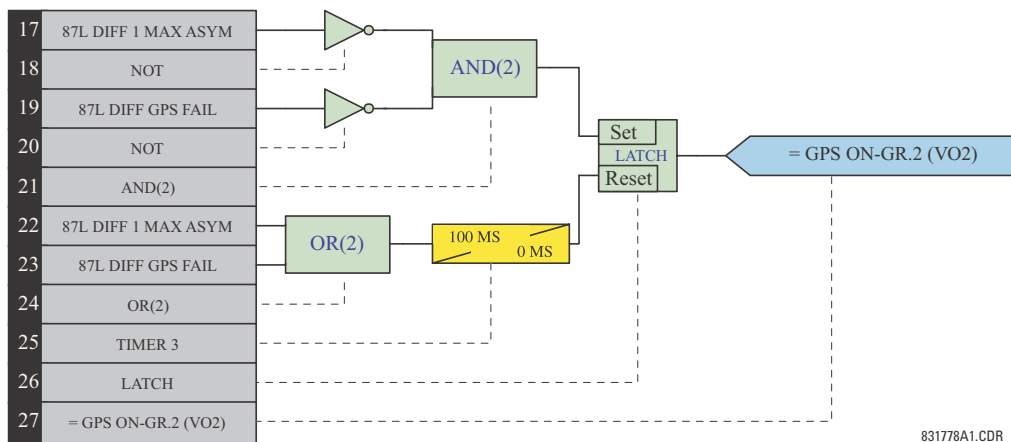

This is a simple and conservative way of using the GPS feature. Follow steps 1 and 3 in compensation method 1. The FlexLogic™ is simple: 87L DIFF GPS FAIL-Timer-Virtual Output Block 87L (VO1). It is recommended that the timer be set no higher than 10 seconds.

9.3.4 COMPENSATION METHOD 3

Continuously operate the 87L element but enable GPS compensation only when valid GPS signals are available. This provides less sensitive protection on GPS signal loss at any terminal and runs with higher pickup and restraint settings.

This approach can be used carefully if maximum channel asymmetry is known and doesn't exceed certain values (2.0 to 2.5 ms). The 87L DIFF MAX ASYM operand can be used to monitor and signal maximum channel asymmetry. Essentially, the L90 switches to another setting group with higher pickup and restraint settings, sacrificing sensitivity to keep the 87L function operational.

- Create FlexLogic similar to that shown below to switch the 87L element to Settings Group 2 (with most sensitive settings) if the L90 has a valid GPS time reference. If a GPS or 87L communications failure occurs, the L90 will switch back to Settings Group 1 with less sensitive settings.

2. Set the 87L element with different differential settings for Settings Groups 1 and 2 as shown below

SETTING	PARAMETER

L90_340.urs | System Setup

9.4.1 DESCRIPTION

Many high voltage lines have transformers tapped to the line serving as an economic approach to the supply of customer load. A typical configuration is shown in the figure below.

Figure 9-3: TYPICAL HV LINE CONFIGURATION

Two distinctly different approaches are available, Distance Backup and Distance Supervision, depending on which concerns are dominant. In either case, the distance function can provide a definite time backup feature to give a timed clearance for a failure of the L90 communications. Additionally, a POTT (Permissive Over-reaching Transfer Trip) scheme can be selected and activated after detection of an L90 communications failure, if an alternate lower bandwidth communications channel is available.

If **Distance Backup** is employed, dependability concerns usually relate to a failure of the communications. The distance elements can then effectively provide a means of fault identification and clearance. However, for a line with tapped transformers, a number of other issues need to be considered to ensure stability for the L90.

Any differential scheme has a potential problem when a LV fault occurs at the tapped transformer location, and the current at the tap is not measured. Because the transformer size can become quite large, the required increase in the differential setting to avoid operation for the LV bus fault can result in a loss of sensitivity.

If the tapped transformer is a source of zero sequence infeed, then the L90 zero-sequence current removal has to be enabled as described in the next section.

The zero sequence infeed creates an apparent impedance setting issue for the backup ground distance and the zero sequence compensation term is also not accurate, so that the positive sequence reach setting must be increased to compensate. The phase distance reach setting may also have to be increased to cope with a transfer across the two transformers, but this is dependent on the termination and configuration of the parallel line.

Three terminal line applications generally will result in larger reach settings for the distance backup and require a calculation of the apparent impedance for a remote fault. This should be carried out for each of the three terminals, as the calculated apparent impedance will be different at each terminal.

Distance Supervision essentially offers a solution for the LV fault condition, but the differential setting must still be increased to avoid operation for an external L-g or L-L-g fault external ground fault. In addition, the distance element reach setting must still see all faults within the protected line and be less than the impedance for a LV bus fault

The effective SIR (source impedance ratio) for the LV fault generally is not high, so that CVT transients do not contribute to measuring errors.

If the distance supervision can be set to avoid operation for a transformer LV fault, then generally the filtering associated with the distance measuring algorithm will ensure no operation under magnetizing inrush conditions. The distance element can be safely set up to $2.5 \times V_{nom} / I_{peak}$, where V_{nom} is the system nominal voltage and I_{peak} is the peak value of the magnetizing inrush current.

For those applications where the tapped station is close to one terminal, then it may be difficult to set the distance supervision to reach the end of the line, and at the same time avoid operation for a LV fault. For this system configuration, a 3-terminal L90 should be utilized; the third terminal is then fed from CT on the high side of the tapped transformer.

9.4.2 PHASE DISTANCE

a) PHASE CURRENT SUPERVISION AND THE FUSE FAILURE ELEMENT

The phase-to-phase (delta) current is used to supervise the phase distance elements, primarily to ensure that in a de-energized state the distance elements will not be picked up due to noise or induced voltages, on the line.

However, this supervision feature may also be employed to prevent operation under fuse failure conditions. This obviously requires that the setting must be above maximum load current and less than the minimum fault conditions for which operation is expected. This potential problem may be avoided by the use of a separate fuse fail function, which means that the phase current supervision can be set much lower, typically two times the capacitance charging current of the line.

The usage of the fuse fail function is also important during double-contingency events such as an external fault during fuse fail conditions. The current supervision alone would not prevent maloperation in such circumstances.

It must be kept in mind that the fuse failure element provided on the L90 needs some time to detect fuse fail conditions. This may create a race between the instantaneous zone 1 and the fuse failure element. Therefore, for maximum security, it is recommended to both set the current supervision above the maximum load current and use the fuse failure function. The current supervision prevents maloperation immediately after the fuse fail condition giving some time for the fuse failure element to take over and block the distance elements permanently. This is of a secondary importance for time-delayed zones 2 and up as the fuse failure element has some extra time for guaranteed operation. The current supervision may be set below the maximum load current for the time delayed zones.

Blocking distance elements during fuse fail conditions may not be acceptable in some applications and/or under some protection philosophies. Applied solutions may vary from not using the fuse failure element for blocking at all; through using it and modifying – through FlexLogic and multiple setting groups mechanisms – other protection functions or other relays to provide some protection after detecting fuse fail conditions and blocking the distance elements; to using it and accepting the fact that the distance protection will not respond to subsequent internal faults until the problem is addressed.

To be fully operational, the Fuse Failure element must be enabled, and its output FlexLogic operand must be indicated as the blocking signal for the selected protection elements.

For convenience, the current supervision threshold incorporates the $\sqrt{3}$ factor.

b) PHASE DISTANCE ZONE 1

As typically used for direct tripping, the zone 1 reach must be chosen so that it does not extend beyond the far end(s) of the protected line. Zone 1 provides nominally instantaneous protection for any phase fault within a pre-determined distance from the relay location. To ensure that no overreach occurs, typically requires a setting of 80 to 90% of the line length, which covers CT and VT errors, relay inaccuracy and transient overreach as well as uncertainty in the line impedance for each phase, although transposition may minimize this latter concern.

The total relay inaccuracy including both steady state and transient overreach even when supplied from CVTs under the source impedance ratios of up to 30, is below 5%.

c) PHASE DISTANCE ZONE 2

Zone 2 is an overreaching element, which essentially covers the final 10 to 20% whole of the line length with a time delay. The additional function for the zone 2 is as a timed backup for faults on the remote bus. Typically the reach is set to 125% of the positive-sequence impedance of the line, to ensure operation, with an adequate margin, for a fault at 100% of the line length. The necessary time delay must ensure that coordination is achieved with the clearance of a close-in fault on the next line section, including the breaker operating time.

The zone 2 time delay is typically set from 0.2 to 0.6 seconds, although this may have to be reviewed more carefully if a short line terminates on the remote bus, since the two zone 2 elements may overlap and therefore not coordinate in a satisfactory manner.

d) PHASE DISTANCE ZONE 3

If a remote backup philosophy is followed, then the reach of this element must be set to account for any infeed at the remote bus, plus the impedance of the longest line which terminates on this remote bus. The time delay must coordinate with other time-delayed protections on any remote line. Circuit loading limitations created by a long zone reach may be overcome by using lens or quadrilateral characteristics and/or a load encroachment supervising characteristic. Consider-

ation should also be given to a situation where the load impedance may enter into the relay characteristic for a time longer than the chosen time delay, which could occur transiently during a system power swing. For this reason the power swing blocking function should be used.

e) PHASE DISTANCE ZONE 4

A further contribution to remote backup, the reach of this element must be set to account for any infeed at the remote bus. The time delay must coordinate with other time-delayed protections on the next line. The use of a lens characteristic or the load encroachment element may be advantageous if load limits are a problem.

To avoid extremely large reach settings, the L90 has the ability to implement any element so that it is reverse looking, which then can provide a back up for the longest line terminated on the local bus. This strategy can be beneficial if the reduced reach helps discrimination between the load and fault conditions, but must be implemented at both ends of the protected line.

f) PHASE DISTANCE ZONE 5

An additional fifth phase distance zone can be used in special applications. This zone may be start zone for arming tripping from all other zones, in both forward and reverse directions of the of protected line. This zone may also be used as an additional reverse-looking zone for implementation of two reverse-looking zones, thus providing two zone backup reverse-looking protection. The fifth distance zone can be used as an alarm zone, indicating that load impedance is approaching the zone characteristic.

9.4.3 GROUND DISTANCE

a) NEUTRAL CURRENT SUPERVISION

The current supervision for the ground distance elements responds to an internally calculated neutral current ($3 \times I_0$). The setting for this element should be based on twice the zero-sequence line capacitance current or the maximum zero-sequence unbalance under maximum load conditions. This element should not be used to prevent an output when the load impedance is inside the distance characteristic on a steady state basis.

b) GROUND DISTANCE ZONE 1

The zone 1 reach must be set so that nominally instantaneous operation does not extend beyond the end of the protected line. However this may be somewhat more complicated than for the phase elements, because of zero sequence mutual induction with an adjacent parallel line, possibly carried on the same tower, which can be out of service and grounded at multiple points. A fault beyond 100% of the protected line may cause overreach unless the reach is reduced significantly, sometimes as low as 65% of the line length. If the line being protected does not have a significant interaction with an adjacent circuit, then the typical 80% setting may be used. If there is significant mutual coupling between the parallel lines, then the mutual compensation feature of the ground distance elements can be used instead of a drastic reduction in the reach.

However, even in this case, there is more uncertainty as compared with the phase distance elements because the zero-sequence impedance of the line and thus the zero-sequence-compensating factors may vary significantly due to weather and other conditions.

c) GROUND DISTANCE ZONE 2

To ensure that the zone 2 can see 100% of the line, inter-circuit mutual effects must be considered, as they can contribute to a significant under-reach. Typically this may occur on double circuit lines, when both lines may carry the same current. An analytical study should be carried out to determine the appropriate reach setting.

The main purpose of this element is to operate for faults beyond the reach of the local zone 1 element, and therefore a time delay must be used similar to the phase fault case.

d) GROUND DISTANCE ZONE 3

This remote back up function must have a reach which is set to account for any infeed at the remote bus, plus the impedance of the longest line which terminates on this remote bus. Similar to the phase fault case, a zone 3 element must be time coordinated with timed clearances on the next section.

e) GROUND DISTANCE ZONE 4

As a further contribution to a remote backup philosophy, the reach of this element must be set to account for any infeed at the remote bus. The time delay must coordinate with other time-delayed protections on the next line. The use of a lens characteristic or load encroachment element may be advantageous if load limits are a problem. To avoid extremely large reach settings the L90 has the ability to implement any element, so that it is reverse looking. This strategy can be beneficial if the reduced reach enhances the discrimination between the load and fault conditions. It should be recognized however that, if adopted, this approach must be implemented at both ends of the protected line.

f) GROUND DISTANCE ZONE 5

An additional fifth ground distance zone can be used in special applications. This zone may be start zone for arming tripping from all other zones, in both forward and reverse directions of the of protected line. This zone may also be used as an additional reverse-looking zone for implementation of two reverse-looking zones, thus providing two zone backup reverse-looking protection. The fifth distance zone can be used as an alarm zone, indicating that load impedance is approaching the zone characteristic.

9.5.1 OVERVIEW

The L90 includes six common pilot-aided schemes:

- direct under-reaching transfer trip (DUTT)
- permissive under-reaching transfer trip (PUTT)
- permissive over-reaching transfer trip (POTT)
- hybrid permissive over-reaching transfer trip (Hybrid POTT)
- directional comparison blocking
- directional comparison unblocking

9.5.2 DIRECT UNDER-REACHING TRANSFER TRIP (DUTT)

This scheme uses an under-reaching Zone 1 distance element to key a transfer trip signal to the remote end(s), where on receipt, the DUTT pilot scheme operates without any additional supervision.

For proper operation of the scheme the Zone 1 phase and ground distance elements must be enabled, configured and set per rules of distance relaying.

The scheme generates an output operand (DUTT TX) that is used to transmit the signal to the remote end. Choices of communications channel include Remote Inputs/Outputs and telecommunications interfaces. When used with telecommunications facilities the output operand should be assigned to operate an output contact connected to key the transmitter at the interface.

Note that the same protection signaling may be used by a breaker failure scheme, in which case the signal can be sealed in by breaker fail for a time longer than the auto-reclose “reclaim” time which then prevents auto-reclose when not required.

A provision for an optional seal-in of the send signal is made to cover those situations where PLC (Power Line Carrier) signaling is used and the signal must be transmitted in a potentially noisy situation due to the fault.

The scheme output operand (DUTT OP) must be configured to interface with other relay functions, output contacts in particular, in order to make the scheme fully operational. Typically, the output operand should be programmed to initiate a trip, breaker fail, and auto-reclose, and drive a user-programmable LED as per user application.

9.5.3 PERMISSIVE UNDER-REACHING TRANSFER TRIP (PUTT)

This scheme uses an under-reaching Zone 1 distance element to key a transfer trip signal to the remote end where it is supervised by the over-reaching Zone 2 distance elements.

For proper operation of the scheme the Zone 1 and 2 phase and ground distance elements must be enabled, configured and set per rules of distance relaying.

The scheme generates an output operand (PUTT TX) that is used to transmit the signal to the remote end. Choices of communications channel include Remote Inputs/Outputs and telecommunications interfaces. When used with telecommunications facilities the output operand should be assigned to operate an output contact connected to key the transmitter at the interface.

The PUTT RX PICKUP DELAY timer can be used to ride through spurious PLC receive signals.

The scheme output operand (PUTT OP) must be configured to interface with other relay functions, output contacts in particular, in order to make the scheme fully operational. Typically, the output operand should be programmed to initiate a trip, breaker fail, and auto-reclose, and drive a user-programmable LED as per user application.

9.5.4 PERMISSIVE OVER-REACHING TRANSFER TRIP (POTT)

This scheme is intended for two-terminal line applications only.

This scheme uses an over-reaching Zone 2 distance element to essentially compare the direction to a fault at both the ends of the line.

Ground directional overcurrent functions available in the relay can be used in conjunction with the Zone 2 distance element to key the scheme and initiate its operation. This provides increased coverage for high-resistance faults.

Good directional integrity is the key requirement for an over-reaching forward-looking protection element used to supplement Zone 2. Even though any FlexLogic operand could be used for this purpose allowing the user to combine responses of various protection elements, or to apply extra conditions through FlexLogic™ equations, this extra signal is primarily meant to be the output operand from either the Negative-Sequence Directional IOC or Neutral Directional IOC. Both of these elements have separate forward (FWD) and reverse (REV) output operands. The forward indication should be used (NEG SEQ DIR OC1 FWD or NEUTRAL DIR OC1 FWD).

An important consideration is when one of the line terminals is open. It is then necessary to identify this condition and arrange for a continuous sending of the permissive signal or use a slower but more secure echo feature to send a signal to the other terminal, which is producing the fault infeed. With any echo scheme however, a means must be provided to avoid a permanent lock up of the transmit/receive loop. The echo co-ordination (ECHO DURATION) and lock-out (ECHO LOCK-OUT) timers perform this function by ensuring that the permissive signal is echoed once for a guaranteed duration of time before going to a lockout for a settable period of time.

It should be recognized that in ring bus or breaker and a half situations, it may be the line disconnect or a combination of the disconnect and/or the breaker(s) status that is the indication that the terminal is open.

The **POTT RX PICKUP DELAY** timer is included in the permissive receive path to ride through spurious receive outputs that may be produced during external faults, when power line carrier is utilized as the communications medium.

No current reversal logic is included for the overreaching phase and ground distance elements, because long reaches are not usually required for two terminal lines. A situation can occur however, where the ground distance element will have an extended reach. This situation is encountered when it is desired to account for the zero sequence inter-circuit mutual coupling. This is not a problem for the ground distance elements in the L90 which do have a current reversal logic built into their design as part of the technique used to improve ground fault directionality.

Unlike the distance protection elements the ground directional overcurrent functions do not have their reach well defined, therefore the current reversal logic is incorporated for the extra signal supplementing Zone 2 in the scheme. The transient blocking approach for this POTT scheme is to recognize that a permissive signal has been received and then allow a settable time **TRANS BLOCK PICKUP DELAY** for the local forward looking directional element to pick up.

The scheme generates an output operand (POTT TX) that is used to transmit the signal to the remote end. Choices of communications channel include Remote Inputs/Outputs and telecommunications interfaces. When used with telecommunications facilities the output operand should be assigned to operate an output contact connected to key the transmitter at the interface. Power Line Carrier (PLC) channels are not recommended for this scheme since the PLC signal can be interrupted by a fault.

For proper operation of the scheme the Zone 2 phase and ground distance elements must be enabled, configured and set per rules of distance relaying. The Line Pickup element should be enabled, configured and set properly to detect line-end-open/weak-infeed conditions.

If used by this scheme, the selected ground directional overcurrent function(s) must be enabled, configured and set accordingly. The output operand from the scheme (POTT OP) must be configured to interface with other relay functions, output contacts in particular, in order to make the scheme fully operational. Typically, the output operand should be programmed to initiate a trip, breaker fail, and auto-reclose, and drive a user-programmable LED as per user application.

9.5.5 HYBRID POTT SCHEME (HYB-POTT)

Generally, this scheme uses an over-reaching Zone 2 distance element to essentially compare the direction to a fault at both ends of the line. Ground directional overcurrent functions available in the relay can be used in conjunction with the Zone 2 distance element to key the scheme and initiate its operation. This increases the coverage for high-resistance faults.

The scheme is intended for three-terminal applications and for weak-infeed conditions. As a long reach of the overreaching distance element may be required for three-terminal applications, transient blocking logic is provided for both distance and ground directional overcurrent elements. In order to cope with weak-infeed conditions an echo feature is made available.

By default the scheme uses the reverse-looking Zone 4 distance element to identify reverse faults. Additionally, reverse-looking ground directional overcurrent functions can be used in conjunction with Zone 4.

For proper operation of the scheme the Zone 2 and 4 phase and ground distance elements must be enabled, configured and set per rules of distance relaying. The Line Pickup element should be enabled, configured and set properly to detect line-end-open/weak-infeed and undervoltage conditions.

If used by this scheme, the selected ground directional overcurrent function(s) must be enabled, configured, and set accordingly.

The scheme generates an output operand (HYBRID POTT TX) that is used to transmit the signal to the remote end. Choices of communications channel include Remote Inputs/Outputs and telecommunications interfaces. When used with telecommunications facilities the output operand should be assigned to operate an output contact connected to key the transmitter at the interface.

For more application recommendation refer to the POTT scheme.

The output operand from the scheme (HYBRID POTT OP) must be configured to interface with other relay functions, output contacts in particular, in order to make the scheme fully operational. Typically, the output operand should be programmed to initiate a trip, breaker fail, and auto-reclose, and drive a user-programmable LED as per user application.

9.5.6 DIRECTIONAL COMPARISON BLOCKING

Generally, the scheme compares the direction to a fault at both ends of the line. Unlike the permissive schemes, the absence of a blocking signal permits operation of the scheme. Consequently, the scheme is biased toward dependability and requires an “on/off” type of signaling.

By default this scheme uses only a forward-looking over-reaching Zone 2 distance element to identify forward faults. Ground directional overcurrent functions available in the relay can be used in conjunction with the Zone 2 distance element to increase the coverage for high-resistance faults.

By default the scheme uses only a reverse-looking Zone 4 distance element to identify reverse faults. Ground directional overcurrent functions available in the relay can be used in conjunction with the Zone 4 distance element for better time and sensitivity coordination.

For proper operation of the scheme the Zone 2 and 4 phase and ground distance elements must be enabled, configured and set per rules of distance relaying.

If used by this scheme, the selected ground directional overcurrent function(s) must be enabled, configured and set accordingly.

The scheme generates output operands (BLOCKING SCHEME TX INIT and BLOCKING SCHEME TX STOP) that are used control the transmission of signals to the remote end. Choices of communications channel include Remote Inputs/Outputs and telecommunications interfaces. When used with telecommunications facilities the output operand should be assigned to operate an output contact connected to key the transmitter at the interface.

A blocking scheme may be preferred over a Hybrid POTT scheme, because of shorter reach settings for the Zone 2 elements. This follows from the fundamental difference that all zone 2 elements are required to see an internal fault for the POTT approach, under all system conditions, which in turn, means that the reversed Zone 4 block initiate elements must also have an increased reach. A blocking scheme on the other hand, can have much shorter Zone 2 reach settings if sequential clearance can be accepted. The simple rule to ensure that all faults can be cleared, is for each terminal to have a reach setting equal to the distance to the tap plus twice the distance from the tap to the remote terminal.

The Zone 2 element must have a coordinating timer **BLOCK RX CO-ORD PKP DELAY**, to ensure that the blocking signal is received for all external faults that are within the set reach of the local overreaching Zone 2.

Transient blocking logic is implemented via the **TRANS BLOCK** timer, which continues to send a blocking signal for a settable time **TRANS BLOCK RESET DELAY**, if it was being sent for at least 30 ms during the initial reverse fault set via **TRANS BLOCK PICKUP DELAY**.

The output operand from the scheme (BLOCKING SCHEME OP) must be configured to interface with other relay functions, output contacts in particular, in order to make the scheme fully operational. Typically, the output operand should be programmed to initiate a trip, breaker fail, and auto-reclose, and drive a user-programmable LED as per user application.

9.5.7 DIRECTIONAL COMPARISON UNBLOCKING

a) OVERVIEW

The directional comparison unblocking scheme is used with a frequency shift keying (FSK) PLC that produces a loss-of-guard output during an actual loss-of-guard signal condition and during reception of the permissive keyed frequency when the received carrier signal changed from guard to permissive frequency. The loss-of-guard signal should preferably be a normally-closed contact, allowing the scheme to get this signal if the communications equipment failed. This loss-of-guard output should be connected to a contact input of the L90. The power line carrier should also provide an output contact when the permissive frequency is received. This output should be wired to any other contact input of the L90.

The directional comparison unblocking scheme allows a window of opportunity for tripping the breaker fast if the permissive signal gets attenuated by the fault to a level below the receiver's threshold. The guard signal is monitored, and the relay is allowed to trip for a loss of guard without receipt of the permissive signal, if the relay sees the fault in the forward, and not reverse direction by means of the forward looking distance zone 2 and ground directional forward, if configured, and reverse looking distance zone 4 and ground directional reverse, if configured.

The scheme is active and ready for operation when the **DCUB BLOCK** setting is "Off" the **DCUB SCHEME FUNCTION** setting is "Enabled". The user can disable or block the scheme by assigning any FlexLogic operand to the **DCUB BLOCK** setting. This operand can consist of any pre-defined logic, including a pilot cutout switch connected to any contact input of the L90. With this pilot cutout switch and the pre-defined logic state on and assigned to **DCUB BLOCK**, the scheme will be disabled. The directional comparison unblocking scheme supervises the operation and keying of all scheme functions. The lockout feature of the scheme also supervises all scheme functions. All timers are fully adjustable, with typical values indicated.

Lockout of the directional comparison unblocking scheme is established as follows. Lockout of the scheme is started for a time duration set by **DCUB LOG TRIP WINDOW** setting if:

- The scheme is enabled *and not* blocked (that is, the scheme is active), and
- no permissive RX signal is received, and
- any loss-of-guard signal is received.

Lockout is sealed-in through an AND gate with the directional comparison unblocking scheme active and any loss-of-guard through **GUARD HEALTHY RESET DELAY** timer. The scheme will thus remain blocked during longer loss-of-guard or channel conditions for any of the configured channels. The **GUARD HEALTHY RESET DELAY** timer ensures that the scheme will remain locked out slightly longer after the loss-of-guard signal(s) is reset. This allows for all channel(s) stabilizing and contact denouncing. This timer determines how long the logic waits before enabling the directional comparison unblocking scheme when the communications channel is restored.

Operating of the directional comparison unblocking scheme consists of two parts: normal operation and loss-of-guard operation.

b) NORMAL OPERATION

Normal operation picks up under the following conditions:

- The scheme is enabled (**DCUB FUNCTION** is "Enabled" and **DCUB BLOCK** is "Off"), and
- any permissive signal is received with its associated loss-of-guard signal (e.g. DCUB RX1 and DCUB LOG1), and
- a fault is seen in the forward zone 2 distance elements or ground directional forward function (if configured), and
- the reverse zone 4 distance elements or ground directional reverse function (if configured) did not pickup to set the transient blocking, and
- the scheme is not locked out.

If these conditions are met, the trip table is run, operating the scheme and asserting DCUB OP FlexLogic operand. The trip table with the aid of the local phase selector and received RX signals will determine what tripping operands will be operated. During normal operation, the loss-of-guard signal will be seen momentarily before the permissive DCUB RX signal is received for each channel being operated, as the channel transitions from guard to permissive frequency, but the scheme operates instantaneously after any DCUB RX signal is received.

c) LOSS-OF-GUARD OPERATION

The loss-of-guard operation picks under the following conditions:

- The scheme is enabled (**DCUB FUNCTION** is “Enabled” and **DCUB BLOCK** is “Off”), and
- any loss-of-guard signal is received without its associated RX signal, and
- a fault is seen in the forward zone 2 distance elements *or* ground directional forward function (if configured), and
- the reverse zone 4 distance elements *or* ground directional reverse function (if configured) did not pickup to set the transient blocking.

If these conditions are met, then the **DCUB LOG PICKUP DELAY** timer is started. After this timer times out, the trip table is run, operating the scheme and asserting the DCUB OP FlexLogic operand. The trip table with the aid of the local phase selector and loss-of-guard signals will determine what tripping operands will be operated. The **DCUB LOG PICKUP DELAY** timer allows for any and all channel(s) to transition from guard to permissive before operating due to loss-of-guard in the presence of a forward fault. The time window of allowing the scheme to operate when no DCUB RX signal is received when any loss-of-guard was received is the difference between the **DCUB LOG TRIP WINDOW** and **DCUB LOG PICKUP DELAY** timers. When using default settings, this value is $150 - 8 = 142\text{ms}$. This means the scheme is unblocked and can trip during this time window if a forward fault is sensed.

d) KEYING OF THE CARRIER(S) UNDER NORMAL CONDITIONS

The keying signals, which allows the relay to key the permissive channel during normal permissive scheme operation by means of the DCUB TX1 through DCUB TX4 signals, are established as follows:

- The scheme is enabled (**DCUB FUNCTION** is “Enabled” and **DCUB BLOCK** is “Off”), and
- a fault is seen in the forward zone 2 distance elements *or* ground directional forward function (if configured), and
- the reverse zone 4 distance elements *or* ground directional reverse function (if configured) did not pickup to set the transient blocking.

If these conditions are met, then the scheme will key the channel(s) by means of asserting transmit signals DCUB TX1 through DCUB TX4 with the aid of the local phase selector or zone 2 distance elements.

e) KEYING OF THE CARRIER DURING ECHO CONDITIONS

The echo signal, which allows the relay to key the permissive channel(s) through the DCUB TX1 through DCUB TX4 transmit operands during echo conditions when the local breaker opened, will key the carrier(s) during the following conditions:

- The scheme is enabled (**DCUB FUNCTION** is “Enabled” and **DCUB BLOCK** is “Off”), and
- the **DCUB PERMISSIVE ECHO** setting is “Enabled”, and
- the LINE PICKUP LEO PKP operand that detects the local breaker to be open picks up for a time set by **LINE END OPEN PICKUP DELAY**, and
- any permissive signal DCUB RX1 through DCUB RX4 is received and any LOG1 to LOG4 is received, and
- a fault is *not* seen in the forward zone 2 distance elements *or* ground directional forward function (if configured) for at least 100 ms, and
- the reverse zone 4 distance elements *or* ground directional reverse function (if configured) did not pickup to set the transient blocking.

If these conditions are met, then the scheme will echo (transmit the DCUB TX1 through DCUB TX4 operands) the received permissive DCUB RX signal(s) back to the remote relay based on the echo table.

The keying or transmit signals DCUB TX1 through DCUB TX4 consist of all normal keying *or* echo keying conditions.

The scheme DCUB TRIP A, DCUB TRIB B, DCUB TRIP C, and DCUB TRIP 3P output operands are hard-wired to the trip output scheme. As such, if the trip output or breaker control operands (if the breaker control function is used) are used for tripping, the scheme fully operational. The permissive key carrier signals DCUB TX1 through DCUB TX4 must still be assigned to the tripping/operating logic, and to output contacts as per the usual L90 logic/output assignments.

9.6.1 DISTANCE SETTINGS ON SERIES COMPENSATED LINES

Traditionally, the reach setting of an underreaching distance function shall be set based on the net inductive impedance between the potential source of the relay and the far-end busbar, or location for which the zone must not overreach. Faults behind series capacitors on the protected and adjacent lines need to be considered for this purpose. For further illustration a sample system shown in the figure below is considered.

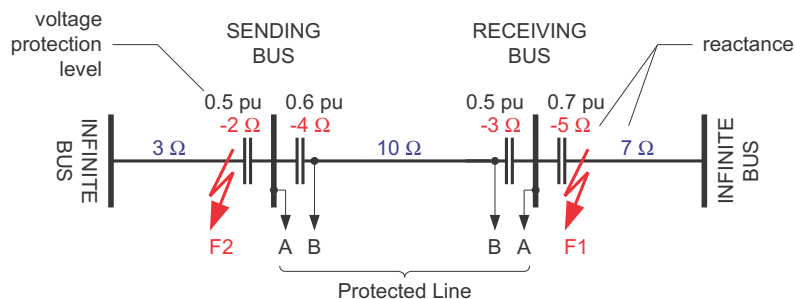

Figure 9-4: SAMPLE SERIES COMPENSATED SYSTEM

Assuming 20% security margin, the underreaching zone shall be set as follows.

At the Sending Bus, one must consider an external fault at F1 as the 5 Ω capacitor would contribute to the overreaching effect. Any fault behind F1 is less severe as extra inductive line impedance increases the apparent impedance:

Reach Setting: $0.8 \times (10 - 3 - 5) = 1.6 \Omega$ if the line-side (B) VTs are used

Reach Setting: $0.8 \times (10 - 4 - 3 - 5) = -1.6 \Omega$ if the bus-side (A) VTs are used

The negative value means that an underreaching zone cannot be used as the circuit between the potential source of the relay and an external fault for which the relay must not pick-up, is overcompensated, i.e. capacitive.

At the Receiving Bus, one must consider a fault at F2:

Reach Setting: $0.8 \times (10 - 4 - 2) = 3.2 \Omega$ if the line-side (B) VTs are used

Reach Setting: $0.8 \times (10 - 4 - 3 - 2) = 0.8 \Omega$ if the bus-side (A) VTs are used

Practically, however, to cope with the effect of sub-synchronous oscillations, one may need to reduce the reach even more. As the characteristics of sub-synchronous oscillations are in complex relations with fault and system parameters, no solid setting recommendations are given with respect to extra security margin for sub-synchronous oscillations. It is strongly recommended to use a power system simulator to verify the reach settings or to use an adaptive L90 feature for dynamic reach control.

If the adaptive reach control feature is used, the **PHS DIST Z1 VOLT LEVEL** setting shall be set accordingly.

This setting is a sum of the overvoltage protection levels for all the series capacitors located between the relay potential source and the far-end busbar, or location for which the zone must not overreach. The setting is entered in pu of the phase VT nominal voltage (RMS, not peak value).

If a minimum fault current level (phase current) is causing a voltage drop across a given capacitor that prompts its air gap to flash over or its MOV to carry practically all the current, then the series capacitor shall be excluded from the calculations (the capacitor is immediately by-passed by its overvoltage protection system and does not cause any overreach problems).

If a minimum fault current does not guarantee an immediate capacitor by-pass, then the capacitor must be included in the calculation: its overvoltage protection level, either air gap flash-over voltage or MOV knee-point voltage, shall be used (RMS, not peak value).

9

Assuming none of the series capacitors in the sample system is guaranteed to get by-passed, the following calculations apply:

For the Sending Bus: $0.5 + 0.7 = 1.2$ pu if the line-side (B) VTs are used
 $0.6 + 0.5 + 0.7 = 1.8$ pu if the bus-side (A) VTs are used

For the Receiving Bus: $0.6 + 0.5 = 1.1$ pu if the line-side (B) VTs are used
 $0.6 + 0.5 + 0.5 = 1.6$ pu if the bus-side (A) VTs are used

9.6.2 GROUND DIRECTIONAL OVERCURRENT

Ground directional overcurrent function (negative-sequence or neutral) uses an offset impedance to guarantee correct fault direction discrimination. The following setting rules apply.

1. If the net impedance between the potential source and the local equivalent system is inductive, then there is no need for an offset. Otherwise, the offset impedance shall be at least the net capacitive reactance.
2. The offset cannot be higher than the net inductive reactance between the potential source and the remote equivalent system. For simplicity and extra security, the far-end busbar may be used rather than the remote equivalent system.

As the ground directional functions are meant to provide maximum fault resistance coverage, it is justified to assume that the fault current is very low and none of the series capacitors is guaranteed to get by-passed. Consider settings of the negative-sequence directional overcurrent protection element for the Sample Series Compensated System.

For the Sending Bus relay, bus-side VTs:

- Net inductive reactance from the relay into the local system = $-2 + 3 = 1 \Omega > 0$; there is no need for offset.
- Net inductive reactance from relay through far-end busbar = $-4 + 10 - 3 = 3 \Omega$; the offset cannot be higher than 3Ω .
- It is recommended to use 1.5Ω offset impedance.

For the Sending Bus relay, line-side VTs:

- Net inductive reactance from relay into local system = $-2 + 3 - 4 = -3 \Omega < 0$; an offset impedance $\geq 3 \Omega$ must be used.
- Net inductive reactance from relay through far-end busbar = $10 - 3 = 7 \Omega$; the offset cannot be higher than 7Ω .
- It is recommended to use 5Ω offset impedance.

For the Receiving Bus relay, bus-side VTs:

- Net inductive reactance from relay into local system = $-5 + 7 = 2 \Omega > 0$; there is no need for offset.
- Net inductive reactance from relay through far-end busbar = $-3 + 10 - 4 = 3 \Omega$; the offset cannot be higher than 3Ω .
- It is recommended to use 1.5Ω offset impedance.

For the Receiving Bus relay, line-side VTs:

- Net inductive reactance from relay into local system = $-3 - 5 + 7 = -1 \Omega < 0$; an offset impedance $\geq 1 \Omega$ must be used.
- Net inductive reactance from relay through far-end busbar = $10 - 4 = 6 \Omega$; the offset cannot be higher than 6Ω .
- It is recommended to use 3.5Ω offset impedance.

9.7.1 DESCRIPTION

The L90 protection system could be applied to lines with tapped transformer(s) even if the latter has its windings connected in a grounded wye on the line side and the transformer(s) currents are not measured by the L90 protection system. The following approach is recommended.

If the setting **SYSTEM SETUP** ⇨ **L90 POWER SYSTEM** ⇨ **ZERO-SEQ CURRENT REMOVAL** is “Enabled”, all relays at the line terminals are calculating zero-sequence for both local and remote currents and are removing this current from the phase currents. This ensures the differential current is immune to the zero-sequence current outfeed caused by the in-zone transformer with a primary wye-connected winding solidly grounded neutral.

At all terminals the following is being performed:

$$\begin{aligned} I_{L_0} &= (I_{L_A} + I_{L_B} + I_{L_C}) / 3 && \text{local zero-sequence current} \\ I_{R_0} &= (I_{R_A} + I_{R_B} + I_{R_C}) / 3 && \text{remote zero-sequence current} \end{aligned}$$

Now, the $I_{\text{PHASE}} - I_0$ values (for Local and Remote) are being used instead of pure phase currents for differential and restraint current calculations. See the *Theory of Operation* chapter for additional details.

For example, the operating current in phase A is determined as:

$$I_{\text{op_A}}^2 = |(I_{L_A} - I_{L_0}) + (I_{R_A} - I_{R_0})|^2 : \text{squared operating current, phase A}$$

where: I_{L_A} = “local” current phase A
 I_{R_A} = “remote” current phase A
 I_{L_0} = local zero-sequence current
 I_{R_0} = remote zero-sequence current
 $I_{\text{op_A}}^2$ = operating (differential) squared current phase A

The restraint current is calculated in a similar way.

When the **ZERO-SEQ CURRENT REMOVAL** feature is enabled, the modified (I_0 removed) differential current in all three phases is shown in the **ACTUAL VALUES** ⇨ **METERING** ⇨ **87L DIFFERENTIAL CURRENT** menu. Local and remote currents values are not changed.

9.7.2 TRANSFORMER LOAD CURRENTS

As the tapped line may be energized from one terminal only, or there may be a low current flowing through the line, the slope setting of the differential characteristic would not guarantee stability of the relay on transformer load currents. Consequently, a pickup setting must be risen accordingly in order to prevent maloperation. The L90 forms its restraint current in a unique way as explained in Chapter 8. Unlike traditional approaches, the effects of slope and pickup settings are combined: the higher the slope, the lower the pickup setting required for the same restraining effect.

Assuming the line energized from one terminal and the current is below the lower break-point of the characteristic one should consider the following stability conditions in order to select the pickup (P) and slope (S_1) settings (I_{LOAD} is a maximum total load current of the tapped transformer(s)).

- Two-terminal applications:

$$\begin{aligned} I_{\text{op}}^2 &= I_{\text{LOAD}}^2 \\ I_{\text{REST}}^2 &= 2S_1^2 I_{\text{LOAD}}^2 + 2P^2 \\ \text{Stability condition: } 2S_1^2 I_{\text{LOAD}}^2 + 2P^2 &> I_{\text{LOAD}}^2 \end{aligned}$$

- Three-terminal applications:

$$\begin{aligned} I_{\text{op}}^2 &= I_{\text{LOAD}}^2 \\ I_{\text{REST}}^2 &= \frac{4}{3} S_1^2 I_{\text{LOAD}}^2 + 2P^2 \\ \text{Stability condition: } \frac{4}{3} S_1^2 I_{\text{LOAD}}^2 + 2P^2 &> I_{\text{LOAD}}^2 \end{aligned}$$

9

The above calculations should take into account the requirement for the pickup setting resulting from line charging currents. Certainly, a security factor must be applied to the above stability conditions. Alternatively, distance supervision can be considered to prevent maloperation due to transformer load currents.

9.7.3 LV-SIDE FAULTS

Distance supervision should be used to prevent maloperation of the L90 protection system during faults on the LV side of the transformer(s). As explained earlier, the distance elements should be set to overreach all line terminals, and at the same time safely underreach the LV busbars of all the tapped transformers. This may present some challenges, particularly for long lines and large transformer tapped close to the substations. If the L90 system retrofits distance relays, there is a good chance that one can set the distance elements to satisfy the imposed. If more than one transformer is tapped, particularly on parallel lines, and the LV sides are interconnected, detailed short circuit studies may be needed to determine the distance settings.

9.7.4 EXTERNAL GROUND FAULTS

External ground faults behind the line terminals will be seen by the overreaching distance elements. At the same time, the tapped transformer(s), if connected in a grounded wye, will feed the zero-sequence current. This current is going to be seen at one L90 terminal only, will cause a spurious differential signal, and consequently, may cause maloperation.

The L90 ensures stability in such a case by removing the zero-sequence current from the phase currents prior to calculating the operating and restraining signals (**SETTINGS** ⇨ ⇩ **SYSTEM SETUP** ⇨ ⇩ **L90 POWER SYSTEM** ⇨ ⇩ **ZERO-SEQ CURRENT REMOVAL** = "Enabled"). Removing the zero-sequence component from the phase currents may cause the L90 to overtrip healthy phases on internal ground fault. This is not a limitation, as the single-pole tripping is not recommended for lines with tapped transformers.

9.8.1 INSTANTANEOUS ELEMENT ERROR DURING L90 SYNCHRONIZATION

As explained in the *Theory of Operation* chapter, two or three L90 relays are synchronized to each other and to system frequency to provide digital differential protection and accurate measurements for other protection and control functions. When an L90 system is starting up, the relays adjust their frequency aggressively to bring all relays into synchronization with the system quickly. The tracking frequency can differ from nominal (or system frequency) by a few Hertz, especially during the first second of synchronization. The 87L function is blocked during synchronization; therefore, the difference between system frequency and relay sampling frequency does not affect 87L function. However, instantaneous elements have additional error caused by the sensitivity of Fourier phasor estimation to the difference between signal frequency and tracking frequency.

To secure instantaneous element operation, it is recommended either to use FlexLogic as shown below to block the instantaneous elements during synchronization, or to use a different setting group with more conservative pickup for this brief interval.

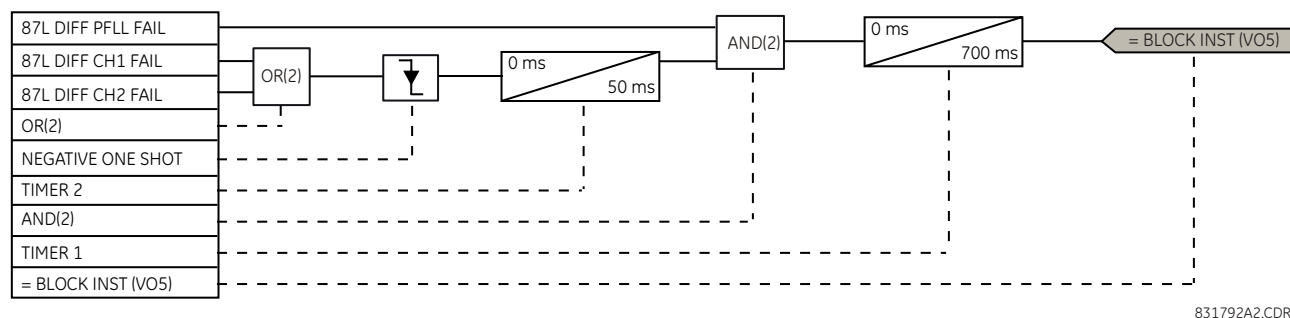

Figure 9-5: FLEXLOGIC TO BLOCK INSTANTANEOUS ELEMENT DURING 87L STARTUP

The elements must be treated selectively. If, for example, the phase undervoltage setting includes margin sufficient to accommodate the maximum additional error on startup, blocking or delay are not needed for phase undervoltage. Similarly, if the phase instantaneous overcurrent setting has sufficient margin, blocking is not needed. Note that significant zero-sequence and negative-sequence current or voltage error will not appear during L90 startup, therefore all elements using these quantities are safe.

The table below indicates the maximum error and recommended block durations for different elements.

ELEMENT	MAXIMUM ERROR ON STARTUP, (OPERATE SIGNAL VS. SETTING)	RECOMMENDED BLOCK DURATION
Phase undervoltage	18%	0.7 seconds
Phase instantaneous overcurrent	9%	0.5 seconds
Ground distance zone 1	7%	Not needed
Phase distance zone 1	4%	Not needed

9.9.1 PHASE DISTANCE PROTECTION

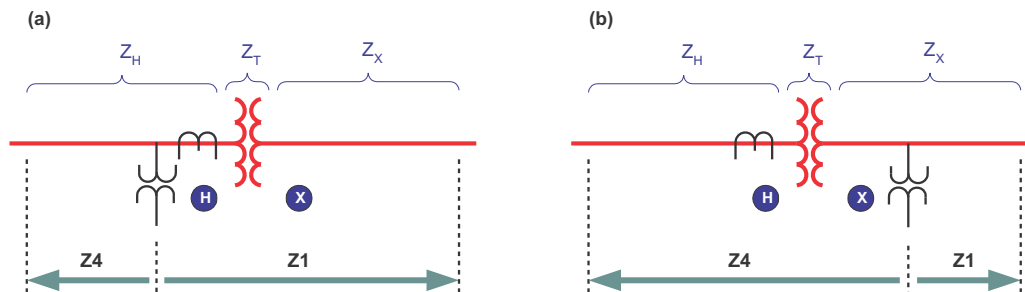

a) DESCRIPTION

Phase distance elements of the L90 could be set to respond to faults beyond any three-phase power transformer. The relay guarantees accurate reach and targeting for any phase fault. Moreover, the current and voltage transformers may be located independently on different sides of the transformer.

The following setting rules apply to this feature:

1. A given distance zone is terminated by location of the VTs, not the CTs.
2. Consequently, the positive-sequence impedance of a transformer must be included in the reach setting only if the transformer is located between the potential source and the intended reach point.
3. The current signals require compensation if the transformer is located between the CTs and the intended reach point. If this is the case the CT connection setting shall be set to transformer connection and vector group as seen from the CTs toward the reach point. Otherwise, the CT connection setting shall be set to "None".
4. The voltage signals require compensation if the transformer is located between the VTs and the intended reach point. If this is the case the VT connection setting shall be set to transformer connection and vector group as seen from the VTs toward the reach point. Otherwise, the VT connection setting shall be set to "None".
5. The reach setting is entered in secondary ohms and as such must take into account location and ratios of VTs and CTs as well as voltage ratio of the involved power transformer.

The following equations explain the setting rules. Consider two applications as shown in the figure below:

PHASE DISTANCE LOOKING THROUGH A POWER TRANSFORMER where: Z_X = intended reach impedance for Zone 1

(primary ohms)

Z_H = intended reach impedance for (primary ohms)

Z_T = positive-sequence impedance of the transformer

V_X, V_H = transformer rated voltages

n_{CT} = transformation ratio of the CTs

n_{VT} = transformation ratio of the VTs

Z_1 : Z1 reach setting (secondary ohms)

: Zone reach setting (secondary ohms)

b) ZONE 1 SETTING IN APPLICATION (A)

As the transformer is located between the potential source and the reach point for Zone 1, the reach impedance must include the positive-sequence impedance of the transformer. In addition, the primary impedance must be re-calculated for the voltage level of the VTs and CTs, and eventually, re-calculated to secondary quantities:

$$Z_1 = (Z_T(\text{at } X) + Z_X) \times \left(\frac{V_H}{V_X}\right)^2 \times \frac{n_{CT}}{n_{VT}} \quad (\text{EQ 9.21})$$

c) ZONE 4 SETTING IN APPLICATION (A)

As the transformer is not located between the potential source and the reach point for , the reach impedance must not include the positive-sequence impedance of the transformer. Because both VTs and CTs are located on the same side as the intended reach point, no correction for the transformer ratio is required. The primary impedance must be only re-calculated to secondary quantities:

d) ZONE 1 SETTING IN APPLICATION (B)

As the transformer is not located between the potential source and the reach point for Z1, the reach impedance must not include the positive-sequence impedance of the transformer. The CTs are located on the other side of the transformer, thus transformer ratio must be included:

$$Z_1 = Z_X \times \left(\frac{V_H}{V_X} \right) \times \frac{n_{CT}}{n_{VT}} \quad (\text{EQ 9.22})$$

e) ZONE 4 SETTING IN APPLICATION (B)

As the transformer is located between the potential source and the reach point for , the reach impedance must include the positive-sequence impedance of the transformer. The VTs are located on the other side of the transformer, thus transformer ratio must be included:

9.9.2 EXAMPLE

Given the following for the system shown in the previous section:

$Z_X = 30 \, \Omega \angle 85^\circ$ (intended reach of Zone 1)
 $Z_H = 0.06 \, \Omega \angle 88^\circ$ (intended reach of Zone)
 $n_{CT} = 8000:5 = 1600$ (located at H)
 $n_{VT} = 315000:120 = 2625$ (located at X)
 Transformer: 13.8/315 kV, 150 MVA, 10%, delta/wye, 315 kV side lagging 30°

Transformer impedance:

$$Z_T(\text{at H}) = \frac{10}{100} \times \frac{(13.8)^2}{150} = 0.127 \, \Omega \angle 90^\circ \quad (\text{EQ 9.23})$$

The Zone 1 settings are:

$$Z_1 = 30 \times \frac{13.8}{315} \times \frac{1600}{2625} = 0.8011 \, \Omega \angle 85^\circ \quad (\text{EQ 9.24})$$

PHS DIST Z1 REACH: "0.80"
 PHS DIST Z1 RCA: "85"
 PHS DIST Z1 XMFR VOL CONNECTION: "None"
 PHS DIST Z1 XMFR CUR CONNECTION: "Dy1"

The settings are:

PHS DIST REACH: "2.60"
 PHS DIST RCA: "89"
 PHS DIST XMFR VOL CONNECTION: "Yd11"
 PHS DIST XMFR CUR CONNECTION: "None"

10.1.1 CHANNEL TESTING

The communications system transmits and receives data between two or three terminals for the 87L function. The system is designed to work with multiple channel options including direct and multiplexed optical fiber, G.703, and RS422. The speed is 64 Kbaud in a transparent synchronous mode with automatic synchronous character detection and CRC insertion.

The Local Loopback Channel Test verifies the L90 communication modules are working properly. The Remote Loopback Channel Test verifies the communication link between the relays meets requirements (BER less than 10^{-4}). All tests are verified by using the internal channel monitoring and the monitoring in the Channel Tests. All of the tests presented in this section must be either OK or PASSED.

1. Verify that a type "W" module is placed in slot 'W' in both relays (e.g. W7J).
2. Interconnect the two relays using the proper media (e.g. single mode fiber cable) observing correct connection of receiving (Rx) and transmitting (Tx) communications paths and turn power on to both relays.
3. Verify that the Order Code in both relays is correct.
4. Cycle power off/on in both relays.
5. Verify and record that both relays indicate In Service on the front display.
6. Make the following setting change in both relays: **GROUPED ELEMENTS** ⇒ **GROUP 1** ⇒ **CURRENT DIFFERENTIAL ELEMENTS** ⇒ **CURRENT DIFFERENTIAL** ⇒ **CURRENT DIFF FUNCTION**: "Enabled".
7. Verify and record that both relays have established communications with the following status checks:
ACTUAL VALUES ⇒ **STATUS** ⇒ **CHANNEL TESTS** ⇒ **CHANNEL 1 STATUS**: "OK"
ACTUAL VALUES ⇒ **STATUS** ⇒ **CHANNEL TESTS** ⇒ **CHANNEL 2 STATUS**: "OK" (If used)
8. Make the following setting change in both relays: **TESTING** ⇒ **TEST MODE**: "Enabled".
9. Make the following setting change in both relays:
TESTING ⇒ **CHANNEL TESTS** ⇒ **LOCAL LOOPBACK TEST** ⇒ **LOCAL LOOPBACK CHANNEL NUMBER**: "1"
10. Initiate the Local Loopback Channel Tests by making the following setting change:
TESTING ⇒ **CHANNEL TESTS** ⇒ **LOCAL LOOPBACK TEST** ⇒ **LOCAL LOOPBACK FUNCTION**: "Yes"
Expected result: In a few seconds "Yes" should change to "Local Loopback Test PASSED" and then to "No", signifying the test was successfully completed and the communication modules operated properly.
11. If Channel 2 is used, make the following setting change and repeat Step 10 for Channel 2 as performed for channel 1:
TESTING ⇒ **CHANNEL TESTS** ⇒ **LOCAL LOOPBACK TEST** ⇒ **LOCAL LOOPBACK CHANNEL NUMBER**: "2"
12. Verify and record that the Local Loopback Test was performed properly with the following status check:
ACTUAL VALUES ⇒ **STATUS** ⇒ **CHANNEL TESTS** ⇒ **CHANNEL 1(2) LOCAL LOOPBACK STATUS**: "OK"
13. Make the following setting change in one of the relays:
TESTING ⇒ **CHANNEL TESTS** ⇒ **REMOTE LOOPBACK TEST** ⇒ **REMOTE LOOPBACK CHANNEL NUMBER**: "1"
14. Initiate the Remote Loopback Channel Tests by making the following setting change:
TESTING ⇒ **CHANNEL TESTS** ⇒ **REMOTE LOOPBACK** ⇒ **REMOTE LOOPBACK FUNCTION**: "Yes"
Expected result: The "Running Remote Loopback Test" message appears; within 60 to 100 sec. the "Remote Loopback Test PASSED" message appears for a few seconds and then changes to "No", signifying the test successfully completed and communications with the relay were successfully established. The "Remote Loopback Test FAILED" message indicates that either the communication link quality does not meet requirements (BER less than 10^{-4}) or the channel is not established – check the communications link connections.
15. If Channel 2 is used, make the following setting change and repeat Step 14 for Channel 2 as performed for Channel 1:
TESTING ⇒ **CHANNEL TESTS** ⇒ **REMOTE LOOPBACK TEST** ⇒ **REMOTE LOOPBACK CHANNEL NUMBER**: "2"
16. Verify and record the Remote Loopback Test was performed properly with the following status check:
ACTUAL VALUES ⇒ **STATUS** ⇒ **CHANNEL TESTS** ⇒ **CHANNEL 1(2) REMOTE LOOPBACK STATUS**: "OK"

17. Verify and record that Remote Loopback Test fails during communications failures as follows: start test as per Steps 13 to 14 and in 2 to 5 seconds disconnect the fiber Rx cable on the corresponding channel.

Expected result: The "Running Remote Loopback Test" message appears. When the channel is momentarily cut off, the "Remote Loopback Test FAILED" message is displayed. The status check should read as follows: **ACTUAL VALUES** ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **CHANNEL 1(2) LOCAL LOOPBACK STATUS:** "Fail"

18. Re-connect the fiber Rx cable. Repeat Steps 13 to 14 and verify that Remote Loopback Test performs properly again.
19. Verify and record that Remote Loopback Test fails if communications are not connected properly by disconnecting the fiber Rx cable and repeating Steps 13 to 14.

Expected result: The **ACTUAL VALUES** ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **CHANNEL 1(2) REMOTE LOOPBACK TEST:** "Fail" message should be constantly on the display.

20. Repeat Steps 13 to 14 and verify that Remote Loopback Test is correct.
21. Make the following setting change in both relays: **TESTING** ⇨ **TEST MODE:** "Disabled"

During channel tests, verify in the ACTUAL VALUES ⇨ STATUS ⇨ CHANNEL TESTS ⇨ CHANNEL 1(2) LOST PACKETS display that the values are very low – even 0. If values are comparatively high, settings of communications equipment (if applicable) should be checked.

10.1.2 CLOCK SYNCHRONIZATION TESTS

The 87L clock synchronization is based upon a peer-to-peer architecture in which all relays are Masters. The relays are synchronized in a distributed fashion. The clocks are phase synchronized to each other and frequency synchronized to the power system frequency. The performance requirement for the clock synchronization is a maximum error of $\pm 130 \mu\text{s}$.

All tests are verified by using PFL status displays. All PFL status displays must be either OK or Fail.

1. Ensure that Steps 1 through 7 inclusive of the previous section are completed.
2. Verify and record that both relays have established communications with the following checks after 60 to 120 seconds:

ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **CHANNEL 1(2) STATUS:** "OK"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **REMOTE LOOPBACK STATUS:** "n/a"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **PFL STATUS:** "OK"

3. Disconnect the fiber Channel 1(2) Tx cable for less than 66 ms (not possible with direct fiber module).

Expected result: **ACTUAL VALUES** ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **CHANNEL 1(2) STATUS:** "OK"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **REMOTE LOOPBACK STATUS:** "n/a"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **PFL STATUS:** "OK"

If fault conditions are applied to the relay during these tests, it trips with a specified 87L operation time.

4. Disconnect the fiber Channel 1(2) Tx cable for more than 66 ms but less than 5 seconds.

Expected result: **ACTUAL VALUES** ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **CHANNEL 1(2) STATUS:** "OK"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **REMOTE LOOPBACK STATUS:** "n/a"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **PFL STATUS:** "OK"

If fault conditions are applied to the relay (after the channel is brought back) during these tests, it trips with a specified 87L operation time plus 50 to 80 ms required for establishing PFL after such interruption.

5. Disconnect the fiber Channel 1(2) Tx cable for more than 5 seconds.

Expected result: **ACTUAL VALUES** ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **CHANNEL 1(2) STATUS:** "OK"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **REMOTE LOOPBACK STATUS:** "n/a"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **PFL STATUS:** "Fail"

6. Reconnect the fiber Channel 1(2) Tx cable and in 6 to 8 seconds confirm that the relays have re-established communications again with the following status checks:

ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **CHANNEL 1(2) STATUS:** "OK"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **REMOTE LOOPBACK STATUS:** "n/a"
ACTUAL VALUES ⇨ **STATUS** ⇨ **CHANNEL TESTS** ⇨ **PFL STATUS:** "OK"

7. Apply a current of 0.5 pu at a frequency 1 to 3% higher or lower than nominal only to local relay phase A to verify that frequency tracking will not affect PFL when only one relay has a current input and both relays track frequency. Wait 200 seconds and verify the following:

ACTUAL VALUES ⇒ **STATUS** ⇒ **CHANNEL TESTS** ⇒ **PFL STATUS**: "OK"

ACTUAL VALUES ⇒ **METERING** ⇒ **TRACKING FREQUENCY** ⇒ **TRACKING FREQUENCY**: actual frequency at both relays

For 3-terminal configuration, the above-indicated tests should be carried out accordingly.

10.1.3 CURRENT DIFFERENTIAL

The 87L element has adaptive restraint and dual slope characteristics. The pickup slope settings and the breakpoint settings determine the element characteristics. The relay displays both local and remote current magnitudes and angles and the differential current which helps with start-up activities. When a differential condition is detected, the output operands from the element will be asserted along with energization of faceplate event indicators.

1. Ensure that relay will not issue any undesired signals to other equipment.
2. Ensure that relays are connected to the proper communication media, communications tests have been performed and the CHANNEL and PFL STATUS displays indicate OK.
3. Minimum pickup test with local current only:
 - Ensure that all 87L setting are properly entered into the relay and connect a test set to the relay to inject current into Phase A.
 - Slowly increase the current until the relay operates and note the pickup value. The theoretical value of operating current below the breakpoint is given by the following formula, where P is the pickup setting and S_1 is the Slope 1 setting (in decimal format):

$$I_{op} = \sqrt{2 \times \frac{P^2}{1 - 2S_1^2}} \quad (\text{EQ 10.1})$$

- Repeat the above test for different slope and pickup settings, if desired.
 - Repeat the above tests for Phases B and C.
4. Minimum pickup test with local current and simulated remote current (pure internal fault simulation):
 - Disconnect the local relay from the communications channel.
 - Loop back the transmit signal to the receive input on the back of the relay.
 - Wait until the CHANNEL and PFL status displays indicate OK.
 - Slowly increase the current until the relay operates and note the pickup value. The theoretical value of operating current below breakpoint is given by the following formula:

$$I_{op} = \sqrt{\frac{2P^2}{(1 + \text{TAP})^2 - 2S_1^2(1 + \text{TAP}^2)}} \quad (\text{EQ 10.2})$$

where TAP represents the CT Tap setting for the corresponding channel.

- Repeat the above test for different slope and pickup settings, if desired.
- During the tests, observe the current phasor at **ACTUAL VALUES** ⇒ **METERING** ⇒ **87L DIFF CURRENT** ⇒ **LOCAL IA**. This phasor should also be seen at **ACTUAL VALUES** ⇒ **METERING** ⇒ **87L DIFF CURRENT** ⇒ **TERMINAL 1(2) IA** along with a phasor of twice the magnitude at **ACTUAL VALUES** ⇒ **METERING** ⇒ **87L DIFF CURRENT** ⇒ **IA DIFF**.
- Repeat the above tests for Phases B and C.
- Restore the communication circuits to normal.

Download the UR Test software from the GE Multilin website (<http://www.gedigitalenergy.com/multilin>) or contact GE Multilin for information about the UR current differential test program which allows the user to simulate different operating conditions for verifying correct responses of the relays during commissioning activities.

10.1.4 LOCAL-REMOTE RELAY TESTS

a) DIRECT TRANSFER TRIP (DTT) TESTS

The direct transfer trip is a function by which one relay sends a signal to a remote relay to cause a trip of remote equipment. The local relay trip outputs will close upon receiving a direct transfer trip from the remote relay. The test procedure is as follows:

1. Ensure that relay will not issue any undesired signals to other equipment and all previous tests have been completed successfully.
2. Cycle power off/on in both relays.
3. Verify and record that both relays indicate In Service on the faceplate display.
4. Make the following setting change in the **SETTINGS** ⇒ **GROUPED ELEMENTS** ⇒ **LINE DIFFERENTIAL ELEMENT** ⇒ **CURRENT DIFFERENTIAL** menu of both relays:
CURRENT DIFF FUNCTION: "Enabled"
5. Verify and record that both relays have established communications by performing the following status check thorough the **ACTUAL VALUES** ⇒ **STATUS** ⇒ **CHANNEL TESTS** menu:
CHANNEL 1(2) STATUS: "OK"
6. At the remote relay, make the following changes in the **SETTINGS** ⇒ **GROUPED ELEMENTS** ⇒ **LINE DIFFERENTIAL ELEMENT** ⇒ **CURRENT DIFFERENTIAL** menu:
CURRENT DIFF DTT: "Enabled"
7. At the Local relay, make the following changes in the **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **CONTACT OUTPUT N1** menu:
CONTACT OUTPUT N1 OPERATE: "87L DIFF RECVD DTT"
8. At the Local relay, verify that **ACTUAL VALUES** ⇒ **STATUS** ⇒ **CONTACT OUTPUTS** ⇒ **Cont Op N1** is in the "Off" state.
9. Apply current to phase A of the remote relay and increase until 87L operates.
10. At the Local relay, observe **ACTUAL VALUES** ⇒ **STATUS** ⇒ **CONTACT OUTPUTS** ⇒ **Cont Op N1** is now in the "On" state.
11. Repeat steps 8 through 10 for phases A and B and observe Contact Outputs N2 and N3, respectively.
12. Repeat steps 8 through 11 with the Remote and Local relays inter-changed.
13. Make the following setting change in the **SETTINGS** ⇒ **GROUPED ELEMENTS** ⇒ **LINE DIFFERENTIAL ELEMENT** ⇒ **CURRENT DIFFERENTIAL** menu of both relays:
CURRENT DIFF FUNCTION: "Disabled"
14. At the Remote relay, set **SETTINGS** ⇒ **INPUTS/OUTPUTS** ⇒ **CONTACT OUTPUT N1** ⇒ **CONTACT OUTPUT N1 OPERATE** to the CURRENT DIFF KEY DTT operand.
15. At the Local relay, observe under the **ACTUAL VALUES** ⇒ **STATUS** ⇒ **CONTACT OUTPUTS** menu that **CONTACT OUTPUT N1, N2 and N3** are "Off".
16. At the Remote relay, set **SETTINGS** ⇒ **TESTING** ⇒ **FORCE CONTACT INPUTS** ⇒ **FORCE Cont Ip N1** to "Closed".
17. At the Local relay, observe under **ACTUAL VALUES** ⇒ **STATUS** ⇒ **CONTACT OUTPUTS** that **CONTACT OUTPUT N1, N2 and N3** are now "On".
18. At both the Local and Remote relays, return all settings to normal.

b) FINAL TESTS

As proper operation of the relay is fundamentally dependent on the correct installation and wiring of the CTs, it must be confirmed that correct data is brought into the relays by an on-load test in which simultaneous measurements of current and voltage phasors are made at all line terminals. These phasors and differential currents can be monitored at the **ACTUAL VALUES** ⇒ **METERING** ⇒ **87L DIFFERENTIAL CURRENT** menu where all current magnitudes and angles can be observed and conclusions of proper relay interconnections can be made.

11.1.1 REPLACE A MODULE

11

WARNING

Withdraw or insert a module only when control power has been removed from the unit, and be sure to insert only the correct module type into a slot, else personal injury, damage to the unit or connected equipment, or undesired operation can result.

NOTICE

To avoid damage to the equipment, use proper electrostatic discharge protection (for example, a static strap) when coming in contact with modules while the relay is energized.

The relay, being modular in design, allows for the withdrawal and insertion of modules. Modules must only be replaced with like modules in their original factory configured slots.

The enhanced faceplate can be opened to the left, once the thumb screw has been removed, as shown below. This allows for easy accessibility of the modules for withdrawal. The new wide-angle hinge assembly in the enhanced front panel opens completely and allows easy access to all modules in the L90.

842812A1.CDR

Figure 11-1: UR MODULE WITHDRAWAL AND INSERTION (ENHANCED FACEPLATE)

The standard faceplate can be opened to the left, once the sliding latch on the right side has been pushed up, as shown below. This allows for easy accessibility of the modules for withdrawal.

842760A1.CDR

Figure 11-2: UR MODULE WITHDRAWAL AND INSERTION (STANDARD FACEPLATE)

To properly remove a module, the ejector/inserter clips, located at the top and bottom of each module, must be pulled simultaneously. Before performing this action, **control power must be removed from the relay**. Record the original location of the module to ensure that the same or replacement module is inserted into the correct slot. Modules with current input provide automatic shorting of external CT circuits.

To properly insert a module, ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/ inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module will be fully inserted.

CPU connections must be individually disconnected from the module before the module can be removed from the chassis.

The new CT/VT modules can only be used with new CPUs; similarly, old CT/VT modules can only be used with old CPUs. In the event that there is a mismatch between the CPU and CT/VT module, the relay does not function and a **DSP ERROR** or **HARDWARE MISMATCH** error displays.

11.2.1 REPLACE BATTERY

11

When required, the battery can be replaced. The power supply module contains the battery.

To avoid injury, ensure that the unit has been powered off for a minimum of three minutes before replacing the battery.

Risk of fire if battery is replaced with incorrect type or polarity.

To replace the battery:

1. Turn off the power to the unit.
2. Wait a minimum of three minutes to ensure that there is no power to the battery.
3. As outlined in the previous section, open the unit by sliding up the latch on the right side of the front panel and opening the panel to the left.
4. Unscrew the bracket on the front left of the unit so that you can open fully the front panel to access the power supply module, which is typically in the first slot on the left side.
5. Simultaneously pull the ejector clips at the top and bottom of the power supply module and remove the module.
6. Unscrew the screw that attaches the metal cover to the module.
7. Slide the metal cover away from the clips about 1 cm (1/4 inch) and remove the cover.
8. Unclip the black plastic holder that keeps the battery in place. The plastic clips into the socket at the bottom on both sides. Use a flat-head screwdriver if you cannot unclip the plastic with your fingers.
9. Observe the + and - polarity of the battery and replace it with the same polarity as marked on the battery holder. Replace the battery with the identical make and model. For example, do not use a rechargeable battery.

Figure 11-3: BATTERY LOCATION ON POWER SUPPLY MODULE

10. Reinstall the battery clip and the metal cover, and reinsert the power supply module into the unit.
11. Power on the unit.
12. Dispose of the old battery as outlined in the next section.

**EN Battery Disposal**

This product contains a battery that cannot be disposed of as unsorted municipal waste in the European Union. See the product documentation for specific battery information. The battery is marked with this symbol, which may include lettering to indicate cadmium (Cd), lead (Pb), or mercury (Hg). For proper recycling return the battery to your supplier or to a designated collection point. For more information see: www.recyclethis.info.

CS Nakládání s bateriemi

Tento produkt obsahuje baterie, které nemohou být zneškodněny v Evropské unii jako netříděný komunální odpad. Viz dokumentace k produktu pro informace pro konkrétní baterie. Baterie je označena tímto symbolem, který může zahrnovat i uvedena písmena, kadmium (Cd), olovo (Pb), nebo rtuť (Hg). Pro správnou recyklaci baterií vraťte svémudodavateli nebo na určeném sběrném místě. Pro více informací viz: www.recyclethis.info.

DA Batteri affald

Dette produkt indeholder et batteri som ikke kan bortskaffes sammen med almindeligt husholdningsaffald i Europa. Se produktinformation for specifikke informationer om batteriet. Batteriet er forsynet med indgraveret symboler for hvad batteriet indeholder: kadmium (Cd), bly (Pb) og kviksølv (Hg). Europæiske brugere af elektrisk udstyr skal aflevere kasserede produkter til genbrug eller til leverandøren. Yderligere oplysninger findes på webstedet www.recyclethis.info.

DE Entsorgung von Batterien

Dieses Produkt beinhaltet eine Batterie, die nicht als unsortierter städtischer Abfall in der europäischen Union entsorgt werden darf. Beachten Sie die spezifischen Batterie-Informationen in der Produktdokumentation. Die Batterie ist mit diesem Symbol gekennzeichnet, welches auch Hinweise auf möglicherweise enthaltene Stoffe wie Kadmium (Cd), Blei (Pb) oder Quecksilber (Hektogramm) darstellt. Für die korrekte Wiederverwertung bringen Sie diese Batterie zu Ihrem lokalen Lieferanten zurück oder entsorgen Sie das Produkt an den gekennzeichneten Sammelstellen. Weitere Informationen hierzu finden Sie auf der folgenden Website: www.recyclethis.info.

EL Απόρριψη μπαταριών

Αυτό το προϊόν περιέχει μια μπαταρία που δεν πρέπει να απορρίπτεται σε δημόσια συστήματα απόρριψης στην Ευρωπαϊκή Κοινότητα. Δείτε την τεκμηρίωση του προϊόντος για συγκεκριμένες πληροφορίες που αφορούν τη μπαταρία. Η μπαταρία είναι φέρει σήμανση με αυτό το σύμβολο, το οποίο μπορεί να περιλαμβάνει γράμματα για να δηλώσουν το κάδμιο (Cd), τον μόλυβδο (Pb), ή τον υδράργυρο (Hg). Για την κατάλληλη ανακύκλωση επιστρέψτε την μπαταρία στον προμηθευτή σας ή σε καθορισμένο σημείο συλλογής. Για περισσότερες πληροφορίες δείτε: www.recyclethis.info.

ES Eliminación de baterías

Este producto contiene una batería que no se pueda eliminar como basura normal sin clasificar en la Unión Europea. Examine la documentación del producto para la información específica de la batería. La batería se marca con este símbolo, que puede incluir siglas para indicar el cadmio (Cd), el plomo (Pb), o el mercurio (Hg). Para el reciclaje apropiado, devuelva este producto a su distribuidor o deshágase de él en los puntos de reciclaje designados. Para mas información : www.recyclethis.info.

ET Patareide kõrvaldamine

Käesolev toode sisaldab patareisid, mida Euroopa Liidus ei tohi kõrvaldada sorteerimata olmejäätmetena. Andmeid patareide kohta vaadake toote dokumentatsioonist. Patareid on märgistatud käesoleva sümboliga, millel võib olla kaadmiumi (Cd), pliid (Pb) või elavhõbedat (Hg) tähistavad tähed. Nõuetekohaseks ringluse võtmiseks tagastage patarei tarnijale või kindlaksmääratud vastuvõtupunkti. Lisainformatsiooni saab Internetist aadressil: www.recyclethis.info.

FI Paristoje ja akkujen hävittäminen

Tuote sisältää pariston, jota ei saa hävittää Euroopan Unionin alueella talousjätteen mukana. Tarkista tuoteselosteesta tuotteen tiedot. Paristo on merkitty tällä symbolilla ja saattaa sisältää kadmiumia (Cd), lyijyä (Pb) tai elohopeaa (Hg). Oikean kierrätystavan varmistamiseksi palauta tuote paikalliselle jälleenmyyjälle tai palauta se paristojen keräyspisteeseen. Lisätietoja sivuilla www.recyclethis.info.

FR Élimination des piles

Ce produit contient une batterie qui ne peuvent être éliminés comme déchets municipaux non triés dans l'Union européenne. Voir la documentation du produit au niveau des renseignements sur la pile. La batterie est marqué de ce symbole, qui comprennent les indications cadmium (Cd), plomb (Pb), ou mercure (Hg). Pour le recyclage, retourner la batterie à votre fournisseur ou à un point de collecte. Pour plus d'informations, voir: www.recyclethis.info.

HU Akkumulátor hulladék kezelése

Ezen termék akkumulátort tartalmaz, amely az Európai Unióban csak a kijelölt módon és helyen dobható ki. A terméken illetve a mellékelt ismertetőn olvasható a kadmium (Cd), ólom (Pb) vagy higany (Hg) tartalomra utaló betűjelzés. A hulladék akkumulátor leadható a termék forgalmazójánál új akkumulátor vásárlásakor, vagy a kijelölt elektronikai hulladékudvarokban. További információ a www.recyclethis.info oldalon.

IT Smaltimento batterie

Questo prodotto contiene una batteria che non può essere smaltita nei comuni contenitori per lo smaltimento rifiuti, nell'Unione Europea. Controllate la documentazione del prodotto per le informazioni specifiche sulla batteria. La batteria è contrassegnata con questo simbolo e può includere alcuni caratteri ad indicare la presenza di cadmio (Cd), piombo (Pb) oppure mercurio (Hg). Per il corretto smaltimento, potete restituirli al vostro fornitore locale, oppure rivolgervi e consegnarli presso i centri di raccolta preposti. Per maggiori informazioni vedere: www.recyclethis.info.

LT Baterijų šalinimas

Šios įrangos sudėtyje yra baterijų, kurias draudžiama šalinti Europos Sąjungos viešose nerūšiuotų atliekų šalinimo sistemose. Informaciją apie baterijas galite rasti įrangos techninėje dokumentacijoje. Baterijos žymimos šiuo simboliu, papildomai gali būti nurodoma kad baterijų sudėtyje yra kadmio (Cd), švino (Pb) ar gyvsidabrio (Hg). Eksploatavimui nebetinkamas baterijas pristatykite į tam skirtas surinkimo vietas arba grąžinkite jas tiesioginiam tiekėjui, kad jos būtų tinkamai utilizuotos. Daugiau informacijos rasite šioje interneto svetainėje: www.recyclethis.info.

LV Bateriju likvidēšana

Šis produkts satur bateriju vai akumulatoru, kuru nedrīkst izmest Eiropas Savienībā esošajās sadzīves atkritumu sistēmās. Sk. produkta dokumentācijā, kur ir norādīta konkrēta informācija par bateriju vai akumulatoru. Baterijas vai akumulatora marķējumā ir šis simbols, kas var ietvert burtus, kuri norāda kadmiju (Cd), svinu (Pb) vai dzīvsudrabu (Hg). Pēc ekspluatācijas laika beigām baterijas vai akumulatori jānodod piegādātājam vai specializētā bateriju savākšanas vietā. Sīkāku informāciju var iegūt vietnē: www.recyclethis.info.

NL Verwijderen van batterijen

Dit product bevat een batterij welke niet kan verwijderd worden via de gemeentelijke huisvuilscheiding in de Europese Gemeenschap. Gelieve de product documentatie te controleren voor specifieke batterij informatie. De batterijen met deze label kunnen volgende indicaties bevatten cadmium (Cd), lood (Pb) of kwik (Hg). Voor correcte vorm van kringloop, geef je de producten terug aan jou lokale leverancier of geef het af aan een gespecialiseerde verzamelpunt. Meer informatie vindt u op de volgende website: www.recyclethis.info.

NO Retur av batteri

Dette produkt inneholder et batteri som ikke kan kastes med usortert kommunalt søppel i den Europeiske Unionen. Se produktokumentasjonen for spesifikk batteriinformasjon. Batteriet er merket med dette symbolet som kan inkludere symboler for å indikere at kadmium (Cd), bly (Pb), eller kvikksølv (Hg) forekommer. Returner batteriet til leverandøren din eller til et dedikert oppsamlingspunkt for korrekt gjenvinning. For mer informasjon se: www.recyclethis.info.

PL Pozbywanie się zużytych baterii

Ten produkt zawiera baterie, które w Unii Europejskiej mogą być usuwane tylko jako posegregowane odpady komunalne. Dokładne informacje dotyczące użytych baterii znajdują się w dokumentacji produktu. Baterie oznaczone tym symbolem mogą zawierać dodatkowe oznaczenia literowe wskazujące na zawartość kadmu (Cd), ołowiu (Pb) lub rtęci (Hg). Dla zapewnienia właściwej utylizacji, należy zwrócić baterie do dostawcy albo do wyznaczonego punktu zbiórki. Więcej informacji można znaleźć na stronie internetowej www.recyclethis.info.

PT Eliminação de Baterias

Este produto contém uma bateria que não pode ser considerado lixo municipal na União Europeia. Consulte a documentação do produto para obter informação específica da bateria. A bateria é identificada por meio de este símbolo, que pode incluir a rotulagem para indicar o cádmio (Cd), chumbo (Pb), ou o mercúrio (Hg). Para uma reciclagem apropriada envie a bateria para o seu fornecedor ou para um ponto de recolha designado. Para mais informação veja: www.recyclethis.info.

RU Утилизация батарей

Согласно европейской директиве об отходах электрического и электронного оборудования, продукты, содержащие батареи, нельзя утилизировать как обычные отходы на территории ЕС. Более подробную информацию вы найдете в документации к продукту. На этом символе могут присутствовать буквы, которые означают, что батарея содержит кадмий (Cd), свинец (Pb) или ртуть (Hg). Для надлежащей утилизации по окончании срока эксплуатации пользователь должен вернуть батареи локальному поставщику или сдать в специальный пункт приема. Подробности можно найти на веб-сайте: www.recyclethis.info.

SK Zaobchádzanie s batériami

Tento produkt obsahuje batériu, s ktorou sa v Európskej únii nesmie nakladať ako s netriedeným komunálnym odpadom. Dokumentácia k produktu obsahuje špecifické informácie o batérii. Batéria je označená týmto symbolom, ktorý môže obsahovať písmená na označenie kadmia (Cd), olova (Pb), alebo ortuti (Hg). Na správnu recykláciu vráťte batériu vášmu lokálnemu dodávateľovi alebo na určené zberné miesto. Pre viac informácií pozrite: www.recyclethis.info.

SL Odlaganje baterij

Ta izdelek vsebuje baterijo, ki je v Evropski uniji ni dovoljeno odstranjevati kot nesortiran komunalni odpad. Za posebne informacije o bateriji glejte dokumentacijo izdelka. Baterija je označena s tem simbolom, ki lahko vključuje napise, ki označujejo kadmij (Cd), svinec (Pb) ali živo srebro (Hg). Za ustrezno recikliranje baterijo vrnite dobavitelju ali jo odstranite na določenem zbirališču. Za več informacij obiščite spletno stran: www.recyclethis.info.

SV Kassering av batteri

Denna produkt innehåller ett batteri som inte får kastas i allmänna sophanteringssystem inom den europeiska unionen. Se produktdokumentationen för specifik batteriinformation. Batteriet är märkt med denna symbol, vilket kan innebära att det innehåller kadmium (Cd), bly (Pb) eller kvicksilver (Hg). För korrekt återvinning skall batteriet returneras till leverantören eller till en därför avsedd deponering. För mer information, se: www.recyclethis.info.

TR Pil Geri Dönüşümü

Bu ürün Avrupa Birliği genel atık sistemlerine atılmaması gereken pil içermektedir. Daha detaylı pil bilgisi için ürünün kataloğunu inceleyiniz. Bu sembolle işaretlenmiş piller Kadmiyum(Cd), Kurşun(Pb) ya da Civa(Hg) içerebilir. Doğru geri dönüşüm için ürünü yerel tedarikçinize geri veriniz ya da özel işaretlenmiş toplama noktalarına atınız. Daha fazla bilgi için: www.recyclethis.info.

A

B.1.1 INTRODUCTION

The UR-series relays support a number of communications protocols to allow connection to equipment such as personal computers, RTUs, SCADA masters, and programmable logic controllers. The Modicon Modbus RTU protocol is the most basic protocol supported by the UR. Modbus is available via RS232 or RS485 serial links or via ethernet (using the Modbus/TCP specification). The following description is intended primarily for users who wish to develop their own master communication drivers and applies to the serial Modbus RTU protocol. Note that:

- The UR always acts as a slave device, meaning that it never initiates communications; it only listens and responds to requests issued by a master computer.
- For Modbus, a subset of the Remote Terminal Unit (RTU) protocol format is supported that allows extensive monitoring, programming, and control functions using read and write register commands.

B.1.2 PHYSICAL LAYER

The Modbus RTU protocol is hardware-independent so that the physical layer can be any of a variety of standard hardware configurations including RS232 and RS485. The relay includes a faceplate (front panel) RS232 port and two rear terminal communications ports that may be configured as RS485, fiber optic, 10Base-T, or 10Base-F. Data flow is half-duplex in all configurations. See chapter 3 for details on communications wiring.

Each data byte is transmitted in an asynchronous format consisting of 1 start bit, 8 data bits, 1 stop bit, and possibly 1 parity bit. This produces a 10 or 11 bit data frame. This can be important for transmission through modems at high bit rates (11 bit data frames are not supported by many modems at baud rates greater than 300).

The baud rate and parity are independently programmable for each communications port. Baud rates of 300, 1200, 2400, 4800, 9600, 14400, 19200, 28800, 33600, 38400, 57600, or 115200 bps are available. Even, odd, and no parity are available. Refer to the *Communications* section of chapter 5 for further details.

The master device in any system must know the address of the slave device with which it is to communicate. The relay will not act on a request from a master if the address in the request does not match the relay's slave address (unless the address is the broadcast address – see below).

A single setting selects the slave address used for all ports, with the exception that for the faceplate port, the relay will accept any address when the Modbus RTU protocol is used.

B.1.3 DATA LINK LAYER

Communications takes place in packets which are groups of asynchronously framed byte data. The master transmits a packet to the slave and the slave responds with a packet. The end of a packet is marked by *dead-time* on the communications line. The following describes general format for both transmit and receive packets. For exact details on packet formatting, refer to subsequent sections describing each function code.

Table B-1: MODBUS PACKET FORMAT

DESCRIPTION	SIZE
SLAVE ADDRESS	1 byte
FUNCTION CODE	1 byte
DATA	<i>N</i> bytes
CRC	2 bytes
DEAD TIME	3.5 bytes transmission time

- **SLAVE ADDRESS:** This is the address of the slave device that is intended to receive the packet sent by the master and to perform the desired action. Each slave device on a communications bus must have a unique address to prevent bus contention. All of the relay's ports have the same address which is programmable from 1 to 254; see chapter 5 for details. Only the addressed slave will respond to a packet that starts with its address. Note that the faceplate port is an exception to this rule; it will act on a message containing any slave address.

A master transmit packet with slave address 0 indicates a broadcast command. All slaves on the communication link take action based on the packet, but none respond to the master. Broadcast mode is only recognized when associated with function code 05h. For any other function code, a packet with broadcast mode slave address 0 will be ignored.

- **FUNCTION CODE:** This is one of the supported functions codes of the unit which tells the slave what action to perform. See the *Supported Function Codes* section for complete details. An exception response from the slave is indicated by setting the high order bit of the function code in the response packet. See the *Exception Responses* section for further details.
- **DATA:** This will be a variable number of bytes depending on the function code. This may include actual values, settings, or addresses sent by the master to the slave or by the slave to the master.
- **CRC:** This is a two byte error checking code. The RTU version of Modbus includes a 16-bit cyclic redundancy check (CRC-16) with every packet which is an industry standard method used for error detection. If a Modbus slave device receives a packet in which an error is indicated by the CRC, the slave device will not act upon or respond to the packet thus preventing any erroneous operations. See the *CRC-16 Algorithm* section for details on calculating the CRC.
- **DEAD TIME:** A packet is terminated when no data is received for a period of 3.5 byte transmission times (about 15 ms at 2400 bps, 2 ms at 19200 bps, and 300 μ s at 115200 bps). Consequently, the transmitting device must not allow gaps between bytes longer than this interval. Once the dead time has expired without a new byte transmission, all slaves start listening for a new packet from the master except for the addressed slave.

B.1.4 CRC-16 ALGORITHM

The CRC-16 algorithm essentially treats the entire data stream (data bits only; start, stop and parity ignored) as one continuous binary number. This number is first shifted left 16 bits and then divided by a characteristic polynomial (11000000000000101B). The 16-bit remainder of the division is appended to the end of the packet, MSByte first. The resulting packet including CRC, when divided by the same polynomial at the receiver will give a zero remainder if no transmission errors have occurred. This algorithm requires the characteristic polynomial to be reverse bit ordered. The most significant bit of the characteristic polynomial is dropped, since it does not affect the value of the remainder.

A C programming language implementation of the CRC algorithm will be provided upon request.

Table B-2: CRC-16 ALGORITHM

SYMBOLS:	-->	data transfer	
	A	16 bit working register	
	A _{low}	low order byte of A	
	A _{high}	high order byte of A	
	CRC	16 bit CRC-16 result	
	i,j	loop counters	
	(+)	logical EXCLUSIVE-OR operator	
	N	total number of data bytes	
	D _i	i-th data byte (i = 0 to N-1)	
	G	16 bit characteristic polynomial = 1010000000000001 (binary) with MSbit dropped and bit order reversed	
	shr (x)	right shift operator (th LSbit of x is shifted into a carry flag, a '0' is shifted into the MSbit of x, all other bits are shifted right one location)	
ALGORITHM:	1.	FFFF (hex) --> A	
	2.	0 --> i	
	3.	0 --> j	
	4.	D _i (+) A _{low} --> A _{low}	
	5.	j + 1 --> j	
	6.	shr (A)	
	7.	Is there a carry?	No: go to 8; Yes: G (+) A --> A and continue.
	8.	Is j = 8?	No: go to 5; Yes: continue
	9.	i + 1 --> i	
	10.	Is i = N?	No: go to 3; Yes: continue
	11.	A --> CRC	

B.2.1 SUPPORTED FUNCTION CODES

Modbus officially defines function codes from 1 to 127 though only a small subset is generally needed. The relay supports some of these functions, as summarized in the following table. Subsequent sections describe each function code in detail.

FUNCTION CODE		MODBUS DEFINITION	GE MULTILIN DEFINITION
HEX	DEC		
03	3	Read holding registers	Read actual values or settings
04	4	Read holding registers	Read actual values or settings
05	5	Force single coil	Execute operation
06	6	Preset single register	Store single setting
10	16	Preset multiple registers	Store multiple settings

B.2.2 READ ACTUAL VALUES OR SETTINGS (FUNCTION CODE 03/04H)

This function code allows the master to read one or more consecutive data registers (actual values or settings) from a relay. Data registers are always 16-bit (two-byte) values transmitted with high order byte first. The maximum number of registers that can be read in a single packet is 125. See the *Modbus memory map* table for exact details on the data registers.

Since some PLC implementations of Modbus only support one of function codes 03h and 04h. The L90 interpretation allows either function code to be used for reading one or more consecutive data registers. The data starting address will determine the type of data being read. Function codes 03h and 04h are therefore identical.

The following table shows the format of the master and slave packets. The example shows a master device requesting three register values starting at address 4050h from slave device 11h (17 decimal); the slave device responds with the values 40, 300, and 0 from registers 4050h, 4051h, and 4052h, respectively.

Table B-3: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	EXAMPLE (HEX)	PACKET FORMAT	EXAMPLE (HEX)
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	04	FUNCTION CODE	04
DATA STARTING ADDRESS - high	40	BYTE COUNT	06
DATA STARTING ADDRESS - low	50	DATA #1 - high	00
NUMBER OF REGISTERS - high	00	DATA #1 - low	28
NUMBER OF REGISTERS - low	03	DATA #2 - high	01
CRC - low	A7	DATA #2 - low	2C
CRC - high	4A	DATA #3 - high	00
		DATA #3 - low	00
		CRC - low	0D
		CRC - high	60

B.2.3 EXECUTE OPERATION (FUNCTION CODE 05H)

This function code allows the master to perform various operations in the relay. Available operations are shown in the *Summary of operation codes* table below.

The following table shows the format of the master and slave packets. The example shows a master device requesting the slave device 11h (17 decimal) to perform a reset. The high and low code value bytes always have the values “FF” and “00” respectively and are a remnant of the original Modbus definition of this function code.

Table B–4: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	EXAMPLE (HEX)	PACKET FORMAT	EXAMPLE (HEX)
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	05	FUNCTION CODE	05
OPERATION CODE - high	00	OPERATION CODE - high	00
OPERATION CODE - low	01	OPERATION CODE - low	01
CODE VALUE - high	FF	CODE VALUE - high	FF
CODE VALUE - low	00	CODE VALUE - low	00
CRC - low	DF	CRC - low	DF
CRC - high	6A	CRC - high	6A

Table B–5: SUMMARY OF OPERATION CODES FOR FUNCTION 05H

OPERATION CODE (HEX)	DEFINITION	DESCRIPTION
0000	NO OPERATION	Does not do anything.
0001	RESET	Performs the same function as the faceplate RESET key.
0005	CLEAR EVENT RECORDS	Performs the same function as the faceplate CLEAR EVENT RECORDS menu command.
0006	CLEAR OSCILLOGRAPHY	Clears all oscillography records.
1000 to 103F	VIRTUAL IN 1 to 64 ON/OFF	Sets the states of Virtual Inputs 1 to 64 either “ON” or “OFF”.

B.2.4 STORE SINGLE SETTING (FUNCTION CODE 06H)

This function code allows the master to modify the contents of a single setting register in an relay. Setting registers are always 16 bit (two byte) values transmitted high order byte first. The following table shows the format of the master and slave packets. The example shows a master device storing the value 200 at memory map address 4051h to slave device 11h (17 dec).

Table B–6: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	EXAMPLE (HEX)	PACKET FORMAT	EXAMPLE (HEX)
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	06	FUNCTION CODE	06
DATA STARTING ADDRESS - high	40	DATA STARTING ADDRESS - high	40
DATA STARTING ADDRESS - low	51	DATA STARTING ADDRESS - low	51
DATA - high	00	DATA - high	00
DATA - low	C8	DATA - low	C8
CRC - low	CE	CRC - low	CE
CRC - high	DD	CRC - high	DD

B.2.5 STORE MULTIPLE SETTINGS (FUNCTION CODE 10H)

This function code allows the master to modify the contents of a one or more consecutive setting registers in a relay. Setting registers are 16-bit (two byte) values transmitted high order byte first. The maximum number of setting registers that can be stored in a single packet is 60. The following table shows the format of the master and slave packets. The example shows a master device storing the value 200 at memory map address 4051h, and the value 1 at memory map address 4052h to slave device 11h (17 decimal).

Table B-7: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	EXAMPLE (HEX)	PACKET FORMAT	EXAMPLE (HEX)
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	10	FUNCTION CODE	10
DATA STARTING ADDRESS - hi	40	DATA STARTING ADDRESS - hi	40
DATA STARTING ADDRESS - lo	51	DATA STARTING ADDRESS - lo	51
NUMBER OF SETTINGS - hi	00	NUMBER OF SETTINGS - hi	00
NUMBER OF SETTINGS - lo	02	NUMBER OF SETTINGS - lo	02
BYTE COUNT	04	CRC - lo	07
DATA #1 - high order byte	00	CRC - hi	64
DATA #1 - low order byte	C8		
DATA #2 - high order byte	00		
DATA #2 - low order byte	01		
CRC - low order byte	12		
CRC - high order byte	62		

B.2.6 EXCEPTION RESPONSES

Programming or operation errors usually happen because of illegal data in a packet. These errors result in an exception response from the slave. The slave detecting one of these errors sends a response packet to the master with the high order bit of the function code set to 1.

The following table shows the format of the master and slave packets. The example shows a master device sending the unsupported function code 39h to slave device 11.

Table B-8: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	EXAMPLE (HEX)	PACKET FORMAT	EXAMPLE (HEX)
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	39	FUNCTION CODE	B9
CRC - low order byte	CD	ERROR CODE	01
CRC - high order byte	F2	CRC - low order byte	93
		CRC - high order byte	95

B.3.1 OBTAINING RELAY FILES VIA MODBUS

a) DESCRIPTION

The UR relay has a generic file transfer facility, meaning that you use the same method to obtain all of the different types of files from the unit. The Modbus registers that implement file transfer are found in the "Modbus File Transfer (Read/Write)" and "Modbus File Transfer (Read Only)" modules, starting at address 3100 in the Modbus Memory Map. To read a file from the UR relay, use the following steps:

1. Write the filename to the "Name of file to read" register using a write multiple registers command. If the name is shorter than 80 characters, you may write only enough registers to include all the text of the filename. Filenames are not case sensitive.
2. Repeatedly read all the registers in "Modbus File Transfer (Read Only)" using a read multiple registers command. It is not necessary to read the entire data block, since the UR relay will remember which was the last register you read. The "position" register is initially zero and thereafter indicates how many bytes (2 times the number of registers) you have read so far. The "size of..." register indicates the number of bytes of data remaining to read, to a maximum of 244.
3. Keep reading until the "size of..." register is smaller than the number of bytes you are transferring. This condition indicates end of file. Discard any bytes you have read beyond the indicated block size.
4. If you need to re-try a block, read only the "size of..." and "block of data", without reading the position. The file pointer is only incremented when you read the position register, so the same data block will be returned as was read in the previous operation. On the next read, check to see if the position is where you expect it to be, and discard the previous block if it is not (this condition would indicate that the UR relay did not process your original read request).

The UR relay retains connection-specific file transfer information, so files may be read simultaneously on multiple Modbus connections.

b) OTHER PROTOCOLS

All the files available via Modbus may also be retrieved using the standard file transfer mechanisms in other protocols (for example, TFTP or MMS).

c) COMTRADE, OSCILLOGRAPHY, AND DATA LOGGER FILES

Oscillography and data logger files are formatted using the COMTRADE file format per IEEE C37.111-1999 Standard Common Format for Transient Data Exchange (COMTRADE) for Power Systems. The files can be obtained in either text or binary COMTRADE format.

d) READING OSCILLOGRAPHY FILES

Familiarity with the oscillography feature is required to understand the following description. Refer to the Oscillography section in Chapter 5 for additional details.

The Oscillography Number of Triggers register is incremented by one every time a new oscillography file is triggered (captured) and cleared to zero when oscillography data is cleared. When a new trigger occurs, the associated oscillography file is assigned a file identifier number equal to the incremented value of this register; the newest file number is equal to the Oscillography_Number_of_Triggers register. This register can be used to determine if any new data has been captured by periodically reading it to see if the value has changed; if the number has increased then new data is available.

The Oscillography Number of Records register specifies the maximum number of files (and the number of cycles of data per file) that can be stored in memory of the relay. The Oscillography Available Records register specifies the actual number of files that are stored and still available to be read out of the relay.

Writing "Yes" (i.e. the value 1) to the Oscillography Clear Data register clears oscillography data files, clears both the Oscillography Number of Triggers and Oscillography Available Records registers to zero, and sets the Oscillography Last Cleared Date to the present date and time.

To read binary COMTRADE oscillography files, read the following filenames:

OSCnnnn.CFG and OSCnnn.DAT

Replace "nnn" with the desired oscillography trigger number. For ASCII format, use the following file names

OSCAnnnn.CFG and OSCAnnn.DAT

e) READING DATA LOGGER FILES

Familiarity with the data logger feature is required to understand this description. Refer to the Data Logger section of Chapter 5 for details. To read the entire data logger in binary COMTRADE format, read the following files.

`datalog.cfg` and `datalog.dat`

To read the entire data logger in ASCII COMTRADE format, read the following files.

`dataloga.cfg` and `dataloga.dat`

To limit the range of records to be returned in the COMTRADE files, append the following to the filename before writing it:

- To read from a specific time to the end of the log: `<space> startTime`
- To read a specific range of records: `<space> startTime <space> endTime`
- Replace `<startTime>` and `<endTime>` with Julian dates (seconds since Jan. 1 1970) as numeric text.

f) READING EVENT RECORDER FILES

To read the entire event recorder contents in ASCII format (the only available format), use the following filename:

`EVT.TXT`

To read from a specific record to the end of the log, use the following filename:

`EVTnnn.TXT` (replace `nnn` with the desired starting record number)

To read from a specific record to another specific record, use the following filename:

`EVT.TXT xxxxx yyyy` (replace `xxxxx` with the starting record number and `yyyy` with the ending record number)

g) READING FAULT REPORT FILES

Fault report data has been available via the L90 file retrieval mechanism since UR firmware version 2.00. The file name is `faultReport#####.htm`. The `#####` refers to the fault report record number. The fault report number is a counter that indicates how many fault reports have ever occurred. The counter rolls over at a value of 65535. Only the last ten fault reports are available for retrieval; a request for a non-existent fault report file will yield a null file. The current value fault report counter is available in "Number of Fault Reports" Modbus register at location 0x3020.

For example, if 14 fault reports have occurred then the files `faultReport5.htm`, `faultReport6.htm`, up to `faultReport14.htm` are available to be read. The expected use of this feature has an external master periodically polling the "Number of Fault Reports" register. If the value changes, then the master reads all the new files.

The contents of the file is in standard HTML notation and can be viewed via any commercial browser.

B.3.2 MODBUS PASSWORD OPERATION

The L90 supports password entry from a local or remote connection.

Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the faceplate RS232 connection. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

When entering a settings or command password via EnerVista or any serial interface, the user must enter the corresponding connection password. If the connection is to the back of the L90, the remote password must be used. If the connection is to the RS232 port of the faceplate, the local password must be used.

The command password is set up at memory location 4000. Command security is required to change the command password. Similarly, the setting password is set up at memory location 4002. These are the same settings found in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **PASSWORD SECURITY** menu via the keypad. Enabling password security for the faceplate display will also enable it for Modbus, and *vice-versa*.

To gain command level security access, the command password must be entered at memory location 4008. To gain setting level security access, the setting password must be entered at memory location 400A. The entered setting password must match the current setting password setting, or must be zero, to change settings or download firmware.

Command and setting passwords each have a 30 minute timer. Each timer starts when you enter the particular password, and is re-started whenever you *use* it. For example, writing a setting re-starts the setting password timer and writing a command register or forcing a coil re-starts the command password timer. The value read at memory location 4010 can be used to confirm whether a command password is enabled or disabled (a value of 0 represents disabled). The value read at memory location 4011 can be used to confirm whether a setting password is enabled or disabled.

Command or setting password security access is restricted to the particular port or particular TCP/IP connection on which the entry was made. Passwords must be entered when accessing the relay through other ports or connections, and the passwords must be re-entered after disconnecting and re-connecting on TCP/IP.

B

B.4.1 MODBUS MEMORY MAP

The map is also viewable in a web browser. In the browser, enter the IP address of the UR and click the option.

Table B-9: MODBUS MEMORY MAP (Sheet 1 of 72)

ADDR	REGISTER NAME	RANGE	UNITS	STEP	FORMAT	DEFAULT
Product Information (Read Only)						
0000	UR Product Type	0 to 65535	---	1	F001	0
0002	Product Version	0 to 655.35	---	0.01	F001	1
0003	Boot Configuration Register	0 to 65535	---	1	F001	0

B.4.2 DATA FORMATS

F001
UR_UINT16 UNSIGNED 16 BIT INTEGER

F002
UR_SINT16 SIGNED 16 BIT INTEGER

F003
UR_UINT32 UNSIGNED 32 BIT INTEGER (2 registers)

High order word is stored in the first register.
Low order word is stored in the second register.

F004
UR_SINT32 SIGNED 32 BIT INTEGER (2 registers)

High order word is stored in the first register/
Low order word is stored in the second register.

F005
UR_UINT8 UNSIGNED 8 BIT INTEGER

F006
UR_SINT8 SIGNED 8 BIT INTEGER

F011
UR_UINT16 FLEXCURVE DATA (120 points)

A FlexCurve is an array of 120 consecutive data points (x, y) which are interpolated to generate a smooth curve. The y-axis is the user defined trip or operation time setting; the x-axis is the pickup ratio and is pre-defined. Refer to format F119 for a listing of the pickup ratios; the enumeration value for the pickup ratio indicates the offset into the FlexCurve base address where the corresponding time value is stored.

F012
DISPLAY_SCALE DISPLAY SCALING
(unsigned 16-bit integer)

MSB indicates the SI units as a power of ten. LSB indicates the number of decimal points to display.

Example: Current values are stored as 32 bit numbers with three decimal places and base units in Amps. If the retrieved value is 12345.678 A and the display scale equals 0x0302 then the displayed value on the unit is 12.35 kA.

F013
POWER_FACTOR (SIGNED 16 BIT INTEGER)

Positive values indicate lagging power factor; negative values indicate leading.

F040
UR_UINT48 48-BIT UNSIGNED INTEGER

F050
UR_UINT32 TIME and DATE (UNSIGNED 32 BIT INTEGER)

Gives the current time in seconds elapsed since 00:00:00 January 1, 1970.

F051
UR_UINT32 DATE in SR format (alternate format for F050)

First 16 bits are Month/Day (MM/DD/xxxx). Month: 1=January, 2=February,...,12=December; Day: 1 to 31 in steps of 1
Last 16 bits are Year (xx/xx/YYYY): 1970 to 2106 in steps of 1

F052
UR_UINT32 TIME in SR format (alternate format for F050)

First 16 bits are Hours/Minutes (HH:MM:xx.xxx).
Hours: 0=12am, 1=1am,...,12=12pm,...23=11pm;
Minutes: 0 to 59 in steps of 1

Last 16 bits are Seconds (xx:xx:SS.SSS): 0=00.000s, 1=00.001,...,59999=59.999s)

F060
FLOATING_POINT IEEE FLOATING POINT (32 bits)

F070
HEX2 2 BYTES - 4 ASCII DIGITS

F071
HEX4 4 BYTES - 8 ASCII DIGITS

F072
HEX6 6 BYTES - 12 ASCII DIGITS

F073
HEX8 8 BYTES - 16 ASCII DIGITS

F074
HEX20 20 BYTES - 40 ASCII DIGITS

2	V_0

F300**UR_UINT32: FLEXLOGIC BASE TYPE (15-bit type)**

The FlexLogic BASE type is 7 bits and is combined with an 8-bit descriptor and 1 bit for protection element to form a 16-bit value. The combined bits are of the form: PTTTTTTTDDDDDDDD, where P bit if set, indicates that the FlexLogic type is associated with a protection element state and T represents bits for the BASE type, and D represents bits for the descriptor.

The values in square brackets indicate the base type with P prefix [PTTTTTTT] and the values in round brackets indicate the descriptor range. The right most T bit indicates whether the type is an ON or OFF type. There can be a total of 64 types (plus protection elements). There can be a total of 256 descriptors of each type.

- [0] Off (0) – this is boolean FALSE value
- [1] On (1) – this is boolean TRUE value
- [2] CONTACT INPUTS (1 to 96)

[128 to 255] ELEMENT STATES (see memory map element states section)

F400**UR_UINT16: CT/VT BANK SELECTION**

bitmask	bank selection
0	Card 1 Contact 1 to 4
1	Card 1 Contact 5 to 8
2	Card 2 Contact 1 to 4
3	Card 2 Contact 5 to 8
4	Card 3 Contact 1 to 4
5	Card 3 Contact 5 to 8

F491**ENUMERATION: ANALOG INPUT MODE**

0 = Default Value, 1 = Last Known

F500**UR_UINT16: PACKED BITFIELD**

First register indicates input/output state with bits 0 (MSB) to 15 (LSB) corresponding to input/output state 1 to 16. The second register indicates input/output state with bits 0 to 15 corresponding to input/output state 17 to 32 (if required). The third register indicates input/output state with bits 0 to 15 corresponding to input/output state 33 to 48 (if required). The fourth register indicates input/output state with bits 0 to 15 corresponding to input/output state 49 to 64 (if required).

The number of registers required is determined by the specific data item. A bit value of 0 = Off and 1 = On.

F501**UR_UINT16: LED STATUS**

Low byte of register indicates LED status with bit 0 representing the top LED and bit 7 the bottom LED. A bit value of 1 indicates the LED is on, 0 indicates the LED is off.

F502**BITFIELD: ELEMENT OPERATE STATES**

Each bit contains the operate state for an element. See the F124 format code for a list of element IDs. The operate bit for element ID X is bit [X mod 16] in register [X/16].

F504**BITFIELD: 3-PHASE ELEMENT STATE**

bitmask	element state
0	Pickup
1	Operate
2	Pickup Phase A
3	Pickup Phase B
4	Pickup Phase C
5	Operate Phase A
6	Operate Phase B
7	Operate Phase C

C.1.1 INTRODUCTION

The IEC 61850 standard is the result of electric utilities and vendors of electronic equipment to produce standardized communications systems. IEC 61850 is a series of standards describing client/server and peer-to-peer communications, substation design and configuration, testing, environmental and project standards. The complete set includes:

- IEC 61850-1: Introduction and overview
- IEC 61850-2: Glossary
- IEC 61850-3: General requirements
- IEC 61850-4: System and project management
- IEC 61850-5: Communications and requirements for functions and device models
- IEC 61850-6: Configuration description language for communication in electrical substations related to IEDs
- IEC 61850-7-1: Basic communication structure for substation and feeder equipment - Principles and models
- IEC 61850-7-2: Basic communication structure for substation and feeder equipment - Abstract communication service interface (ACSI)
- IEC 61850-7-3: Basic communication structure for substation and feeder equipment – Common data classes
- IEC 61850-7-4: Basic communication structure for substation and feeder equipment – Compatible logical node classes and data classes
- IEC 61850-8-1: Specific Communication Service Mapping (SCSM) – Mappings to MMS (ISO 9506-1 and ISO 9506-2) and to ISO/IEC 8802-3
- IEC 61850-9-1: Specific Communication Service Mapping (SCSM) – Sampled values over serial unidirectional multi-drop point to point link
- IEC 61850-9-2: Specific Communication Service Mapping (SCSM) – Sampled values over ISO/IEC 8802-3
- IEC 61850-10: Conformance testing

These documents can be obtained from the IEC (<http://www.iec.ch>). It is strongly recommended that all those involved with any IEC 61850 implementation obtain this document set.

C.1.2 COMMUNICATION PROFILES

IEC 61850 specifies the use of the Manufacturing Message Specification (MMS) at the upper (application) layer for transfer of real-time data. This protocol has been in existence for several of years and provides a set of services suitable for the transfer of data within a substation LAN environment. Actual MMS protocol services are mapped to IEC 61850 abstract services in IEC 61850-8-1.

The L90 relay supports IEC 61850 server services over TCP/IP. The TCP/IP profile requires the L90 to have an IP address to establish communications. These addresses are located in the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **NETWORK** menu. It is possible to have up to five simultaneous connections (in addition to DNP and Modbus/TCP (non-IEC 61850) connections).

- **Client/server:** This is a connection-oriented type of communication. The connection is initiated by the client, and communication activity is controlled by the client. IEC 61850 clients are often substation computers running HMI programs or SOE logging software. Servers are usually substation equipment such as protection relays, meters, RTUs, transformer tap changers, or bay controllers.
- **Peer-to-peer:** This is a non-connection-oriented, high speed type of communication usually between substation equipment such as protection relays. GSSE and GOOSE are methods of peer-to-peer communication.
- **Substation configuration language (SCL):** A substation configuration language is a number of files used to describe the configuration of substation equipment. Each configured device has an *IEC Capability Description* (ICD) file. The substation single line information is stored in a *System Specification Description* (SSD) file. The entire substation configuration is stored in a *Substation Configuration Description* (SCD) file. The SCD file is the combination of the individual ICD files and the SSD file.

C.2.1 OVERVIEW

IEC 61850 defines an object-oriented approach to data and services. An IEC 61850 *physical device* can contain one or more *logical device(s)*. Each logical device can contain many *logical nodes*. Each logical node can contain many *data objects*. Each data object is composed of *data attributes* and *data attribute components*. Services are available at each level for performing various functions, such as reading, writing, control commands, and reporting.

Each L90 IED represents one IEC 61850 physical device. The physical device contains one logical device, and the logical device contains many logical nodes. The logical node LPHD1 contains information about the L90 IED physical device. The logical node LLN0 contains information about the L90 IED logical device.

C.2.2 GGIO1: DIGITAL STATUS VALUES

The GGIO1 logical node is available in the L90 to provide access to as many 128 digital status points and associated time-stamps and quality flags. The data content must be configured before the data can be used. GGIO1 provides digital status points for access by clients.

It is intended that clients use GGIO1 in order to access digital status values from the L90. Configuration settings are provided to allow the selection of the number of digital status indications available in GGIO1 (8 to 128), and to allow the choice of the L90 FlexLogic operands that drive the status of the GGIO1 status indications. Clients can utilize the IEC 61850 buffered and unbuffered reporting features available from GGIO1 in order to build sequence of events (SOE) logs and HMI display screens. Buffered reporting should generally be used for SOE logs since the buffering capability reduces the chances of missing data state changes. Unbuffered reporting should generally be used for local status display.

C.2.3 GGIO2: DIGITAL CONTROL VALUES

The GGIO2 logical node is available to provide access to the L90 virtual inputs. Virtual inputs are single-point control (binary) values that can be written by clients. They are generally used as control inputs. GGIO2 provides access to the virtual inputs through the IEC 61850 standard control model (ctlModel) services:

- Status only.
- Direct control with normal security.
- SBO control with normal security.

Configuration settings are available to select the control model for each point. Each virtual input used through GGIO2 should have its **VIRTUAL INPUT 1(64) FUNCTION** setting programmed as “Enabled” and its corresponding **GGIO2 CF SPSCO1(64) CTLMODEL** setting programmed to the appropriate control configuration.

C.2.4 GGIO3: DIGITAL STATUS AND ANALOG VALUES FROM GOOSE DATA

The GGIO3 logical node is available to provide access for clients to values received via configurable GOOSE messages. The values of the digital status indications and analog values in GGIO3 originate in GOOSE messages sent from other devices.

C.2.5 GGIO4: GENERIC ANALOG MEASURED VALUES

The GGIO4 logical node provides access to as many as 32 analog value points, as well as associated timestamps and quality flags. The data content must be configured before the data can be used. GGIO4 provides analog values for access by clients.

It is intended that clients use GGIO4 to access generic analog values from the L90. Configuration settings allow the selection of the number of analog values available in GGIO4 (4 to 32) and the choice of the FlexAnalog values that determine the value of the GGIO4 analog inputs. Clients can utilize polling or the IEC 61850 unbuffered reporting feature available from GGIO4 in order to obtain the analog values provided by GGIO4.

C.2.6 MMXU: ANALOG MEASURED VALUES

A limited number of measured analog values are available through the MMXU logical nodes.

Each MMXU logical node provides data from a L90 current and voltage source. There is one MMXU available for each configurable source (programmed in the **SETTINGS** ⇒ **SYSTEM SETUP** ⇒ **SIGNAL SOURCES** menu). MMXU1 provides data from L90 source 1, and MMXU2 provides data from L90 source 2.

MMXU data is provided in two forms: instantaneous and deadband. The instantaneous values are updated every time a read operation is performed by a client. The deadband values are calculated as described in IEC 61850 parts 7-1 and 7-3. The selection of appropriate deadband settings for the L90 is described in chapter 5 of this manual.

IEC 61850 buffered and unbuffered reporting capability is available in all MMXU logical nodes. MMXUx logical nodes provide the following data for each source:

- MMXU1.MX.TotW: three-phase real power
- MMXU1.MX.TotVAr: three-phase reactive power
- MMXU1.MX.TotVA: three-phase apparent power
- MMXU1.MX.TotPF: three-phase power factor
- MMXU1.MX.Hz: frequency
- MMXU1.MX.PPV.phsAB: phase AB voltage magnitude and angle
- MMXU1.MX.PPV.phsBC: phase BC voltage magnitude and angle
- MMXU1.MX.PPV.phsCA: Phase CA voltage magnitude and angle
- MMXU1.MX.PhV.phsA: phase AG voltage magnitude and angle
- MMXU1.MX.PhV.phsB: phase BG voltage magnitude and angle
- MMXU1.MX.PhV.phsC: phase CG voltage magnitude and angle
- MMXU1.MX.A.phsA: phase A current magnitude and angle
- MMXU1.MX.A.phsB: phase B current magnitude and angle
- MMXU1.MX.A.phsC: phase C current magnitude and angle
- MMXU1.MX.A.neut: ground current magnitude and angle
- MMXU1.MX.W.phsA: phase A real power
- MMXU1.MX.W.phsB: phase B real power
- MMXU1.MX.W.phsC: phase C real power
- MMXU1.MX.VAr.phsA: phase A reactive power
- MMXU1.MX.VAr.phsB: phase B reactive power
- MMXU1.MX.VAr.phsC: phase C reactive power
- MMXU1.MX.VA.phsA: phase A apparent power
- MMXU1.MX.VA.phsB: phase B apparent power
- MMXU1.MX.VA.phsC: phase C apparent power
- MMXU1.MX.PF.phsA: phase A power factor
- MMXU1.MX.PF.phsB: phase B power factor
- MMXU1.MX.PF.phsC: phase C power factor

C.2.7 PROTECTION AND OTHER LOGICAL NODES

The following list describes the protection elements for all UR-series relays. The L90 relay will contain a subset of protection elements from this list.

- PDIF: bus differential, transformer instantaneous differential, transformer percent differential, current differential

- PDIS: phase distance, ground distance
- PIOC: phase instantaneous overcurrent, neutral instantaneous overcurrent, ground instantaneous overcurrent, negative-sequence instantaneous overcurrent.
- PTOC: phase time overcurrent, neutral time overcurrent, ground time overcurrent, negative-sequence time overcurrent, neutral directional overcurrent, negative-sequence directional overcurrent
- PTUV: phase undervoltage, auxiliary undervoltage, third harmonic neutral undervoltage
- PTOV: phase overvoltage, neutral overvoltage, auxiliary overvoltage, negative sequence overvoltage
- RBRF: breaker failure
- RREC: autoreclosure
- RPSB: power swing detection
- RFLO: fault locator
- XCBR: breaker control
- XSWI: circuit switch
- CSWI: switch controller

The protection elements listed above contain *start* (pickup) and *operate* flags. For example, the start flag for PIOC1 is PIOC1.ST.Str.general. The operate flag for PIOC1 is PIOC1.ST.Op.general. For the L90 protection elements, these flags take their values from the pickup and operate FlexLogic operands for the corresponding element.

Some protection elements listed above contain directional start values. For example, the directional start value for PDIS1 is PDIS1.ST.Str.dirGeneral. This value is built from the directional FlexLogic operands for the element.

The RFLO logical node contains the measurement of the distance to fault calculation in kilometers. This value originates in the fault locator function.

The XCBR logical node is directly associated with the breaker control feature.

- XCBR1.ST.Loc: This is the state of the XCBR1 local/remote switch. A setting is provided to assign a FlexLogic operand to determine the state. When local mode is true, IEC 61850 client commands will be rejected.
- XCBR1.ST.Opcnt: This is an operation counter as defined in IEC 61850. Command settings are provided to allow the counter to be cleared.
- XCBR1.ST.Pos: This is the position of the breaker. The breaker control FlexLogic operands are used to determine this state.
 - Intermediate state (00) is indicated when the BREAKER 1 OPEN and BREAKER 1 CLOSED operands are both On.
 - Off state (01) is indicated when the BREAKER 1 OPEN operand is On.
 - On state (10) is indicated when the BREAKER 1 CLOSED operand is On.
 - Bad state (11) is indicated when the BREAKER 1 OPEN and BREAKER 1 CLOSED operands are Off.
- XCBR1.ST.BlkOpn: This is the state of the block open command logic. When true, breaker open commands from IEC 61850 clients will be rejected.
- XCBR1.ST.BlkCls: This is the state of the block close command logic. When true, breaker close commands from IEC 61850 clients will be rejected.
- XCBR1.CO.Pos: This is where IEC 61850 clients can issue open or close commands to the breaker. SBO control with normal security is the only supported IEC 61850 control model.
- XCBR1.CO.BlkOpn: This is where IEC 61850 clients can issue block open commands to the breaker. Direct control with normal security is the only supported IEC 61850 control model.
- XCBR1.CO.BlkCls: This is where IEC 61850 clients can issue block close commands to the breaker. Direct control with normal security is the only supported IEC 61850 control model.

C.3.1 BUFFERED/UNBUFFERED REPORTING

IEC 61850 buffered and unbuffered reporting is provided in the GGIO1 logical nodes (for binary status values) and MMXU1 to MMXU6 (for analog measured values). Report settings can be configured using the EnerVista UR Setup software, substation configurator software, or via an IEC 61850 client. The following items can be configured:

- **TrgOps:** Trigger options. The following bits are supported by the L90:
 - Bit 1: data-change
 - Bit 4: integrity
 - Bit 5: general interrogation
- **OptFlds:** Option Fields. The following bits are supported by the L90:
 - Bit 1: sequence-number
 - Bit 2: report-time-stamp
 - Bit 3: reason-for-inclusion
 - Bit 4: data-set-name
 - Bit 5: data-reference
 - Bit 6: buffer-overflow (for buffered reports only)
 - Bit 7: entryID (for buffered reports only)
 - Bit 8: conf-revision
 - Bit 9: segmentation
- **IntgPd:** Integrity period.
- **BufTm:** Buffer time.

C.3.2 FILE TRANSFER

MMS file services are supported to allow transfer of oscillography, event record, or other files from a L90 relay.

C.3.3 TIMESTAMPS AND SCANNING

The timestamp values associated with all IEC 61850 data items represent the *time of the last change* of either the value or quality flags of the data item. To accomplish this functionality, all IEC 61850 data items must be regularly scanned for data changes, and the timestamp updated when a change is detected, regardless of the connection status of any IEC 61850 clients. For applications where there is no IEC 61850 client in use, the IEC 61850 **SERVER SCANNING** setting can be programmed as “Disabled”. If a client is in use, this setting should be programmed as “Enabled” to ensure the proper generation of IEC 61850 timestamps.

C.3.4 LOGICAL DEVICE NAME

The logical device name is used to identify the IEC 61850 logical device that exists within the L90. This name is composed of two parts: the IED name setting and the logical device instance. The complete logical device name is the combination of the two character strings programmed in the **IEDNAME** and **LD INST** settings. The default values for these strings are “IED-Name” and “LDInst”. These values should be changed to reflect a logical naming convention for all IEC 61850 logical devices in the system.

C.3.5 LOCATION

The LPHD1 logical node contains a data attribute called *location* (LPHD1.DC.PhyNam.location). This is a character string meant to describe the physical location of the L90. This attribute is programmed through the **LOCATION** setting and its default value is “Location”. This value should be changed to describe the actual physical location of the L90.

C.3.6 LOGICAL NODE NAME PREFIXES

IEC 61850 specifies that each logical node can have a name with a total length of 11 characters. The name is composed of:

- A five or six-character name prefix.
- A four-character standard name (for example, MMXU, GGIO, PIOC, etc.).
- A one or two-character instantiation index.

Complete names are of the form `xxxxxxPIOC1`, where the `xxxxxx` character string is configurable. Details regarding the logical node naming rules are given in IEC 61850 parts 6 and 7-2. It is recommended that a consistent naming convention be used for an entire substation project.

C.3.7 CONNECTION TIMING

A built-in TCP/IP connection timeout of two minutes is employed by the L90 to detect 'dead' connections. If there is no data traffic on a TCP connection for greater than two minutes, the connection will be aborted by the L90. This frees up the connection to be used by other clients. Therefore, when using IEC 61850 reporting, clients should configure report control block items such that an integrity report will be issued at least every 2 minutes (120000 ms). This ensures that the L90 will not abort the connection. If other MMS data is being polled on the same connection at least once every 2 minutes, this timeout will not apply.

C.3.8 NON-IEC 61850 DATA

The L90 relay makes available a number of non-IEC 61850 data items. These data items can be accessed through the "UR" MMS domain. IEC 61850 data can be accessed through the standard IEC 61850 logical device. To access the non-IEC data items, the **INCLUDE NON-IEC DATA** setting must be "Enabled".

C.3.9 COMMUNICATION SOFTWARE UTILITIES

The exact structure and values of the supported IEC 61850 logical nodes can be seen by connecting to a L90 relay with an MMS browser, such as the "MMS Object Explorer and AXS4-MMS" DDE/OPC server from Sisco Inc.

C.4.1 OVERVIEW

IEC 61850 specifies two types of peer-to-peer data transfer services: Generic Substation State Events (GSSE) and Generic Object Oriented Substation Events (GOOSE). GSSE services are compatible with UCA 2.0 GOOSE. IEC 61850 GOOSE services provide virtual LAN (VLAN) support, Ethernet priority tagging, and EtherType Application ID configuration. The support for VLANs and priority tagging allows for the optimization of Ethernet network traffic. GOOSE messages can be given a higher priority than standard Ethernet traffic, and they can be separated onto specific VLANs. Because of the additional features of GOOSE services versus GSSE services, it is recommended that GOOSE be used wherever backwards compatibility with GSSE (or UCA 2.0 GOOSE) is not required.

Devices that transmit GSSE and/or GOOSE messages also function as servers. Each GSSE publisher contains a “GSSE control block” to configure and control the transmission. Each GOOSE publisher contains a “GOOSE control block” to configure and control the transmission. The transmission is also controlled via device settings. These settings can be seen in the ICD and/or SCD files, or in the device configuration software or files.

IEC 61850 recommends a default priority value of 4 for GOOSE. Ethernet traffic that does not contain a priority tag has a default priority of 1. More details are specified in IEC 61850 part 8-1.

IEC 61850 recommends that the EtherType Application ID number be configured according to the GOOSE source. In the L90, the transmitted GOOSE Application ID number must match the configured receive Application ID number in the receiver. A common number may be used for all GOOSE transmitters in a system. More details are specified in IEC 61850 part 8-1.

C.4.2 GSSE CONFIGURATION

IEC 61850 Generic Substation Status Event (GSSE) communication is compatible with UCA GOOSE communication. GSSE messages contain a number of double point status data items. These items are transmitted in two pre-defined data structures named DNA and UserSt. Each DNA and UserSt item is referred to as a ‘bit pair’. GSSE messages are transmitted in response to state changes in any of the data points contained in the message. GSSE messages always contain the same number of DNA and UserSt bit pairs. Depending on the configuration, only some of these bit pairs may have values that are of interest to receiving devices.

The **GSSE FUNCTION**, **GSSE ID**, and **GSSE DESTINATION MAC ADDRESS** settings are used to configure GSSE transmission. **GSSE FUNCTION** is set to “Enabled” to enable the transmission. If a valid multicast Ethernet MAC address is entered for the **GSSE DESTINATION MAC ADDRESS** setting, this address will be used as the destination MAC address for GSSE messages. If a valid multicast Ethernet MAC address is not entered (for example, 00 00 00 00 00 00), the L90 will use the source Ethernet MAC address as the destination, with the multicast bit set.

C.4.3 FIXED GOOSE

The L90 supports two types of IEC 61850 Generic Object Oriented Substation Event (GOOSE) communication: fixed GOOSE and configurable GOOSE. All GOOSE messages contain IEC 61850 data collected into a *dataset*. It is this dataset that is transferred using GOOSE message services. The dataset transferred using the L90 fixed GOOSE is the same data that is transferred using the GSSE feature; that is, the DNA and UserSt bit pairs. The FlexLogic operands that determine the state of the DNA and UserSt bit pairs are configurable via settings, but the fixed GOOSE dataset always contains the same DNA/UserSt data structure. Upgrading from GSSE to GOOSE services is simply a matter of enabling fixed GOOSE and disabling GSSE. The remote inputs and outputs are configured in the same manner for both GSSE and fixed GOOSE.

It is recommended that the fixed GOOSE be used for implementations that require GOOSE data transfer between UR-series IEDs. Configurable GOOSE may be used for implementations that require GOOSE data transfer between UR-series IEDs and devices from other manufacturers.

C.4.4 CONFIGURABLE GOOSE

The configurable GOOSE feature allows for the configuration of the datasets to be transmitted or received from the L90. The L90 supports the configuration of eight (8) transmission and reception datasets, allowing for the optimization of data transfer between devices.

Items programmed for dataset 1 and 2 will have changes in their status transmitted as soon as the change is detected. Dataset 1 should be used for high-speed transmission of data that is required for applications such as transfer tripping, blocking, and breaker fail initiate. At least one digital status value needs to be configured in dataset 1 to enable transmission of all data configured for dataset 1. Configuring analog data only to dataset 1 will not activate transmission.

Items programmed for datasets 3 through 8 will have changes in their status transmitted at a maximum rate of every 100 ms. Datasets 3 through 8 will regularly analyze each data item configured within them every 100 ms to identify if any changes have been made. If any changes in the data items are detected, these changes will be transmitted through a GOOSE message. If there are no changes detected during this 100 ms period, no GOOSE message will be sent.

For all datasets 1 through 8, the integrity GOOSE message will still continue to be sent at the pre-configured rate even if no changes in the data items are detected.

The GOOSE functionality was enhanced to prevent the relay from flooding a communications network with GOOSE messages due to an oscillation being created that is triggering a message.

The L90 has the ability of detecting if a data item in one of the GOOSE datasets is erroneously oscillating. This can be caused by events such as errors in logic programming, inputs improperly being asserted and de-asserted, or failed station components. If erroneously oscillation is detected, the L90 will stop sending GOOSE messages from the dataset for a minimum period of one second. Should the oscillation persist after the one second time-out period, the L90 will continue to block transmission of the dataset. The L90 will assert the **MAINTENANCE ALERT: GGIO Ind XXX oscill** self-test error message on the front panel display, where **XXX** denotes the data item detected as oscillating.

The configurable GOOSE feature is recommended for applications that require GOOSE data transfer between UR-series IEDs and devices from other manufacturers. Fixed GOOSE is recommended for applications that require GOOSE data transfer between UR-series IEDs.

IEC 61850 GOOSE messaging contains a number of configurable parameters, all of which must be correct to achieve the successful transfer of data. It is critical that the configured datasets at the transmission and reception devices are an exact match in terms of data structure, and that the GOOSE addresses and name strings match exactly. Manual configuration is possible, but third-party substation configuration software may be used to automate the process. The EnerVista UR Setup software can produce IEC 61850 ICD files and import IEC 61850 SCD files produced by a substation configurator (refer to the *IEC 61850 IED configuration* section later in this appendix).

NOTICE

Use independent ports for IEC 61850 communication and take care when configuring the settings, else loss of protection or misoperation of the relay can result.

The following example illustrates the configuration required to transfer IEC 61850 data items between two devices. The general steps required for transmission configuration are:

1. Configure the transmission dataset.
2. Configure the GOOSE service settings.
3. Configure the data.

The general steps required for reception configuration are:

1. Configure the reception dataset.
2. Configure the GOOSE service settings.
3. Configure the data.

This example shows how to configure the transmission and reception of three IEC 61850 data items: a single point status value, its associated quality flags, and a floating point analog value.

The following procedure illustrates the transmission configuration.

1. Configure the transmission dataset by making the following changes in the **PRODUCT SETUP** ⇒ **COMMUNICATION** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION** ⇒ **TRANSMISSION** ⇒ **CONFIGURABLE GOOSE** ⇒ **CONFIGURABLE GOOSE 1** ⇒ **CONFIG GSE 1 DATASET ITEMS** settings menu:
 - Set **ITEM 1** to “GGIO1.ST.Ind1.q” to indicate quality flags for GGIO1 status indication 1.
 - Set **ITEM 2** to “GGIO1.ST.Ind1.stVal” to indicate the status value for GGIO1 status indication 1.

The transmission dataset now contains a set of quality flags and a single point status Boolean value. The reception dataset on the receiving device must exactly match this structure.

2. Configure the GOOSE service settings by making the following changes in the **PRODUCT SETUP** ⇒ **COMMUNICATION** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION** ⇒ **TRANSMISSION** ⇒ **CONFIGURABLE GOOSE** ⇒ **CONFIGURABLE GOOSE 1** settings menu:
 - Set **CONFIG GSE 1 FUNCTION** to “Enabled”.
 - Set **CONFIG GSE 1 ID** to an appropriate descriptive string (the default value is “GOOSEOut_1”).
 - Set **CONFIG GSE 1 DST MAC** to a multicast address (for example, 01 00 00 12 34 56).
 - Set the **CONFIG GSE 1 VLAN PRIORITY**; the default value of “4” is OK for this example.
 - Set the **CONFIG GSE 1 VLAN ID** value; the default value is “0”, but some switches may require this value to be “1”.
 - Set the **CONFIG GSE 1 ETYPE APPID** value. This setting represents the EtherType application ID and must match the configuration on the receiver (the default value is “0”).
 - Set the **CONFIG GSE 1 CONFREV** value. This value changes automatically as described in IEC 61850 part 7-2. For this example it can be left at its default value.
3. Configure the data by making the following changes in the **PRODUCT SETUP** ⇒ **COMMUNICATION** ⇒ **IEC 61850 PROTOCOL** ⇒ **GGIO1 STATUS CONFIGURATION** settings menu:
 - Set **GGIO1 INDICATION 1** to a FlexLogic operand used to provide the status of GGIO1.ST.Ind1.stVal (for example, a contact input, virtual input, a protection element status, etc.).

The L90 must be rebooted (control power removed and re-applied) before these settings take effect.

The following procedure illustrates the reception configuration.

1. Configure the reception dataset by making the following changes in the **PRODUCT SETUP** ⇒ **COMMUNICATION** ⇒ **IEC 61850 PROTOCOL** ⇒ **GSSE/GOOSE CONFIGURATION** ⇒ **RECEPTION** ⇒ **CONFIGURABLE GOOSE** ⇒ **CONFIGURABLE GOOSE 1** ⇒ **CONFIG GSE 1 DATASET ITEMS** settings menu:
 - Set **ITEM 1** to “GGIO3.ST.Ind1.q” to indicate quality flags for GGIO3 status indication 1.
 - Set **ITEM 2** to “GGIO3.ST.Ind1.stVal” to indicate the status value for GGIO3 status indication 1.

The reception dataset now contains a set of quality flags, a single point status Boolean value, and a floating point analog value. This matches the transmission dataset configuration above.
2. Configure the GOOSE service settings by making the following changes in the **INPUTS/OUTPUTS** ⇒ **REMOTE DEVICES** ⇒ **REMOTE DEVICE 1** settings menu:
 - Set **REMOTE DEVICE 1 ID** to match the GOOSE ID string for the transmitting device. Enter “GOOSEOut_1”.
 - Set **REMOTE DEVICE 1 ETYPE APPID** to match the EtherType application ID from the transmitting device. This is “0” in the example above.
 - Set the **REMOTE DEVICE 1 DATASET** value. This value represents the dataset number in use. Since we are using configurable GOOSE 1 in this example, program this value as “GOOSEIn 1”.
3. Configure the data by making the following changes in the **INPUTS/OUTPUTS** ⇒ **REMOTE INPUTS** ⇒ **REMOTE INPUT 1** settings menu:
 - Set **REMOTE IN 1 DEVICE** to “GOOSEOut_1”.
 - Set **REMOTE IN 1 ITEM** to “Dataset Item 2”. This assigns the value of the GGIO3.ST.Ind1.stVal single point status item to remote input 1.

Remote input 1 can now be used in FlexLogic equations or other settings. The L90 must be rebooted (control power removed and re-applied) before these settings take effect.

The value of remote input 1 (Boolean on or off) in the receiving device will be determined by the GGIO1.ST.Ind1.stVal value in the sending device. The above settings will be automatically populated by the EnerVista UR Setup software when a complete SCD file is created by third party substation configurator software.

C.4.5 ETHERNET MAC ADDRESS FOR GSSE/GOOSE

Ethernet capable devices each contain a unique identifying address called a Media Access Control (MAC) address. This address cannot be changed and is unique for each Ethernet device produced worldwide. The address is six bytes in length and is usually represented as six hexadecimal values (for example, 00 A0 F4 01 02 03). It is used in all Ethernet frames as the 'source' address of the frame. Each Ethernet frame also contains a *destination* address. The destination address can be different for each Ethernet frame depending on the intended destination of the frame.

A special type of destination address called a *multicast* address is used when the Ethernet frame can be received by more than one device. An Ethernet MAC address is multicast when the least significant bit of the first byte is set (for example, 01 00 00 00 00 00 is a multicast address).

GSSE and GOOSE messages must have multicast destination MAC addresses.

By default, the L90 is configured to use an automated multicast MAC scheme. If the L90 destination MAC address setting is not a valid multicast address (that is, the least significant bit of the first byte is not set), the address used as the destination MAC will be the same as the local MAC address, but with the multicast bit set. Thus, if the local MAC address is 00 A0 F4 01 02 03, then the destination MAC address will be 01 A0 F4 01 02 03.

C.4.6 GSSE ID AND GOOSE ID SETTINGS

GSSE messages contain an identifier string used by receiving devices to identify the sender of the message, defined in IEC 61850 part 8-1 as GsID. This is a programmable 65-character string. This string should be chosen to provide a descriptive name of the originator of the GSSE message.

GOOSE messages contain an identifier string used by receiving devices to identify the sender of the message, defined in IEC 61850 part 8-1 as GoID. This programmable 65-character string should be a descriptive name of the originator of the GOOSE message. GOOSE messages also contain two additional character strings used for identification of the message: DatSet - the name of the associated dataset, and GoCBRef - the reference (name) of the associated GOOSE control block. These strings are automatically populated and interpreted by the L90; no settings are required.

C.5.1 OVERVIEW

The L90 can be configured for IEC 61850 via the EnerVista UR Setup software as follows.

1. An ICD file is generated for the L90 by the EnerVista UR Setup software that describe the capabilities of the IED.
2. The ICD file is then imported into a system configurator along with other ICD files for other IEDs (from GE or other vendors) for system configuration.
3. The result is saved to a SCD file, which is then imported back to EnerVista UR Setup to create one or more settings file(s). The settings file(s) can then be used to update the relay(s) with the new configuration information.

The configuration process is illustrated below.

Figure C-1: IED CONFIGURATION PROCESS

The following acronyms and abbreviations are used in the procedures describing the IED configuration process for IEC 61850:

- BDA: Basic Data Attribute, that is not structured
- DAI: Instantiated Data Attribute
- DO: Data Object type or instance, depending on the context

- DOI: Instantiated Data Object
- IED: Intelligent Electronic Device
- LDInst: Instantiated Logical Device
- LNInst: Instantiated Logical Node
- SCL: Substation Configuration Description Language. The configuration language is an application of the Extensible Markup Language (XML) version 1.0.
- SDI: Instantiated Sub DATA; middle name part of a structured DATA name
- UR: GE Multilin Universal Relay series
- URI: Universal Resource Identifier
- URS: UR-series relay setting file
- XML: Extensible Markup Language

The following SCL variants are also used:

- ICD: IED Capability Description
- CID: Configured IED Description
- SSD: System Specification Description
- SCD: Substation Configuration Description

The following IEC related tools are referenced in the procedures that describe the IED configuration process for IEC 61850:

- **System configurator** or **Substation configurator**: This is an IED independent system level tool that can import or export configuration files defined by IEC 61850-6. It can import configuration files (ICD) from several IEDs for system level engineering and is used to add system information shared by different IEDs. The system configuration generates a substation related configuration file (SCD) which is fed back to the IED configurator (for example, EnerVista UR Setup) for system related IED configuration. The system configurator should also be able to read a system specification file (SSD) to use as base for starting system engineering, or to compare it with an engineered system for the same substation.
- **IED configurator**: This is a vendor specific tool that can directly or indirectly generate an ICD file from the IED (for example, from a settings file). It can also import a system SCL file (SCD) to set communication configuration parameters (that is, required addresses, reception GOOSE datasets, IDs of incoming GOOSE datasets, etc.) for the IED. The IED configurator functionality is implemented in the GE Multilin EnerVista UR Setup software.

C.5.2 CONFIGURING IEC 61850 SETTINGS

Before creating an ICD file, the user can customize the IEC 61850 related settings for the IED. For example, the IED name and logical device instance can be specified to uniquely identify the IED within the substation, or transmission GOOSE datasets created so that the system configurator can configure the cross-communication links to send GOOSE messages from the IED. Once the IEC 61850 settings are configured, the ICD creation process will recognize the changes and generate an ICD file that contains the updated settings.

Some of the IED settings will be modified during the system configuration process. For example, a new IP address may be assigned, line items in a Transmission GOOSE dataset may be added or deleted, or prefixes of some logical nodes may be changed. While all new configurations will be mapped to the L90 settings file when importing an SCD file, all unchanged settings will preserve the same values in the new settings file.

These settings can be configured either directly through the relay panel or through the EnerVista UR Setup software (preferred method). The full list of IEC 61850 related settings are as follows:

- Network configuration: IP address, IP subnet mask, and default gateway IP address (access through the **Settings > Product Setup > Communications > Network** menu tree in EnerVista UR Setup).
- Server configuration: IED name and logical device instance (access through the **Settings > Product Setup > Communications > IEC 61850 > Server Configuration** menu tree in EnerVista UR Setup).
- Logical node prefixes, which includes prefixes for all logical nodes except LLN0 (access through the **Settings > Product Setup > Communications > IEC 61850 > Logical Node Prefixes** menu tree in EnerVista UR Setup).

- MMXU deadbands, which includes deadbands for all available MMXUs. The number of MMXUs is related to the number of CT/VT modules in the relay. There are two MMXUs for each CT/VT module. For example, if a relay contains two CT/VT modules, there will be four MMXUs available (access through the **Settings > Product Setup > Communications > IEC 61850 > MMXU Deadbands** menu tree in EnerVista UR Setup).
- GGIO1 status configuration, which includes the number of status points in GGIO1 as well as the potential internal mappings for each GGIO1 indication. However only the number of status points will be used in the ICD creation process (access through the **Settings > Product Setup > Communications > IEC 61850 > GGIO1 Status Configuration** menu tree in EnerVista UR Setup).
- GGIO2 control configuration, which includes ctlModels for all SPCSOs within GGIO2 (access through the **Settings > Product Setup > Communications > IEC 61850 > GGIO2 Control Configuration** menu tree in EnerVista UR Setup).
- Configurable transmission GOOSE, which includes eight configurable datasets that can be used for GOOSE transmission. The GOOSE ID can be specified for each dataset (it must be unique within the IED as well as across the whole substation), as well as the destination MAC address, VLAN priority, VLAN ID, ETYPE APPID, and the dataset items. The selection of the dataset item is restricted by firmware version; for version 7.1x, only GGIO1.ST.Indx.stVal and GGIO1.ST.Indx.q are valid selection (where x is between 1 to N, and N is determined by number of GGIO1 status points). Although configurable transmission GOOSE can also be created and altered by some third-party system configurators, we recommend configuring transmission GOOSE for GE Multilin IEDs before creating the ICD, and strictly within EnerVista UR Setup software or the front panel display (access through the **Settings > Product Setup > Communications > IEC 61850 > GSSE/GOOSE Configuration > Transmission > Tx Configurable GOOSE** menu tree in EnerVista UR Setup).
- Configurable reception GOOSE, which includes eight configurable datasets that can be used for GOOSE reception. However, unlike datasets for transmission, datasets for reception only contains dataset items, and they are usually created automatically by process of importing the SCD file (access through the **Settings > Product Setup > Communications > IEC 61850 > GSSE/GOOSE Configuration > Reception > Rx Configurable GOOSE** menu tree in EnerVista UR Setup).
- Remote devices configuration, which includes remote device ID (GOOSE ID or GoID of the incoming transmission GOOSE dataset), ETYPE APPID (of the GSE communication block for the incoming transmission GOOSE), and DATASET (which is the name of the associated reception GOOSE dataset). These settings are usually done automatically by process of importing SCD file (access through the **Settings > Inputs/Outputs > Remote Devices** menu tree in EnerVista UR Setup).
- Remote inputs configuration, which includes device (remote device ID) and item (which dataset item in the associated reception GOOSE dataset to map) values. Only the items with cross-communication link created in SCD file should be mapped. These configurations are usually done automatically by process of importing SCD file (access through the **Settings > Inputs/Outputs > Remote Inputs** menu tree in EnerVista UR Setup).

C.5.3 ABOUT ICD FILES

The SCL language is based on XML, and its syntax definition is described as a W3C XML Schema. ICD is one type of SCL file (which also includes SSD, CID and SCD files). The ICD file describes the capabilities of an IED and consists of four major sections:

- Header
- Communication
- IEDs
- DataTypeTemplates

The root file structure of an ICD file is illustrated below.

Figure C-2: ICD FILE STRUCTURE, SCL (ROOT) NODE

The **Header** node identifies the ICD file and its version, and specifies options for the mapping of names to signals

The **Communication** node describes the direct communication connection possibilities between logical nodes by means of logical buses (sub-networks) and IED access ports. The communication section is structured as follows.

Figure C-3: ICD FILE STRUCTURE, COMMUNICATIONS NODE

The **SubNetwork** node contains all access points which can (logically) communicate with the sub-network protocol and without the intervening router. The **ConnectedAP** node describes the IED access point connected to this sub-network. The **Address** node contains the address parameters of the access point. The **GSE** node provides the address element for stating the control block related address parameters, where **IdInst** is the instance identification of the logical device within the IED on which the control block is located, and **cbName** is the name of the control block.

The **IED** node describes the (pre-)configuration of an IED: its access points, the logical devices, and logical nodes instantiated on it. Furthermore, it defines the capabilities of an IED in terms of communication services offered and, together with its **LNType**, instantiated data (DO) and its default or configuration values. There should be only one IED section in an ICD since it only describes one IED.

Figure C-4: ICD FILE STRUCTURE, IED NODE

842797A1.CDR

The **DataTypeTemplates** node defines instantiable logical node types. A logical node type is an instantiable template of the data of a logical node. A **LNodeType** is referenced each time that this instantiable type is needed with an IED. A logical node type template is built from DATA (DO) elements, which again have a DO type, which is derived from the DATA classes (CDC). DOs consist of attributes (DA) or of elements of already defined DO types (SDO). The attribute (DA) has a functional constraint, and can either have a basic type, be an enumeration, or a structure of a **DAType**. The DAType is built from BDA elements, defining the structure elements, which again can be **BDA** elements or have a base type such as DA.

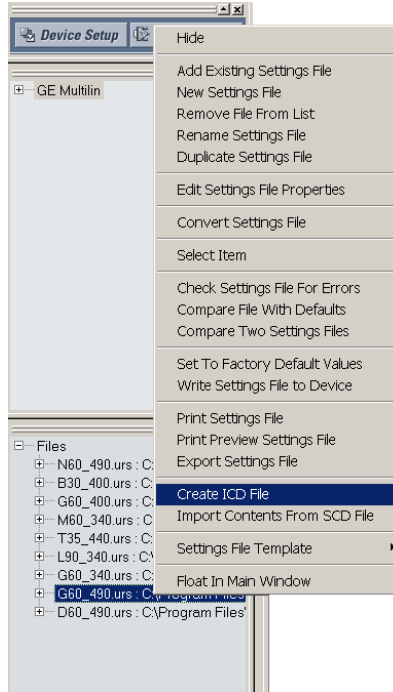

Figure C-5: ICD FILE STRUCTURE, DATATYPETEMPLATES NODE

C.5.4 CREATING AN ICD FILE WITH ENERVISTA UR SETUP

An ICD file can be created directly from a connected L90 IED or from an offline L90 settings file with the EnerVista UR Setup software using the following procedure:

1. Right-click the connected UR-series relay or settings file and select **Create ICD File**.

2. The EnerVista UR Setup will prompt to save the file. Select the file path and enter the name for the ICD file, then click **OK** to generate the file.

The time to create an ICD file from the offline L90 settings file is typically much quicker than create an ICD file directly from the relay.

C.5.5 ABOUT SCD FILES

System configuration is performed in the system configurator. While many vendors (including GE Multilin) are working their own system configuration tools, there are some system configurators available in the market (for example, Siemens DIGSI version 4.6 or above and ASE Visual SCL Beta 0.12).

Although the configuration tools vary from one vendor to another, the procedure is pretty much the same. First, a substation project must be created, either as an empty template or with some system information by importing a system specification file (SSD). Then, IEDs are added to the substation. Since each IED is represented by its associated ICD, the ICD files are imported into the substation project, and the system configurator validates the ICD files during the importing process. If the ICD files are successfully imported into the substation project, it may be necessary to perform some additional minor steps to attach the IEDs to the substation (see the system configurator manual for details).

Once all IEDs are inserted into the substation, further configuration is possible, such as:

- Assigning network addresses to individual IEDs.
- Customizing the prefixes of logical nodes.
- Creating cross-communication links (configuring GOOSE messages to send from one IED to others).

When system configurations are complete, the results are saved to an SCD file, which contains not only the configuration for each IED in the substation, but also the system configuration for the entire substation. Finally, the SCD file is passed back to the IED configurator (vendor specific tool) to update the new configuration into the IED.

The SCD file consists of at least five major sections:

- Header.
- Substation.
- Communication.
- IED section (one or more).
- DataTypeTemplates.

The root file structure of an SCD file is illustrated below.

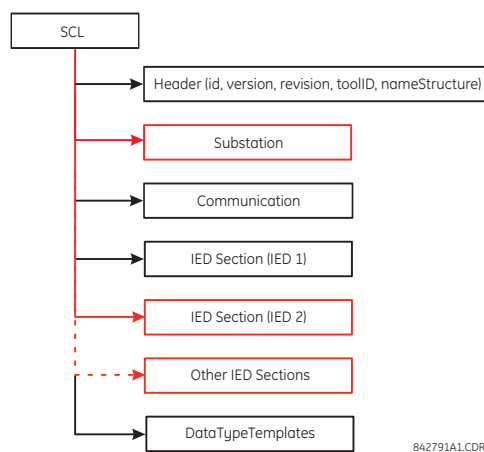

Figure C-6: SCD FILE STRUCTURE, SCL (ROOT) NODE

Like ICD files, the **Header** node identifies the SCD file and its version, and specifies options for the mapping of names to signals.

The **Substation** node describes the substation parameters:

Figure C-7: SCD FILE STRUCTURE, SUBSTATION NODE

The **Communication** node describes the direct communication connection possibilities between logical nodes by means of logical buses (sub-networks) and IED access ports. The communication section is structured as follows.

Figure C-8: SCD FILE STRUCTURE, COMMUNICATIONS NODE

The **SubNetwork** node contains all access points which can (logically) communicate with the sub-network protocol and without the intervening router. The **ConnectedAP** node describes the IED access point connected to this sub-network. The **Address** node contains the address parameters of the access point. The **GSE** node provides the address element for stating the control block related address parameters, where **IdInst** is the instance identification of the logical device within the IED on which the control block is located, and **cbName** is the name of the control block.

The **IED Section** node describes the configuration of an IED.

842794A1.CDR

Figure C-9: SCD FILE STRUCTURE, IED NODE

C.5.6 IMPORTING AN SCD FILE WITH ENERVISTA UR SETUP

The following procedure describes how to update the L90 with the new configuration from an SCD file with the EnerVista UR Setup software.

1. Right-click anywhere in the files panel and select the **Import Contents From SCD File** item.

2. Select the saved SCD file and click **Open**.

3. The software will open the SCD file and then prompt the user to save a UR-series settings file. Select a location and name for the URS (UR-series relay settings) file.
If there is more than one GE Multilin IED defined in the SCD file, the software prompt the user to save a UR-series settings file for each IED.
4. After the URS file is created, modify any settings (if required).
5. To update the relay with the new settings, right-click on the settings file in the settings tree and select the **Write Settings File to Device** item.
6. The software will prompt for the target device. Select the target device from the list provided and click **Send**. The new settings will be updated to the selected device.

TIME (CLAUSE 5.5)				
T1	Time resolution of internal clock (nearest negative power of 2 in seconds)			20
T2	Time accuracy of internal clock			SNTP, IRIG-B
T3	Supported TimeStamp resolution (nearest value of 2^{-n} in seconds, according to 6.1.2.9.3.2)			20

- c6:** shall declare support for at least one (BRCB or URCB)
c7: shall declare support for at least one (QueryLogByTime or QueryLogAfter)
c8: shall declare support for at least one (SendGOOSEMessage or SendGSSEMessage)
c9: shall declare support if TP association is available
c10: shall declare support for at least one (SendMSVMessage or SendUSVMessage)

C.7.1 LOGICAL NODES TABLE

The UR-series of relays supports IEC 61850 logical nodes as indicated in the following table. Note that the actual instantiation of each logical node is determined by the product order code. For example, the logical node “PDIS” (distance protection) is available only in the D60 Line Distance Relay.

Table C–1: IEC 61850 LOGICAL NODES (Sheet 1 of 4)

NODES	UR-FAMILY
L: SYSTEM LOGICAL NODES	
LPHD: Physical device information	Yes
LLN0: Logical node zero	Yes
LCCH: Physical communication channel supervision	---
LGOS: GOOSE subscription	---
LSVS: Sampled value subscription	---
LTIM: Time management	---
LTMS: Time master supervision	---
LTRK: Service tracking	---
A: LOGICAL NODES FOR AUTOMATIC CONTROL	
ANCR: Neutral current regulator	---
ARCO: Reactive power control	---
ATCC: Automatic tap changer controller	---
AVCO: Voltage control	---
C: LOGICAL NODES FOR CONTROL	
CALH: Alarm handling	---
CCGR: Cooling group control	---
CILO: Interlocking	---
CPOW: Point-on-wave switching	---
CSWI: Switch controller	Yes
CSYN: Synchronizer controller	---
F: LOGICAL NODES FOR FUNCTIONAL BLOCKS	
FCNT: Counter	---
FCSD: Curve shape description	---
FFIL: Generic filler	---
FLIM: Control function output limitation	---
FPID: PID regulator	---
FRMP: Ramp function	---
FSPT: Set-point control function	---
FXOT: Action at over threshold	---
FXUT: Action at under threshold	---
G: LOGICAL NODES FOR GENERIC REFERENCES	
GAPC: Generic automatic process control	---
GGIO: Generic process I/O	Yes
GLOG: Generic log	---
GSAL: Generic security application	---
I: LOGICAL NODES FOR INTERFACING AND ARCHIVING	
IARC: Archiving	---
IHMI: Human machine interface	---
ISAF: Safety alarm function	---
ITCI: Telecontrol interface	---
ITMI: Telemonitoring interface	---

Table C–1: IEC 61850 LOGICAL NODES (Sheet 2 of 4)

NODES	UR-FAMILY
ITPC: Teleprotection communication interfaces	---
K: LOGICAL NODES FOR MECHANICAL AND NON-ELECTRIC PRIMARY EQUIPMENT	
KFAN: Fan	---
KFIL: Filter	---
KPMP: Pump	---
KTNK: Tank	---
KVLV: Valve control	---
M: LOGICAL NODES FOR METERING AND MEASUREMENT	
MENV: Environmental information	---
MFLK: Flicker measurement name	---
MHAI: Harmonics or interharmonics	---
MHAN: Non phase related harmonics or interharmonics	---
MHYD: Hydrological information	---
MMDC: DC measurement	---
MMET: Meteorological information	---
MMTN: Metering	---
MMTR: Metering	---
MMXN: Non-phase-related measurement	Yes
MMXU: Measurement	Yes
MSQI: Sequence and imbalance	Yes
MSTA: Metering statistics	---
P: LOGICAL NODES FOR PROTECTION FUNCTIONS	
PDIF: Differential	Yes
PDIR: Direction comparison	---
PDIS: Distance	Yes
PDOP: Directional overpower	---
PDUP: Directional underpower	---
PFRC: Rate of change of frequency	---
PHAR: Harmonic restraint	---
PHIZ: Ground detector	---
PIOC: Instantaneous overcurrent	Yes
PMRI Motor restart inhibition	---
PMSS: Motor starting time supervision	---
POPF: Over power factor	---
PPAM: Phase angle measuring	---
PRTR: Rotor protection	---
PSCH: Protection scheme	---
PSDE: Sensitive directional earth fault	---
PTEF: Transient earth fault	---
PTOC: Time overcurrent	Yes
PTOF: Overfrequency	---
PTOV: Overvoltage	Yes
PTRC: Protection trip conditioning	Yes
PTTR: Thermal overload	---
PTUC: Undercurrent	---
PTUF: Underfrequency	---
PTUV: Undervoltage	Yes

Table C–1: IEC 61850 LOGICAL NODES (Sheet 3 of 4)

NODES	UR-FAMILY
PUPF: Underpower factor	---
PVOC: Voltage controlled time overcurrent	---
PVPH: Volts per Hz	---
PZSU: Zero speed or underspeed	---
Q: LOGICAL NODES FOR POWER QUALITY EVENTS	
QFVR: Frequency variation	---
QITR: Current transient	---
QIUB: Current unbalance variation	---
QVTR: Voltage transient	---
QVUB: Voltage unbalance variation	---
QVVR: Voltage variation	---
R: LOGICAL NODES FOR PROTECTION-RELATED FUNCTIONS	
RADR: Disturbance recorder channel analogue	---
RBDR: Disturbance recorder channel binary	---
RBRF: Breaker failure	---
RDIR: Directional element	---
RDRE: Disturbance recorder function	---
RDRS: Disturbance record handling	---
RFLO: Fault locator	Yes
RMXU: Differential measurements	---
RPSB: Power swing detection/blocking	Yes
RREC: Autoreclosing	Yes
RSYN: Synchronism-check or synchronizing	---
S: LOGICAL NODES FOR SENSORS AND MONITORING	
SARC: Monitoring and diagnostics for arcs	---
SCBR: Circuit breaker supervision	---
SIMG: Insulation medium supervision (gas)	---
SIML: Insulation medium supervision (liquid)	---
SLTC: Tap changer supervision	---
SOPM: Supervision of operating mechanism	---
SPDC: Monitoring and diagnostics for partial discharges	---
SPTR: Power transformer supervision	---
SSWI: Circuit switch supervision	---
STMP: Temperature supervision	---
SVBR: Vibration supervision	---
T: LOGICAL NODES FOR INSTRUMENT TRANSFORMERS	
TANG: Angle	---
TAXD: Axial displacement	---
TCTR: Current transformer	---
TDST: Distance	---
TFLW: Liquid flow	---
TFRQ: Frequency	---
TGSN: Generic sensor	---
THUM: Humidity	---
TLVL: Media level	---
TMGF: Magnetic field	---
TMVM: Movement sensor	---

Table C-1: IEC 61850 LOGICAL NODES (Sheet 4 of 4)

NODES	UR-FAMILY
TPOS: Position indicator	---
TPRS: Pressure sensor	---
TRTN: Rotation transmitter	---
TSND: Sound pressure sensor	---
TTMP: Temperature sensor	---
TTNS: Mechanical tension	---
TVBR: Vibration sensor	---
TVTR: Voltage transformer	---
TWPH: Water acidity	---
X: LOGICAL NODES FOR SWITCHGEAR	
XCBR: Circuit breaker	Yes
XSWI: Circuit switch	Yes
Y: LOGICAL NODES FOR POWER TRANSFORMERS	
YEFN: Earth fault neutralizer (Petersen coil)	---
YLTC: Tap changer	---
YPSH: Power shunt	---
YPTR: Power transformer	---
Z: LOGICAL NODES FOR FURTHER POWER SYSTEM EQUIPMENT	
ZAXN: Auxiliary network	---
ZBAT: Battery	---
ZBSH: Bushing	---
ZCAB: Power cable	---
ZCAP: Capacitor bank	---
ZCON: Converter	---
ZGEN: Generator	---
ZGIL: Gas insulated line	---
ZLIN: Power overhead line	---
ZMOT: Motor	---
ZREA: Reactor	---
ZRES: Resistor	---
ZRRC: Rotating reactive component	---
ZSAR: Surge arrestor	---
ZSCR: Semi-conductor controlled rectifier	---
ZSMC: Synchronous machine	---
ZTCF: Thyristor controlled frequency converter	---
ZTRC: Thyristor controlled reactive component	---

D.1.1 INTEROPERABILITY DOCUMENT

This document is adapted from the IEC 60870-5-104 standard. For this section the boxes indicate the following: ☒ – used in standard direction; ☐ – not used; ■ – cannot be selected in IEC 60870-5-104 standard.

1. SYSTEM OR DEVICE:

- ☐ System Definition
 ☐ Controlling Station Definition (Master)
 ☒ **Controlled Station Definition (Slave)**

2. NETWORK CONFIGURATION:

- Point-to-Point ■ Multipoint
 ■ Multiple-Point-to-Point ■ Multipoint-Star

3. PHYSICAL LAYER

Transmission Speed (control direction):

Unbalanced Interchange Circuit V.24/V.28 Standard:	Unbalanced Interchange Circuit V.24/V.28 Recommended if >1200 bits/s:	Balanced Interchange Circuit X.24/X.27:
■ 400 bits/sec. ■ 200 bits/sec. ■ 300 bits/sec. ■ 600 bits/sec. ■ 1200 bits/sec.	■ 2400 bits/sec. ■ 4800 bits/sec. ■ 9600 bits/sec.	■ 2400 bits/sec. ■ 4800 bits/sec. ■ 9600 bits/sec. ■ 19200 bits/sec. ■ 38400 bits/sec. ■ 56000 bits/sec. ■ 64000 bits/sec.

Transmission Speed (monitor direction):

Unbalanced Interchange Circuit V.24/V.28 Standard:	Unbalanced Interchange Circuit V.24/V.28 Recommended if >1200 bits/s:	Balanced Interchange Circuit X.24/X.27:
■ 400 bits/sec. ■ 200 bits/sec. ■ 300 bits/sec. ■ 600 bits/sec. ■ 1200 bits/sec.	■ 2400 bits/sec. ■ 4800 bits/sec. ■ 9600 bits/sec.	■ 2400 bits/sec. ■ 4800 bits/sec. ■ 9600 bits/sec. ■ 19200 bits/sec. ■ 38400 bits/sec. ■ 56000 bits/sec. ■ 64000 bits/sec.

4. LINK LAYER

Link Transmission Procedure:	Address Field of the Link:
■ Balanced Transmission ■ Unbalanced Transmission	■ Not Present (Balanced Transmission Only) ■ One Octet ■ Two Octets ■ Structured ■ Unstructured
Frame Length (maximum length, number of octets): Not selectable in companion IEC 60870-5-104 standard	

When using an unbalanced link layer, the following ADSU types are returned in class 2 messages (low priority) with the indicated causes of transmission:

- ~~The standard assignment of ADSUs to class 2 messages is used as follows:~~
- ~~A special assignment of ADSUs to class 2 messages is used as follows:~~

5. APPLICATION LAYER

Transmission Mode for Application Data:

Mode 1 (least significant octet first), as defined in Clause 4.10 of IEC 60870-5-4, is used exclusively in this companion standard.

Common Address of ADSU:

- ~~One Octet~~
- ☒ Two Octets

Information Object Address:

- ~~One Octet~~ ☒ Structured
- ~~Two Octets~~ ☒ Unstructured
- ☒ Three Octets

Cause of Transmission:

- ~~One Octet~~
- ☒ Two Octets (with originator address). Originator address is set to zero if not used.

Maximum Length of APDU: 253 (the maximum length may be reduced by the system).

Selection of standard ASDUs:

For the following lists, the boxes indicate the following: ☒ – used in standard direction; ☐ – not used; ■ – cannot be selected in IEC 60870-5-104 standard.

Process information in monitor direction

<input checked="" type="checkbox"/> <1> := Single-point information	M_SP_NA_1

6. BASIC APPLICATION FUNCTIONS

Station Initialization:

☒ Remote initialization

Cyclic Data Transmission:

☒ Cyclic data transmission

Read Procedure:

☒ Read procedure

Spontaneous Transmission:

- ☒ Spontaneous transmission

Double transmission of information objects with cause of transmission spontaneous:

The following type identifications may be transmitted in succession caused by a single status change of an information object. The particular information object addresses for which double transmission is enabled are defined in a project-specific list.

- ☐ Single point information: M_SP_NA_1, M_SP_TA_1, M_SP_TB_1, and M_PS_NA_1
- ☐ Double point information: M_DP_NA_1, M_DP_TA_1, and M_DP_TB_1
- ☐ Step position information: M_ST_NA_1, M_ST_TA_1, and M_ST_TB_1
- ☐ Bitstring of 32 bits: M_BO_NA_1, M_BO_TA_1, and M_BO_TB_1 (if defined for a specific project)
- ☐ Measured value, normalized value: M_ME_NA_1, M_ME_TA_1, M_ME_ND_1, and M_ME_TD_1
- ☐ Measured value, scaled value: M_ME_NB_1, M_ME_TB_1, and M_ME_TE_1
- ☐ Measured value, short floating point number: M_ME_NC_1, M_ME_TC_1, and M_ME_TF_1

Station interrogation:

- | | | | |
|---|---|--|--|
| <input checked="" type="checkbox"/> Global | | | |
| <input checked="" type="checkbox"/> Group 1 | <input checked="" type="checkbox"/> Group 5 | <input checked="" type="checkbox"/> Group 9 | <input checked="" type="checkbox"/> Group 13 |
| <input checked="" type="checkbox"/> Group 2 | <input checked="" type="checkbox"/> Group 6 | <input checked="" type="checkbox"/> Group 10 | <input checked="" type="checkbox"/> Group 14 |
| <input checked="" type="checkbox"/> Group 3 | <input checked="" type="checkbox"/> Group 7 | <input checked="" type="checkbox"/> Group 11 | <input checked="" type="checkbox"/> Group 15 |
| <input checked="" type="checkbox"/> Group 4 | <input checked="" type="checkbox"/> Group 8 | <input checked="" type="checkbox"/> Group 12 | <input checked="" type="checkbox"/> Group 16 |

Clock synchronization:

- ☒ Clock synchronization (optional, see Clause 7.6)

Command transmission:

- ☒ Direct command transmission
 - ☐ Direct setpoint command transmission
 - ☒ Select and execute command
 - ☐ Select and execute setpoint command
 - ☒ C_SE ACTTERM used
 - ☒ No additional definition
 - ☒ Short pulse duration (duration determined by a system parameter in the outstation)
 - ☒ Long pulse duration (duration determined by a system parameter in the outstation)
 - ☒ Persistent output
 - ☒ Supervision of maximum delay in command direction of commands and setpoint commands
- Maximum allowable delay of commands and setpoint commands: **10 s**

Transmission of integrated totals:

- ☒ Mode A: Local freeze with spontaneous transmission
- ☒ Mode B: Local freeze with counter interrogation
- ☒ Mode C: Freeze and transmit by counter-interrogation commands
- ☒ Mode D: Freeze by counter-interrogation command, frozen values reported simultaneously
- ☒ Counter read
- ☒ Counter freeze without reset

- ☒ Counter freeze with reset
- ☒ Counter reset

- ☒ General request counter
- ☒ Request counter group 1
- ☒ Request counter group 2
- ☒ Request counter group 3
- ☒ Request counter group 4

Parameter loading:

- ☒ Threshold value
- ☐ Smoothing factor
- ☐ Low limit for transmission of measured values
- ☐ High limit for transmission of measured values

Parameter activation:

- ☐ Activation/deactivation of persistent cyclic or periodic transmission of the addressed object

Test procedure:

- ☐ Test procedure

File transfer:

File transfer in monitor direction:

- ☐ Transparent file
- ☐ Transmission of disturbance data of protection equipment
- ☐ Transmission of sequences of events
- ☐ Transmission of sequences of recorded analog values

File transfer in control direction:

- ☐ Transparent file

Background scan:

- ☐ Background scan

Acquisition of transmission delay:

- ☒ Acquisition of transmission delay

Definition of time outs:

PARAMETER	DEFAULT VALUE	REMARKS	SELECTED VALUE
t_0	30 s	Timeout of connection establishment	120 s
t_1	15 s	Timeout of send or test APDUs	15 s
t_2	10 s	Timeout for acknowledgements in case of no data messages $t_2 < t_1$	10 s
t_3	20 s	Timeout for sending test frames in case of a long idle state	20 s

Maximum range of values for all time outs: 1 to 255 s, accuracy 1 s

Maximum number of outstanding I-format APDUs k and latest acknowledge APDUs (w):

PARAMETER	DEFAULT VALUE	REMARKS	SELECTED VALUE
k	12 APDUs	Maximum difference receive sequence number to send state variable	12 APDUs
w	8 APDUs	Latest acknowledge after receiving w I-format APDUs	8 APDUs

Maximum range of values k : 1 to 32767 ($2^{15} - 1$) APDUs, accuracy 1 APDU

Maximum range of values w : 1 to 32767 APDUs, accuracy 1 APDU
 Recommendation: w should not exceed two-thirds of k .

Portnumber:

PARAMETER	VALUE	REMARKS
Portnumber	2404	In all cases

RFC 2200 suite:

RFC 2200 is an official Internet Standard which describes the state of standardization of protocols used in the Internet as determined by the Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects has to be chosen by the user of this standard.

- ☒ Ethernet 802.3
- ☐ Serial X.21 interface
- ☐ Other selection(s) from RFC 2200 (list below if selected)

D.1.2 POINT LIST

D

The IEC 60870-5-104 data points are configured through the **SETTINGS** ⇒ **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **DNP / IEC104 POINT LISTS** menu. Refer to the *Communications* section of Chapter 5 for additional details.

D

E.1.1 DNP V3.00 DEVICE PROFILE

The following table provides a 'Device Profile Document' in the standard format defined in the DNP 3.0 Subset Definitions Document.

Table E-1: DNP V3.00 DEVICE PROFILE (Sheet 1 of 3)

(Also see the IMPLEMENTATION TABLE in the following section)	
Vendor Name: General Electric Multilin	
Device Name: UR Series Relay	
Highest DNP Level Supported: For Requests: Level 2 For Responses: Level 2	Device Function: <input type="checkbox"/> Master <input checked="" type="checkbox"/> Slave
Notable objects, functions, and/or qualifiers supported in addition to the Highest DNP Levels Supported (the complete list is described in the attached table): Binary Inputs (Object 1) Binary Input Changes (Object 2) Binary Outputs (Object 10) Control Relay Output Block (Object 12) Binary Counters (Object 20) Frozen Counters (Object 21) Counter Change Event (Object 22) Frozen Counter Event (Object 23) Analog Inputs (Object 30) Analog Input Changes (Object 32) Analog Deadbands (Object 34) Time and Date (Object 50) File Transfer (Object 70) Internal Indications (Object 80)	
Maximum Data Link Frame Size (octets): Transmitted: 292 Received: 292	Maximum Application Fragment Size (octets): Transmitted: configurable up to 2048 Received: 2048
Maximum Data Link Re-tries: <input checked="" type="checkbox"/> None <input type="checkbox"/> Fixed at 3 <input type="checkbox"/> Configurable	Maximum Application Layer Re-tries: <input checked="" type="checkbox"/> None <input type="checkbox"/> Configurable
Requires Data Link Layer Confirmation: <input checked="" type="checkbox"/> Never <input type="checkbox"/> Always <input type="checkbox"/> Sometimes <input type="checkbox"/> Configurable	

Table E–1: DNP V3.00 DEVICE PROFILE (Sheet 2 of 3)

Requires Application Layer Confirmation:				
<input type="checkbox"/> Never <input type="checkbox"/> Always <input checked="" type="checkbox"/> When reporting Event Data <input checked="" type="checkbox"/> When sending multi-fragment responses <input type="checkbox"/> Sometimes <input type="checkbox"/> Configurable				
Timeouts while waiting for:				
Data Link Confirm:	<input checked="" type="checkbox"/> None	<input type="checkbox"/> Fixed at ____	<input type="checkbox"/> Variable	<input type="checkbox"/> Configurable
Complete Appl. Fragment:	<input checked="" type="checkbox"/> None	<input type="checkbox"/> Fixed at ____	<input type="checkbox"/> Variable	<input type="checkbox"/> Configurable
Application Confirm:	<input type="checkbox"/> None	<input checked="" type="checkbox"/> Fixed at 10 s	<input type="checkbox"/> Variable	<input type="checkbox"/> Configurable
Complete Appl. Response:	<input checked="" type="checkbox"/> None	<input type="checkbox"/> Fixed at ____	<input type="checkbox"/> Variable	<input type="checkbox"/> Configurable
Others:				
Transmission Delay:	No intentional delay			
Need Time Interval:	Configurable (default = 24 hrs.)			
Select/Operate Arm Timeout:	10 s			
Binary input change scanning period:	8 times per power system cycle			
Analog input change scanning period:	500 ms			
Counter change scanning period:	500 ms			
Frozen counter event scanning period:	500 ms			
Unsolicited response notification delay:	100 ms			
Unsolicited response retry delay	configurable 0 to 60 sec.			
Sends/Executes Control Operations:				
WRITE Binary Outputs	<input checked="" type="checkbox"/> Never	<input type="checkbox"/> Always	<input type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
SELECT/OPERATE	<input type="checkbox"/> Never	<input checked="" type="checkbox"/> Always	<input type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
DIRECT OPERATE	<input type="checkbox"/> Never	<input checked="" type="checkbox"/> Always	<input type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
DIRECT OPERATE – NO ACK	<input type="checkbox"/> Never	<input checked="" type="checkbox"/> Always	<input type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
Count > 1	<input checked="" type="checkbox"/> Never	<input type="checkbox"/> Always	<input type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
Pulse On	<input type="checkbox"/> Never	<input type="checkbox"/> Always	<input checked="" type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
Pulse Off	<input type="checkbox"/> Never	<input type="checkbox"/> Always	<input checked="" type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
Latch On	<input type="checkbox"/> Never	<input type="checkbox"/> Always	<input checked="" type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
Latch Off	<input type="checkbox"/> Never	<input type="checkbox"/> Always	<input checked="" type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
Queue	<input checked="" type="checkbox"/> Never	<input type="checkbox"/> Always	<input type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
Clear Queue	<input checked="" type="checkbox"/> Never	<input type="checkbox"/> Always	<input type="checkbox"/> Sometimes	<input type="checkbox"/> Configurable
Explanation of ‘Sometimes’: Object 12 points are mapped to UR Virtual Inputs. The persistence of Virtual Inputs is determined by the VIRTUAL INPUT X TYPE settings. Both “Pulse On” and “Latch On” operations perform the same function in the UR; that is, the appropriate Virtual Input is put into the “On” state. If the Virtual Input is set to “Self-Reset”, it will reset after one pass of FlexLogic. The On/Off times and Count value are ignored. “Pulse Off” and “Latch Off” operations put the appropriate Virtual Input into the “Off” state. “Trip” and “Close” operations both put the appropriate Virtual Input into the “On” state.				

Table E-1: DNP V3.00 DEVICE PROFILE (Sheet 3 of 3)

Reports Binary Input Change Events when no specific variation requested: <ul style="list-style-type: none"> <input type="checkbox"/> Never <input checked="" type="checkbox"/> Only time-tagged <input type="checkbox"/> Only non-time-tagged <input type="checkbox"/> Configurable 	Reports time-tagged Binary Input Change Events when no specific variation requested: <ul style="list-style-type: none"> <input type="checkbox"/> Never <input checked="" type="checkbox"/> Binary Input Change With Time <input type="checkbox"/> Binary Input Change With Relative Time <input type="checkbox"/> Configurable (attach explanation)
Sends Unsolicited Responses: <ul style="list-style-type: none"> <input type="checkbox"/> Never <input checked="" type="checkbox"/> Configurable <input type="checkbox"/> Only certain objects <input type="checkbox"/> Sometimes (attach explanation) <input checked="" type="checkbox"/> ENABLE/DISABLE unsolicited Function codes supported 	Sends Static Data in Unsolicited Responses: <ul style="list-style-type: none"> <input checked="" type="checkbox"/> Never <input type="checkbox"/> When Device Restarts <input type="checkbox"/> When Status Flags Change <p>No other options are permitted.</p>
Default Counter Object/Variation: <ul style="list-style-type: none"> <input type="checkbox"/> No Counters Reported <input type="checkbox"/> Configurable (attach explanation) <input checked="" type="checkbox"/> Default Object: 20 Default Variation: 1 <input checked="" type="checkbox"/> Point-by-point list attached 	Counters Roll Over at: <ul style="list-style-type: none"> <input type="checkbox"/> No Counters Reported <input type="checkbox"/> Configurable (attach explanation) <input checked="" type="checkbox"/> 16 Bits (Counter 8) <input checked="" type="checkbox"/> 32 Bits (Counters 0 to 7, 9) <input type="checkbox"/> Other Value: _____ <input checked="" type="checkbox"/> Point-by-point list attached
Sends Multi-Fragment Responses: <ul style="list-style-type: none"> <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No 	

E.1.2 IMPLEMENTATION TABLE

The following table identifies the variations, function codes, and qualifiers supported by the L90 in both request messages and in response messages. For static (non-change-event) objects, requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01. Static object requests sent with qualifiers 17 or 28 will be responded with qualifiers 17 or 28. For change-event objects, qualifiers 17 or 28 are always responded.

Table E-2: IMPLEMENTATION TABLE (Sheet 1 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)
1	0	Binary Input (Variation 0 is used to request default variation)	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	Binary Input	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	2	Binary Input with Status	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
2	0	Binary Input Change (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	Binary Input Change without Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	Binary Input Change with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	3	Binary Input Change with Relative Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
10	0	Binary Output Status (Variation 0 is used to request default variation)	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	2	Binary Output Status	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
12	1	Control Relay Output Block	3 (select) 4 (operate) 5 (direct op) 6 (dir. op, noack)	00, 01 (start-stop) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	echo of request
20	0	Binary Counter (Variation 0 is used to request default variation)	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	32-Bit Binary Counter	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. Refer to the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the L90 is not restarted, but the DNP process is restarted.

Table E-2: IMPLEMENTATION TABLE (Sheet 2 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)
20 cont'd	2	16-Bit Binary Counter	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	5	32-Bit Binary Counter without Flag	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	6	16-Bit Binary Counter without Flag	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
21	0	Frozen Counter (Variation 0 is used to request default variation)	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	32-Bit Frozen Counter	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	2	16-Bit Frozen Counter	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	9	32-Bit Frozen Counter without Flag	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	10	16-Bit Frozen Counter without Flag	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
22	0	Counter Change Event (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	32-Bit Counter Change Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	16-Bit Counter Change Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	5	32-Bit Counter Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	6	16-Bit Counter Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
23	0	Frozen Counter Event (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	32-Bit Frozen Counter Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	16-Bit Frozen Counter Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. Refer to the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the L90 is not restarted, but the DNP process is restarted.

Table E-2: IMPLEMENTATION TABLE (Sheet 3 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)
23 cont'd	5	32-Bit Frozen Counter Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	6	16-Bit Frozen Counter Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
30	0	Analog Input (Variation 0 is used to request default variation)	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	32-Bit Analog Input	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	2	16-Bit Analog Input	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	3	32-Bit Analog Input without Flag	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	4	16-Bit Analog Input without Flag	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
	5	short floating point	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
32	0	Analog Change Event (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	32-Bit Analog Change Event without Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	16-Bit Analog Change Event without Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	3	32-Bit Analog Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	4	16-Bit Analog Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	5	short floating point Analog Change Event without Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	7	short floating point Analog Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
34	0	Analog Input Reporting Deadband (Variation 0 is used to request default variation)	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	16-bit Analog Input Reporting Deadband (default – see Note 1)	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
			2 (write)	00, 01 (start-stop) 07, 08 (limited quantity) 17, 28 (index)		

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. Refer to the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the L90 is not restarted, but the DNP process is restarted.

Table E-2: IMPLEMENTATION TABLE (Sheet 4 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)
34 cont'd	2	32-bit Analog Input Reporting Deadband	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
			2 (write)	00, 01 (start-stop) 07, 08 (limited quantity) 17, 28 (index)		
	3	Short floating point Analog Input Reporting Deadband	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
50	1	Time and Date (default – see Note 1)	1 (read) 2 (write)	00, 01 (start-stop) 06 (no range, or all) 07 (limited qty=1) 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) (see Note 2)
52	2	Time Delay Fine			129 (response)	07 (limited quantity) (quantity = 1)
60	0	Class 0, 1, 2, and 3 Data	1 (read) 20 (enable unsol) 21 (disable unsol) 22 (assign class)	06 (no range, or all)		
	1	Class 0 Data	1 (read) 22 (assign class)	06 (no range, or all)		
	2	Class 1 Data	1 (read)	06 (no range, or all)		
	3	Class 2 Data	20 (enable unsol)	07, 08 (limited quantity)		
	4	Class 3 Data	21 (disable unsol) 22 (assign class)			
70	0	File event - any variation	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
			22 (assign class)	06 (no range, or all)		
	2	File authentication	29 (authenticate)	5b (free format)	129 (response)	5b (free format)
	3	File command	25 (open) 27 (delete)	5b (free format)		
	4	File command status	26 (close) 30 (abort)	5b (free format)	129 (response) 130 (unsol. resp.)	5b (free format)
	5	File transfer	1 (read) 2 (write)	5b (free format)	129 (response) 130 (unsol. resp.)	5b (free format)
	6	File transfer status			129 (response) 130 (unsol. resp.)	5b (free format)
	7	File descriptor	28 (get file info.)	5b (free format)	129 (response) 130 (unsol. resp.)	5b (free format)
80	1	Internal Indications	1 (read)	00, 01 (start-stop) (index =7)	129 (response)	00, 01 (start-stop)
			2 (write) (see Note 3)	00 (start-stop) (index =7)		
---		No Object (function code only) see Note 3	13 (cold restart)			
---		No Object (function code only)	14 (warm restart)			
---		No Object (function code only)	23 (delay meas.)			

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. Refer to the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the L90 is not restarted, but the DNP process is restarted.

E.2.1 BINARY INPUT POINTS

The DNP binary input data points are configured through the **PRODUCT SETUP** ⇨ ⇩ **COMMUNICATIONS** ⇨ ⇩ **DNP / IEC104 POINT LISTS** ⇨ **BINARY INPUT / MSP POINTS** menu. Refer to the *Communications* section of Chapter 5 for additional details. When a freeze function is performed on a binary counter point, the frozen value is available in the corresponding frozen counter point.

BINARY INPUT POINTS

Static (Steady-State) Object Number: **1**

Change Event Object Number: **2**

Request Function Codes supported: **1 (read), 22 (assign class)**

Static Variation reported when variation 0 requested: **2 (Binary Input with status), Configurable**

Change Event Variation reported when variation 0 requested: **2 (Binary Input Change with Time), Configurable**

Change Event Scan Rate: **8 times per power system cycle**

Change Event Buffer Size: **500**

Default Class for All Points: **1**

E.2.2 BINARY AND CONTROL RELAY OUTPUT

Supported Control Relay Output Block fields: Pulse On, Pulse Off, Latch On, Latch Off, Paired Trip, Paired Close.

BINARY OUTPUT STATUS POINTS

Object Number: **10**

Request Function Codes supported: **1 (read)**

Default Variation reported when Variation 0 requested: **2 (Binary Output Status)**

CONTROL RELAY OUTPUT BLOCKS

Object Number: **12**

Request Function Codes supported: **3 (select), 4 (operate), 5 (direct operate), 6 (direct operate, noack)**

Table E-3: BINARY/CONTROL OUTPUTS

E.2.3 COUNTERS

The following table lists both Binary Counters (Object 20) and Frozen Counters (Object 21). When a freeze function is performed on a Binary Counter point, the frozen value is available in the corresponding Frozen Counter point.

BINARY COUNTERS

Static (Steady-State) Object Number: **20**

Change Event Object Number: **22**

Request Function Codes supported: **1 (read), 7 (freeze), 8 (freeze noack), 9 (freeze and clear), 10 (freeze and clear, noack), 22 (assign class)**

Static Variation reported when variation 0 requested: **1 (32-Bit Binary Counter with Flag)**

Change Event Variation reported when variation 0 requested: **1 (32-Bit Counter Change Event without time)**

Change Event Buffer Size: **10**

Default Class for all points: **3**

FROZEN COUNTERS

Static (Steady-State) Object Number: **21**

Change Event Object Number: **23**

Request Function Codes supported: **1 (read)**

Static Variation reported when variation 0 requested: **1 (32-Bit Frozen Counter with Flag)**

Change Event Variation reported when variation 0 requested: **1 (32-Bit Frozen Counter Event without time)**

Change Event Buffer Size: **10**

Default Class for all points: **3**

Table E-4: BINARY AND FROZEN COUNTERS

POINT INDEX	NAME/DESCRIPTION
0	Digital Counter 1
1	Digital Counter 2
2	Digital Counter 3
3	Digital Counter 4
4	Digital Counter 5
5	Digital Counter 6
6	Digital Counter 7
7	Digital Counter 8
8	Oscillography Trigger Count
9	Events Since Last Clear

A counter freeze command has no meaning for counters 8 and 9. L90 Digital Counter values are represented as 32-bit integers. The DNP 3.0 protocol defines counters to be unsigned integers. Care should be taken when interpreting negative counter values.

E.2.4 ANALOG INPUTS

The DNP analog input data points are configured through the **PRODUCT SETUP** ⇒ **COMMUNICATIONS** ⇒ **DNP / IEC104 POINT LISTS** ⇒ **ANALOG INPUT / MME POINTS** menu. Refer to the *Communications* section of Chapter 5 for additional details.

It is important to note that 16-bit and 32-bit variations of analog inputs are transmitted through DNP as signed numbers. Even for analog input points that are not valid as negative values, the maximum positive representation is 32767 for 16-bit values and 2147483647 for 32-bit values. This is a DNP requirement.

The deadbands for all Analog Input points are in the same units as the Analog Input quantity. For example, an Analog Input quantity measured in volts has a corresponding deadband in units of volts. This is in conformance with DNP Technical Bulletin 9809-001: Analog Input Reporting Deadband. Relay settings are available to set default deadband values according to data type. Deadbands for individual Analog Input Points can be set using DNP Object 34.

Static (Steady-State) Object Number: **30**

Change Event Object Number: **32**

Request Function Codes supported: **1 (read), 2 (write, deadbands only), 22 (assign class)**

Static Variation reported when variation 0 requested: **1 (32-Bit Analog Input)**

Change Event Variation reported when variation 0 requested: **1 (Analog Change Event without Time)**

Change Event Scan Rate: defaults to **500 ms**

Change Event Buffer Size: **256**

Default Class for all Points: **2**

F.1.1 RADIUS SERVER CONFIGURATION

The following procedure is an example of how to set up a simple RADIUS server, where the third-party tool used is also an example.

1. Download and install [FreeRADIUS](#) as the RADIUS server.
2. In the RADIUSD.CONF file, locate the "bind_address" field and enter your RADIUS server IP address.
3. In the USERS.CONF file in the <Path_to_Radius>\etc\raddb folder, add the following text to configure a user "Tester" with an Administrator role.

```
Tester:
->User-Password == "Testing1!1"
->GE-UR-Role = Administrator
```

4. In the CLIENTS.CONF file in the <Path_to_Radius>\etc\raddb folder, add the following text to define a RADIUS client, where the client IP address is 10.0.0.2, the subnet mask is 255.255.255.0, the shared secret specified here is also configured on the UR device for successful authentication, and the shortname is a short, optional alias that can be used in place of the IP address.

```
client 10.0.0.2/24 {
  secret = testing123
  shortname = private-network-1
}
```

5. In the <Path_to_Radius>\etc\raddb folder, create a file called dictionary.ge and add the following content.

```
# #####
# GE VSAS
# #####

VENDOR                                GE                                2910

# Management authorization
BEGIN-VENDOR                          GE

# Role ID
ATTRIBUTE                             GE-UR-Role                    1                integer

# GE-UR-ROLE values
VALUE GE-UR-Role                      Administrator                1
VALUE GE-UR-Role                      Supervisor                  2
VALUE GE-UR-Role                      Engineer                    3
VALUE GE-UR-Role                      Operator                    4
VALUE GE-UR-Role                      Observer                    5

END-VENDOR                            GE
# #####
```

6. In the dictionary file in the <Path_to_Radius>\etc\raddb folder, add the following line.
\$INCLUDE dictionary.ge
7. For the first start, run the RADIUS server in debug mode by entering
<Path_to_Radius>/start_radiusd_debug.bat
8. Set up the RADIUS client on the UR as follows. Access **Device > Settings > Product Setup > Security**. Configure the IP address and ports for the RADIUS server. Leave the GE vendor ID field at the default of 2910. Update the RADIUS shared secret as specified in the CLIENTS.CONF file.

G.1.1 REVISION HISTORY

Table G–1: REVISION HISTORY (Sheet 1 of 2)

MANUAL P/N	L90 REVISION	RELEASE DATE	ECO

G.1.2 CHANGES TO THE L90 MANUAL

Table G–2: MAJOR UPDATES FOR L90 MANUAL REVISION Z2

PAGE (Z1)	PAGE (Z2)	CHANGE	DESCRIPTION
---	---	Update	General revision throughout document
5-108	5-108	Update	Updated hysteresis numbers and logic diagrams in section 5.4.8 Phasor Measurement Unit
8-	---	Delete	Security chapter - Moved content to other parts of manual and deleted the Security chapter
---	11-	Add	Added Maintenance chapter, moving module replacement content from chapter 3, adding battery replacement instructions, and moving battery disposal instructions from beginning of manual
---	F-	Add	Added appendix on RADIUS server configuration

Table G–3: MAJOR UPDATES FOR L90 MANUAL REVISION Z1 (Sheet 1 of 2)

PAGE (Y3)	PAGE (Z1)	CHANGE	DESCRIPTION
---	---	Add	Added CPU options U and V to order code tables in chapter 2, a note above Rear Terminal View figure in chapter 3, and CPU Module Communications Wiring figure in chapter 3
---	---	Add	Added Parallel Redundancy Protocol (PRP) to order code tables and specifications in chapter 2, section 5.2.5d Settings > Product Setup > Communications > Network, section 6.3.1 Actual Values > Status > PRP, and Appendix B Modbus table and F627 and F628 enumeration tables
---	---	Add	Added (line differential with) in-zone transformer functionality content from L30 manual, including product description, specifications, and Modbus memory map
---	---	Add	Added restricted ground fault content from T60 manual, including section 5.6c Restricted Ground Fault on page 5-207, 6.3.12 Restricted Ground Fault on page 6-24, Modbus memory map, and enumeration tables
1-1	1-1	Add	Added General Cautions and Warnings to section 1.1.1
1-5	1-5	Update	Revised section 1.3.1 on system requirements, including addition of support for Windows 7 and Windows Server 2008
2-16	2-16	Update	Updated several specifications
5-24	5-24	Add	Added section 5.2.5e Routing

Table G–3: MAJOR UPDATES FOR L90 MANUAL REVISION Z1 (Sheet 2 of 2)

PAGE (Y3)	PAGE (Z1)	CHANGE	DESCRIPTION
5-85	5-85	Update	Updated Figures 5-21 and 5-22 Dual Breaker Control Scheme Logic, sheets 1 and 2
5-89	5-89	Update	Updated Figure 5-23 Disconnect Switch Scheme Logic
5-150	5-150	Update	Updated Figure 5-61 Current Differential Scheme Logic
5-328	5-328	Add	Reinserted section 5.8.5d Remote Devices: ID of Device for Receiving GSSE/GOOSE Messages, meaning the Settings > Input/Outputs > Remote Devices settings

Table G–4: MAJOR UPDATES FOR L90 MANUAL REVISION Y3

PAGE (Y2)	PAGE (Y3)	CHANGE	DESCRIPTION
--	xi	Add	Added battery disposal information as chapter 0
5-246	5-246	Update	Updated Figure 5-132 Trip Output Scheme Logic (Sheet 1 of 2)

Table G–5: MAJOR UPDATES FOR L90 MANUAL REVISION Y2

PAGE (Y1)	PAGE (Y2)	CHANGE	DESCRIPTION
All	All	Update	Minor changes throughout document
All	All	Delete	Deleted CPU options U and V
1-1	1-1	Update	Updated Figure 1-1 Rear Nameplate
3-8	3-8	Update	Updated Figure 3-10 Rear Terminal View
5-298	5-298	Add	Added Block Scheme Target and Block Scheme Event to section 5.7g Directional Comparison Blocking

Table G–6: MAJOR UPDATES FOR L90 MANUAL REVISION Y1 (Sheet 1 of 3)

PAGE (X2)	PAGE (Y1)	CHANGE	DESCRIPTION
All	All	Delete	Deleted content pertaining to Ethernet switch
Title	Title	Update	Changed part numbers. Updated address and contact information.
1-1	1-1	Update	Updated address and contact information
2-	2-	Add	Added CPU options T, U, and V to order code table
2-	2-	Delete	Removed E, G, H, J, S from CPU options from order code tables
2-9	2-9	Delete	Deleted 9S, 2S, 2T from replacement module order code Tables 2-7 and 2-8
2-27	2-27	Update	Updated Ethernet fiber table in section 2.4.8 Communications
3-10	3-10	Update	Updated Figure 3-12 Typical Wiring Diagram
3-23	3-23	Update	Deleted references to COM 1 RS485 port in section 3.2.9 CPU Communication Ports. Revised text and Figure 3-24 CPU Module Communications Wiring to include only modules T, U, V in section 3.2.9a.
5-1	5-1	Update	Updated the front panel main menu to include the CyberSentry security menu
5-15	5-15	Update	Update Communications main menu to remove the SNMP Protocol submenu
5-16	5-16	Delete	Deleted references to COM1 RS485 port in section 5.2.4b Serial Ports
5-16	5-16	Add	Added section 5.2.4c Ethernet Network Topology
5-17	5-17	Update	Updated Networks section 5.2.4d to include all three Ethernet ports
5-17	5-17	Update	Added 0 as valid number to section 5.2.4e Modbus Protocol section
5-38	5-	Delete	Deleted Local Time Offset, Daylight Savings Time, DST (start/stop for month/day/hour) from Real Time Clock menu
5-	5-38	Add	Added submenus Precision Time Protocol, SNMP Protocol, and Local Time and Synchronizing Source settings to Real Time Clock menu

Table G-6: MAJOR UPDATES FOR L90 MANUAL REVISION Y1 (Sheet 2 of 3)

PAGE (X2)	PAGE (Y1)	CHANGE	DESCRIPTION
5-	5-40	Add	Added new Precision Time Protocol (1588) menu and setting descriptions
5-	5-	Update	Changed Communication to Real Time Clock in SNTP protocol settings path. Moved SNTP Protocol menu and settings descriptions to Real Time Clock subsection
5-37	5-	Delete	Deleted section k) SNTP Protocol and the settings descriptions
5-	5-43	Add	Added new section for Local Time menu settings and settings description
5-	5-55	Add	Added new PTP Fail menu item to the User-Programmable Self Tests menu
5-	5-	Add	Added PTP Failure and CLOCK UNSYNCHRONIZED to FlexLogic Operands table
5-76	5-76	Update	Updated Figure 5-16 Channel Asymmetry Compensation Logic and added definition for Local GPS Trouble in preceding text
5-91	5-91	Update	Updated PMU main menu to add aggregator and control block menu items
5-	5-91	Add	Added UR Synchrophasor Implementation of IEC61850-90-5 to the PMU software option description
5-91	5-91	Update	Updated Figure: Complete Synchrophasor Implementation
5-	5-92	Add	Added Figure: N60 Support For Four Logical Device PMU
5-92	5-92	Update	Updated Table: Implementation By Model Number
5-	5-93	Add	Added Figure: Logical Nodes Supported In Each Logical Device
5-	5-94	Add	Added Figure: Data Set Created From User Selected Internal Items
5-	5-95	Add	Added Figure: Example Of Aggregator Data Sets
5-	5-95	Add	Added Figure: CFG-2 Based Configuration Solution
5-	5-96	Add	Added examples for a synchrophasor dataset and the creation of different datasets
5-	5-95	Add	Added example for a CFG-2 based configuration
5-97	5-97	Update	Updated PMU 1 basic configuration menu to add 37.118 and 90-5 configuration settings submenus
5-	5-98	Add	Added PMU 1 configuration menus for 37.118 and 90-5 with settings descriptions
5-98	5-98	Update	Changed PMU 1 Function setting description
5-	5-109	Add	Added PMU AGGR 1 configuration menu and setting descriptions
5-	5-109	Add	Added new aggregators section with PMU 1 aggregators menu and setting descriptions
5-109	5-109	Update	Updated PMU 1 aggregators menu to include 37.118 and 90-5 aggregator configuration submenus
5-	5-110	Add	Added 90-5 AGGR 1 configuration menu and setting descriptions
5-	5-111	Add	Added Table 5- # Of ASDUs
5-	5-111	Add	Added new control block section with IEC 90-5 MSVCB configuration menu and setting descriptions
5-	5-135	Update	Added row for DeltaTime to Table 5-: FlexElement Base Units
5-	5-277 to 300	Add	Added remaining pilot scheme content to the POTT content already there
5-	5-316	Add	Added new CyberSentry security section and main menu, local passwords, session settings, restore defaults, and supervisory subsections to Chapter 5
5-321	5-321	Delete	Deleted section 5.8.5d Remote Devices: ID of Device for Receiving GSSE/GOOSE Messages, meaning the Settings > Input/Outputs > Remote Devices settings
6-1	6-1	Update	Update Actual Values main menu to include Real Time Clock Synchronization submenu
6-	6-7	Add	Added new section for Real Time Clock synchronizing consisting of the menu of settings and the setting descriptions
6-10	6-10	Delete	Deleted section 6.2.17 Ethernet Switch
6-	6-11	Add	Added new section 6.2.18 Remaining Connection Status
7-	7-1	Add	Added Security command to the Commands main menu
7-	7-3	Add	Added Reboot Relay command and description to the Relay Maintenance menu items
7-	7-	Add	Added Security menu and submenu commands and descriptions to the Command menu
7-	7-	Add	Added to Minor self-test error message **Bad PTP Signal**

Table G–6: MAJOR UPDATES FOR L90 MANUAL REVISION Y1 (Sheet 3 of 3)

PAGE (X2)	PAGE (Y1)	CHANGE	DESCRIPTION
8-	8-4	Add	Added new section for CyberSentry software option with overview and security menu subsections
9-	9-20	Add	Added section 9.3 Distance Elements from D60
9-	9-29	Add	Added section 9.4 Phase Distance Applied to Power Transformers
9-	9-37	Add	Added sections 9.5.3 Communications Channels for Pilot-Aided Schemes, 9.5.4 Permissive Echo Signaling, 9.5.5 Pilot Scheme/Phase Selector Coordination, and 9.5.6 Cross-Country Fault Example
10-16	10-16	Update	Replaced section 10.5 POTT Signaling Scheme with all the pilot-scheme content as section 10.5 Protection Signaling Schemes
10-	10-26	Add	Added section 10.9 Phase Distance through Power Transformers
A-	A-	Add	Added Flexanalog item PTP–IRIG-B Delta to Table A-1: FlexAnalog Data Items
B-8	B-8	Update	Updated Modbus memory map table to include port 0 for Modbus slave address, TCP, DNP, HTTP, TFTP, MMS, and removed references to COM 1 RS485 port
C-23	C-23	Update	Updated tables in sections C.6.3 ACSI Services Conformance Statement and C.7.1 Logical Nodes Table

S	Sensitive	Z	Impedance, Zone

GE MULTILIN RELAY WARRANTY

GE Multilin warrants each relay it manufactures to be free from defects in material and workmanship under normal use and service for a period of 24 months from date of shipment from factory.

In the event of a failure covered by warranty, GE Multilin will undertake to repair or replace the relay providing the warrantor determined that it is defective and it is returned with all transportation charges prepaid to an authorized service centre or the factory. Repairs or replacement under warranty will be made without charge.

Warranty shall not apply to any relay which has been subject to misuse, negligence, accident, incorrect installation or use not in accordance with instructions nor any unit that has been altered outside a GE Multilin authorized factory outlet.

GE Multilin is not liable for special, indirect or consequential damages or for loss of profit or for expenses sustained as a result of a relay malfunction, incorrect application or adjustment.

For complete text of Warranty (including limitations and disclaimers), refer to GE Multilin Standard Conditions of Sale.
